Adds any existing dimensions and volume at the position of the cursor.

Insert References

Opens the selection of references screen from which the desired references can be chosen and inserted at the position of the cursor.

OK

Stores the data and closes the editor.

Cancel

Closes the editor without further action.

Other Charges

All associated costs such as collection, handling, surcharges, etc. are present in the ancillary charges table. The charge types are based on the master data (activity types , master data rates)) combined with the shipment data (Incoterms , chargeable weight). Totals are therefore automatically determined and proposed for settlement.

Charge

The charge for which the amounts are calculated.

Amount

the amount of the charges. These are entered manually, or are automatically calculated from the master data

PP/CC

Depending on the incoterms selected in the general tab of the shipment this field indicates if the charge is prepaid or collect. The payment terms can be as per the following table:

Code	Designation	Explanation
PP	Prepaid	Costs are paid by the sender
CC	Collect	Costs are paid by the recipient

Due

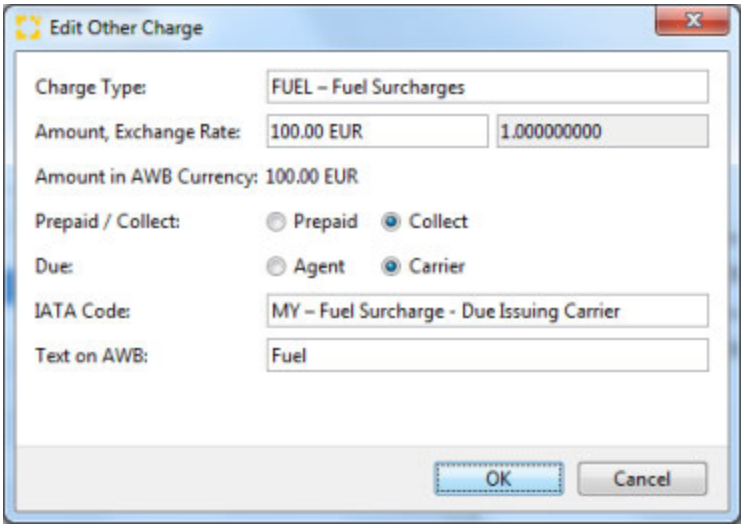
Indicates to whom the costs should be paid:

Designation	Explanation
Agent	The agent or carrier who issues the Air Waybill (PP) and who is defined as the receiving agent (import agent) or carrier (CC).
Carrier	The carrier or airline who transported the shipment

New

The button opens the **New Other Charge** editor which allows new charges to be inserted.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Charge Type

New charges can be found using the search function.

Amount, Exchange Rate

If a valid tariff has been found for the charge code, the total amount of the charge will automatically be calculated and inserted. Use the dropdown menu or the F5 function key if the tariff needs to be recalculated. The amount can also be manually entered or changed. The currency of the charge will default to the local currency but it may also be entered or changed. In the adjacent field the exchange rate for the charge will appear. If the local currency is used the rate will be 1.0000, if a foreign currency used the rate will appear automatically or can be entered or changed.

Amount in AWB Currency

If the charge has been enter in a foreign currency, this field will show the amount converted to the local currency.

Prepaid/Collect

Indicates whether the charge is prepaid or collect. The default value will be based on the inco terms (see the *general tab*) but this default can be changed.

Due

Defines if the charge is *due Agent* or *due Carrier*. The default value for charges can be stored in the air cargo master data

Text on AWB

This will be the code used on the AWB to describe the charge type. By default the first 2 digits of the IATA code are used.

OK

Stores the data and closes the editor.

Cancel

Closes the editor without further action.

Edit

Open the other charge editor to edit the highlighted charge.

Delete

Removes the highlighted ancillary charge.

Update other charges

This action link will recalculate all ancillary charges according to current tariffs.

Distribution of costs

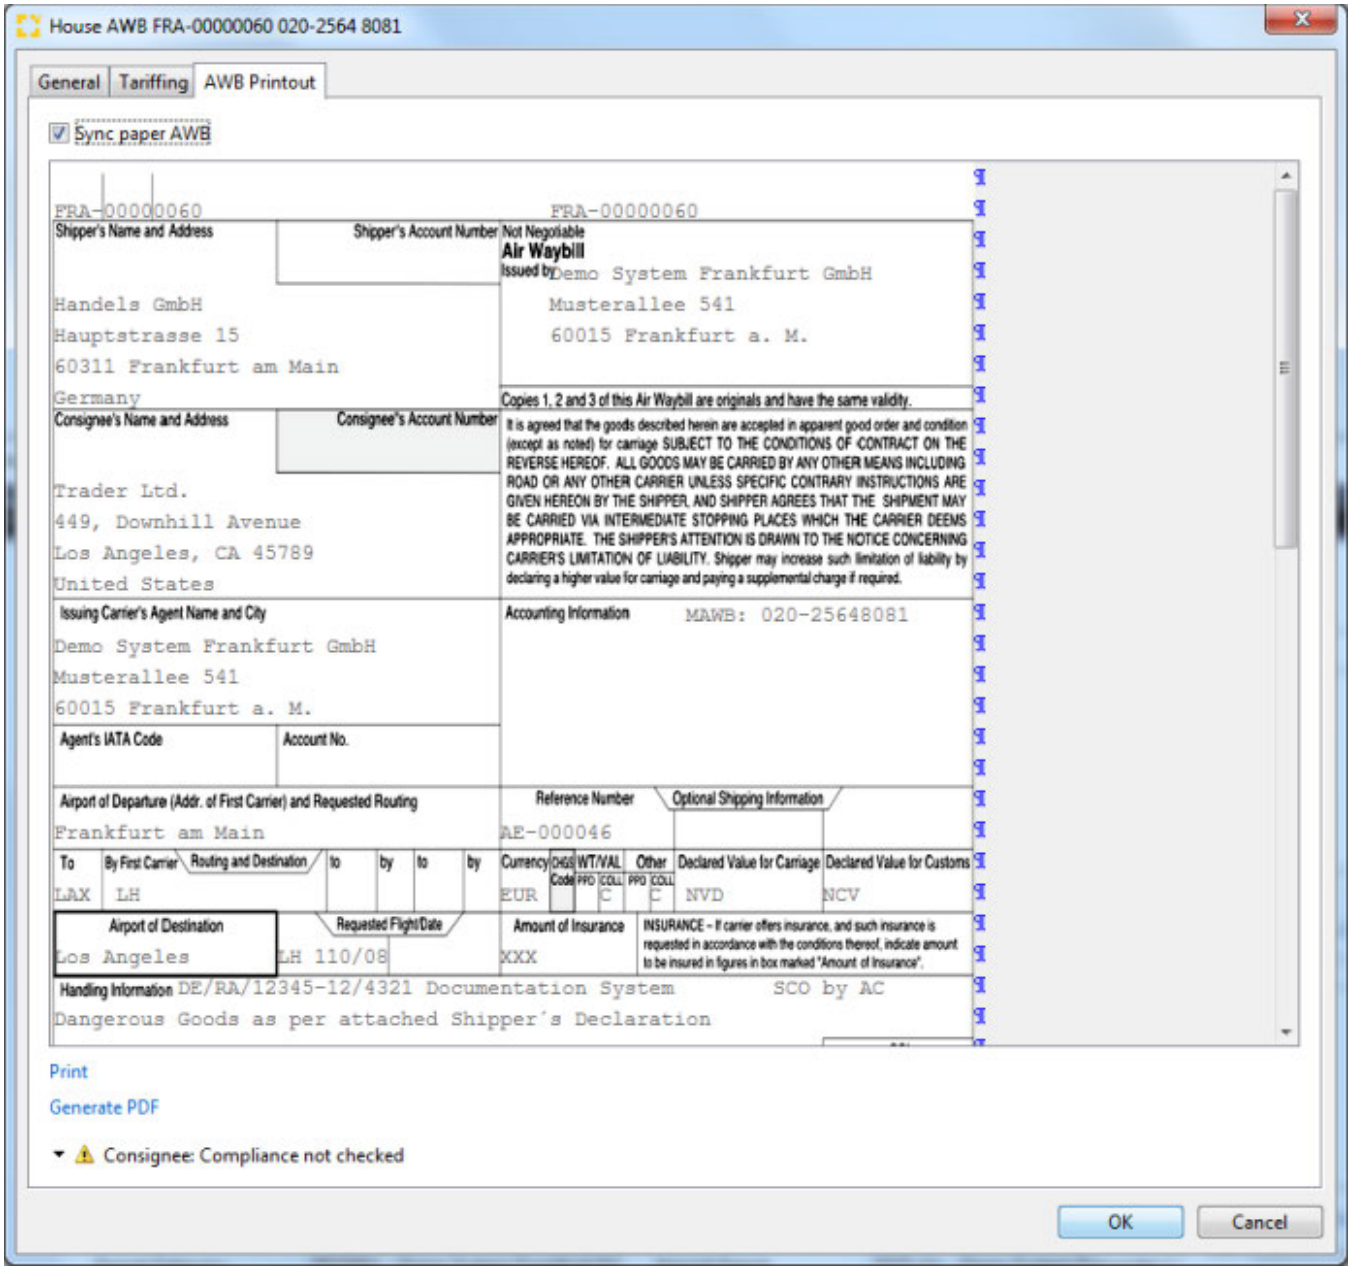
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

the charges are summed into 4 separate totals; total prepaid due agent, total collect due agent, total prepaid due carrier and total collect due carrier. How the costs will be presented on the AWB can be controlled using the drop down menus which will present the option shown below:

Code	Explanation
P	Costs will be printed on the AWB
X	Costs will NOT be printed on the AWB
T	The costs will be shown only as a total on the AWB

AWB Printout

This tab provides a visual representation of the printed AWB.



Sync paper AWB

This box is checked by default and causes the AWB to be shown as per all the data entered in the *general* and *tariff* tabs. When check the representation of the AWB cannot be edited. If the box is unchecked, then the AWB may be freely edited and the text blocks can be accessed and inserted into the AWB.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If the box is checked again after editing the AWB, all changes will be lost because the document will once again be regenerated according to the data stored in the *general* and *tariff* tabs.

Print

Prints the AWB exactly as it appears in the representation to the predefined printer. The document will also appear as a text document and pdf document in the documents tab of the shipment. The pdf version may then be sent attached to an email.

Generate PDF

Only a pdf version of the document is created which also appears in the documents tab of the shipment.

Print and send FWB

Prints the AWB as described above and sends a copy to TRAXON Global Cargo Communications System in the form of an FWB.

Send FWB

Sends the shipment electronically in the form of an FWB to TRAXON Global Cargo Communications System. There is no print of the document.

OK

Stores the data and closes the editor.

Cancel

Closes the editor without further action.

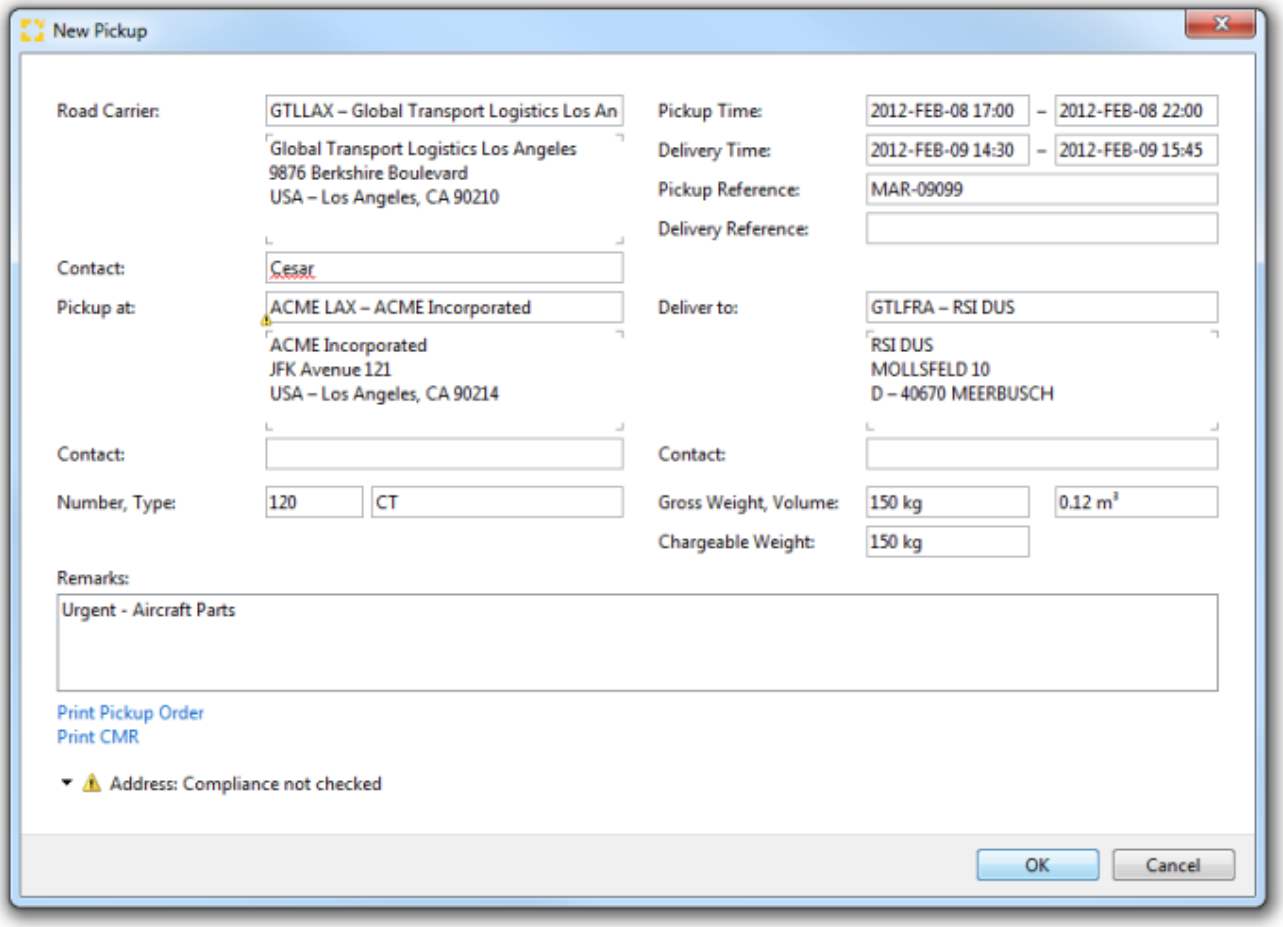
Transport Orders - AOG General - AOG - Forwarding

- Introduction
- Description

Introduction

Create and print pickup notes for collection of goods and delivery orders for transport of goods to the terminal. Additionally, a CMR (International waybill for road freight transport) may also be printed.

Description



Road Carrier

The trucking company who will transport the consignment. Locate the desired carrier using the search field. The **contact name** for the carrier may be entered or selected from the list of contacts for this partner. If a pickup address has been stored for this partner, this may also be used when completing the delivery order. If a set of pickup or delivery addresses have been stored for this partner, these may also be used when completing the delivery order.

Contact (Road Carrier)

The name of the contact person at the road carrier. If used on a regular basis, the contact person should be stored in the contacts section of the partner maintenance , this will allow automatic entry of the contact name.

Pickup time window from/to

The period in which the consignment may be picked up. These are date and time fields.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delivery time window from /to

The period in which the consignment may be delivered. These are date and time fields.

Pickup Reference

The reference used by the shipper for the shipment.

Delivery reference

The reference used by the receiver of the shipment.

Pickup at

The address at which the item should be picked up. The desired partner can be located with the search field. The default address will be the address of the shipper. The **contact name** for the pickup location may be entered or selected from the list of contacts for this partner. If a set of pickup addresses have been stored for this partner, these may also be used when completing the delivery order.

Contact (at pickup address)

The name of the contact person where the goods are to be collected. If used on a regular basis, the contact person should be stored in the contacts section of the partner maintenance , this will allow automatic entry of the contact name.

Deliver to

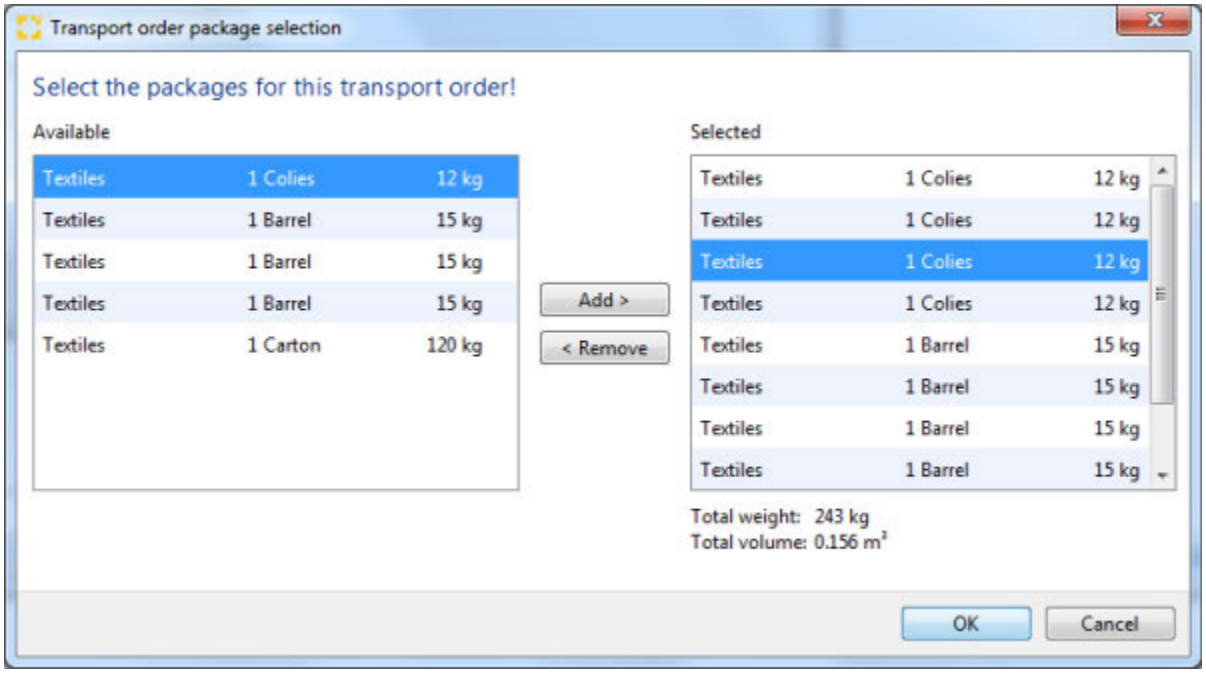
The address to which the consignment is to be delivered. The desired partner can be located with the search field. The **contact name** for the delivery location may be entered or selected from the list of contacts for this partner. If a set of delivery addresses have been stored for this partner, these may also be used when completing the delivery order.

Contact (at place of delivery)

The name of the contact person at the place where the goods will be delivered. If used on a regular basis, the contact person should be stored in the contacts section of the partner maintenance , this will allow automatic entry of the contact name.

Amount

The total number of pieces on this delivery order. The field has a drop down menu or F3 function key to access the package selection tool.



By default, all packages are proposed for delivery.

Gross weight, Volume

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The gross weight and volume of the pieces will appear. If the package editor has been used to select the pieces then these fields will adjust to show the correct volume and gross weight of the selected pieces.

Chargeable Weight.

The gross weight and volume from the main editor or the package editor is defaulted. This information can be further adjusted if necessary,.

Remarks

Comments or instructions entered in this field will be printed on the delivery order.

Print

Print the pickup / delivery order. The document will be created as a PDF document that can be viewed in the *Documents* tab.

CMR...

Open the CMR editor to create in international road transport order.

OK

Save the data and close the transport order editor.

Cancel

Close the transport order editor without taking any further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

CMR - Pickup Order - General - Air - AOG - Forwarding

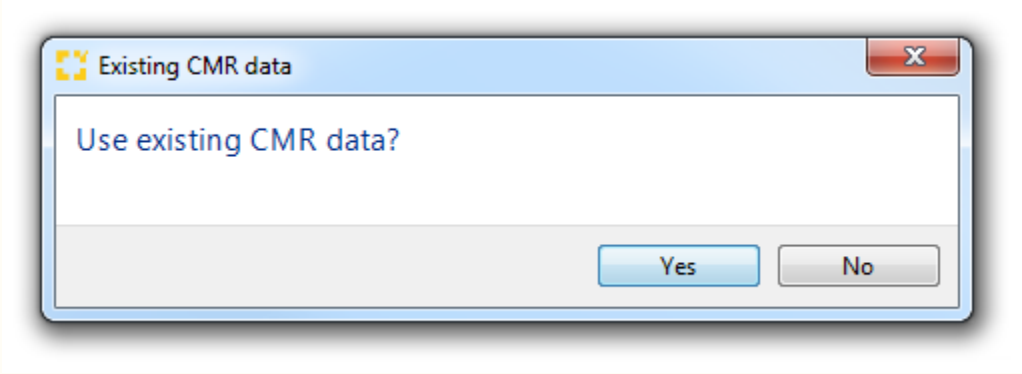
- Introduction
- Description

Introduction

The CMR editor is used to create a CMR waybill according to the Convention on the Contract for the International Carriage of Goods by Road. These may be printed and stored as PDF copies.

Description

When a CMR has already been printed, on selecting the *CMR* option a dialogue will appear asking if existing CMR data should be used.



Yes

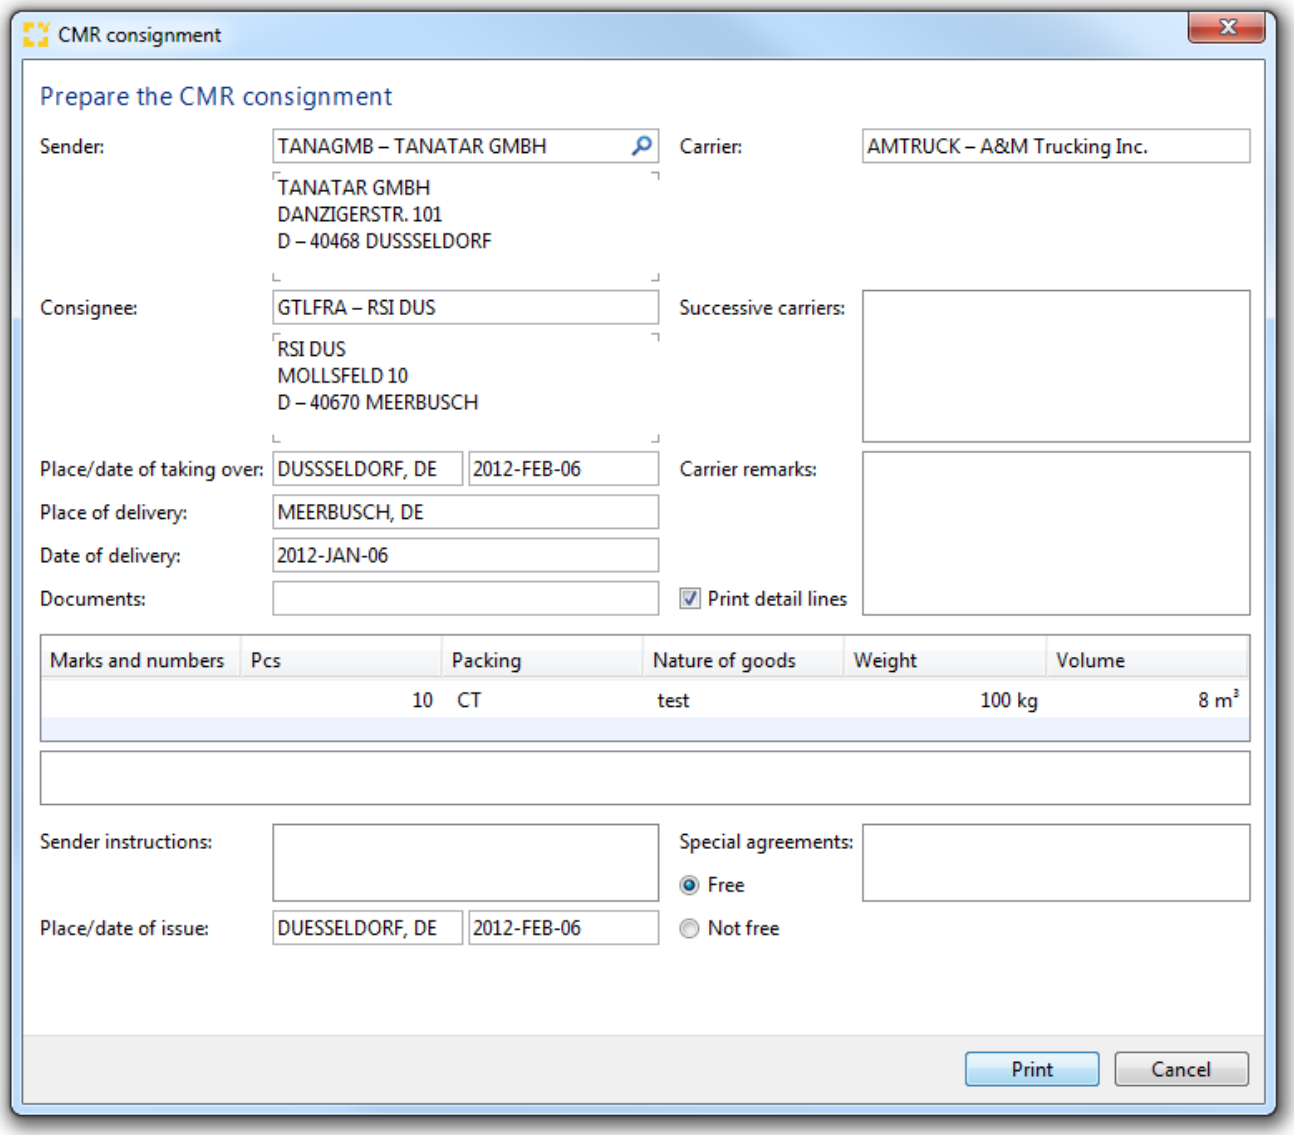
Opens the existing CMR in the editor.

No

Creates a new CMR.

CMR Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Sender

This is the sender of the shipment. This is a search field that can be used to locate the correct partner.

Carrier

The carrier who will transport the shipment. This is a search field that can be used to locate the correct carrier.

Consignee

The recipient of the shipment. This is a search field that can be used to locate the correct partner.

Successive Carriers

A free text area where the names of carriers who will transport the goods subsequent to the first carrier may be recorded.

Place of Pickup

The location where the goods will be picked up. This will default to the city and state of the sender.

Date of Pickup

The date when the goods are to be picked up. This is a date field .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Place of Delivery

The city where the and state where the goods will be delivers. This will default to the city and state of the consignee.

Date of delivery

The date the goods are to be delivered. This is a date field .

Documents

Any documents included with the shipment should be listed here.

Carrier remarks

Any remarks from the carrier.

Print detail lines

The details of the cargo are shown in a summary table, being the marks and numbers, the number of pieces, packing type, nature of goods, weight and volume. If these are to print on the CMR then the *Print details lines* box should be checked.

Remarks

The shipment number appears in the general remarks area below the detail line. Further remarks may be added.

Sender Instructions

Special instructions from the sender may be recorded here.

Special Agreements

If special arrangements have been made, these may be recorded here.

Place (of issue)

The place where the CMR is issued.

Date of issue

The date the CMR is issued. This is a date field .

Free/Not free

Payment instructions for the CMR:

- Free = The sender has paid the freight charges.
- Not free = The recipient must pay the freight charges.

Print

Prints the CMR documents. PDF copies of these documents will appear in the *documents* tab of shipments. The Editor is then closed and the data is stored.

The following PDF documents are created:

- CMR 1 (Sender)
- CMR 2 (Receiver)
- CMR 3 (Carrier)
- CMR 4 (Carrier)

Example CMR consignment note

Cancel

Closes the CMR editor without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

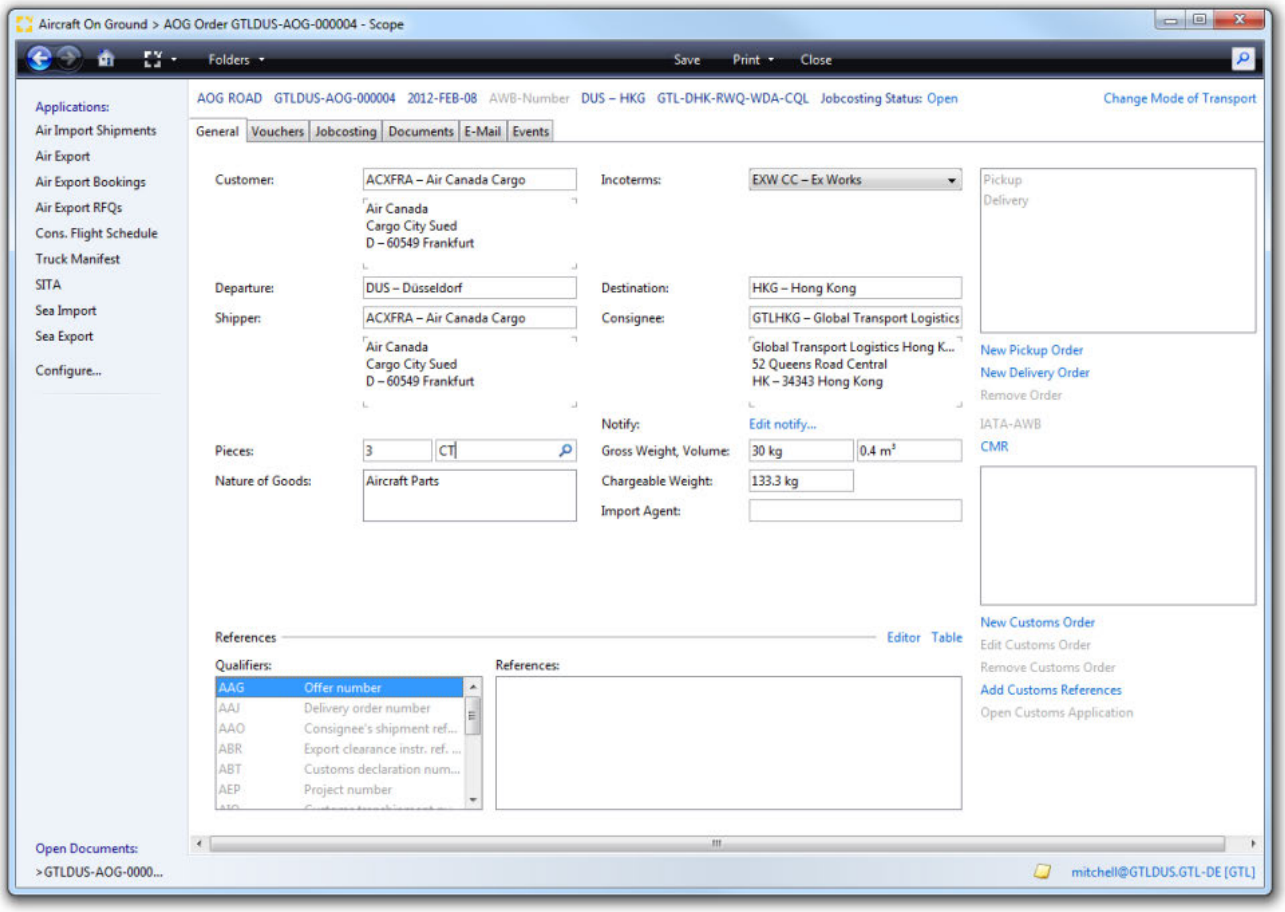
General - Road - AOG - Forwarding

- Introduction
- Description

Introduction

The General tab of the AOG shipment editor is where information such as the sender, recipient, number of packages and the weight of the shipment can be stored and edited. Pickup and delivery orders and CMR consignment notes (non-USA) can be created. AOG shipments can also be created as air shipments and this is detailed in the chapter on AOG air Shipments .

Description



Save

The *save* function will store the new Road AOG details. The function is only available if all the Validation symbols have been cleared indicating all mandatory fields have been completed. When incomplete the relevant error messages will indicate which fields need completion.

Print

The print option presents a list of documents that may be printed:

- File Covers
- Preadvice
- Release Note (or Shipment Certificate)
- Export Certificate
- Master Labels (waybill labels)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Master-Labels are mainly used in AOG air shipments. Further information is available in AOG Air shipments

Close

Closes the current shipment. If new details have not been saved, a dialogue box appears to confirm exit without saving.

Title Bar

The following information and actions appear in the title bar for a shipment. Blue text indicates that the text has an action link and offers further activities.

- **Type of shipment**
  Type of shipment. For a road shipment this is *AOG ROAD*
- **Shipment number**
  Assigned by the system after the shipment has been saved for the first time.
- **Service date**
  The date the shipment was first saved.
- **Departure airport - Destination airport**
  Departure and destination of the shipment.
- **USI number**
  Unique shipment identification number (Unique Shipment Identifier). When the shipment is first saved this identifier is automatically generated by the system and is used for internal purposes.
- **Jobcosting Status**
  An indication if income and costs on the shipment have been finalized.
- **Change Mode of Transport**
  This action link will convert the shipment to an AOG Air shipment.

Customer

Generally the customer is the business partner who is responsible for generating the shipment and for the transportation costs. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

Incoterms

The delivery terms for the shipment

Departure

Airport of departure of the shipment. The IATA-Code and the full name of the airport are displayed. Either of these can be entered to launch an automatic [full text search|Full Text Search - Field Types - User Interface - General#feldsuche] that will display all matching airports.

Destination

Airport of destination of the shipment. The IATA-Code and the full name of the airport are displayed. Either of these can be entered to launch an automatic f ull text search that will display all matching airports.

Shipper

Shipper of the shipment. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

Consignee

Consignee of the shipment. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

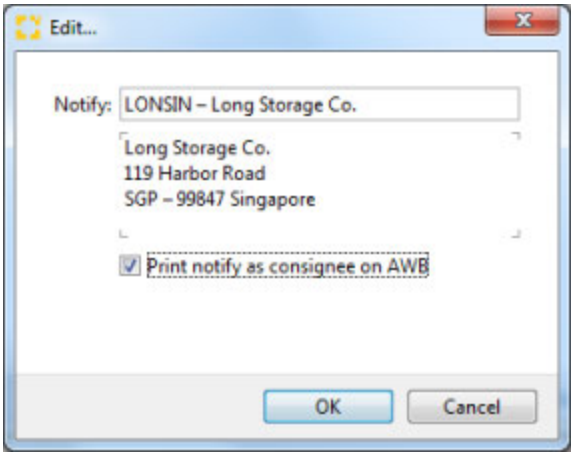
Notify

The party to be Notified when the shipment arrives. Typically, consignment is addressed to the recipient but actually delivered to the Notify.

If a notify has not been entered, the action link *Edit* will be displayed. Once a Notify is recorded it will display the first line of notify address. Clicking on this action link will open the Notify editor.

Notify Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Notify

The notify address can be located by using the search field. The context menu of the Partner field provides options for new partner addresses to be created or existing partners may be edited.

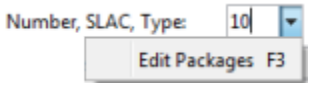
> In the master data of the (partner / Role - Airfreight Export), if the partner has the role "Forwarding Customer" applied, this role allows a permanent Notify address for the partner to be saved. This will be used automatically when this partners is used in any shipment where this partner is the recipient (consignee).

Print Notify as Consignee on AWB

This function should only be used in AOG Air shipments where an air waybill is being printed.

Number

Total number of packages in the consignment



The total number of packages, packaging type, gross weight and volume can be entered at this stage in the appropriate fields starting with the total number of packages. Within the number field, press F3 or select the drop down menu for access to the package editor. The package editor allows much greater detail to be entered about individual packages.

> If the package editor has been used to capture details about the packages, then the package fields are disabled and any additions or changes to packages must be made using the package editor. If required, all packages and their details can be removed from the package editor and this will release the package fields in the general shipment entry, allowing package totals to be entered instead of details.

Type (Packing type)

The type of packages used for the cargo. The available packing types are maintained in the master data packing types maintenance program . (If the package editor has been used to enter a variety of packing types, this field is blank.)

Gross weight, volume

Total gross weight and volume of the shipment

Nature of Goods

The description of the goods. It is possible to select from predefined text blocks. If the packages editor has been used to enter multiple descriptions of goods, then these product descriptions will appear in this field as comma separated values)

Chargeable Weight

Total chargeable weight of the shipment.

Import agent

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The station that will receive the cargo at the point of arrival. The field search function can be used to locate an alternative agent.

The Import Agents available at the destination will vary according to the following:

- If no destination has been entered, then all agents are offered for selection
- If a destination is entered and the master data for that destination has only one agent assigned to it, then that agent will be used as the import agent for the shipment.
- If a destination has more than one agent assigned by the master data then the field will be blank but it is only possible to select one of the assigned agents.
- If a destination is assigned where no agent has been assigned in the master data , then it is not possible to select an agent until an agent is assigned in the master data

References

This section records various types of references and the references themselves. These can then be printed or transmitted electronically to other destinations. More information about the function of the references editor is available here.

New Pickup Order / New Delivery Order

These action links will open the transport order editor where pickup notes or delivery orders may be created.

Remove order

This option will delete any delivery or pickup note that has already been created. The document highlighted in the pane showing existing delivery/pickup notes will be deleted. It is only possible to delete a pickup note or transport order if it has not been printed and if there are no entries in the costs and revenue section of the shipment.

CMR

Opens the CMR editor where a new CMR road transport order can be created.

All transport orders that have been created will be visible in the transport orders window. These may be re-opened by *double clicking* them. They may then be re-edited and printed again if necessary.

New Customs order

Opens a Customs order editor to create a new customs order

Edit Customs order

Opens the customs order editor to edit an existing customs order highlighted in the pane showing customs orders.

Remove Customs order

Remove an existing customs order highlighted in the list of created customs orders.

Add Customs references

Opens the Add Customs references application. Up to 10 additional customs references may be added.

- More information on individual customs applications see the chapter on Customs.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

CMR - AOG - Forwarding

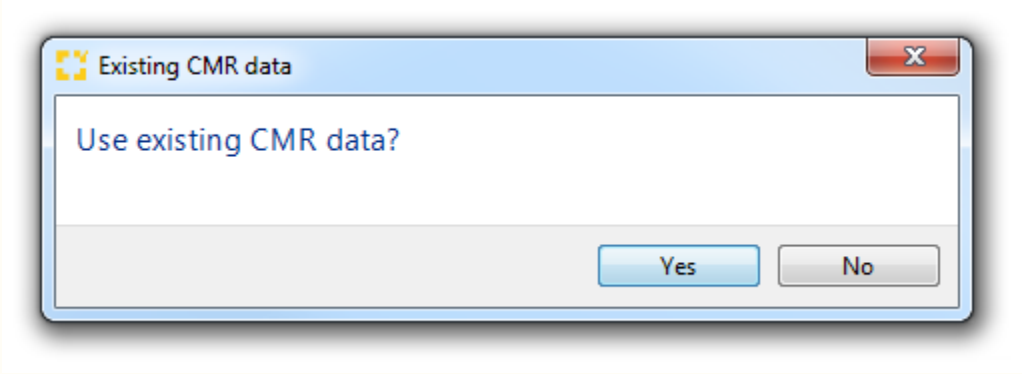
- Introduction
- Description

Introduction

The CMR editor is used to create a CMR waybill according to the Convention on the Contract for the International Carriage of Goods by Road. These may be printed and stored as PDF copies.

Description

When a CMR has already been printed, on selecting the *CMR* option a dialogue will appear asking if existing CMR data should be used.



Yes

Opens the existing CMR in the editor.

No

Creates a new CMR.

CMR Editor

Sender

This is the sender of the shipment. This is a search field that can be used to locate the correct partner.

Carrier

The carrier who will transport the shipment. This is a search field that can be used to locate the correct carrier.

Consignee

The recipient of the shipment. This is a search field that can be used to locate the correct partner.

Successive Carriers

A free text area where the names of carriers who will transport the goods subsequent to the first carrier may be recorded.

Place of Pickup

The location where the goods will be picked up. This will default to the city and state of the sender.

Date of Pickup

The date when the goods are to be picked up. This is a date field .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Place of Delivery

The city where the and state where the goods will be delivers. This will default to the city and state of the consignee.

Date of delivery

The date the goods are to be delivered. This is a date field .

Documents

Any documents included with the shipment should be listed here.

Carrier remarks

Any remarks from the carrier.

Print detail lines

The details of the cargo are shown in a summary table, being the marks and numbers, the number of pieces, packing type, nature of goods, weight and volume. If these are to print on the CMR then the *Print details lines* box should be checked.

Remarks

The shipment number appears in the general remarks area below the detail line. Further remarks may be added.

Sender Instructions

Special instructions from the sender may be recorded here.

Special Agreements

If special arrangements have been made, these may be recorded here.

Place (of issue)

The place where the CMR is issued.

Date of issue

The date the CMR is issued. This is a date field .

Free/Not free

Payment instructions for the CMR:

- Free = The sender has paid the freight charges.
- Not free = The recipient must pay the freight charges.

Print

Prints the CMR documents. PDF copies of these documents will appear in the *documents* tab of shipments. The Editor is then closed and the data is stored.

The following PDF documents are created:

- CMR 1 (Sender)
- CMR 2 (Receiver)
- CMR 3 (Carrier)
- CMR 4 (Carrier)

Example CMR consignment note

Cancel

Closes the CMR editor without further action.

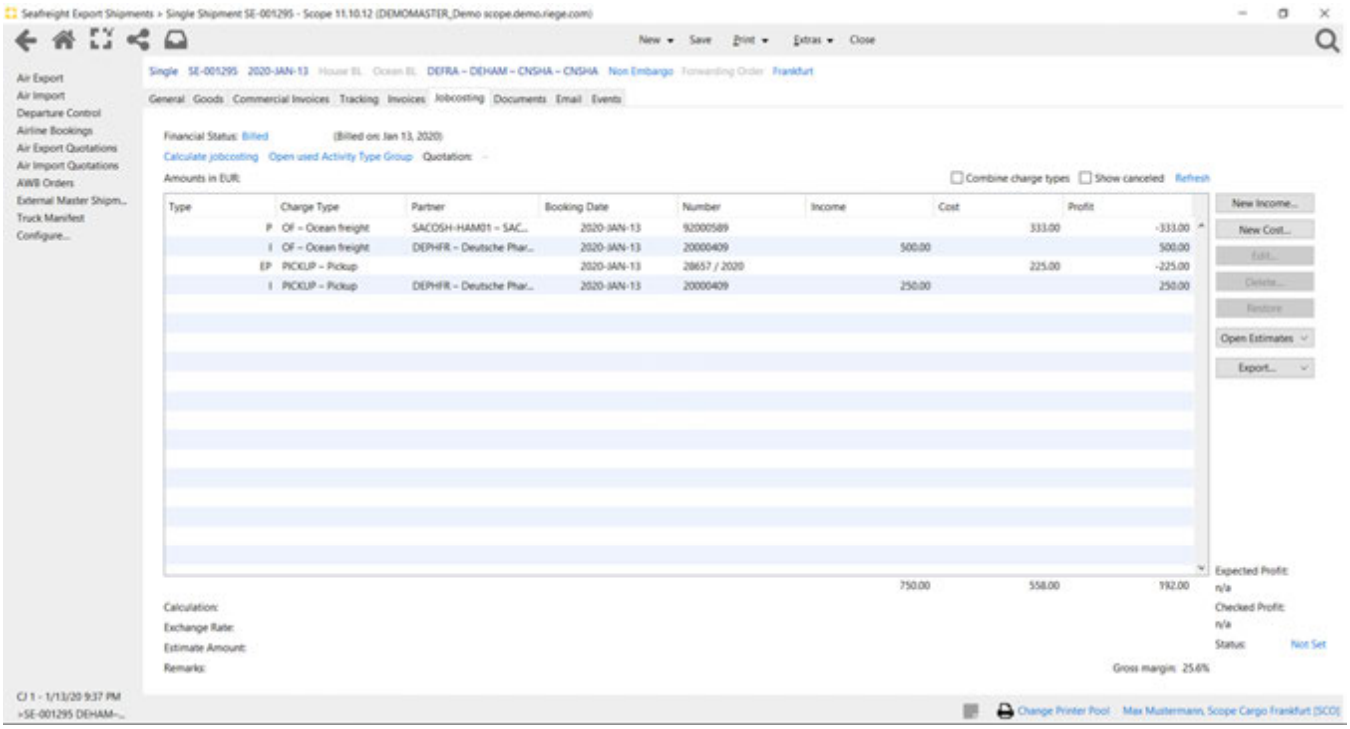
Jobcosting - AOG - Spedition

- Introduction
- Description

Introduction

The tab jobcosting displays all costs and revenues. This enables an overview of the profitability of the shipment. Cost and revenue is based on the master data sets; activity type, charge type and tariff rates, and these are applied according to the nature of the shipment for example the Incoterms used and the chargeable weight of the shipment. Jobcosting figures are generated automatically by input of payable vouchers and output of invoices and credit notes (More information is available in the section on Automatic tariffing). Expenditure and revenue accruals may also be manually inserted into job-costing, but it is intended that jobcosting should be largely automated.

Description



Main menu bar and title bar

see General tab

Calculate jobcosting

By clicking on this link, any predefined the action costs and revenues are based on the master data (activity types , master data rate) in connection with the shipment data (Incoterms , chargeable weight generates). In addition, an initial invoice with the relevant cost categories and stored as a draft which tariffs will be applied after the initial account application process, can be printed and completed.

Show Cancelled

Check this box to show cancelled documents. This box is unchecked by default.

Refresh

This link will refresh the list of transactions and include the latest.

New Income

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens charges editor and allows entry of a new income.

New Expense

Opens charges editor and allows entry of a new expense.

Edit

Opens the charges editor and allows the charge highlighted in the overview of charges.

Delete

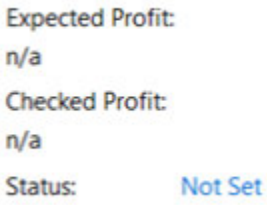
Deletes the charge highlighted in the overview of charges.

Compute Breakdown

The button will recalculate the breakdown of all master to charges to the house shipments on the consolidation. Normally this action occurs automatically, but this button can be used to force the process.

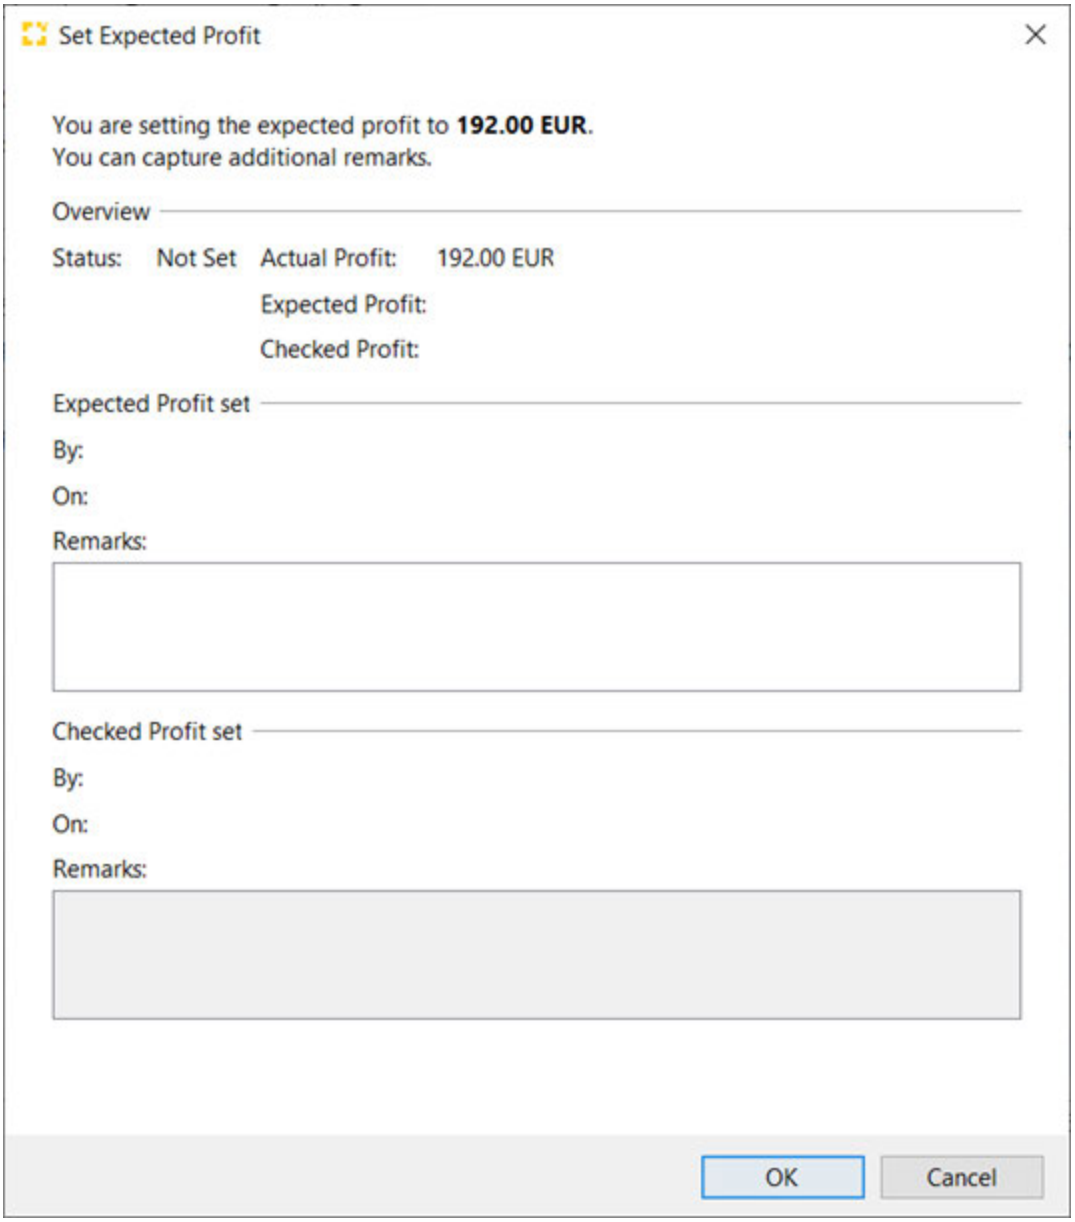
Expected Profit

Set an expected profit



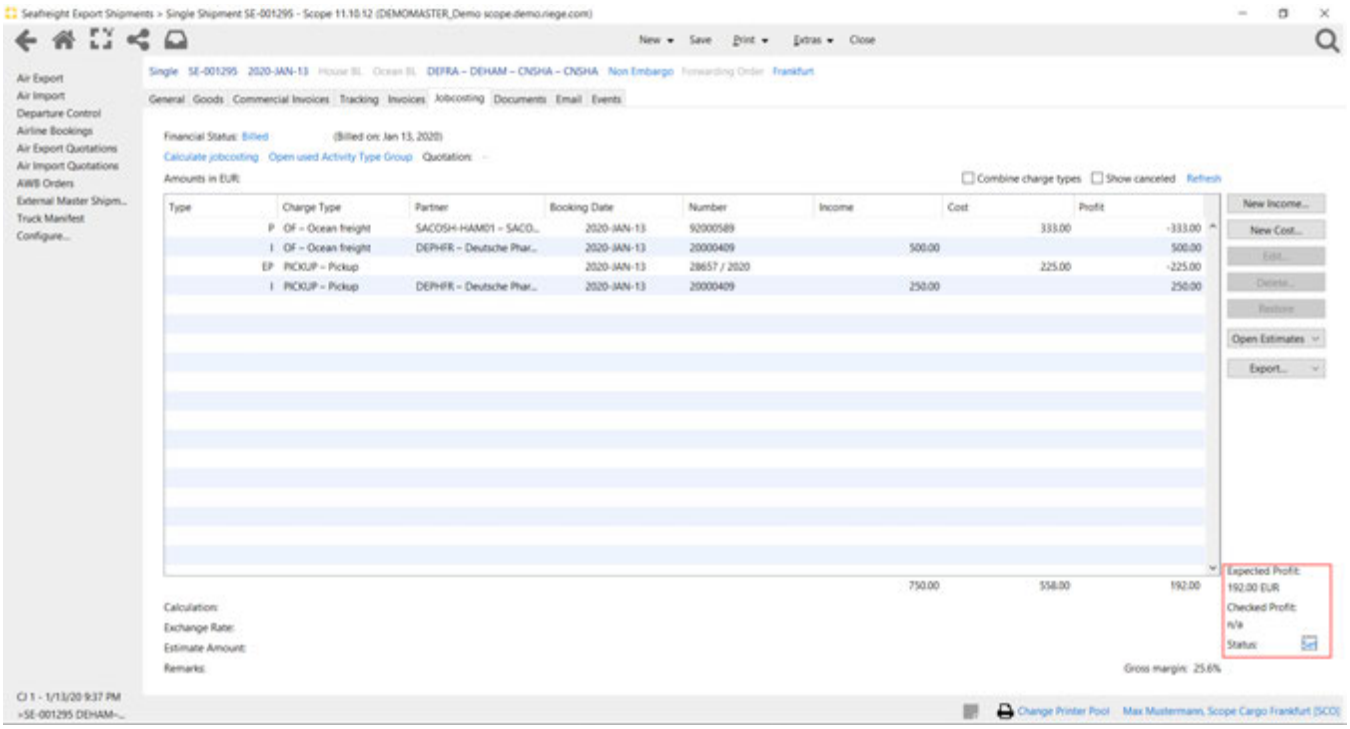
By clicking button "Not Set" a new window opens and the actual profit can be set as expected profit. Previously all expected income and expected costs have to be added to jobcosting.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



After confirming expected profit status changes at jobcosting tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Only certain entries may be edited or deleted. Entries that cannot be edited or deleted can be adjusted here

Turnover in local currency

individual charges are shown in local currency. Double click an entry to open it or highlight the entry and then select the Edit button to open the charges editor.

Type

The type of charge line.

Charge type

Charge type of the current line.

Partner

Partner code of the business partner to whom the charge was applied or from whom the charge was received.

Booking date

The date of the document that contains the charge.

Number

The voucher number for the voucher that contains the charge.

Income

Income or revenue amount.

Cost

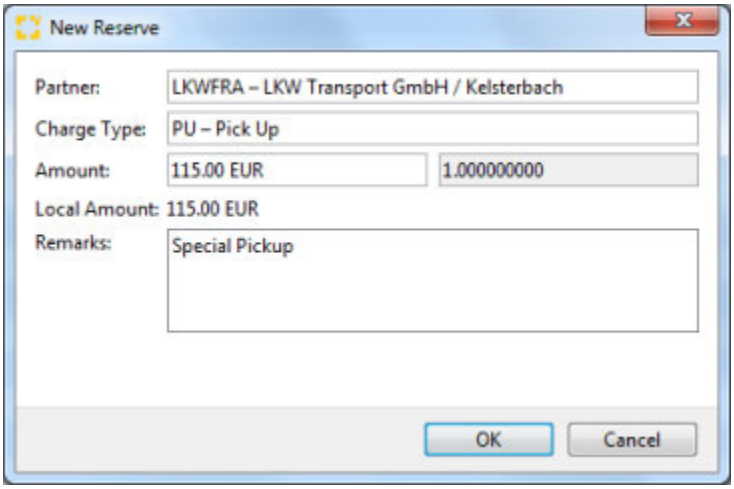
Cost or expenses amount.

Profit

The profit of the line item.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Charges Editor



Partner

The party who billed or received the charge. The partner search function is available to locate a different partner.

Charge Type

Charge type of the item.

Amount, Exchange Rate

the amount of the item in local currency. If in foreign currency an exchange rate is shown.

> In addition to manual adjustment of the value of the item, the field also provided a drop down menu to access an on screen calculator (F3) or refresh of tariffs (F5) to apply any new tariffs to the line item.

Total

The total amount in local currency.

Remarks

Any remarks relevant to the line item may be recorded. Right click to access text blocks .

OK

Store the line item and any changes made.

Cancel

Exits the application without any changes.

New Outgoing Credit Note

Opens the application to create a new outgoing credit note.

New Incoming Invoice

Opens the application to create a new incoming invoice.

New Incoming Credit Note

Opens the application to create a new incoming credit note.

Consol Profit Analysis (For air export master shipments)

Opens the application to make master shipment profit analysis .

Refresh

refreshes the list of vouchers.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Shipment Monitor

- Introduction
- description
- Tracking diagram editor
- Notifications

Introduction

The shipment monitor is used to monitor the status of shipments. An overview of all shipments is shown with options to filter these. This provides an immediate view of the status of each shipment in terms fulfillment of each milestone specified for the shipment. Any shipment can be opened showing its milestone performance in detail and the shipment itself can be opened if required.

tracking plan

A *tracking plan* represents the planned and actual flow of a program in the form of a list of *milestones* with planned and actual times. The order of the milestones within a tracking plan is fixed and is on the tracking template defined, from such a plan for each mission was created. Milestones, which are in a tracking plan above, go Milestones, which are listed below, are normally required. A tracking plan is *completed* when all of its milestones are met.

Milestone

A *Milestone* represents a point in the transport of a consignment. Each Milestone has a name, a place, a *plan period* and an associated *tolerance window* within which applies the fulfillment of the milestones as planned. A Milestone can either automatically (eg by an EDI message, an action in Scope) or manually be met (see below Manual handling). If the fulfillment of a time Milestones outside the tolerance window, this is considered *failed* . Such failed Milestones it applies to analyisieren and judge.

Some milestones are automatically activated by Scope or disabled depending on which segment they are located. Does the tracking template as a Milestone *pickup* before the pick-up segment, we of this, when the scope of the mission hidden *Port to Door* is.

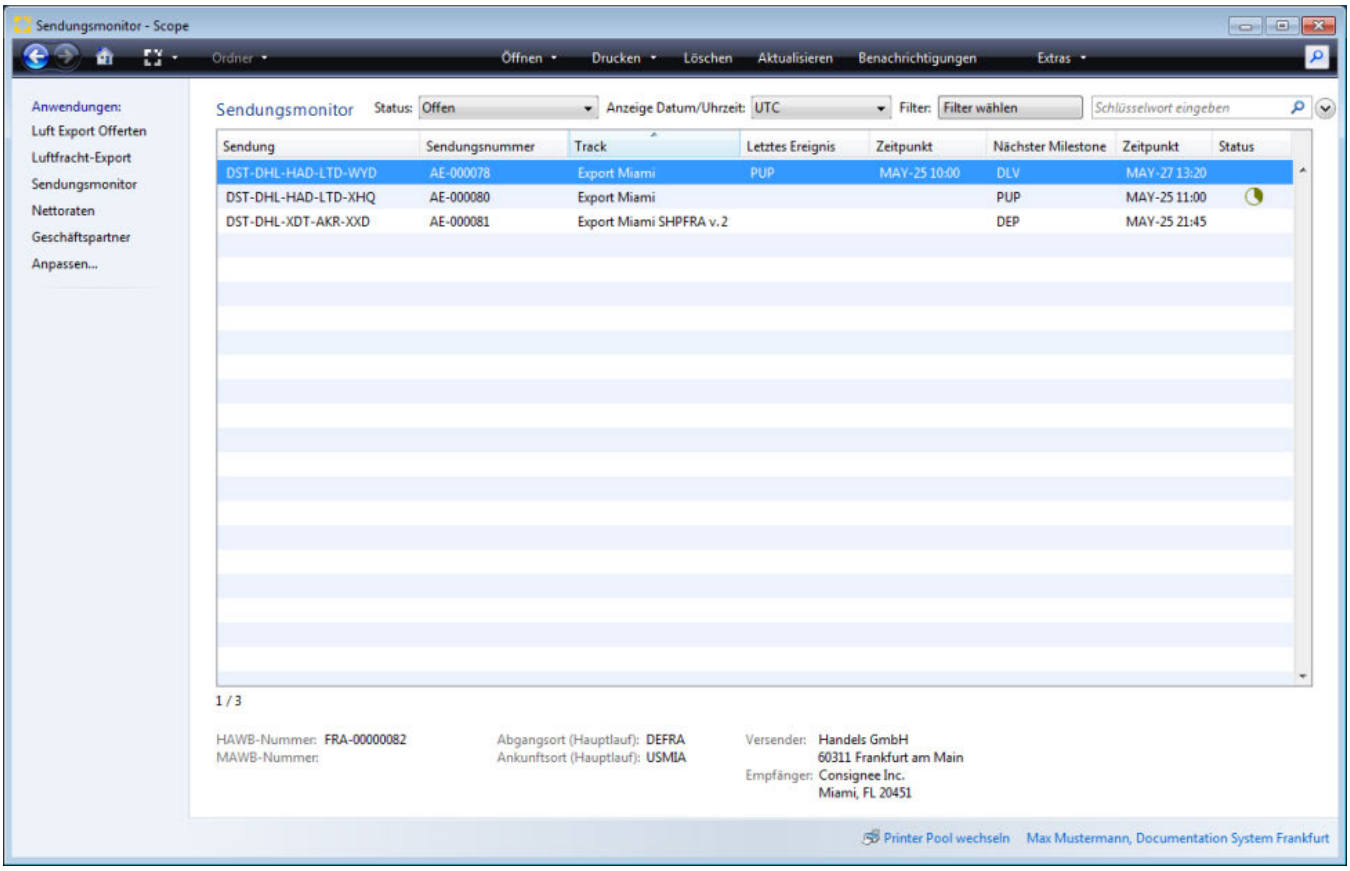
exception

An *Exception* (exception) represents an event in the forwarding of a consignment, which does not match the planned schedule. As a result, exceptions differ from Milestones. Exceptions are used to draw the attention of an agent on the air, which is likely to act. This must not be any current program "controls" continuously, but only those for which such exceptional situation is detected. Exceptions have two states: *open* and *finished* (treated). Solange has not yet responded to an exception, it is open in the state, then settled in the state.

Exceptions may occur either in a transport section, or in a concrete Milestone. Example: An event *FNA* can normally the concrete Milestone *FWB* be assigned as exception, at a *FSU DIS* message Scope can not automatically detect where the shortfall has occurred (departure, transit airport, destination), therefore this exception can only badly a concrete Milestone assign. Instead, it is in the transport section *Main Carriage Air* situates (main run airfreight).

description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the overview all open tracking plans are displayed. In the preview area is a brief summary of the selected program appears.

The following columns are visible in the overview:

column name	explanation	Standard visibility
broadcast	Unique consignment ID	visible
tracking number	Item number in the current branch	visible
track	Name of the Tracking template from which the plan is developed	visible
section	Section, where the consignment is located just, eg. B. Pickup or Main Carriage Air. *This column is hidden by default. You can activate it by right-clicking on the table heading.*	hidden
Last event	Code of last met Milestones	visible
time	Date and time of the last milestone fulfillment	visible
Last Charge	Responsible party for the past met Milestone	hidden
Next Milestone	Code of the next to be fulfilled Milestones	visible
time	Plan date and time of the next to be fulfilled Milestones	visible
Next Responsible	Responsible party for the next to be met Milestone	hidden
Next confirmation	Code of the first to be confirmed Milestones. *This column is hidden by default. You can activate it by right-clicking on the table heading.*	hidden

In broadcast monitor only selected status are identified, these are:

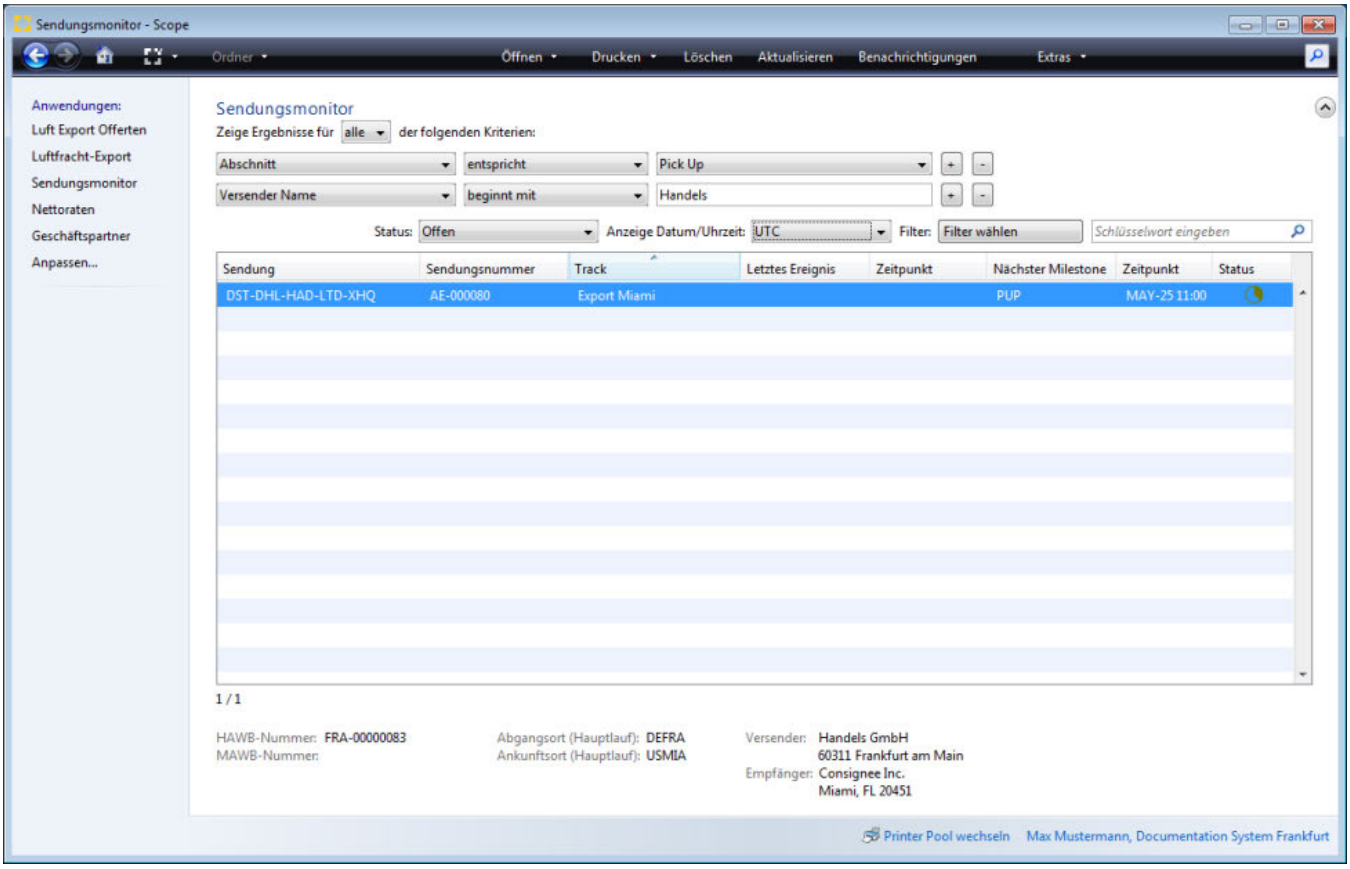
symbol	status Description
◯	Tolerance window of the next open Milestones has begun, but not yet reached schedule time

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

	Planned time of the next open Milestones is exceeded, but the time window allowed for completion is still open
	The planned time and allowed time window for complete of the next open Milestone is exceeded, the shipment is out of plan

The *status list* allows tracking plans to be filtered by status. The following statuses are provided in Scope:

filter value	description
Incomplete	All tracking plans, which still have at least one open milestone, regardless of its status
Due	The allowed time window for the next milestone has started and so the milestone is due to be resolved, but it is still within the allowed time window and the exact planned time for completion is not yet reached
Critical	The planned time for the next milestone is exceeded, but the time window for completion is still open, so the milestone can still be resolved in time
Out of Plan	The time window allowed for completion of the next milestone has been exceeded, hence the shipment is out of plan.
To be approved	Milestones are open that need manual approval to resolve them.
Failed Actions	Tracking plans with failed milestones that have not yet been confirmed



The broadcast monitor also offers a search can be entered via the individual search criteria. Searches can be saved as a filter. The following criteria are currently supported:

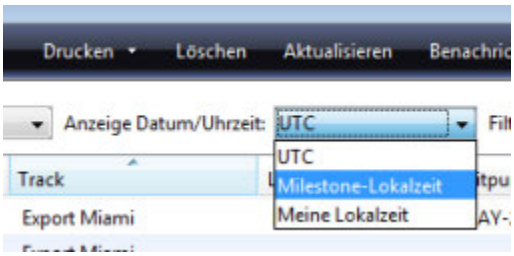
name	description
departure	Annahmeort or departure HAWB
Departure (main run)	Port of Departure
section	Section, where the consignment according to tracking plan is currently

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

destination	Delivery, Final Destination, destination HAWB
Destination (main run)	Port of Destination
recipient name	Name of the addressee
Export Agent Name	Name of Export agents or the export branch
Import Agent Name	Name of the import agent or the import branch
cost Center	Cost Center of the shipment (date of establishment)
Next Milestone (Code)	Code of the first unfinished Milestones
Next Milestone (Schedule time)	Schedule time of the first unfinished Milestones
Open exceptions	Tracking plans have unhandled exceptions
clerk	Clerk of the program (current branch)
track	tracking template
mode of transport	Luffracht, freight etc.
responsible party	Which party is responsible for the next unfulfilled Milestone?
shipper name	Name of the consignor.
Competent office	Which branch is currently responsible for this mission?

Information

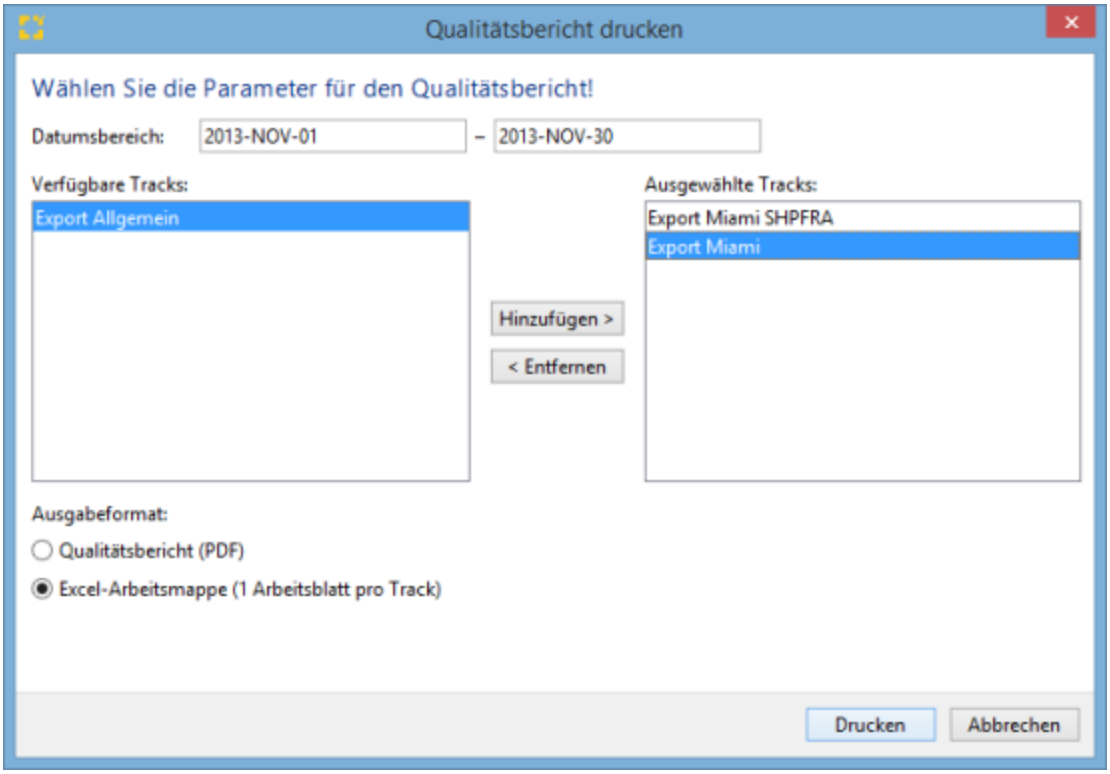
Tip: Set up a filter for your shipments to, ie "clerk corresponds John Doe".



The selection list *Date / Time* to display dates and times for the entire table can be switched. UTC contains all information in the UTC time zone (as Greenwich Mean Time), Milestone local time shows planned and actual hours each in the time zone of the Milestone-map and My local time converts all information in the time zone of the currently logged in user.

The program Action *Update* downloads the tracking plans again. About the program action *opening* can be opened for the selected entry in the list, either the tracking map (default behavior) or the corresponding broadcast. The program Action *Print ...* opens a dialog box in which a quality report can be created as a PDF document or an Excel workbook.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The Excel workbook is structured as follows:

- A worksheet per track and version
- An additional worksheet "Exceptions", which contains detailed information on all exceptions.

The worksheet per track and version contains one row per shipment. The column specifications are as follows (columns C, D, E, F and G are per Milestone repeated):

column	content
A (Shipment)	Unique ID of the program
B (References)	shipment numbers
C (Code)	Code of Milestones
D (Planned Time)	Schedule time of Milestones
E (Actual Time)	Handle Time of Milestones
F (Responsible)	Responsible party for Milestone
G (confirmation)	If a Milestone was confirmed in this cell is the basic of confirmation
...	
exceptions	*true* if the shipment has experienced an exception, otherwise *false*

The exceptions worksheet is structured as follows:

column	content
A (Track)	Name and version of the track (the tracking template)
B (USI)	Unique ID of the program
C (Date, Time)	Time at which the exception occurred
D (Time Zone)	Time zone of the date in which the exception occurred
E (Code)	Short Name of Exception
F (Name)	Expanded Name of Exception

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

G (Response Time)	When was responding to the exception?
H (Response Time Zone)	When was the exception responding (time zone)?
I (Response User)	Which clerk has responded to the exception?
J (Response code)	What was the response to the exception or what caused the exception?
K (Response Remarks)	Free text detection in response to an exception

Datums- und Uhrzeitangaben in Excel-Arbeitsblättern

The dates and times in Excel Quality Report are always in Milestone or Exception local time. It is possible to automate the difference between planned and actual time of Milestones to calculate and evaluate, but the current format is not suitable for run-time analysis, since the information is not normalized to a time zone. A cell of the type "Date / Time" is not an exact time stamp unfortunately in Excel data model.

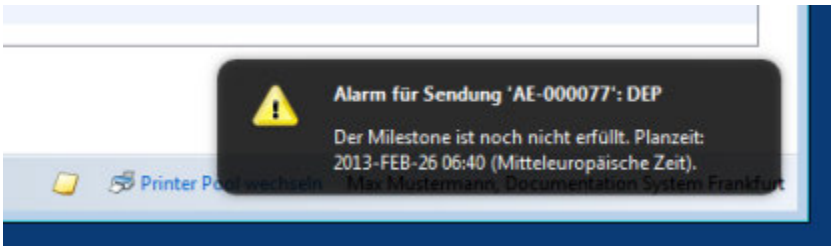
Tracking diagram editor

During transport an item passes through various stations. To track these stations, so-called tracking events are used. These events are the Riders **Tracking** listed individually. This allows a detailed Sendungsnachverfolgung.

{include} konnte nicht gerendert werden Die eingeschlossene Seite konnte nicht gefunden werden.

Notifications

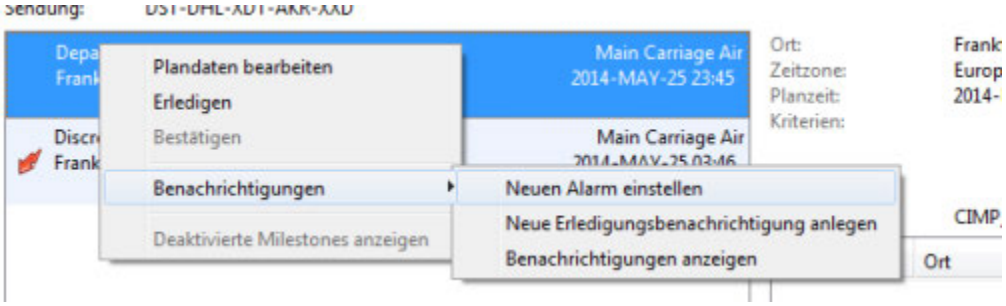
The broadcast monitor application, with the aid of tracking templates are set so that users are notified when certain events occur or in case of deviations. D epending on how the administrator receives an email or a notification Scope (see screenshot) or the file is in the folder *Inbox* moved the agent.



There are two possible triggers for a notification:

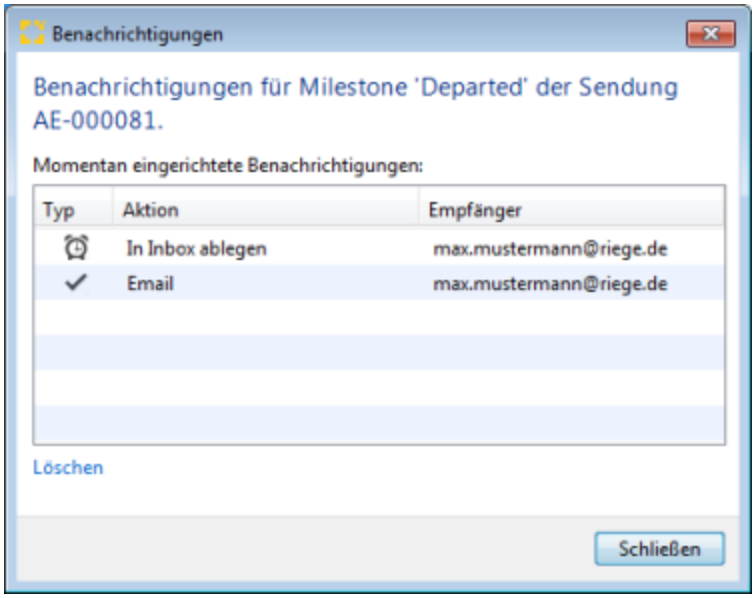
1. A Milestone was done.
2. A Milestone was within a specified period (usually the schedule time window) is not done, so that the agent must take care of this case (alarm).
3. A new exception has been registered.

Edit notifications



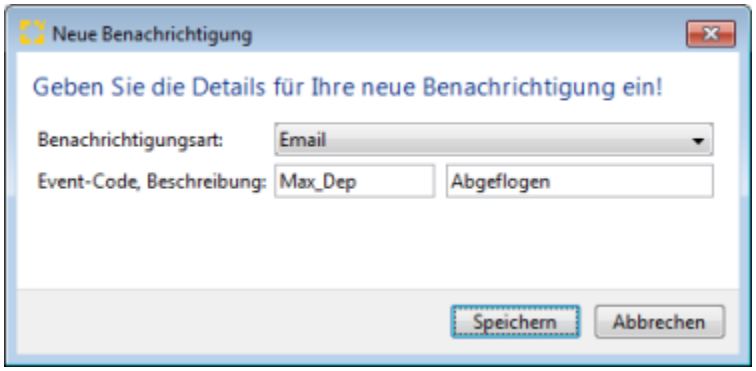
All notifications of milestones can be viewed from the context menu in the Milestone list. Notifications that have been set manually, can also be deleted.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



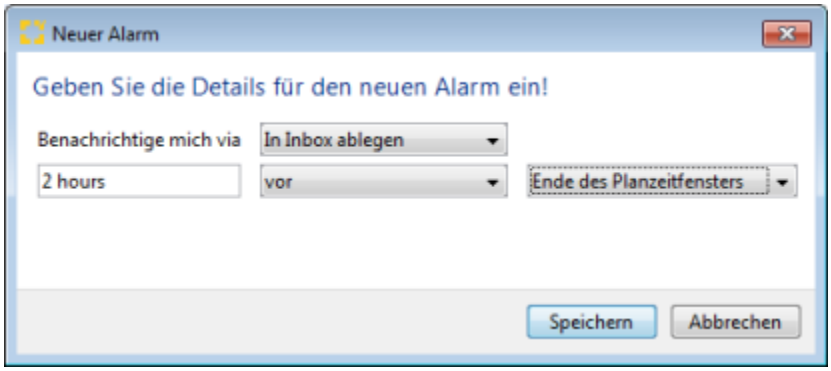
column	description
Type	Completion notification (hook), Alarm (Alarm)
action	What should happen when the notification is carried out?
receiver	Who is the recipient of the notification? This column is not always filled.

Setting a new completion notification



In Type field Benachrichrigungsmethode (Email, Scope alert Move to Inbox folder) must be entered. In the fields of event code and description can also be adapted for the notification of the text.

Create a new alarm



The first line of the notification method (email, Scope alert Move to Inbox folder) must be entered. The second line is set when the alarm is to be triggered.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Email templates for notifications and alerts

When an email notification or alert is to be sent, it is critical that email templates for both these kinds of alerts have been created.

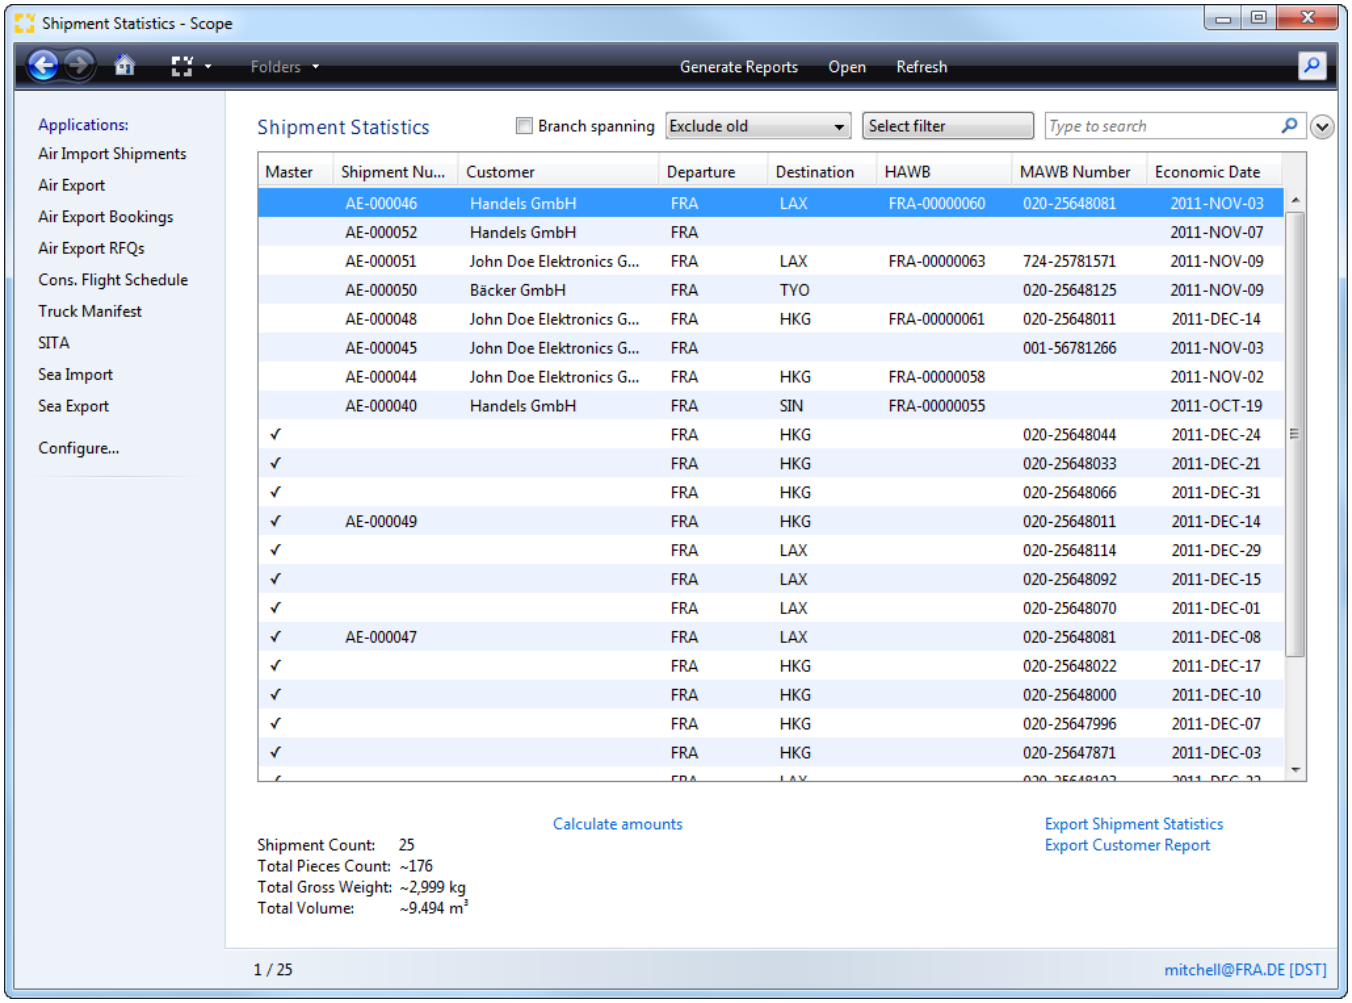
Shipment Overview

- Introduction
- Description

Introduction

The shipment statistic application is used to generate statistics from all shipment data. These reports will include related revenues and expenses. Extensive filter functions are available to drill down the shipment data and there is instant output to spreadsheets for further processing. In addition a set of predefined reports are available for month-end and open estimates reporting.

Description



Generate Reports

This action opens a generate reports pop-up window in which pre-defined reports for the month-end and open estimates can be generated.

Open

To view a shipment listed in the report, highlight the shipment and select **Open**. The shipment will open in the application used to created it. On closing the shipment, the shipment statistics screen will be restored.

Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Updates the index to ensure that the latest shipment details are present and will be included in the report.

Shipment Statistics

A summary table showing all the shipments that will be included in the report. The filter and search functions can be used to revise this listing.

Branch spanning

By default only the shipments in the current branch are included in the report. This check box can be used to include shipments from all branches

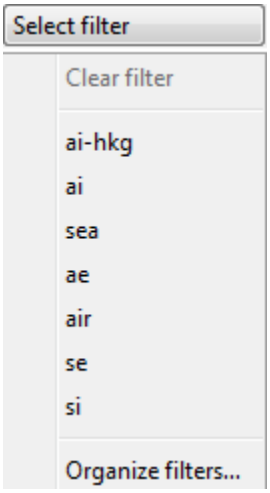
Exclude Old

This is a a drop-down filter. By default it displays *Exclude Old* and it can be changed to *Show All*. These options operate as follows:

Selection	Result
Show All	All existing records are included
Exclude Old	Records older than 3 months will be excluded

Select Filter

This drop-down menu will display filter management options and any filters that have been created:



Clear filter

If a filter has been selected, remove it using this option. The summary table will then include shipments that were previously excluded by the filter.

Saved filters

This is a list of previously stored filters. To apply a filter to the summary table, click the desired filter.

Organize filters

To edit existing filters and create new filters, select this option to launch the Organize filters application.

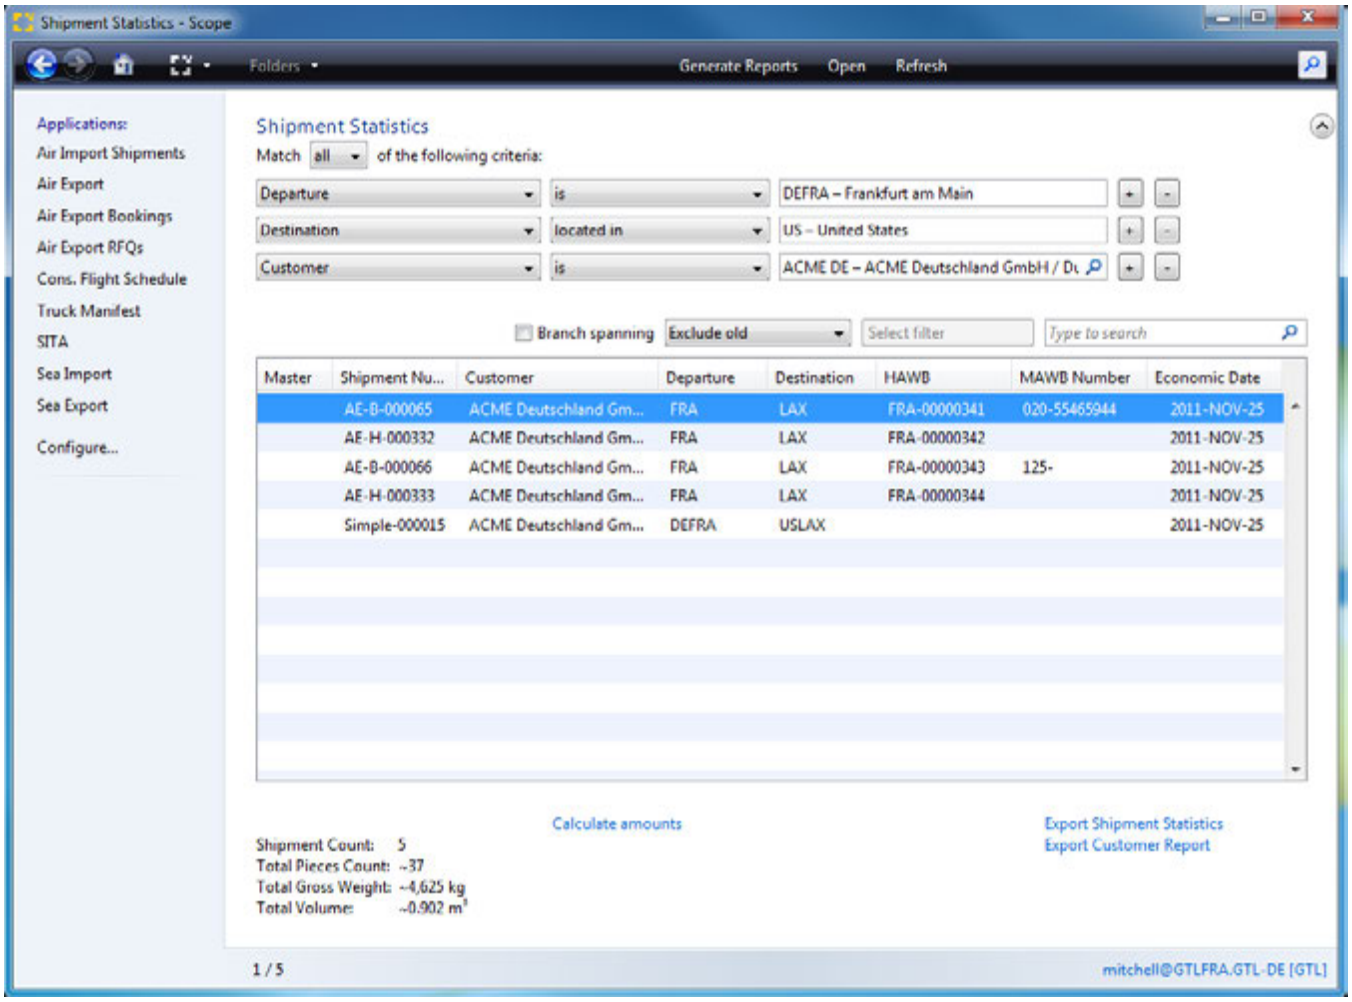
Text to search

This is a full text search field. Enter a keyword or text to restrict the summary table to those shipments that match the keywords or texts.

Advanced Search

Using the and buttons, the advanced search function is activated.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The advanced search introduces an expanded set of filter options to the summary table. Multiple rows of these filter options can be added using the + button, or removed using the - button. Each row of filter options comprises the following:

Match All/One of the following Criteria

This first option indicates how multiple filter rows are to be applied:

Option	Description	Example	Result
All	records must match all of the criteria in all filter rows	Departure=DEFRA, destination=USA	All records where both the Departure is DEFRA **and** the Destination is USA are produced.
One	records need to match only one of the criteria in all filter rows	Departure=DEFRA, destination=USA	All records where the Departure is DEFRA **or** the Destination is USA are produced.

Definition of Criteria

The filter row is comprised of three elements; the object of the search, the comparison criterion and the value of the object itself which may be a date, a location, a time period or a mode of transport. A complete description of the filter row is in the table below:

Object of the search	Comparison criterion	value of the object
Cost center	is	Cost center (search field)
Customer	is	Business partners (search field)
Economic date	is equal to is greater (than) is less (than) is between in the last	Date Date Date Date and Date No. of days, weeks or months
Economic Month	is *or* is not	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

		Current month Last month before last month
Transport Conveyance	is *or* is not	Airfreight Export Airfreight Import Seafreight Export Seafreight Import Airfreight Seafreight Import Export
Departure	is *or* is not Located in *or* not located in	UNLocodes (search field) Country code (search field)
Destination	is *or* is not Located in *or* not located in	UNLocodes (search field) Country code (search field)

As the above filter rows are applied, the summary table will immediately show the results of the filters in terms of the list of matching shipments.

Advanced searches cannot be saved unless the they are created using the organize filters option found in the select filter button.

Calculate amounts

This action link at the bottom of the summary table will produce a financial summary of the shipments displayed in the summary table:

	Income	Cost	☐ Include transit charges
Estimated:	0.00 EUR	258.49 EUR	
Open:	2,705.00 EUR	0.00 EUR	
Booked:	462.50 EUR	2,035.70 EUR	
	3,167.50 EUR -	2,294.19 EUR =	873.31 EUR

Include Transit

Ongoing items that do not represent profit or loss figures such as VAT charges and customs duties are excluded from the financial summary. Check this text box to include these items.

In order to include income and costs in the spreadsheet reports described below, the **Calculate amounts** action must be activated.

Export Shipment Statistics

The data in the summary table will be produced in spreadsheet format. The report will open in the default spreadsheet application (Excel, iWork, Calc etc.) on the local computer. The report provides the following columns:

- Branch
- HAWB Number
- MAWB Number
- Economic Date
- Departure
- Destination
- Customer
- Shipper
- Consignee
- Import Agent
- Export Agent
- Incoterms
- ETD
- ETA
- Pieces
- Gross Weight
- Chargeable Weight
- Volume
- Salesperson
- Open Income
- Income
- Estimate Income
- Open costs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Cost
- Estimate Costs
- Profit

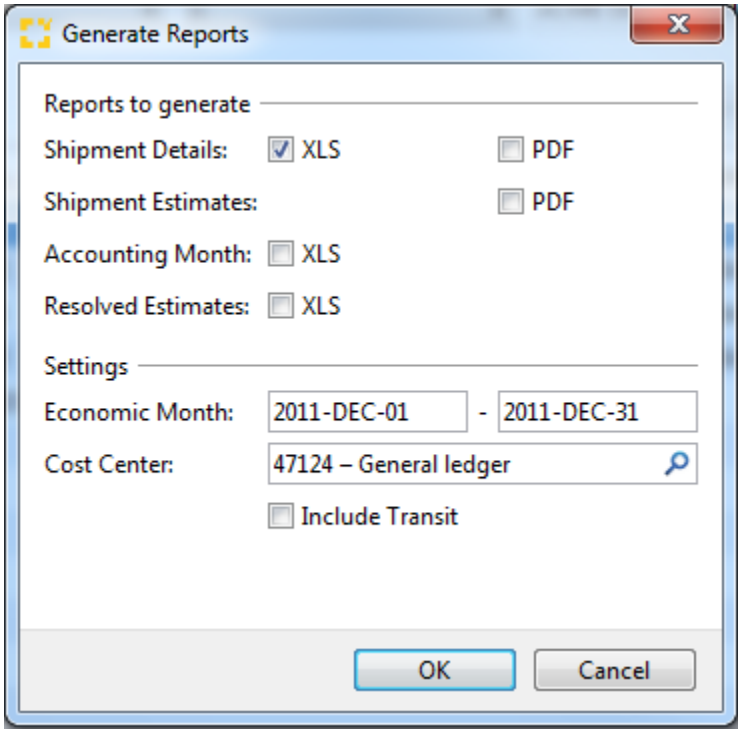
Export Customer Report

The data in the summary table will be produced in spreadsheet format. The report will open in the default spreadsheet application (Excel, iWork, Calc etc.) on the local computer. Prior to opening, a dialogue pop-up appears where the customer can be identified, this can be: the actual customer, the salesperson, the shipper or the consignee. The report provides the following columns:

- Customer
- Shipments
- Pieces
- Gross Weight
- Chargeable Weight
- Volume
- Turnover
- Profit

Reports to Generate

This application is launched via the Generate Reports option on the menu bar.



The first section of the pop-up presents a list of reports that are available. To the right are check boxes to choose the report and in some cases to generate the report in XLS and/or PDF format the options are:

Report Type	XLS (Spreadsheet)	PDF
Shipment Details	✓	✓
Shipment Estimates	✗	✓
Accounting Month	✓	✗
Resolved Estimates	✓	✗

Shipment Details

A shipment report including income, costs, estimates and profit in XLS (spreadsheet) or PDF format.

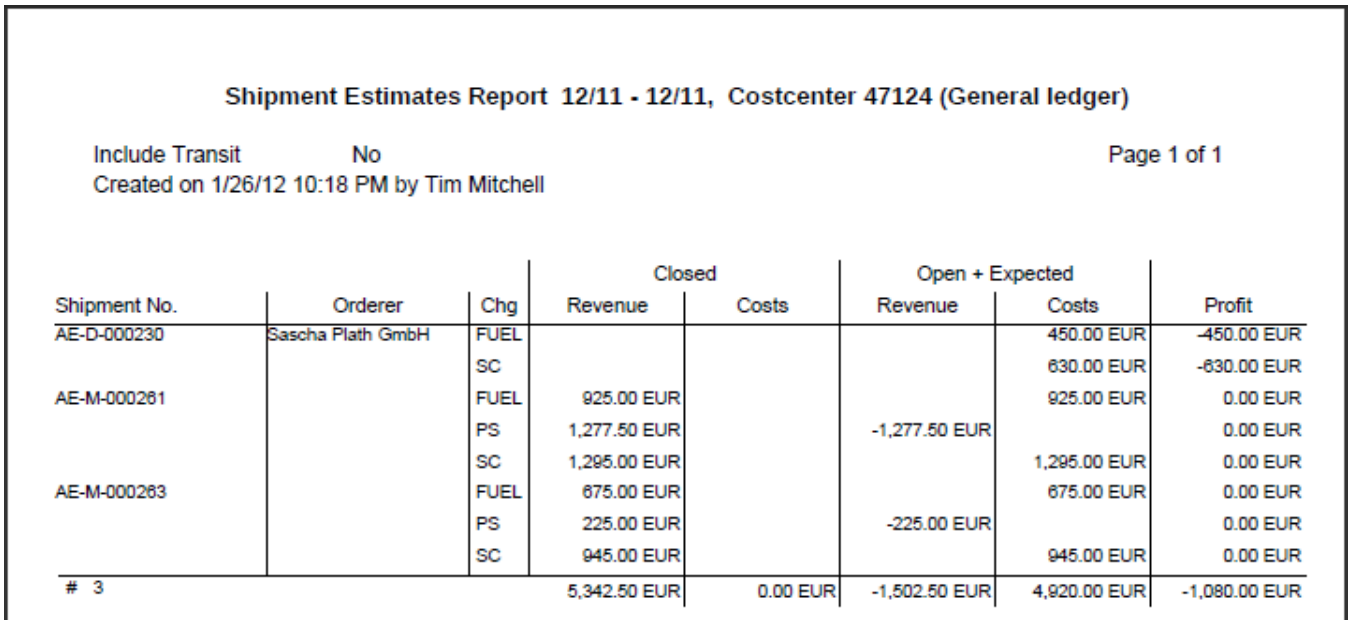
- Branch
- HAWB Number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- MAWB Number
- Economic Date
- Departure
- Destination
- Customer
- Shipper
- Consignee
- Import Agent
- Export Agent
- Incoterms
- ETD
- ETA
- Pieces
- Gross Weight
- Chargeable Weight
- Volume
- Open Income
- Income
- Estimate Income
- Open costs
- Cost
- Estimate Costs
- Profit

Shipment Estimates

A report showing shipment open estimates in PDF format



Shipment Estimates Report 12/11 - 12/11, Costcenter 47124 (General ledger)

Include Transit No Page 1 of 1
Created on 1/26/12 10:18 PM by Tim Mitchell

Accounting Month

Month end report as an XLS spreadsheet listing.

- Shipment Number
- Income
- Cost
- Accruals
- Profit

Resolved Estimates

A spreadsheet report showing:

- Shipment Number
- Charge Type
- Voucher Date
- Voucher Amount
- Estimate Amount
- Estimate Date

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Settings

Economic Month

The economic period for the report. This is a date and time field

Cost Center

The cost center for the report. This is a text search field that can be used to locate the correct valid cost center.

Include Transit

Ongoing items that do not represent profit or loss figures such as VAT charges and customs duties are excluded from the report. Check this text box to include these items.

OK

Runs the report. XLS and PDF files will open in the default spreadsheet program and pdf viewer on the local computer.

Cancel

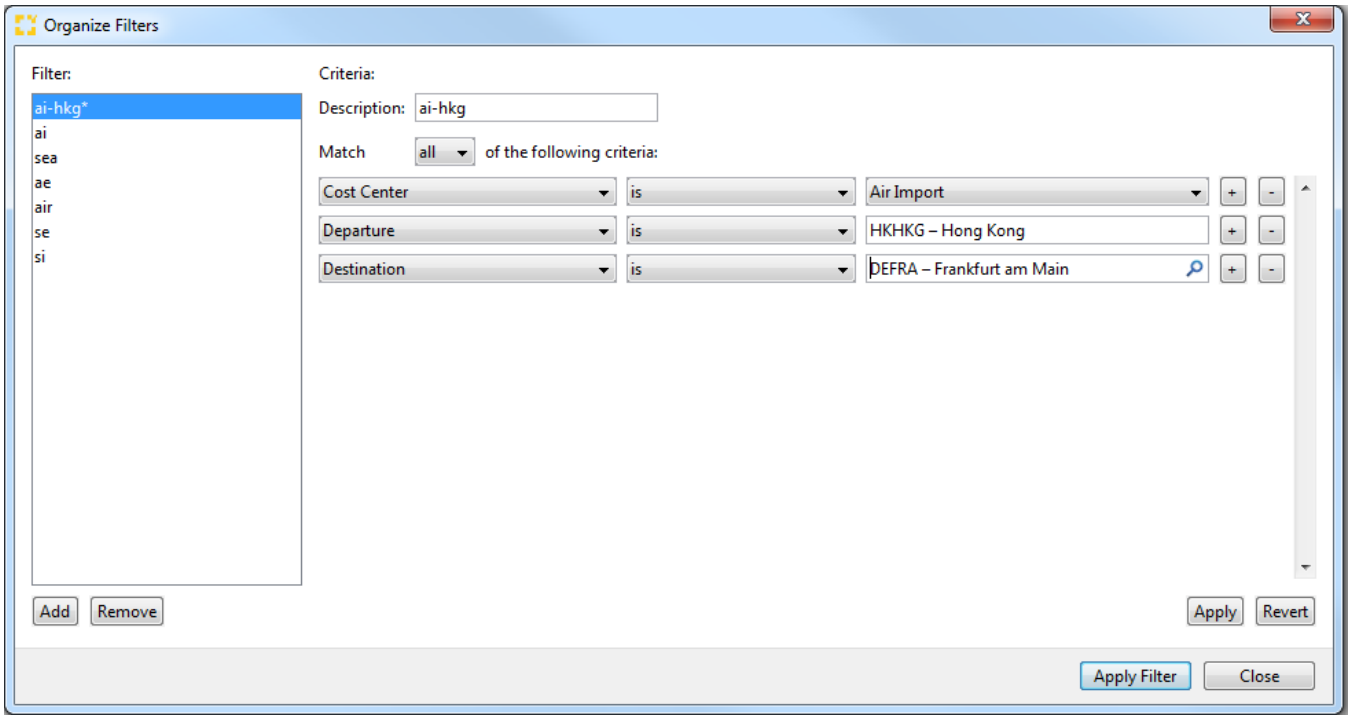
Exits this report generator and returns to the statistics application without further action.

{anchor:organize filters]

Organize Filters

The select filter button in the statistics application includes the option organize filters, this is used to create and store advanced searches that can be reused.

The organize filters application lists existing filters on the left and the contents of each filter on the right with options to add and remove filters.



Filter

This is a listing of all existing filters. As each filter is highlighted, the details of the filter appear to the right.

Add

Creates a new filter. All the fields to the right are cleared so that the process of building a new filter can begin.

Remove

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Removes the highlighted filter from the list.

Criteria

The criteria is the area where details of existing filters are shown, or new filters can be defined.

Description

This will be the name of the filter. It should be descriptive of the filter so that it can be readily identified from just this short description.

Match All/One of the following Criteria

This first option indicates how multiple filter rows are to be applied:

Option	Description	Example	Result
All	records must match all of the criteria in all filter rows	Departure=DEFRA, destination=USA	All records where both the Departure is DEFRA **and** the Destination is USA are produced.
One	records need to match only one of the criteria in all filter rows	Departure=DEFRA, destination=USA	All records where the Departure is DEFRA **or** the Destination is USA are produced.

Definition of Criteria

The filter row is comprised of three elements; the object of the search, the comparison criterion and the value of the object itself which may be a date, a location, a time period or a mode of transport. A complete description of the filter row is in the table below:

Object of the search	Comparison criterion	value of the object
Cost center	is	Cost center (search field)
Customer	is	Business partners (search field)
Economic date	is equal to is greater (than) is less (than) is between in the last	Date Date Date Date and Date No. of days, weeks or months
Economic Month	is or is not	Current month Last month before last month
Transport Conveyance	is or is not	Airfreight Export Airfreight Import Seafreight Export Seafreight Import Airfreight Seafreight Import Export |
Departure	is *or* is not Located in *or* not located in	UNLocodes (search field) Country code (search field)
Destination	is *or* is not Located in *or* not located in	UNLocodes (search field) Country code (search field)

Multiple rows of these filter options can be added using the  button, or removed using the  button.

Apply

Active when a new filter is being created. This button will save the new filter.

Revert

Active when a new filter is being created. This button will clear all the criteria so that the new filter can be rebuilt.

Apply

Applies the selected filter to the summary table so that only matching results are present.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Close

Closes the **Organise Filters** application and returns to the summary table.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Statistics

- Introduction
- Description

Introduction

Scope offers four types of shipment statistics:

- Statistics
  including all shipment types
- Airfreight
  including only air export and air import shipments
- Seafreight
  including only sea export and sea import shipments
- Consol
  including only consolidated shipments

Because all these types of applications are working in the same way, only the general statistic is described in detail here.
The differences and additional functionalities are described in the appropriate sections below.

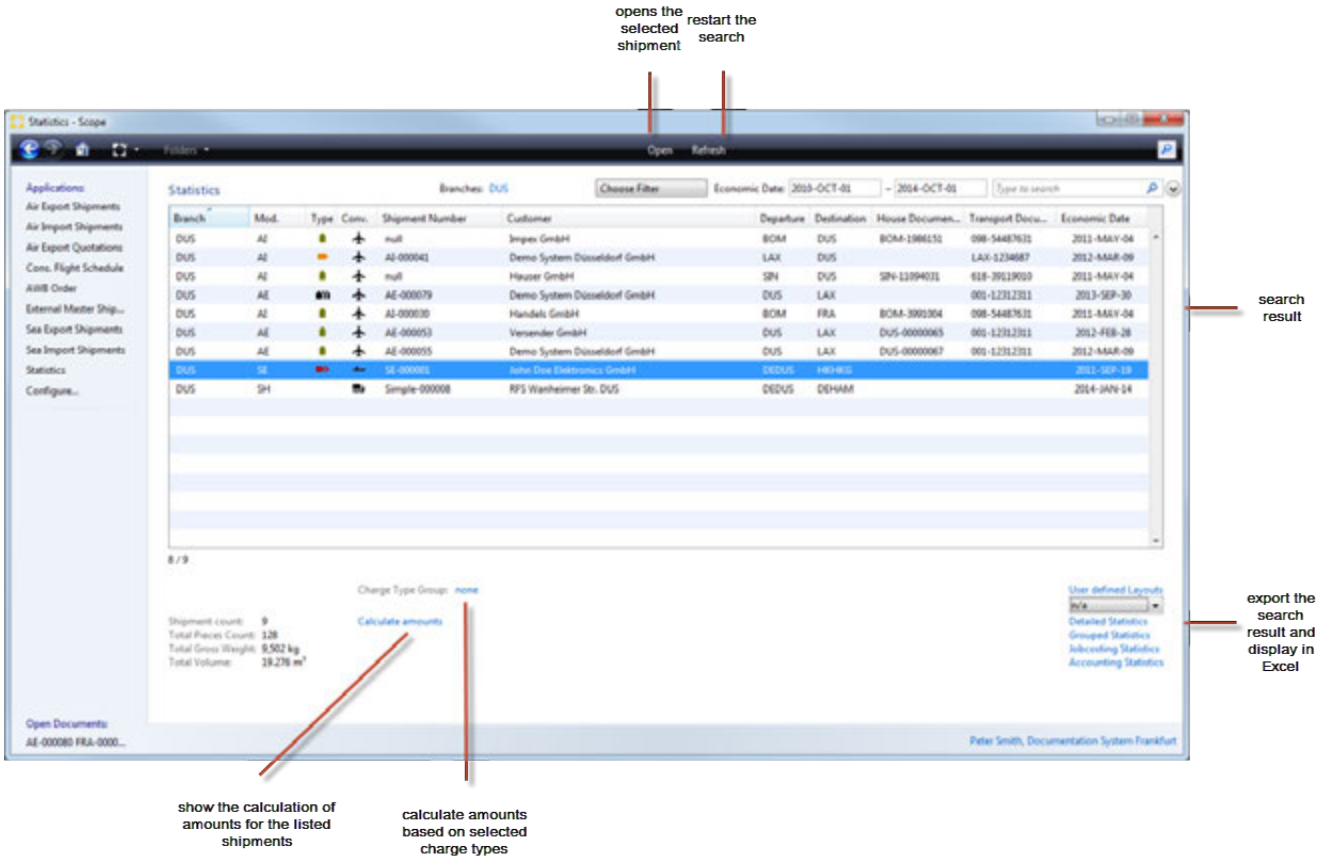
Description

Statistics

The example mentioned below shows the result of a search run over all shipment types. Users interested only in seafreight, airfreight or consol statistics should choose the appropriate application from the menu.

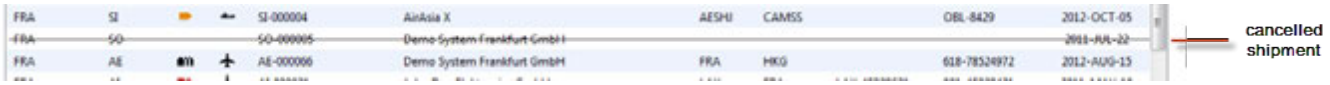
To open a shipment which is selected in the result table, the user just click onto the *open-button* in the title bar.

The search run can be started again by clicking onto the *refresh-button* in the title bar. The list of the found shipments, depending on the search criteria, will be displayed immediately.

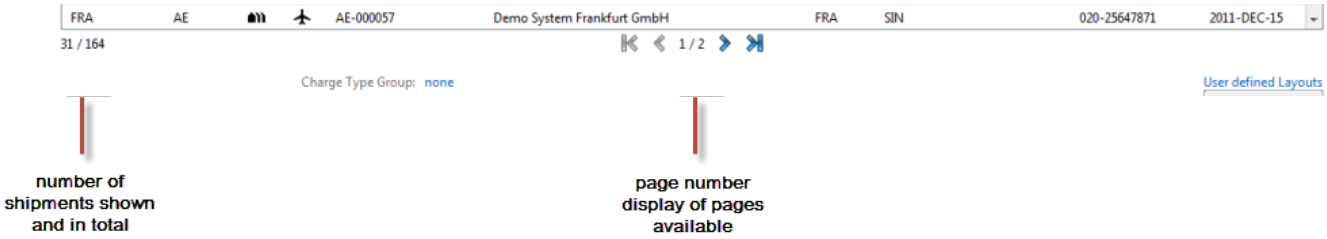


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If a shipment was cancelled it appears in the result list but striked through. The *open-button* in the title bar is still available but will not work with cancelled shipments.

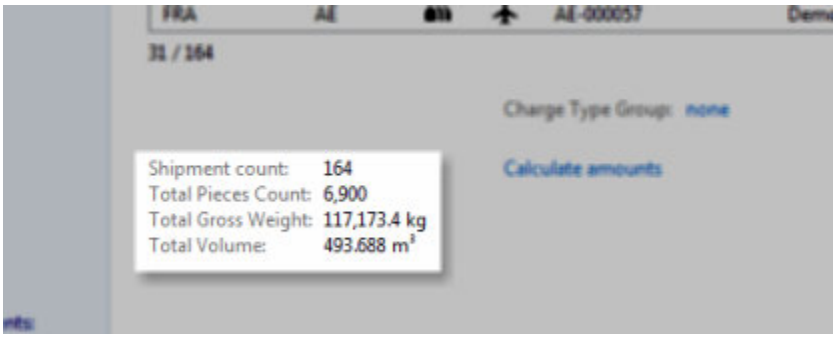


If the search result is too big to be displayed onto one page, one may browse through the pages by using the buttons shown below:



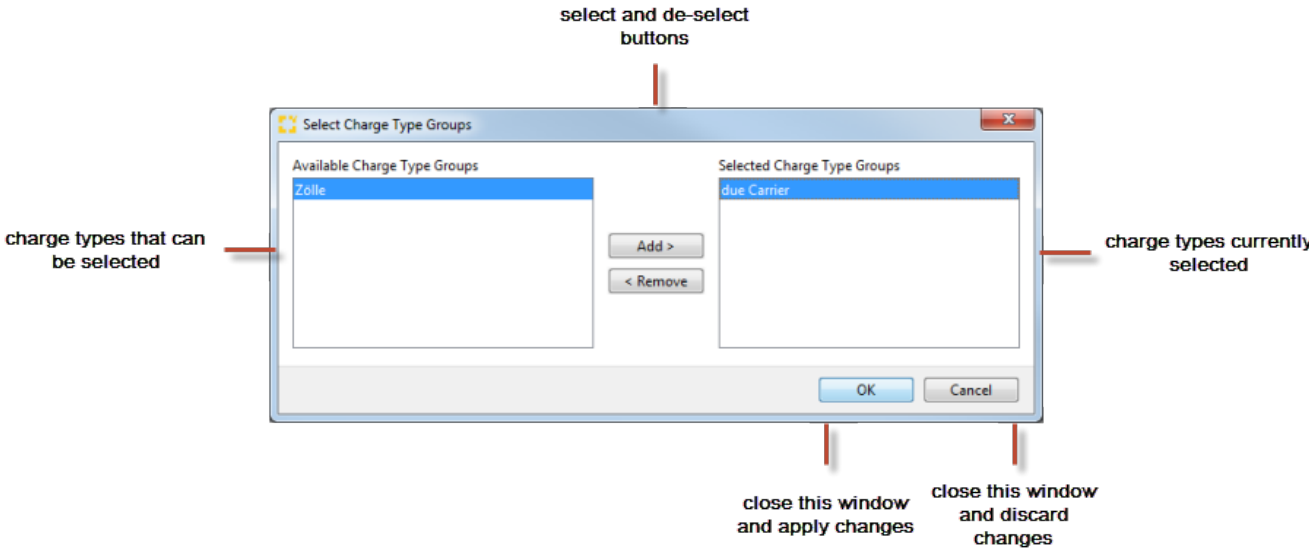
On the lefthand of the page the currently selected row in the displayed list is shown and the number of available rows in the result list.

Below this information a short summary is displayed which shows the totals of all shipments included in the result list.



This calculation is not filtered in any way. It just shows the totals overall.

The user may group charge types to display only amounts for the included charge types. A group can be created by clicking onto the value shown beside the *Charge Type Group* Label:



To add an item to the group of selected charge types, the user clicks on the appropriate row in the lefthand list and then onto the Add button. The item will disappear from the list of available items and is shown in the list of selected charge types.
Vice versa the user may remove a charge type from the list of selected charge types by selecting this charge type and clicking onto the Remove button. The item will disappear from the list of selected items and is shown in the list of available charge types again.

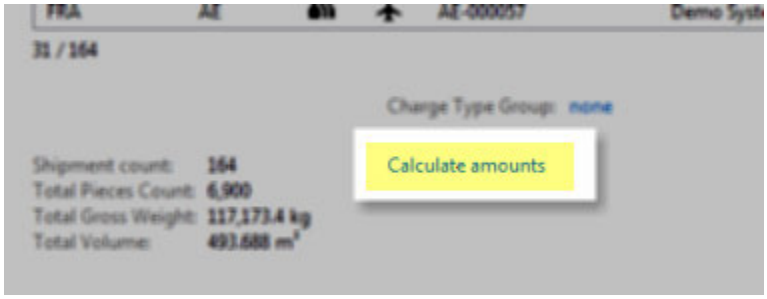
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Discarding all changes is done by clicking onto the Cancel button. The windows will get closed and no changes applies to the statistic screen.

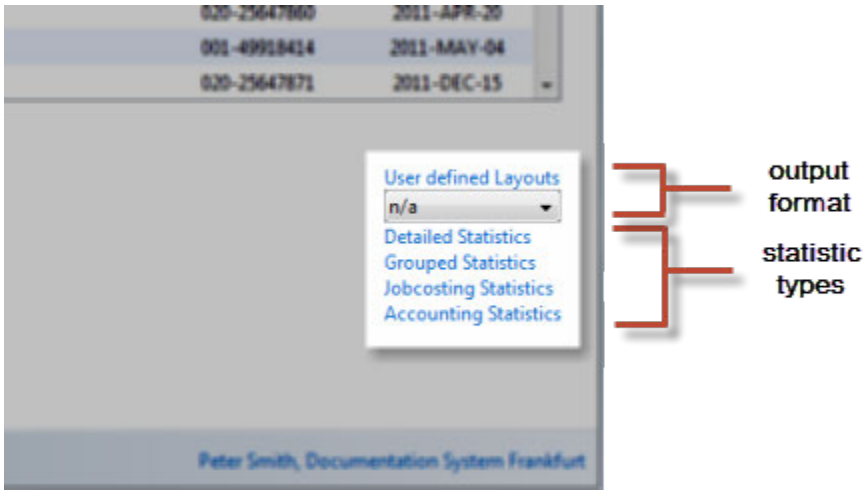
By saving the changes - use the OK button - the window is closed and the changes comes into effect:

The displayed calculation will disappear by clicking on the Refresh button.

Basically, the option *Calculate amounts* will do the same, considering an eventually selected filter by grouping charge types as described above.
This option offers a fast access to recently used statistics over frequently used charge types.
The user should be aware that this option does not show the overall amounts if a charge type group is selected.



The application offers an export function to be able to work on the displayed shipments in another system, e.g. Excel:



If no user defined output format is stored the export application will send all shipment data to the external editor, e.g. Excel:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

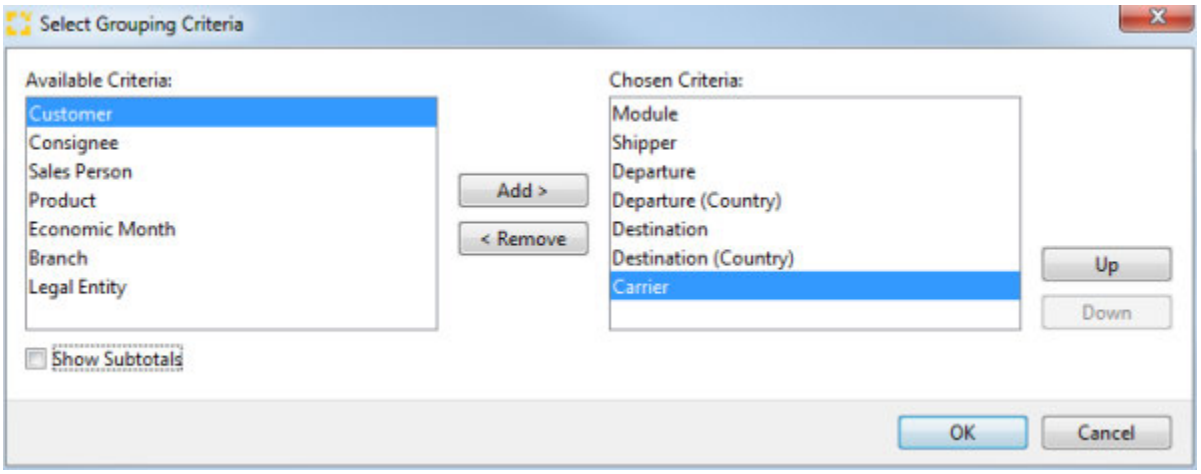
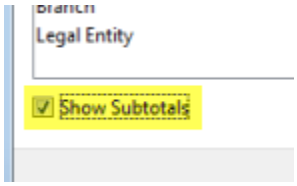
The above example shows the cutout of the output if the users had choosed *Detailed Statistics*.

To receive an output where the data is grouped, the user may click the function *Grouped Statistics*. A windows opens from where the user may arrange a grouping by several criteria:



The functionality is the same as described in similar selection applications. Additionally the user is able to sort the choosen criteria and therefore the grouping itself by using the up- and down-buttons.



If the option Show Subtotals is selected, the generated output contains a sub totals row at the end of every group as shown below:

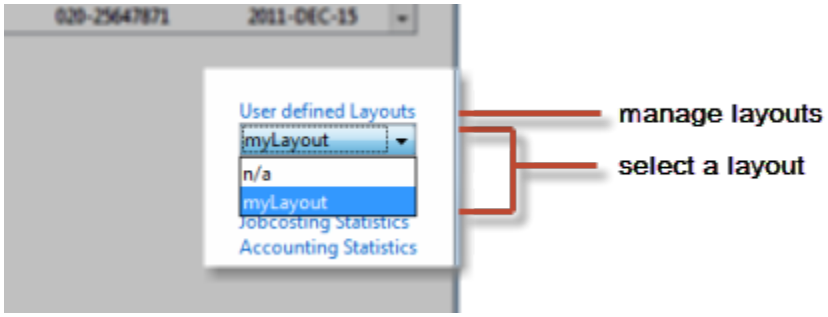
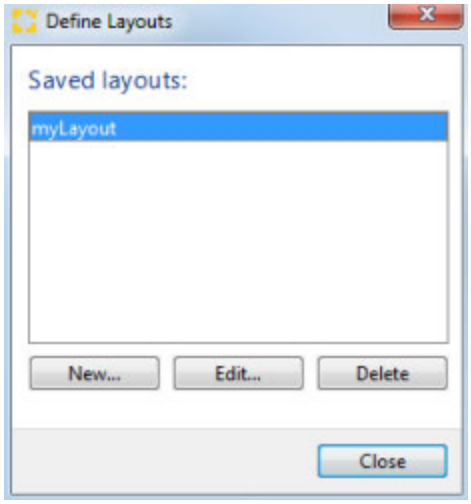
To not deliver all columns to the external editor everytime, the user is able to select the columns which are to be exported:



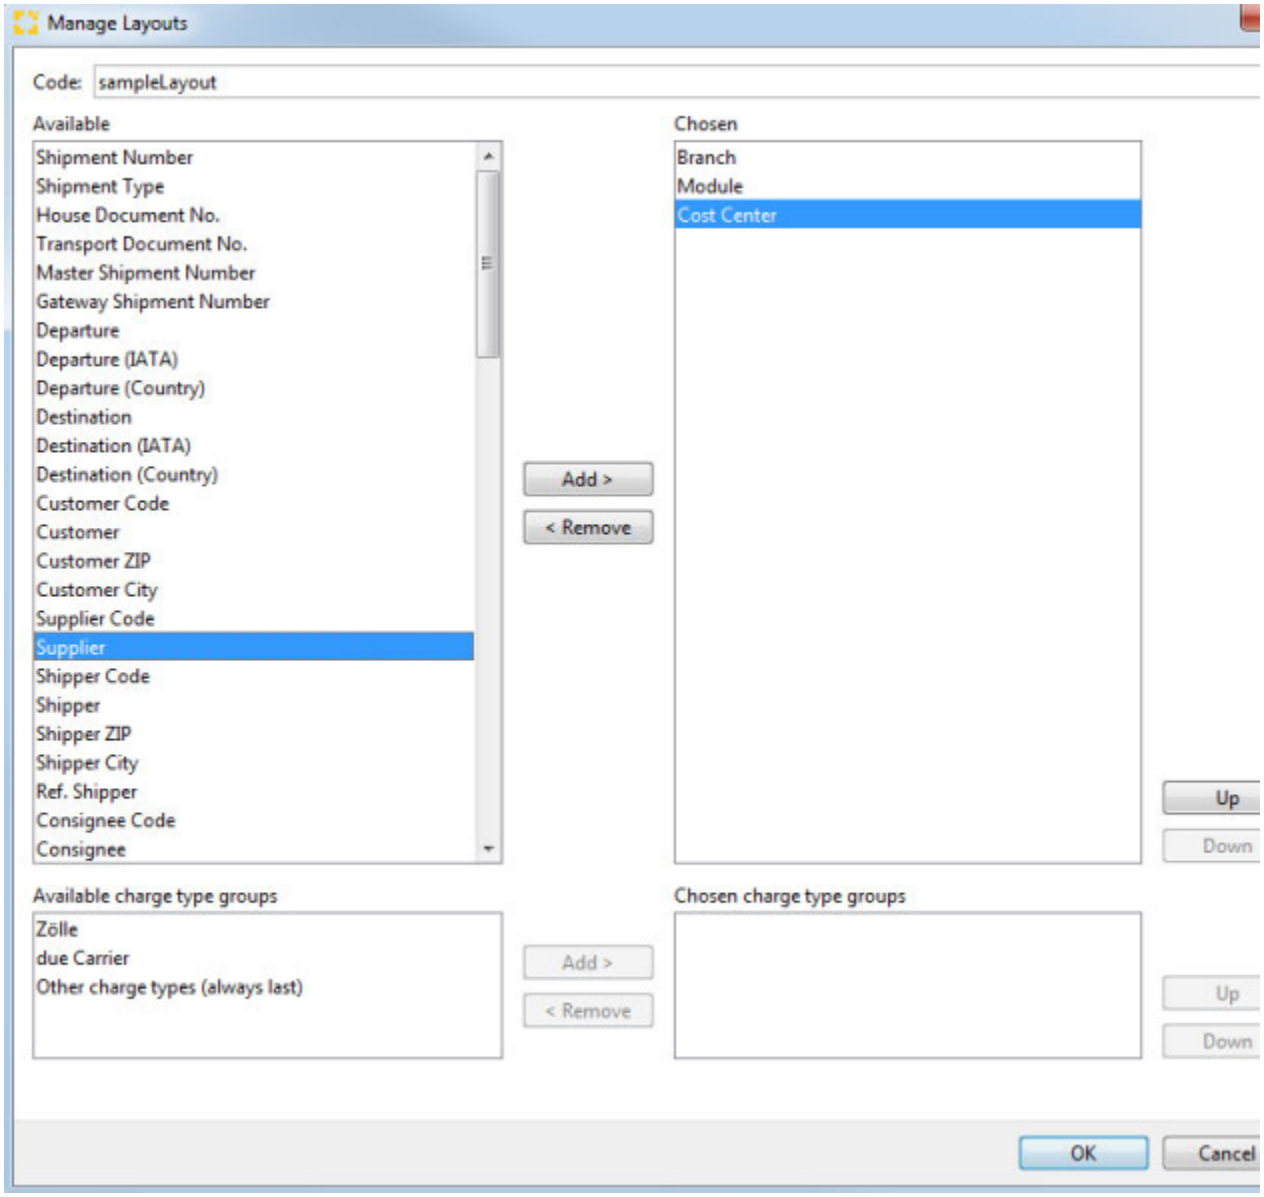
The user may select a previously stored layout by clicking on the drop-down list. If the option *n/a* is selected, all columns will be exported.

To create, delete or edit a previously defined layout, the function labeled *User defined Layouts* may be used:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



From here one can edit or delete an existing layout or create a new one:



The name of the layout is entered in the text field labeled as *Code*.
The exported statistic output will contain all the columns mentioned in the righthand list *Chosen*.

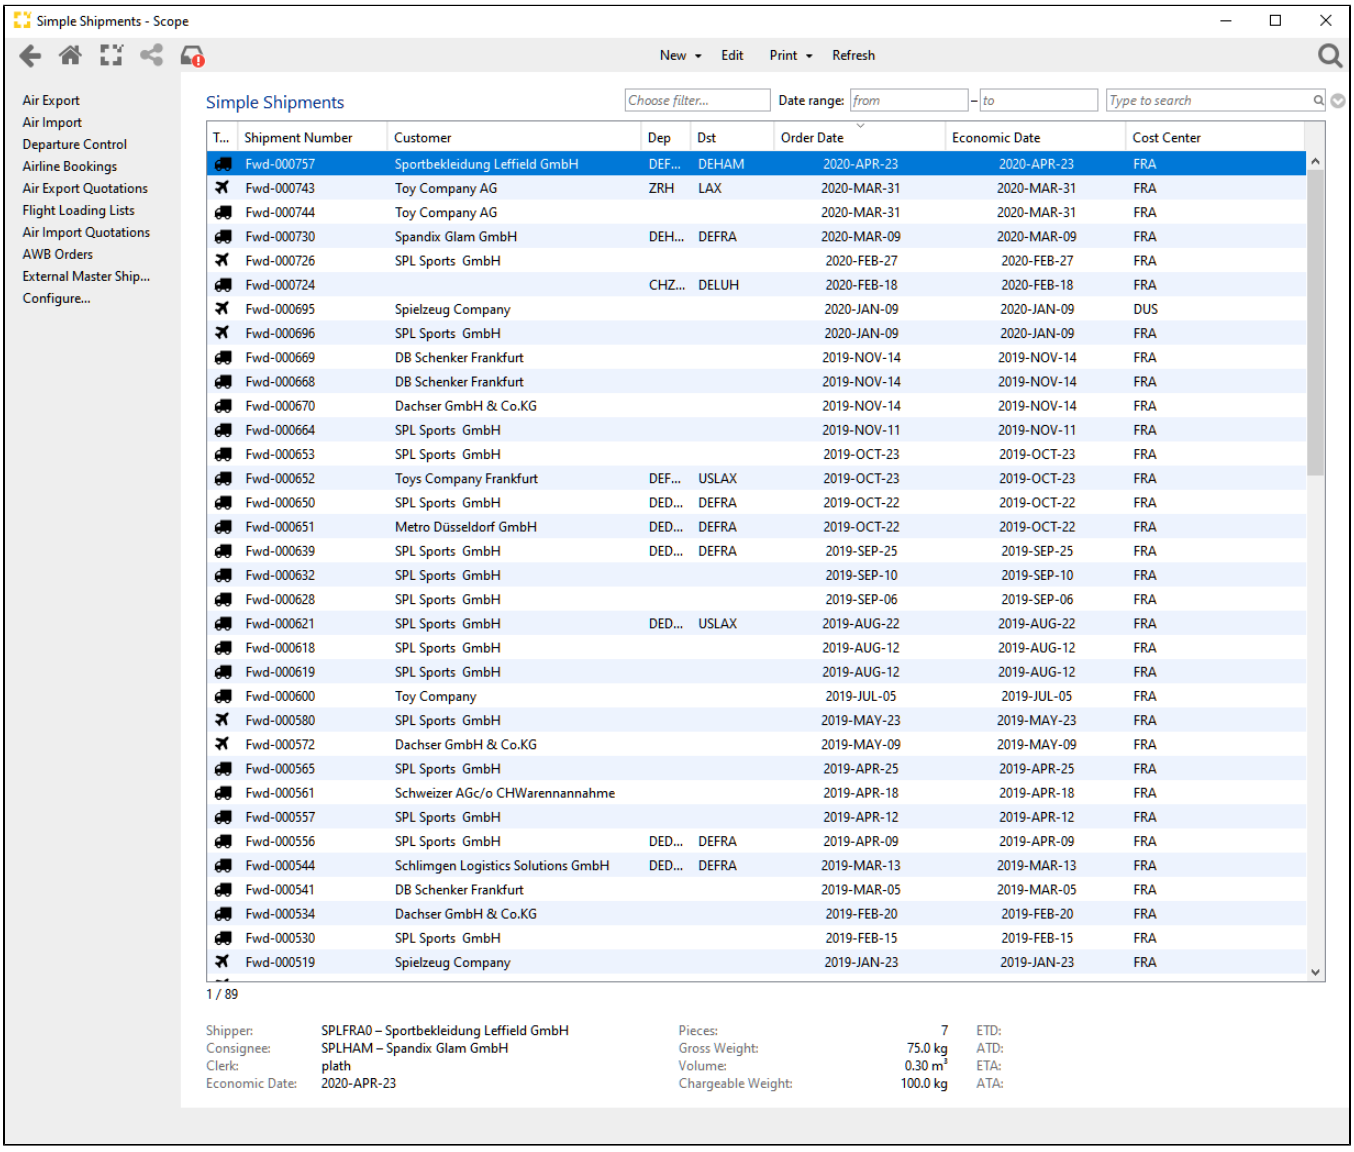
Simple Shipments

- Introduction
- Description

Introduction

Simple shipments are created for shipments that have limited transport information and for this reason simple shipments are the fastest method for recording shipment. Complete invoicing, jobcosting and some print options are provided for simple shipments. Typically simple shipments are created for shipments that are not handled by the local branch and occurred between remote parties.

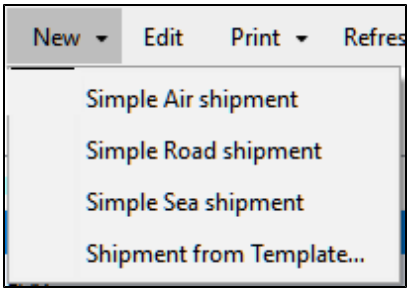
Description



New

The ***New*** option offers the choice of creating a new air, sea or road simple shipment as well as the option to create a new shipment from template:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Edit

Opens the shipment highlighted in the overview. Alternatively, double click the shipment to open it.

Refresh

Updates the index to ensure the latest simple shipments are visible in the overview.

Date range From / To

The shipments displayed can be limited to a specific time period using these date fields

Type to search

This is a full text search field. Any detail of a shipment or set of shipments may be entered to restrict results to that keyword.

Advanced filter options

For advanced filter options, see https://wiki.riege.de/display/SCOPEEN/Advanced+Filter+-+Functions+-+General

Simple Shipments (summary table)

The summary table displays all the shipments matching the search terms. Orders are shown in rows displaying the shipment type, customer, departure, destination, order date, economic date and cost centre.

Shipment Type

The symbols in the left most column represent the shipment types:

Symbol	Shipment Type
	Airfreight
	Seafreight
	Road Transport

On opening an order further functions are available as described in the following chapters:

- Documents - Simple Shipment - Forwarding
- E-Mail - Simple Shipment - Forwarding
- General - Simple Shipment - Forwarding
- Jobcosting - Simple Shipments - Forwarding
- Vouchers - Simple Shipments - Forwarding

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

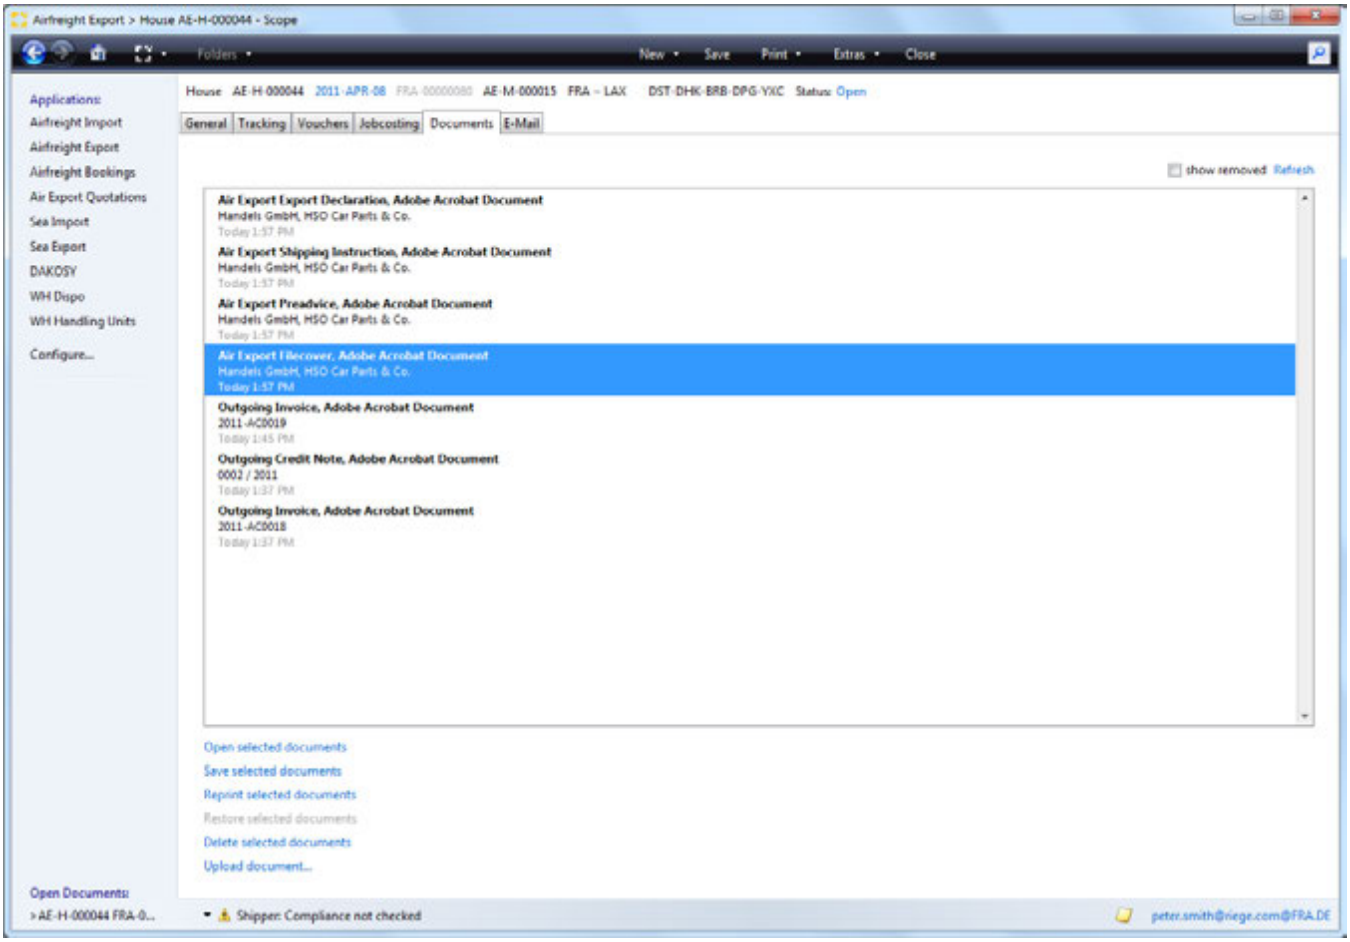
Documents - Simple Shipment - Forwarding

- Introduction
- Description

Introduction

The documents tab shows all documents that have been created and printed for the current shipment. These documents can be opened, downloaded, reprinted, deleted and some documents may be uploaded to web-tracking. Uploaded documents are also displayed.

Description



Document Overview

This area displays all documents that are associated with this shipment or order. The name of the document together with the type of document and creation date are shown. The current version of a document is always displayed. By selecting the show deleted check box, all previous or deleted versions of a document will be shown. These are displayed in ~~strike-through~~ text.

Show removed

Documents that have been previously deleted will be displayed.

Refresh

Updates the current list of documents.

Open selected documents

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

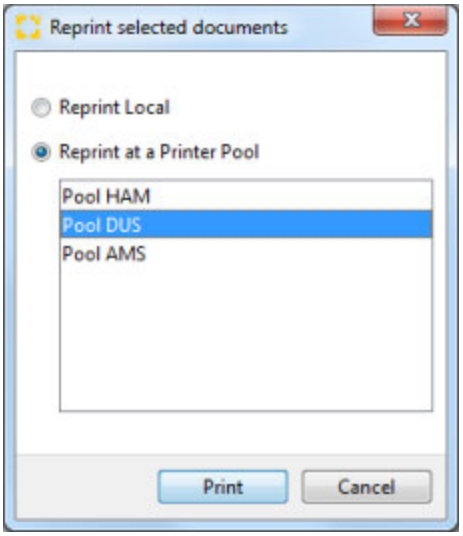
Opens any document currently highlighted in the list. Documents will open according to the file type associations of the local pc. For example Adobe Acrobat Reader will be used to open PDFs if that is the program associated with PDFs on the local pc.

Save selected document

Save the selected document to a drive on the local PC. A folder navigator will appear to allow navigation to the correct folder.

Reprint selected documents.

Opens a print application that allows the document to be printed to the local printer, or to a printer in an available print pool. It is possible to setup the print pools of remote offices to be accessible for printing to these remote offices.



Local printer

Print the document on the predefined default printer.

Print to printer pool

Allows selection of a printer pool from the list displayed.

Printer-Pools (List)

The desired printer pool can be selected from the list. Documents can be set to print to particular printers automatically.

Print

Print the document to the selected printer.

Cancel

Cancel the operation without further action.

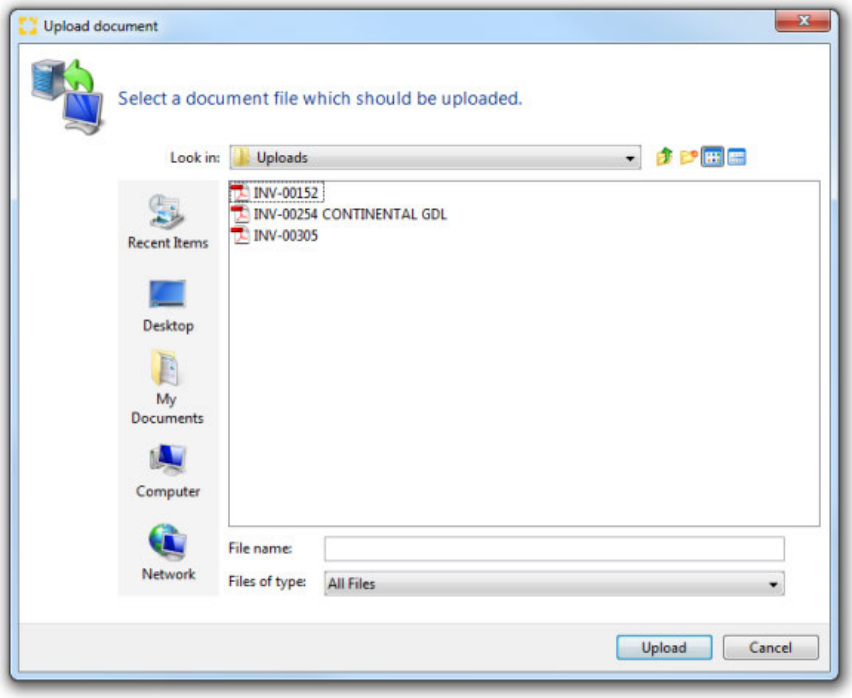
Delete/Restore selected document

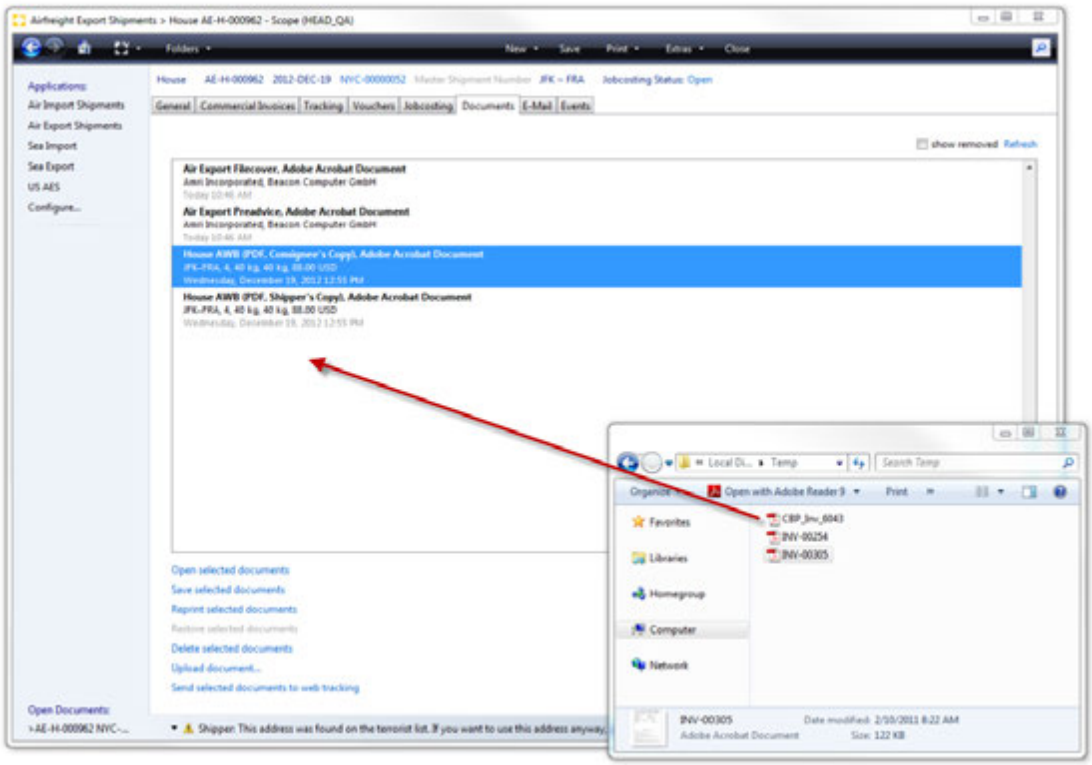
The document highlighted in the list will be deleted from view. Documents are not physically deleted but marked as inactive and therefore not visible. To view all documents including inactive documents, check the show removed box to the right above the document listing. If a document has been deleted, it can be restored by using the show removed check box, highlighting the inactive document and then selecting the *Restore selected documents* action.

Upload document...

Opens a file dialogue window which can be used to upload an external file to the current shipment. Alternately, navigate to the document on the desktop and drag and drop the document into the documents tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

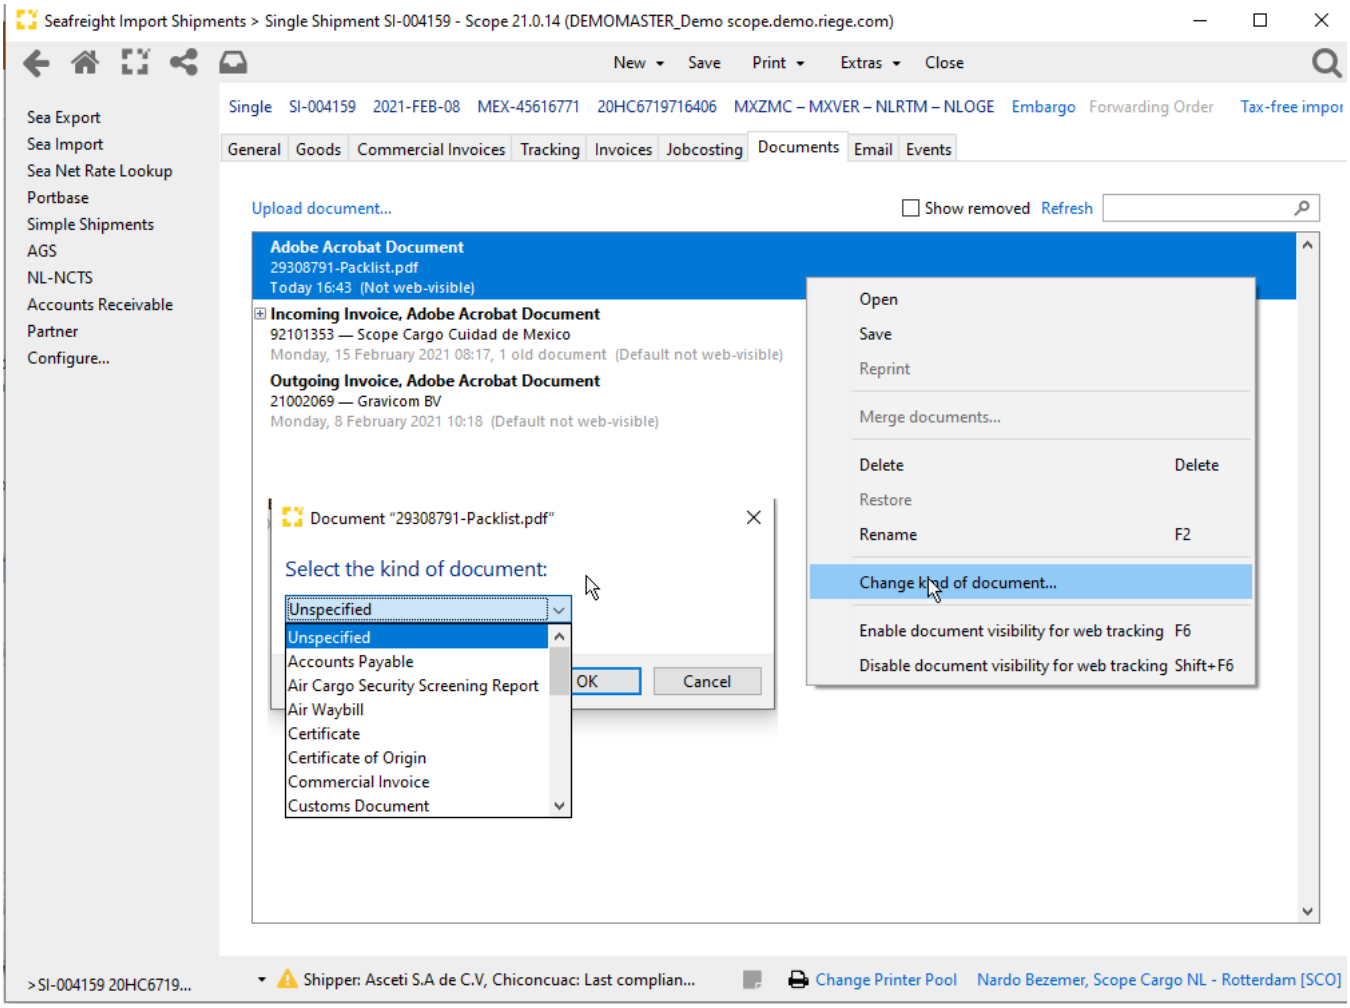




Assign Kind of Document type

During upload or via a right mouse click ,it is possible to set a document kind to the uploaded documents
when a uploaded document has a proper kind set, it will be available to automated email processes (invoices, prealerts)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Available kinds are :

- Accounts Payable (incoming invoice)
- Air Cargo Security screening report
- Air Waybill
- Certificate
- Certificate of Origin
- Commercial Invoice
- Customs document
- Dangerous Goods Declaration
- Forwarding instructions
- Goods receipt
- House Bill of lading
- Image
- Insurance Certificate
- Master Air Waybill
- Master B/L (Draft)
- Master B/L
- Packing List
- Proof of delivery
- Shipping documents
- Shipping Instructions
- Waybill

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

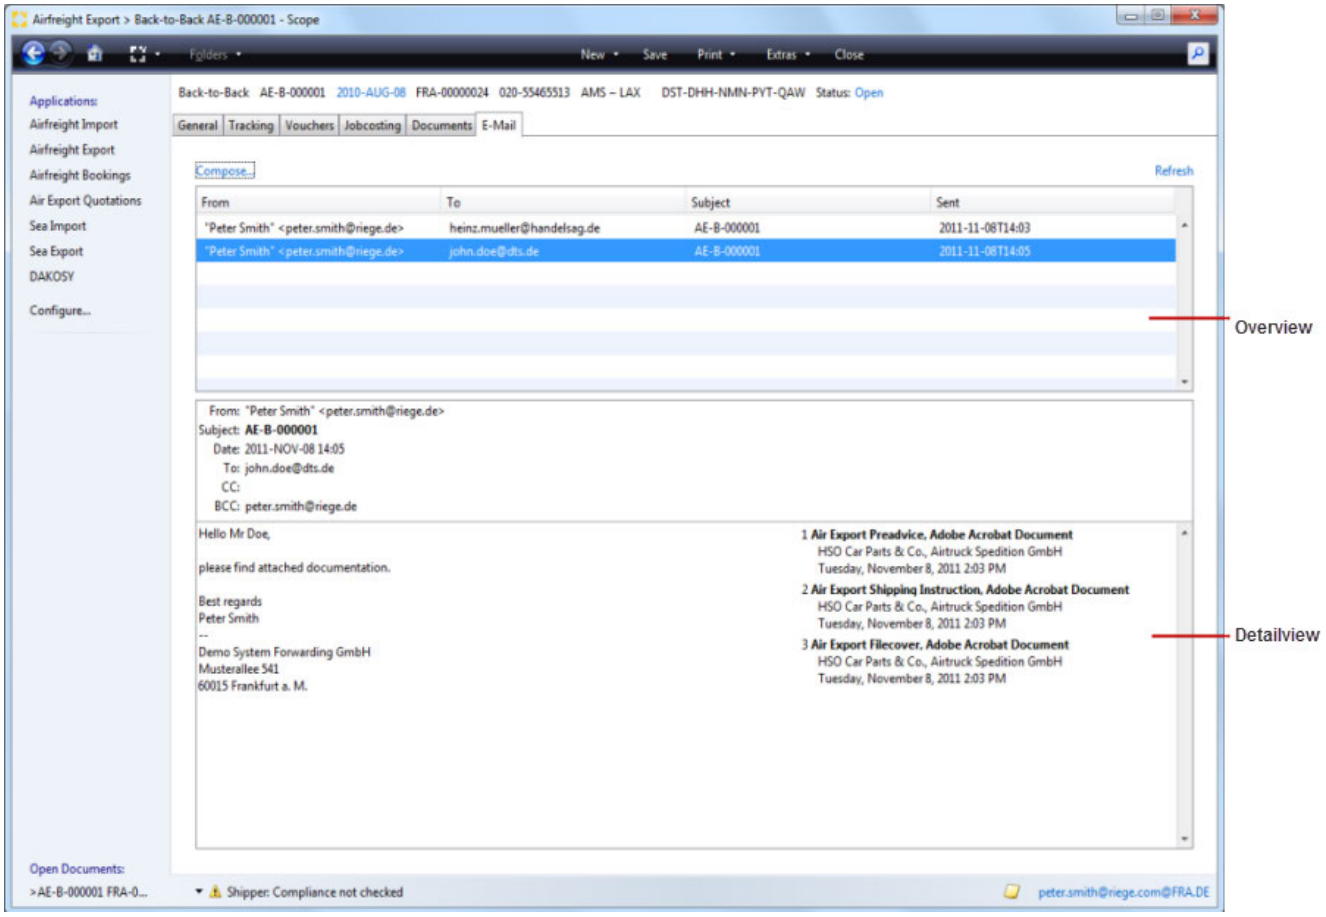
E-Mail - Simple Shipment - Forwarding

- Introduction
- Description

Introduction

In most application there is an E-mail function. This allows the quick creation of emails related to the shipment and to easily attach documents stored within the shipment.

Description



New E-Mail...

Opens the e-mail editor to create a new e-mail and send it.

Refresh

Refreshes the list of existing emails

Overview

An overview of all pre-generated e-mails with sender, recipient, subject and date of shipment all displayed. The marked email will be displayed in detail in the lower part of the screen.

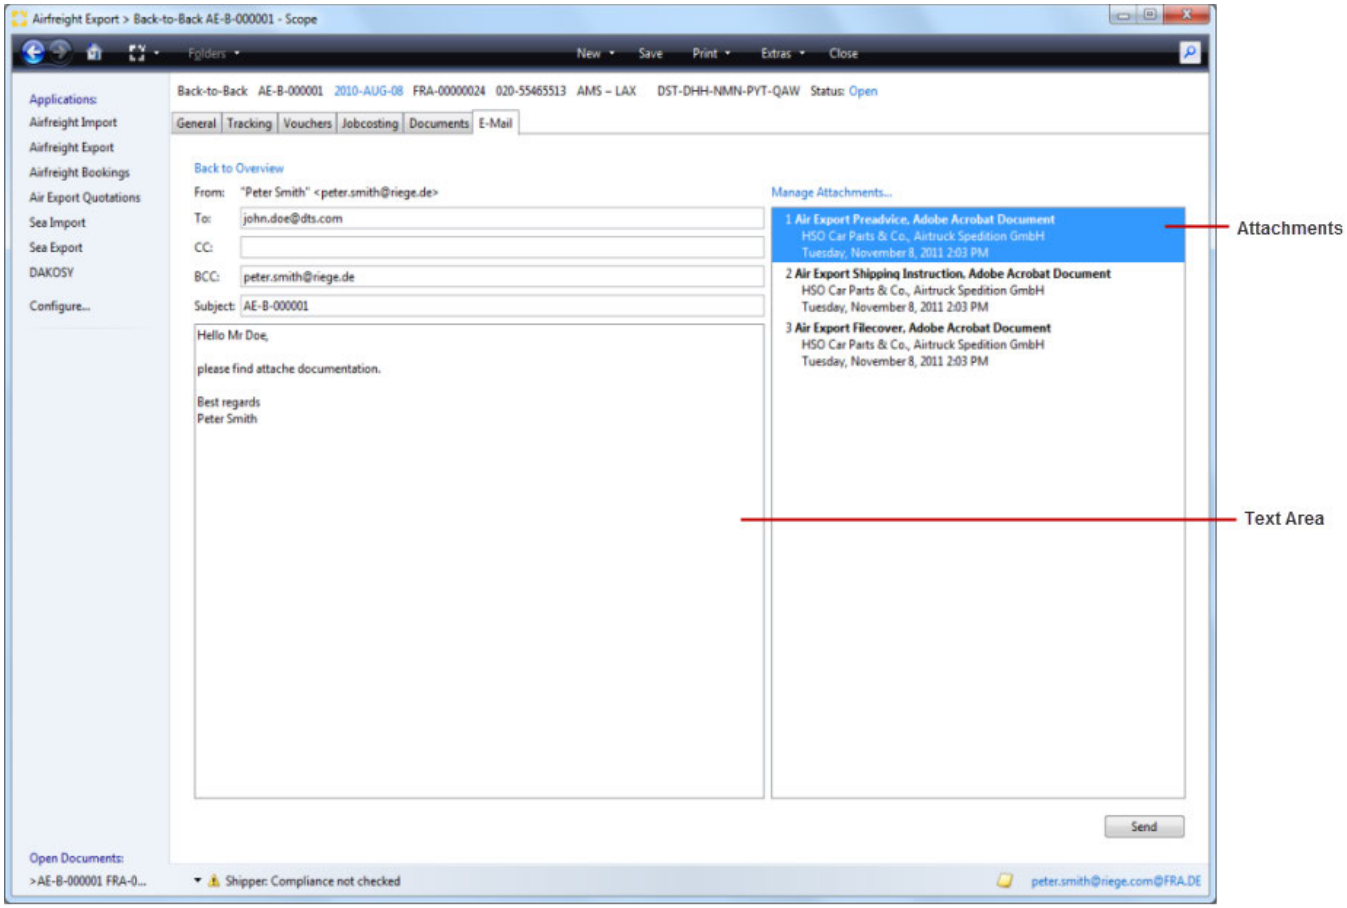
Detail section

In this area, displaying the marked email in the overview shows, all parties receiving the mail, the body text of the mail and any attachments.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

E-Mail Editor

selecting the "compose" option produces the email editor.



Back to overview

this will return the view to the e-mail overview screen.

From

E-mail sender. The sender name and e-mail address is taken from the user profile of the current user.

To

E-mail recipients. The e-mail address of the recipient can be entered here. Multiple e-mail recipients can be entered if separated by commas.

Copy

E-mail recipient or recipients to which a copy of the e-mail will be sent. Multiple e-mail recipients can be entered if separated by commas.

Blind Copy (BCC)

E-mail recipient or recipients to which a blind copy of the e-mail will be sent. Multiple e-mail recipients can be entered if separated by commas. By default, the e-mail address of the sender or logged on user is used so that the user will automatically receive an e-mail copy in their external e-mail program.

Subject

The subject of the email that is being composed.

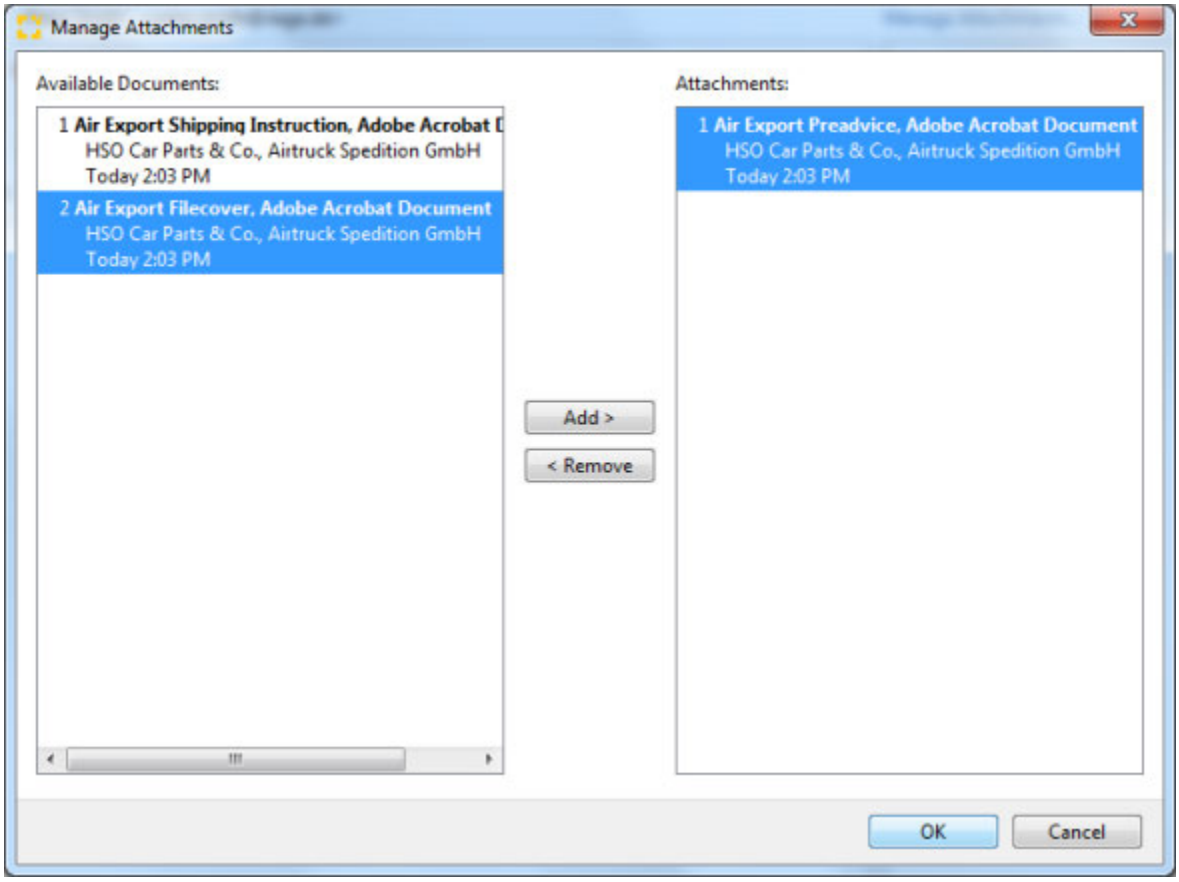
Text area

The area where the content of the email is written.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Manage Attachments...

This action will open a popup window in which the attachments to this e-mail can be added or removed.



Available Documents

This area will display all documents that are currently in the documents tab of the shipment. Only these may be included as attachments.

Attachments

This area will display documents that are already attached.

Add

Moves one or more selected documents from the list of available documents and adds these to the e-mail as an attachment.

Remove

Moves one or more of the selected documents form the **attachments** area back into the **available documents** areas. This removes the document from the email.

> **External Documents**
>
> External documents such as those stored locally on a hard disk or a network drive can be uploaded to the **documents tab of the application using the *Upload documents* option in the *document tab**. Once this is done, these documents will now be available as documents that can be attached to emails.

OK

Confirms the documents to be attached and closes the pop-up window.

Cancel

Closes the attachments pop-up without any further action.

Attachements

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This areas displays all the documents that have been attached to the email.

Send

Send the E-Mail.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

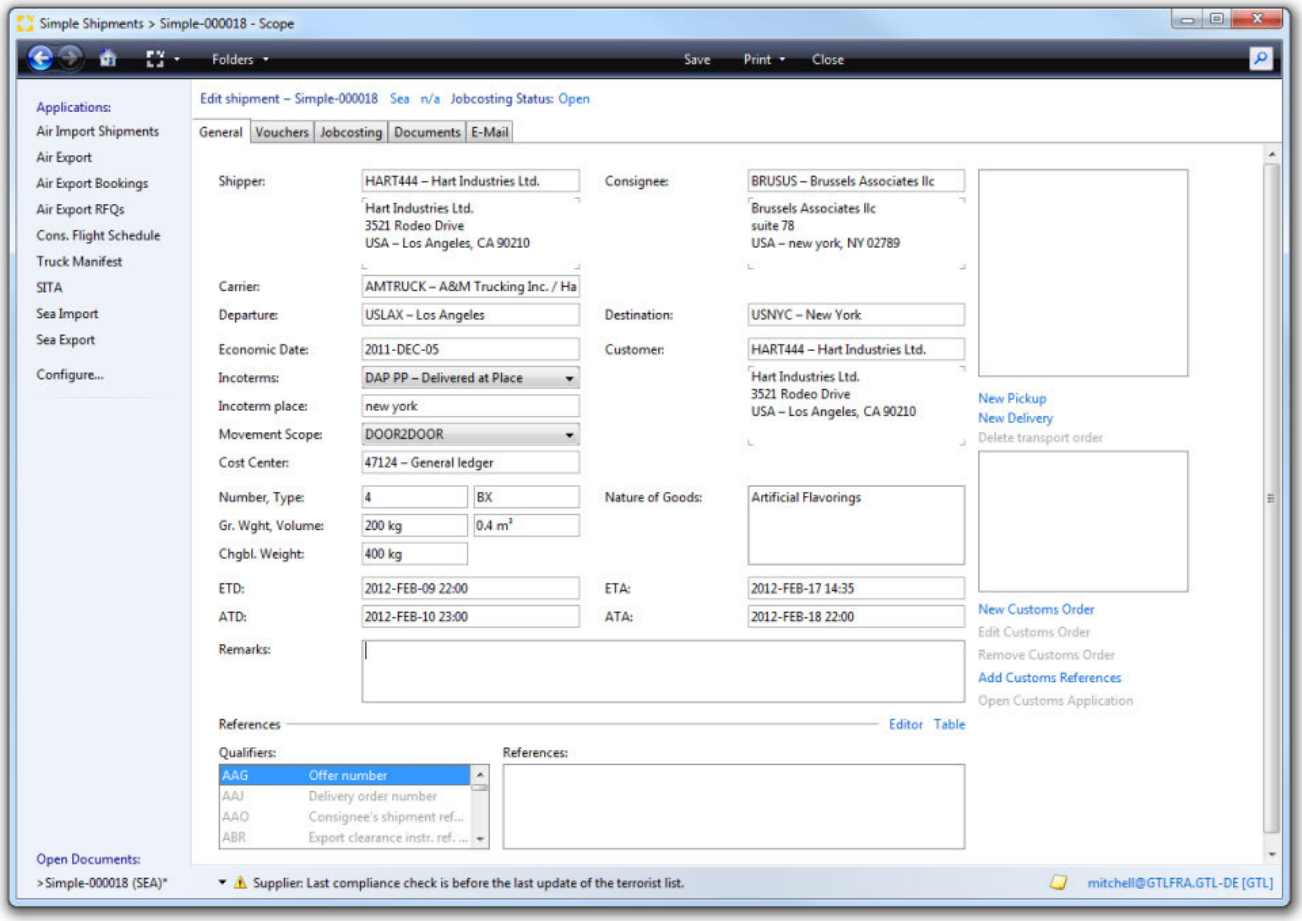
General - Simple Shipment - Forwarding

- Introduction
- Description

Introduction

The **General** tab records the basic shipment details, the customer, the shipper, the consignee, the transport details, cargo description and references.

Description



Save

The save option will ensure the entered data is stored. Saving is only possible if all required fields are filled and the corresponding validation icons are not present. If this is not the case then an error message will appear in the corresponding display.

Print

By clicking on the appropriate item in the list under the print command, the required documents can be printed.

Currently the following documents are available:

- File cover
- Export Declaration
- CMR..

Close

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Closes the simple shipment. If changes have been made, a dialogue appears requesting confirmation if changes should be saved.

Title Bar

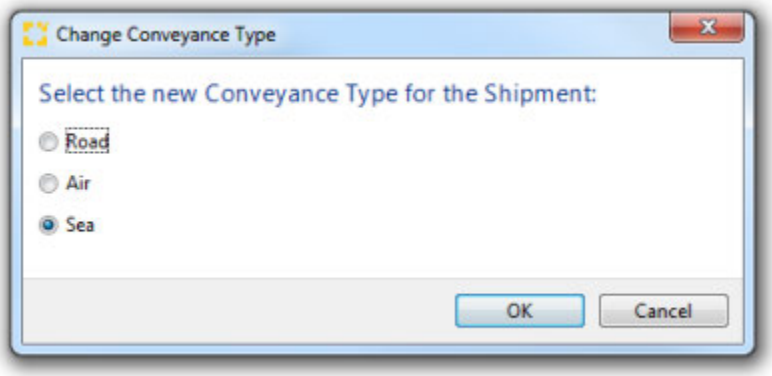
The following information and actions appear in the title bar for a shipment. Blue text indicates that the text has an action link and offers further activities.

Simple Shipment number

Assigned by the system after the shipment has been saved for the first time.

Type of shipment

The type of shipment can be clicked to change the simple shipment to any of the three available types; air, sea or road.



Jobcosting Status

An indication if income and costs on the shipment have been finalized.

Shipper

Shipper of the shipment. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

Consignee

Consignee of the shipment. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

Carrier

The air carrier who transported the goods. This is a full text search field any part of the carrier address may be entered to locate the correct carrier.

Incoterms

The delivery terms for the shipment

Departure

Airport of departure of the shipment. The IATA-Code and the full name of the airport are displayed. Either of these can be entered to launch an automatic [full text search|Full Text Search - Field Types - User Interface - General#feldsuche] that will display all matching airports.

Destination

Airport of destination of the shipment. The IATA-Code and the full name of the airport are displayed. Either of these can be entered to launch an automatic f ull text search that will display all matching airports.

Economic Date

The economic {date | Date and time - Field types - User desktop - General] that should be applied to the system.

Customer

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Generally the customer is the business partner who is responsible for generating the shipment and for the transportation costs. The desired partner may be found with the search field. The drop down menu will open the business partner context menu where amongst other things, a new partner may be created or an existing partner may be edited.

Incoterms

Incoterms identify the costs risks and tasks associated with international transportation of commercial goods. They are 3 letter codes issued by the International Chamber of Commerce (ICC).

The current version of the list is Incoterms 2010. This field is used to record the Incoterms that will be applied to the shipment.

Choose from the following Incoterms using the drop-down menu (click on the arrow):

Incoterm 2010	Description
EXW	Ex Works
FCA	Free Carrier
FAS	Carriage Paid To
FOB	Free on Board
CFR	Cost and Freight
CIF	Cost, Insurance & Freight
CPT	Carriage Paid To
CIP	Carriage and Insurance Paid to
DDP	Delivered Duty Paid
DAP	Delivered at Place

Incoterm Place

The field will default to the city of the shipper or consignee, depending on the Incoterms chosen.

Movement Scope

The type of transport being arranged. These can be selected via the drop-down menu (click on the down-arrow), the following movement orders are available:

Type of order	Description
Door2Door	The shipment is picked up at the customer / plant ("front door") in the exporting country and delivered to the customer / plant ("front door") in the importing country.
Door2Port	The shipment is picked up at the customer / plant ("front door") in the exporting country and transported to the port of loading or port of discharge.
Port2Door	The shipment is received at the port of loading or port of discharge and delivered to the customer / plant ("front door") in the importing country.
Port2Port	The shipment is received at the loading port and transported to the port of discharge.

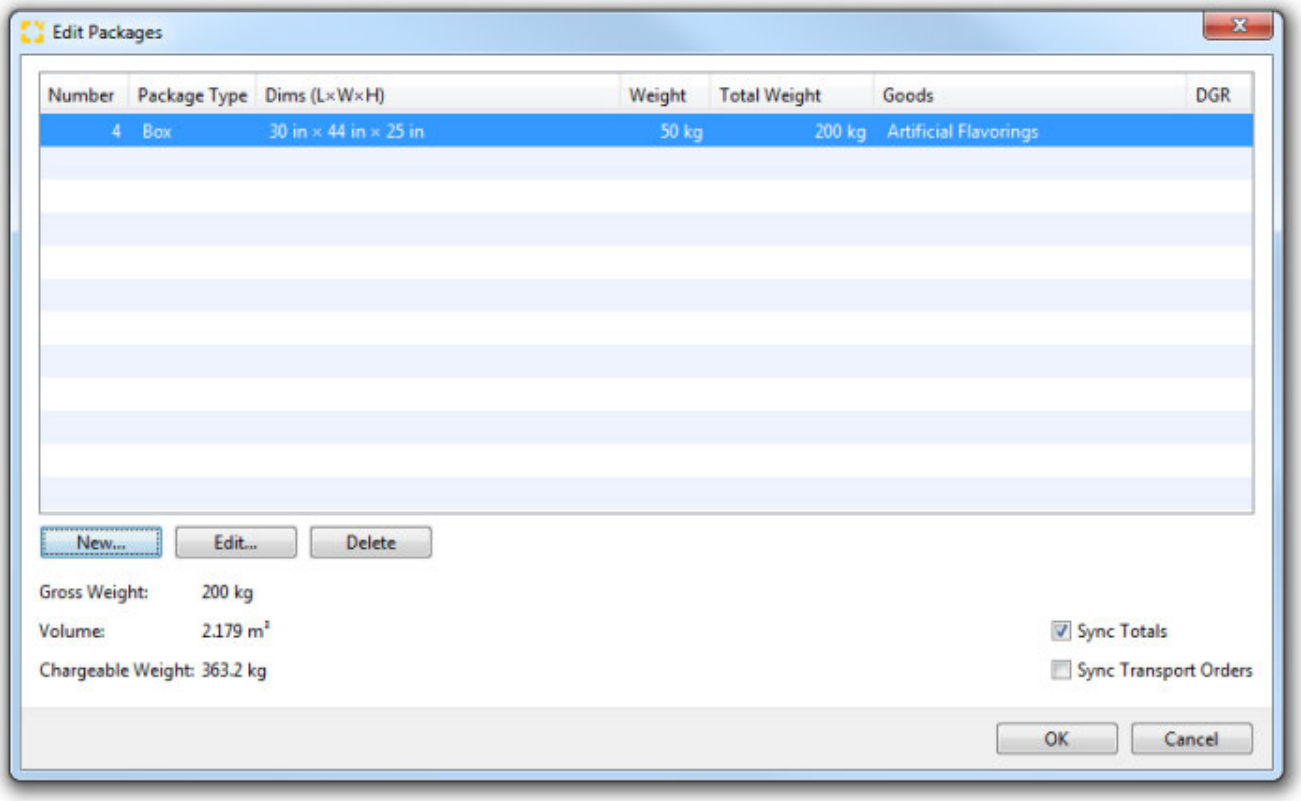
Cost Center

This field will display the cost center that has been determined according to the cost center filter for the current shipment. If no cost center can be determined this field is a full text search field that can be used to select a valid cost center.

Number

Total number of packages in the consignment

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The total number of packages, packaging type, gross weight and volume can be entered at this stage in the appropriate fields starting with the total number of packages. Within the number field, press F3 or select the drop down menu for access to the package editor. The package editor allows much greater detail to be entered about individual packages.

If the package editor has been used to capture details about the packages, then the package fields are disabled and any additions or changes to packages must be made using the package editor. If required, all packages and their details can be removed from the package editor and this will release the package fields in the general shipment entry, allowing package totals to be entered instead of details.

Type (Packing type)

The type of packages used for the cargo. The available packing types are maintained in the master data packing types maintenance program . (If the package editor has been used to enter a variety of packing types, this field is blank.)

Gross weight, volume

Total gross weight and volume of the shipment

Nature of Goods

The description of the goods. It is possible to select from predefined text blocks. If the packages editor has been used to enter multiple descriptions of goods, then these product descriptions will appear in this field as comma separated values)

Chargeable Weight

Total chargeable weight of the shipment.

ETD

Estimated time of departure

ETA

Estimated time of arrival

ATD

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Actual time of departure

ATA

Actual time of arrival

Remarks

A free text area where additional information about the shipment may be recorded.

References

This section records various types of references and the references themselves. These can then be printed or transmitted electronically to other destinations. More information about the function of the references editor is available here.

New Pickup Order / New Delivery Order

These action links will open the transport order editor where pickup notes or delivery orders may be created.

Delete transport order

This option will delete any delivery or pickup note that has already been created. The document highlighted in the pane showing existing delivery/pickup notes will be deleted. It is only possible to delete a pickup note or transport order if it has not been printed and if there are no entries in the costs and revenue section of the shipment.

All transport orders that have been created will be visible in the transport orders window. These may be re-opened by *double clicking* them. They may then be re-edited and printed again if necessary.

New Customs order

Opens a Customs order editor to create a new customs order

Edit Customs order

Opens the customs order editor to edit an existing customs order highlighted in the pane showing customs orders.

Remove Customs order

Remove an existing customs order highlighted in the list of created customs orders.

Add Customs references

Opens the Add Customs references application. Up to 10 additional customs references may be added.

- More information on individual customs applications see the chapter on Customs.

Tip

Use the key combination **Ctrl + I** to see details about the user session including email address and phone number. It is also possible to take over the session from the existing user.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

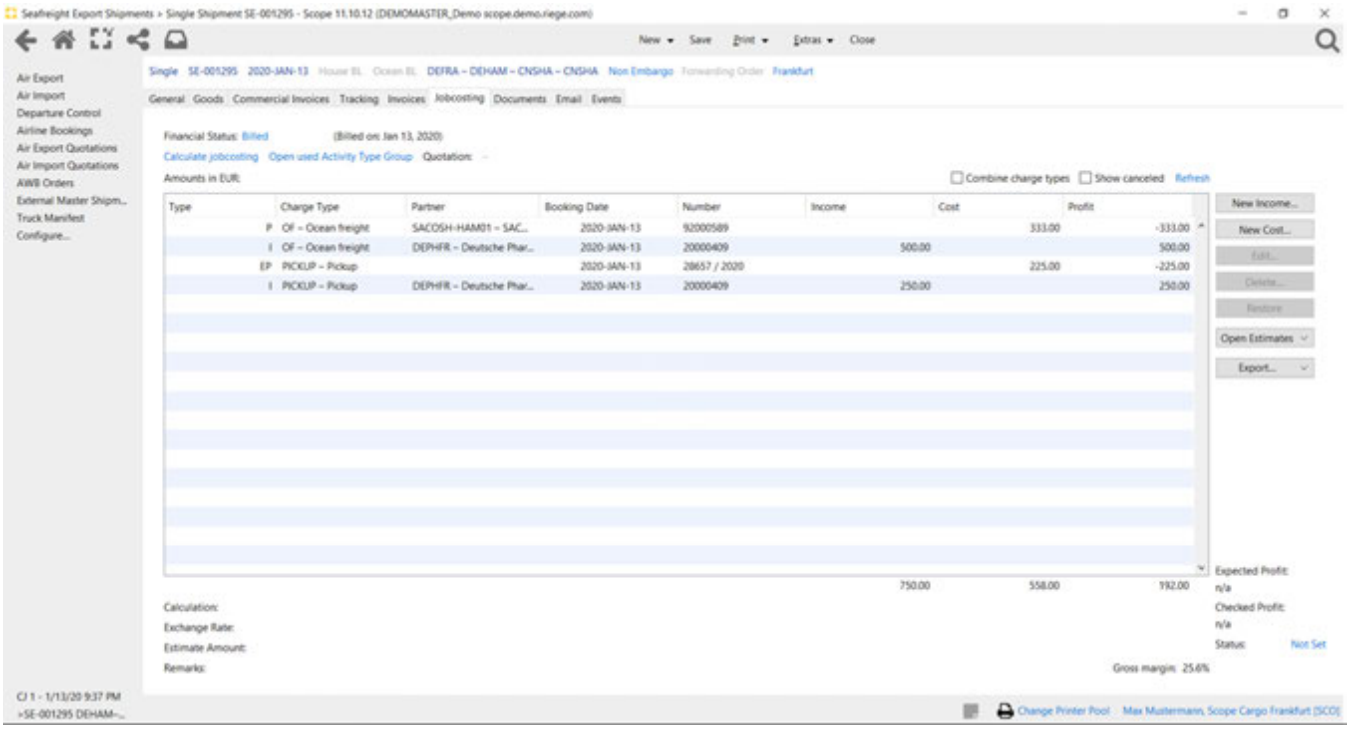
Jobcosting - Simple Shipments - Forwarding

- Introduction
- Description

Introduction

The tab jobcosting displays all costs and revenues. This enables an overview of the profitability of the shipment. Cost and revenue is based on the master data sets; activity type, charge type and tariff rates, and these are applied according to the nature of the shipment for example the Incoterms used and the chargeable weight of the shipment. Jobcosting figures are generated automatically by input of payable vouchers and output of invoices and credit notes (More information is available in the section on Automatic tariffing). Expenditure and revenue accruals may also be manually inserted into job-costing, but it is intended that jobcosting should be largely automated.

Description



Main menu bar and title bar

see General tab

Calculate jobcosting

By clicking on this link, any predefined the action costs and revenues are based on the master data (activity types , master data rate) in connection with the shipment data (Incoterms , chargeable weight generates). In addition, an initial invoice with the relevant cost categories and stored as a draft which tariffs will be applied after the initial account application process, can be printed and completed.

Show Cancelled

Check this box to show cancelled documents. This box is unchecked by default.

Refresh

This link will refresh the list of transactions and include the latest.

New Income

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens charges editor and allows entry of a new income.

New Expense

Opens charges editor and allows entry of a new expense.

Edit

Opens the charges editor and allows the charge highlighted in the overview of charges.

Delete

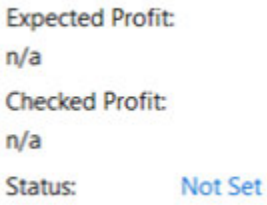
Deletes the charge highlighted in the overview of charges.

Compute Breakdown

The button will recalculate the breakdown of all master to charges to the house shipments on the consolidation. Normally this action occurs automatically, but this button can be used to force the process.

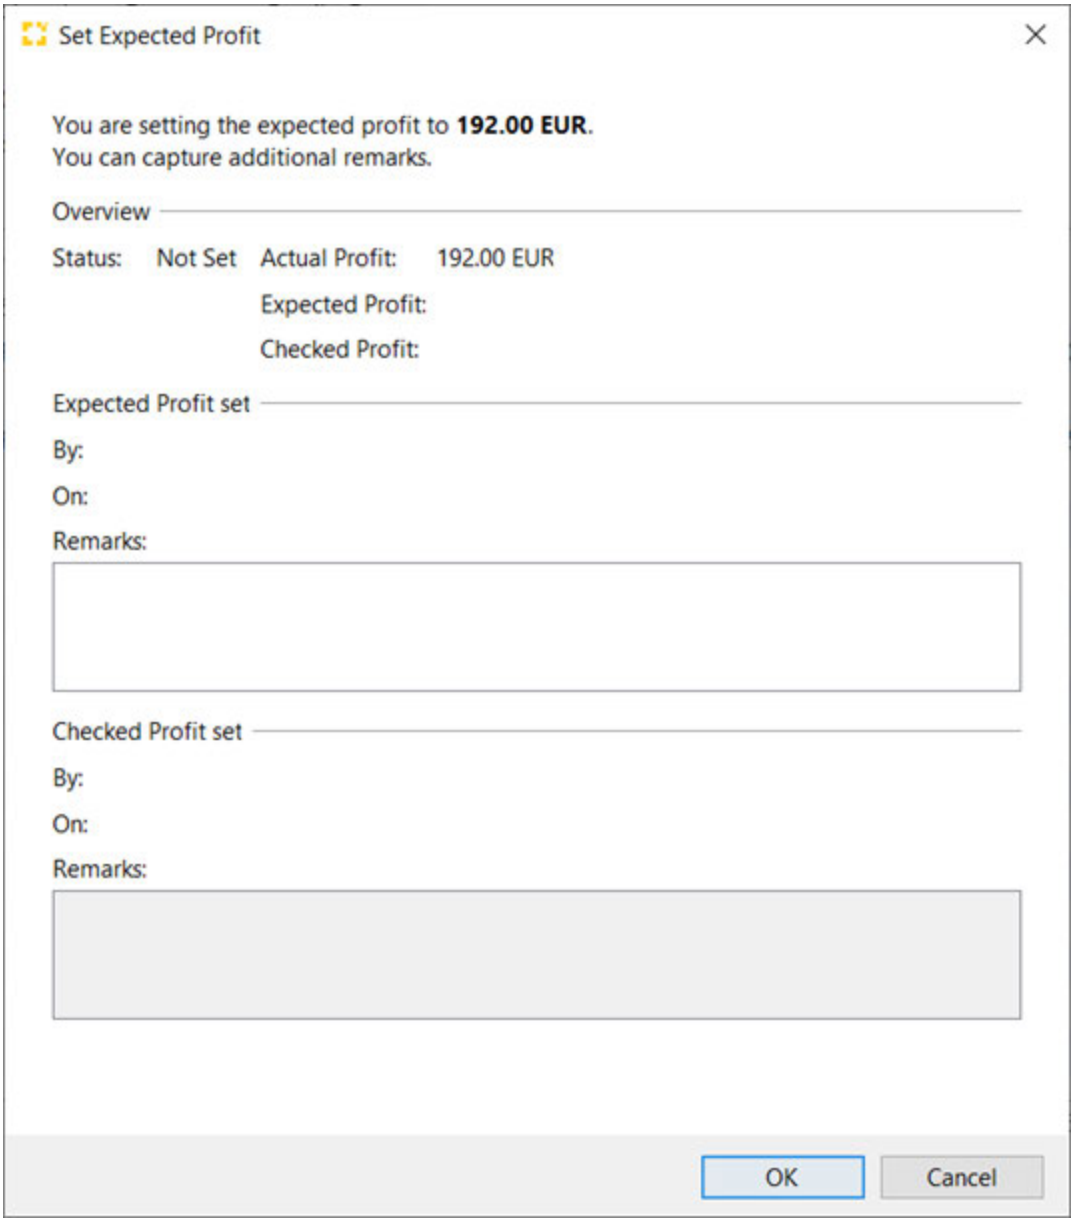
Expected Profit

Set an expected profit



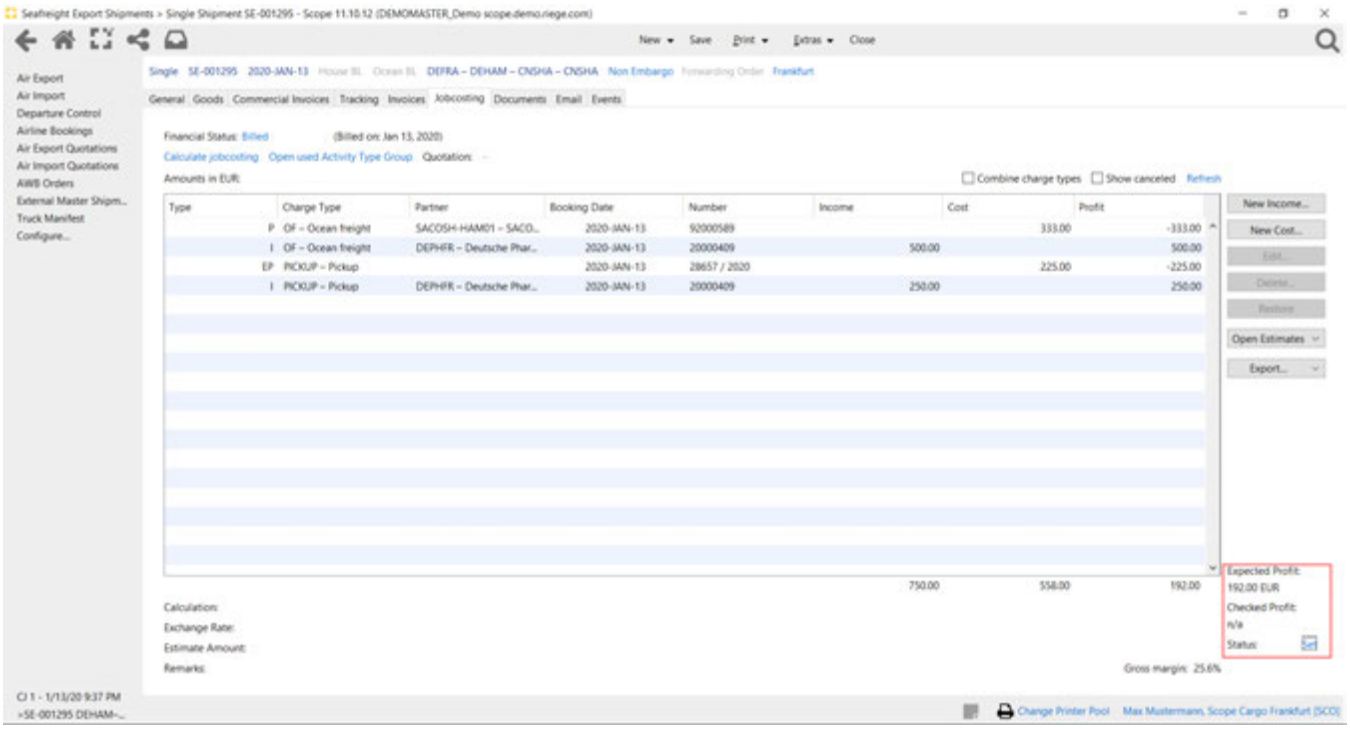
By clicking button "Not Set" a new window opens and the actual profit can be set as expected profit. Previously all expected income and expected costs have to be added to jobcosting.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



After confirming expected profit status changes at jobcosting tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Only certain entries may be edited or deleted. Entries that cannot be edited or deleted can be adjusted here

Turnover in local currency

individual charges are shown in local currency. Double click an entry to open it or highlight the entry and then select the Edit button to open the charges editor.

Type

The type of charge line.

Charge type

Charge type of the current line.

Partner

Partner code of the business partner to whom the charge was applied or from whom the charge was received.

Booking date

The date of the document that contains the charge.

Number

The voucher number for the voucher that contains the charge.

Income

Income or revenue amount.

Cost

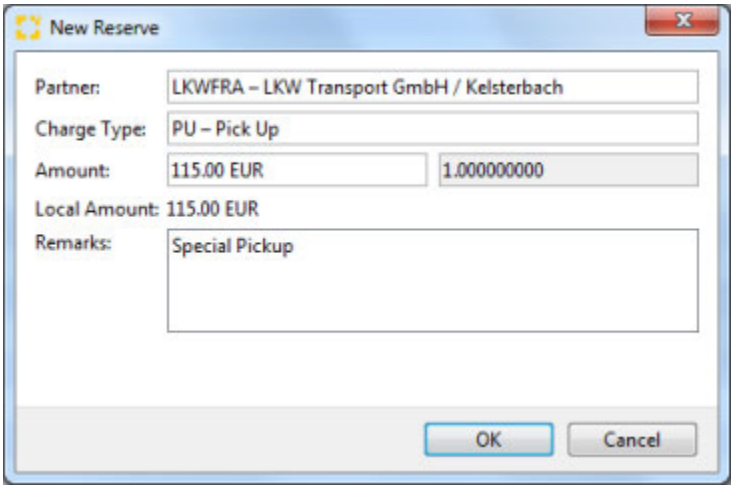
Cost or expenses amount.

Profit

The profit of the line item.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Charges Editor



Partner

The party who billed or received the charge. The partner search function is available to locate a different partner.

Charge Type

Charge type of the item.

Amount, Exchange Rate

the amount of the item in local currency. If in foreign currency an exchange rate is shown.

> In addition to manual adjustment of the value of the item, the field also provided a drop down menu to access an on screen calculator (F3) or refresh of tariffs (F5) to apply any new tariffs to the line item.

Total

The total amount in local currency.

Remarks

Any remarks relevant to the line item may be recorded. Right click to access text blocks .

OK

Store the line item and any changes made.

Cancel

Exits the application without any changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

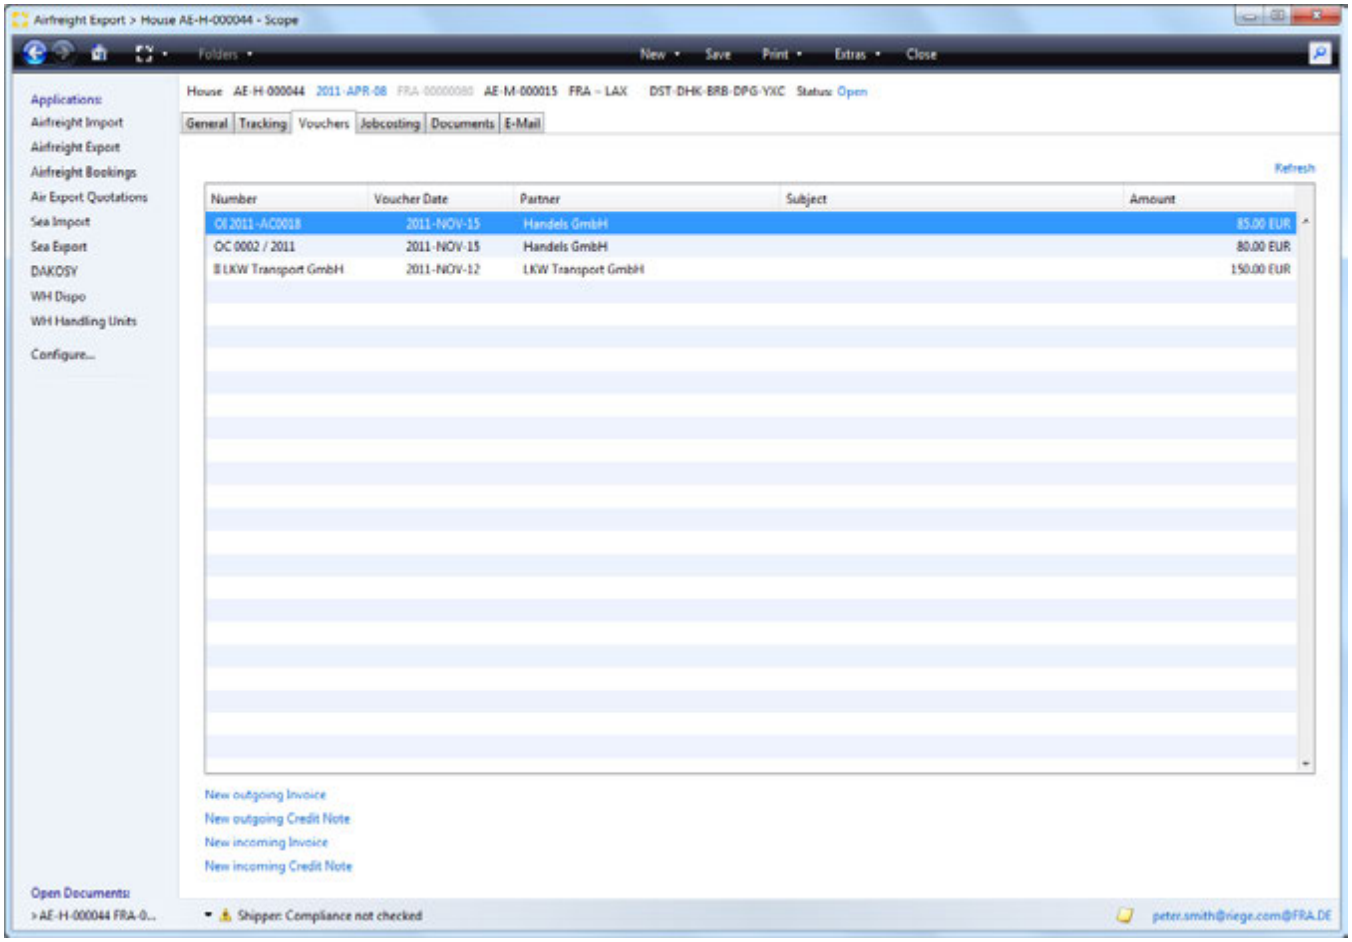
Vouchers - Simple Shipments - Forwarding

- Introduction
- Description

Introduction

For all shipments and orders, the **voucher** tab displays all billings associated with the job. Single outgoing and incoming invoices or credit notes can be created or opened for further editing. This allows quick and simple access to the shipment related accounting.

Description



Main menu bar and title bar

see Tab **General**

AGS

- Introduction
- Description

Introduction

This section of the manual describes the implementation of AGS (NL Customs new system "AanGifteSysteem"). AGS is the Customs system, implemented by NL Customs from 2013, 2014 onwards for all storage, export and import declarations, including periodical declarations (pending).

Attached is a Power-point slide show recapping the key elements of AGS Imports

Description

AGS supports both the import and export stream and are running in the same application but have their own declaration entry and permission set.

AGS Imports Description

AGS Exports Description

AGS Supplemental Information

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

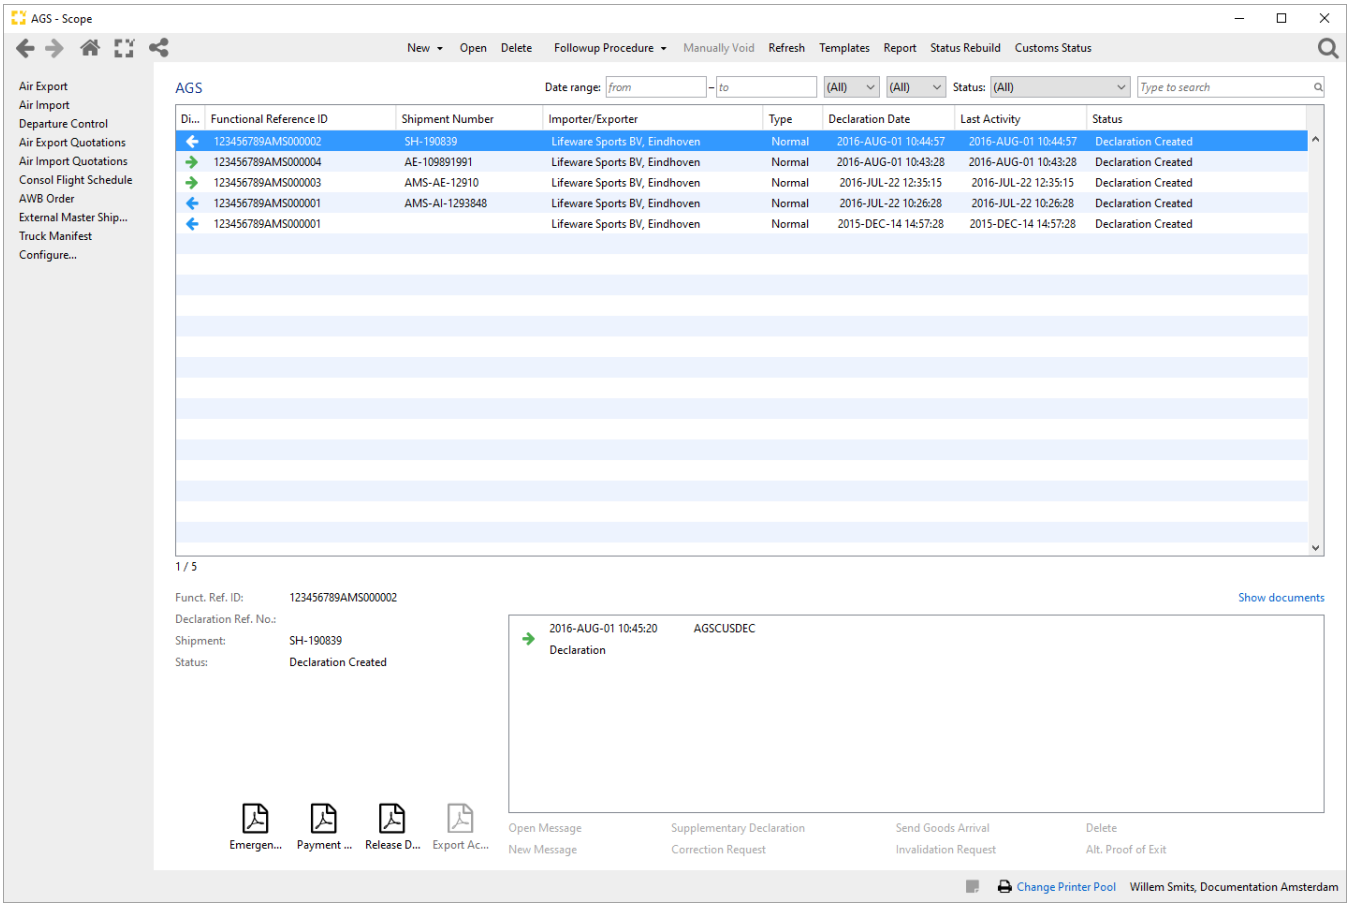
AGS - Homeview

- Introduction
- Description

Introduction

Description

The General overview of AGS is started via the path NL Customs \ AGS.



Application Actions

New

Option to create a stand-alone new AGS declaration not linked to a shipment.

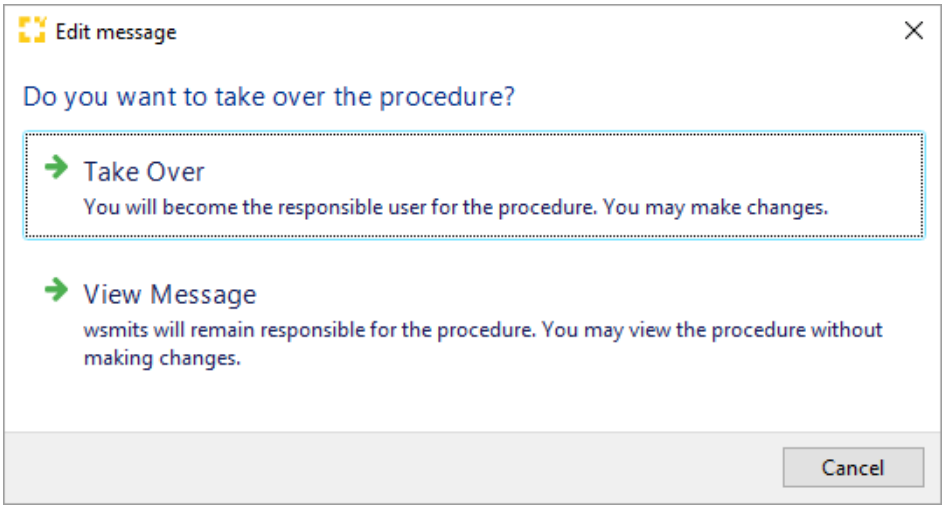
AGS Export : Create an AGS Export declaration
AGS Import : Create an AGS import declaration

Depending on the permissions you will see only one or both types, if you do not have permission to create either an AGS export declaration or import declaration they will be hidden from you view.

Open

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens the selected AGS declaration depending on the status of the declaration in write enable modes or display only.
If the declaration is in write enabled status but the user was not last user to update the declaration, a question will be asked whether the user wants to edit, and so take over responsibility of the declaration,
or only open the declaration in read only modes for review without taking over the responsibility.

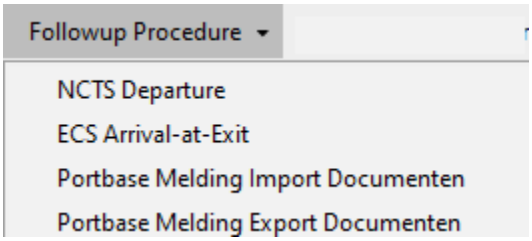


Delete

Allows the delete of a AGS declaration, this option will only be available for AGS declaration with the status "Declaration Created".
In other cases the declaration can not be deleted and has not yet been preceded by a rejection message

Followup Procedure

With this option the details of the selected AGS declaration can be re-used to create a applicable following procedure.
If the follow-up module is available.



AGS Imports

- Portbase Melding Import Documenten: Notification to the container terminal regarding the customs document (AGS imports) with which a container will be retrieved from the terminal.

AGS Exports

- Portbase Melding Export Documenten: Notification to the container terminal regarding the customs document (AGS exports) and booking number with which a container will be delivered to the terminal
- NCTS Departure : NCTS Produce used to the a virtuel "Exit from EU" triggering the Confirmation of Exit on the AGS Export shipment
- ECS Arrival at Exit : ECS Procedure to notify NL Customs about the fact that a Export shipment has arrived at the last warehouse before leaving the EU

Manually Void

Option to give declarations which are not finished, hanging on send due to NL customs communications disruption or error, a Manual void status in order to filter out these declarations from the regular views,
a reason for setting this status is required.

Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

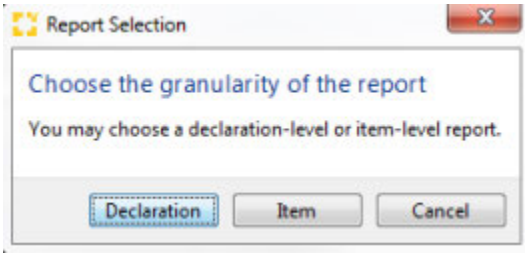
Option to refresh the homeview to ensure the latest information is displayed.

Templates

Changes the homeview from actual declarations to an view of existing templates with the option to create new or modify existing templates.

Report

option which allows to export the details of the declarations which meet the active filter criteria



The report can be produced either:

- one line per declaration and all items details consolidated, in the linked sample all exported fields are shown,
- one line per item of each declaration, in the linked sample all exported fields are shown.

Search & filter

in the search and filter bar AGS declarations can be filtered and searched for with the following options.

Date range (from / to)

Filter declarations where the create or accepted date of the declaration is within the entered date range.

Direction

Filter between Import, export or all declarations,

Type

Filter Declaration on basis of the declaration method

description
Normal Import Declarations
Temporary Imports
Storage(imports)
Normal Export declarations
Storage (exports)
Re-Exportation
Outward Processing

Search Box

Search box to filter declarations on entered details. The search box allow searching (filtering) on de the following items

- Shipment number
- Importer Partner
- Exporter Partner
- User id (responsible user)
- Article code
- Consignee
- HS Code
- VAT number - OB responsible

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Homeview Columns

In the homeview columns the following columns can be displayed

Functional refererence ID

The functional reference Id is the indentification assigned by Scope to the declaration. this is a unqiue number for the Netherlands and consists of the following logic

Position	Details
1 - 9	LRN number from the Branch Partner License Holder Role
10-16	The branch code
17-22	6 digit counter

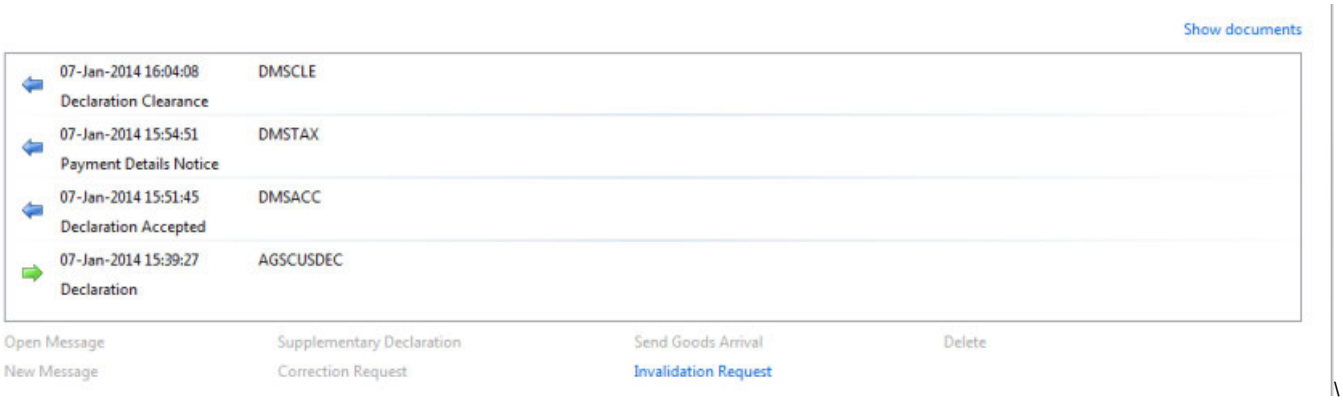
Release document	Release document with all details of the declaration,Note: There is no official NL customs Layout and application is free to create own layout, untill NL customs has decided upon a official layout this is the layout Scope will be using.	AGSRelease.pdf
Export EAD	Export Accompany document	AGS-EAD-SAMPLE.pdf

Message

In the messages box a chronological overview of all incoming and outgoing message are displayed



Action Links

Under the message are shown the available action links, if an action link is enabled or disabled depends on the state of the declaration and if a message is selected.

Action link	Module	Active	description
Open Message	Import /Export	Whenever a message has been selected	opens the declaration message related to the selected message.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

New Message	Import /Export	When on the last outgoing message (regardless of the type) an rejection has been received	Allows modification and sending of a new message
Supplementary Declaration	Import /Export	When a declaration with method set to "B" is in the correct state (Goods released)	Allow creation and sending of the supplementary details on a incomplete declaration
Correction	Import /Export	When a declaration is in the correct state to allow corrections. Status must be higher then "Accepted" but lower then "Cleared"	Allow creation and sending of the correction on the declaration.
Send Goods Arrival	Import /Export	When a declaration with method set to "B" is in the correct state (Pre-declaration received)	Allow creation and sending of the Goods Arrival Message
Delete	Import /Export	When a Correction or Invalidation Request, Supplemental declaration or Goods Arrival has been created but not send	Allow the deletion of the created additional message and return the declaration to the previous state of the original declaration
Alt	Export	When the message "DMSGER" notification has been received	Send information about alternative proof available showing actual export from the EU if the normal ECS procedure was not followed, found by NL Customs

AGS Export

- Introduction
- Description

Introduction

This section of the manual describes the implementation of AGS Export declarations.

Description

This section described the general flow, business logic and declaration status of AGS Exports declarations.

General Business rules.

Declarant / Importer logic (AGS3)

In AGS the roles of Partners consist of the following Roles:

Exporter : Partner, who is legally Responsible for the information in the Declaration.
Declarant: Partner, who is financially responsible for the declaration
Customs Agent: Partner, who is doing the actual creation and sending of the message.

Partner Validation and defaulting Schema

From Shipment Defaulting

Consignee Declaration	exporter
Has no NL customs Partner Role	Empty, the NL customs Partner Role is mandatory for the partner used as exporter. This has been decided to ensure a record of DV is created.
Has NL customs Partner with "acts as exporter" active	The consignee Partner
Has NL customs Partner with different partner as exporter	The exporter Partner from the consignee

Validation

Exporter Partner setup	RS in the declaration	allowed	Action
no NL customs Partner Role	1,2 or 3	✗	Update or creation of the NL customs Partner Role required
NL customs Partner Role without exporter setting,	1,2,3,	✗	Update of the NL customs Partner Role required
NL customs Partner Role with RS 1	1	✓	
NL customs Partner Role with RS 2	2	✓	
NL customs Partner Role with RS 2	3	✗	RS code in de Partner setting must be equal to the RS code in the declaration
NL customs Partner Role with RS 3	2	✗	RS code in de Partner setting must be equal to the RS code in the declaration

Actually Send in the message

RS in Declaration	Declarant	Agent	Exporter
1	✓	✗	✓
2	✓	✓	✓
3	✓	✓	✓

Definition of "Aangever"

Aangever http://www.belastingdienst.nl/bibliotheek/handboeken/html/boeken/HD/toepassingsgebied_en_basisdefinities-de_douanewetgeving_omvang_en_begrippen.html#HD-d117e672

Onder "aangever" verstaat het CDW de persoon die op eigen naam aangifte doet of in wiens naam een aangifte gedaan wordt (de zogenaamde directe vertegenwoordiging, zie ook onderdeel 2.00.00, paragraaf 2.2.1 van dit Handboek).

Wie mag als aangever optreden? Dit kan iedere persoon zijn die de goederen bij de douane aan kan brengen (zie voor het begrip "aanbrengen" hierna) of kan laten aanbrengen en alle bescheiden kan overleggen die voor de toepassing van de betreffende regeling zijn voorgeschreven. Dat wil dus zeggen ieder die de (juridische of feitelijke) beschikkingsmacht over de goederen heeft. (artikel 64 CDW)

Statistical Value Calculation

Under AGS the statistical value should be transmitted to NL Customs, Scope is able to calculate the Statistical Value
On basis of the Commodity value, inco terms and possible freight details.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

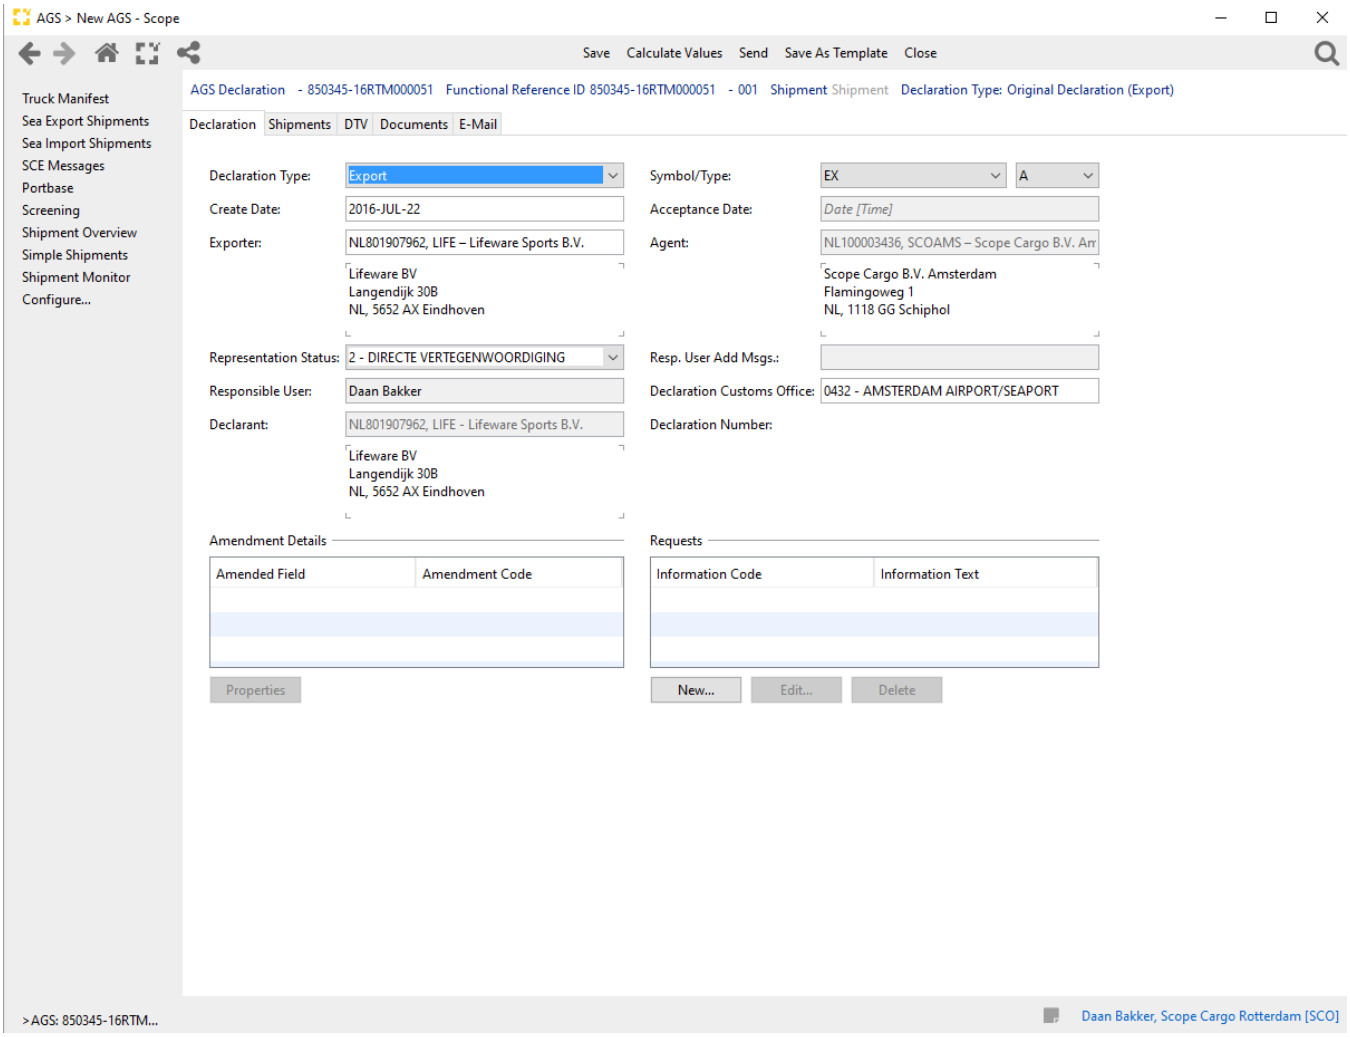
AGS Export - Declaration (original)

- Introduction
- Description

Introduction

In this entry an AGS Export declaration is prepared and send to customs ,to register Free EU goods to be exported outside the EU.

Description



Declaration Type

The declaration Type determines the set of allowed "Requested Regulation"

Declaration type (EN)		Declaration type (NL)	Allowed Symbol	Allowed regulations	Matrix (Apendix 37 - CDW)
Export	Normal	Normaal	EX, EU, CO	10,11,23	A
Export	Storage	Opslag	EX, EU, CO	76,77	B
Export	Re-exportation	Wederuitvoer	EX, EU, CO	31,	C/D
Export	Outward processing	Passieve veredeling	EX, EU, CO	21,22	E

Symbol

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The symbol of the declaration (EX, EU,CO)

Type

The type / method of the declaration

code	description
A	Normal declarations
B	Incomplete declarations
D	Pre-arrival declaration
E	Incomplete - pre-arrival declaration
Y	Afterwards declarations (used after emergency procedure) or selected Venue declarations

Create Date

The date the declaration is created will be defaulted with today.

Acceptance Date

Date when NL customs accepted the original declaration. This field is enabled and mandatory when the type is set to "Y/afterwards declaration".

Exporter

Partner for whom the export declaration is created. See the separate section where the logic of a exporter is described.

Agent

The partner mentioned in the field AGS Export Declarant of the branch Partner's NL Customs License Holder role.
Field is disabled and will be defaulted by the system as described.

Representation Status

The representation status of the declaration.

Resp. User Add. Message

Auditing field in which the last user who changed / sent an additional message is registered.

Responsible User

Auditing field in which the last user who changed / sent the declaration is registered.

Declaration Customs Office

The Customs office where the declaration will be handled

Declarant

The financially / legally responsible partner of the declaration. See the separate section where the logic of a exporter is described.

Requests

Enter requests: At this moment the only request possible is the "C1" request for an extended period of incomplete declarations.

Information Code

Select the appropriate code.

Information Text

Enter applicable details, in case of C1 mention the extended period in weeks with a maximum of 12.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

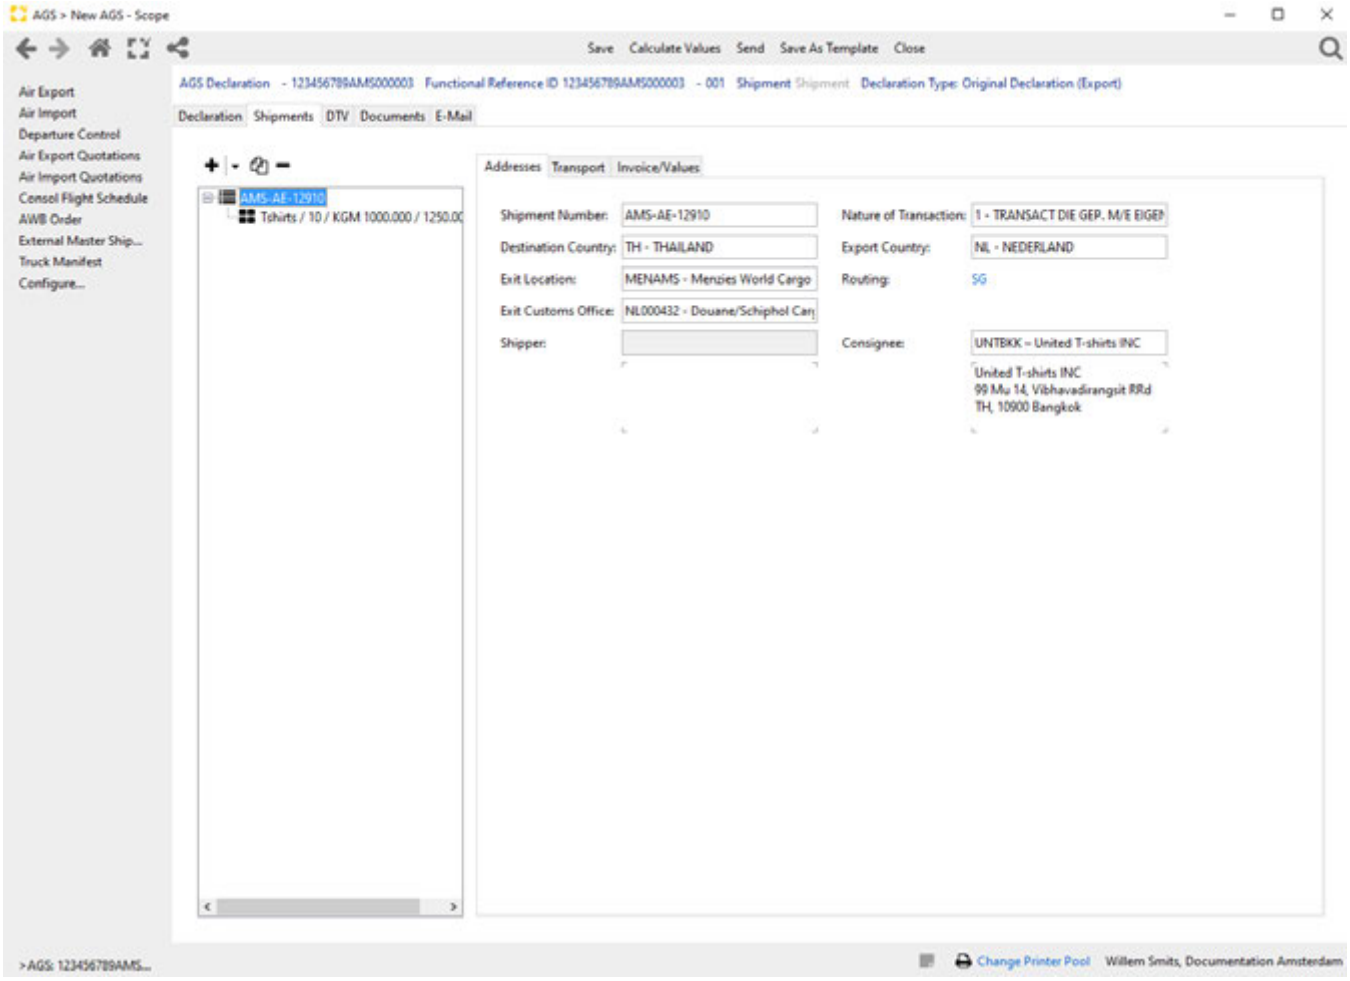
AGS Export - Declaration - Shipments - Addresses

- Introduction
- Description

Introduction

In the shipments section of an AGS declaration the details regarding the actual shipment and involved partners are registered. AGS in principle supports multiple shipments under one declaration. However, this is not yet supported by EU - UCC Customs laws. Until that time the option to add multiple shipments will stay disabled.

Description



Shipment number Reference

The shipment reference number which will be transmitted to AGS the defaulting rules are set by the configurarion in the role NL Customs License Holder of branch partner

Nature of Transaction

Nature of transaction code, indicating the financial transaction linked to the goods (Customs code list A22)

Destination country

Final destination country code where the export is going to

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Export Country

The code for the EU country where the transport originates from

Exit Location

NL Customs goods location where the goods will be loaded / depart from the EU

Exit Customs Office

The Customs office where the export declaration will be handled for actual exportation (ECS)

Shipper

The actual shipper of the shipment is not used/mentioned in the AGS export declaration

Consignee

The receiver of the goods as indicated in the transport documentation.

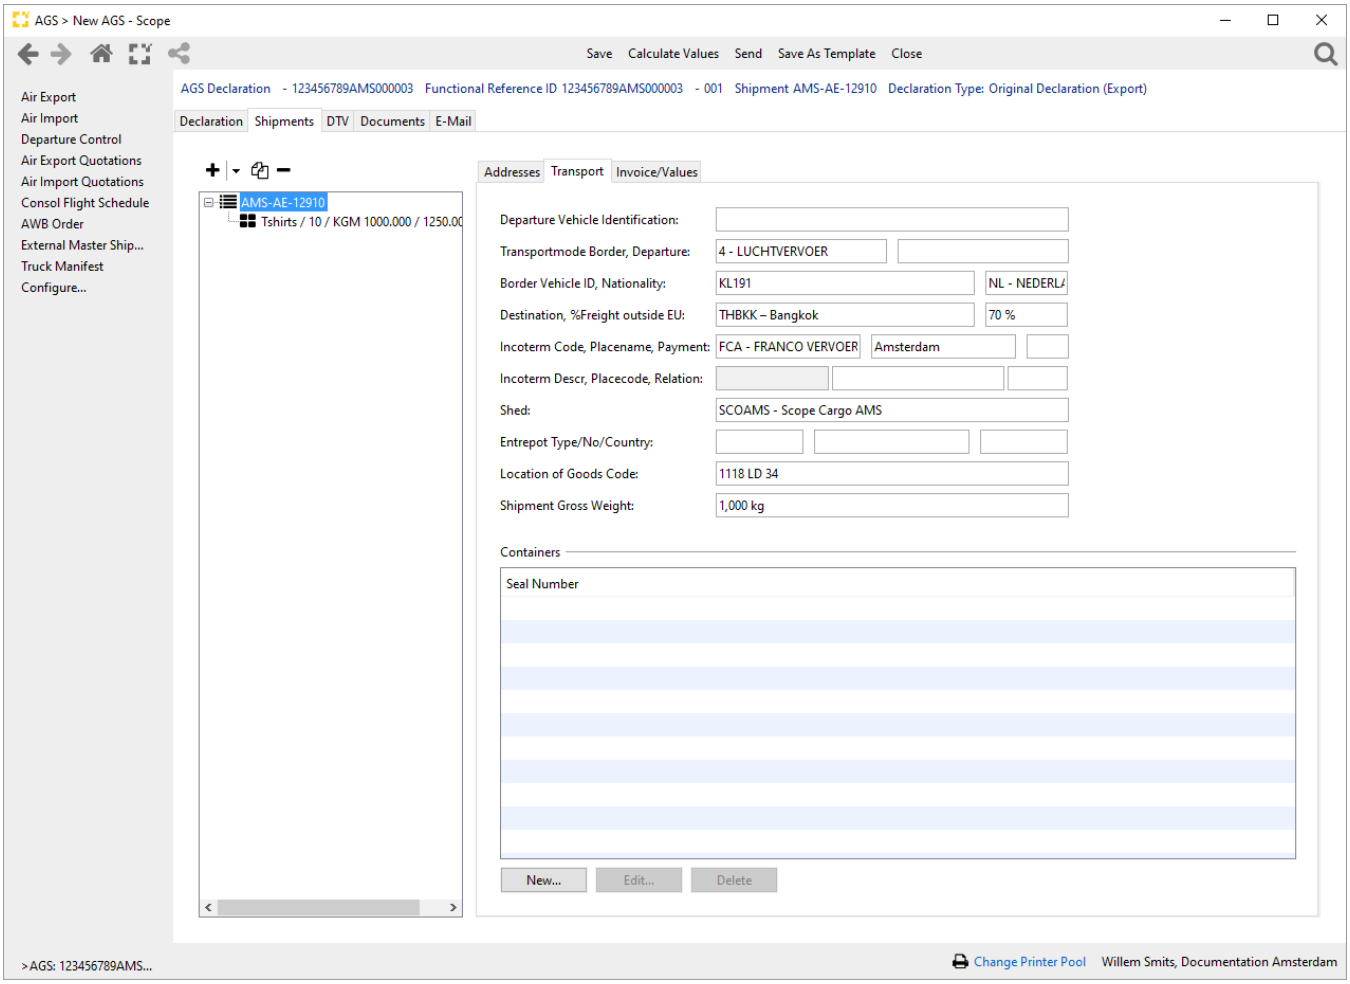
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Export - Declaration - Shipments - Transport

- Introduction
- Description

Introduction

Description



Departure Vehicle Identification

Identification of the transport means in which the goods depart from the declaration's location

Transport Mode Border

The coded type of transport means in which the goods will cross the EU border

Transport Mode Departure

The coded type of transport means in which the goods will depart from the clearance location.

Border Vehicle Nationality

The nationality of the transport means in which the goods will cross the EU border

Origin, %freight Outside EU

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The destination code (IATA airport code) to determine the applicable airfreight discount percentage

Incoterms

The Incoterms under which the goods have been sold, shipped.

Code

The Incoterms code as listed in the code list

Place

The place name corresponding with the Incoterms, most commonly used in declarations.

Description

Textual description of the Incoterms applicable, only enabled when the code is set to XXX

Place Code

The UNLO-code for the place applicable on the Incoterms, either the name or the code is used, not both together

Relation

The relation between the entered place name / place code and the location where the declaration is done, this field is optional.

Shed

The partner where the goods are stored at the moment of the declaration, the actual AGS details are defaulted from this partner.

Entrepot Details

The entrepot (Custom warehouse details) where the goods are stored, these details are listed below, the entrepot details must be correct since they are validated in AGS and should only be used if the previous regulation requested equals 71 or 78.

- Entrepot Type
- Number
- Country code

Location of Goods Code

The textual description of the location where the goods declared are located at the time of Customs clearance, validated formatting by Customs:
9999 XX 99999 XXXXXXX

Position	Value
1 - 4	Digits of the postal code
5	space
6 - 7	Letters of the postal code
8	space
9 - 13	Digits of the house number (no letters)
14	space
15 - 35	Additional information

Shipment Gross Weight

Total gross weight of the shipment, this is validated against the sum of the gross weight of the individual items

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Container / Seal Grid

List of seal numbers used on the containers to seal them after loading

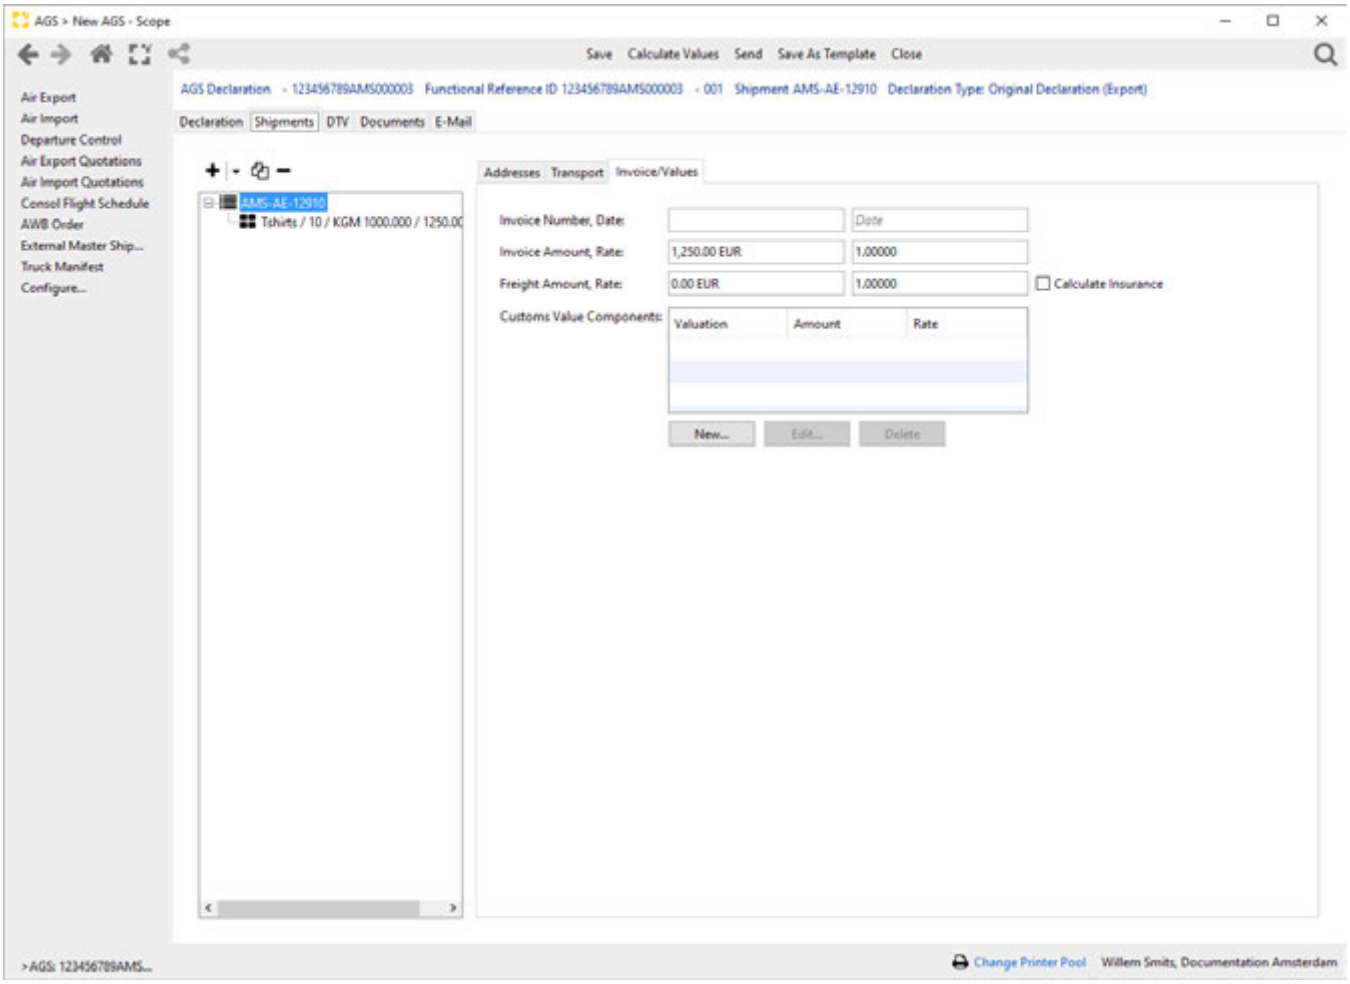
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Export - Declaration - Shipments - Invoice Values

- Introduction
- Description

Introduction

On the tab "Invoice/values" the financial details of the whole shipment are registered and will be used as the base amounts for calculation the values on item level



Description

Invoice number

The invoice number of the commercial invoice, which uniquely belongs to the shipment covered in the declaration, mandatory in case (use DV1 is active) where NL Customs should calculate the customs value else it should remain empty.

invoice date

The invoice issue date of the commercial invoice, which uniquely belongs to the shipment covered in the declaration, mandatory in case where NL Customs should calculate the customs value else it should remain empty.

Invoice Amount

The invoice amount applicable for the whole declaration, the full amount will be validated against the sum the commodity value of the items.

Invoice Exchange rate

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Applicable exchange rate for the entered currency value, The exchange rate is determined by NL customs and will be updated in Scope automatically through a system background process.

Freight Amount

The total freight amount applicable for the whole declaration, not adjusted for the discount

Freight Amount exchange rate

Applicable exchange rate for the entered currency value

Calculate insurance

Flag to indicate whether of not insurance should be calculated, the status of the flag will be determined by Scope on basis of the selected inco-term.

Customs value components

Additional components which influence the customs value of the items, the components can be entered on shipment level to be prorated down to individual items,

Value adjustment Code

Drop-down list with the available codes, as per customs code list A11

Value adjustment amount

The applicable amount for the selected value adjustment codes, in case of freight amount this will reflect the full freight amount adjusted against the applicable freight discount percentage.

Value adjustment rate

Applicable exchange rate for the entered currency value

System calculated values

The application will calculate the following values automatically when the "calculate values" option is used.

Code	What	How
VK	The freight charge part calculated on basis if the discount value when the incoterm used dictate that freight cost should be added.	Freight Amount * (100% - %freight outside EU)
VZ	The Insurance charge, if the flag "Calculate insurance" is active and on the NL customs partner Role of the importer a Percentage is entered	SUM(invoice amount + calculated freight amount (VK)) * Insurance percentage.

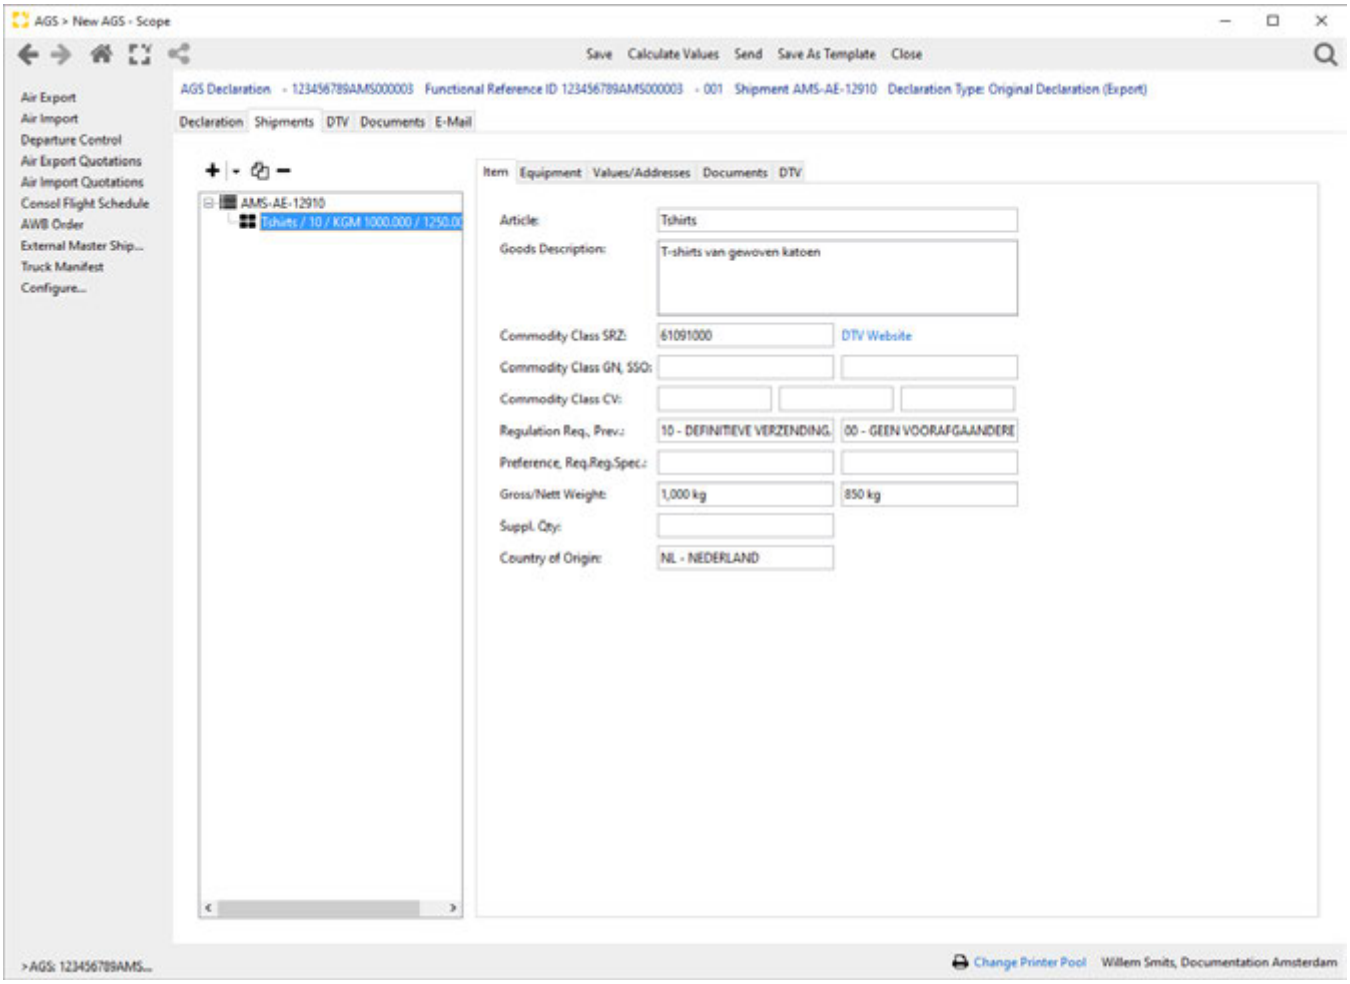
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Export - Declaration - Shipments - Items - Item

- Introduction
- Description

Introduction

In the items section the details per declared goods item are entered. In AGS declarations a maximum of 99 items per declaration is applicable.
In the item tab of the items, the item declared will be specified.



Description

Article

Optional selection of a master data article and the corresponding defaulting
This field also allows to enter a new article code and store it in Article Maintenance.
Save actions when available will be indicated by a icon.

Goods Description

The textual description of the goods, defaulted from Article Maintenance, if an article is used.

Commodity Class SRZ

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The goods classification code (EU) applicable in AGS, minimum length 8 positions, maximum length 18 positions, replaces the old HS number from Sagitta.
The new NL customs website for the SRZ numbers is DTV (tarief.douane.nl/tariff/index.jsf)

Commodity Class GN

The commodity class GN indicates national regulations for the item and specifications can be found at DTV (tarief.douane.nl/tariff/index.jsf)

Commodity Class SSO

Specification of the UNDG code

Commodity Class CV

Specification for Category / Item number as published, linked to import and/or export licenses (CDIU)

Requested Regulation

The requested regulation under which the declaration is done, only displayed here, actual value set on declaration level.

Previous regulation

The code for the previous customs regulation, will determine whether the entrepot details are mandatory (71,78) or to be left empty (00)

Exemption Regulation

The possible exemption regulations applicable on the item declared.

Gross Weight

Gross weight for the item, will be defaulted by the total gross weight registered on the declaration of the first item and on additional items by the remainder of the gross weight.

Nett Weight

Nett weight for the item, can be defaulted as 85% of the entered gross weight.

Supplemental Quantity

The supplemental quantity of the item, if required for the selected commodity classification code SRZ.

Country of Origin

The country of origin applicable for the goods declared

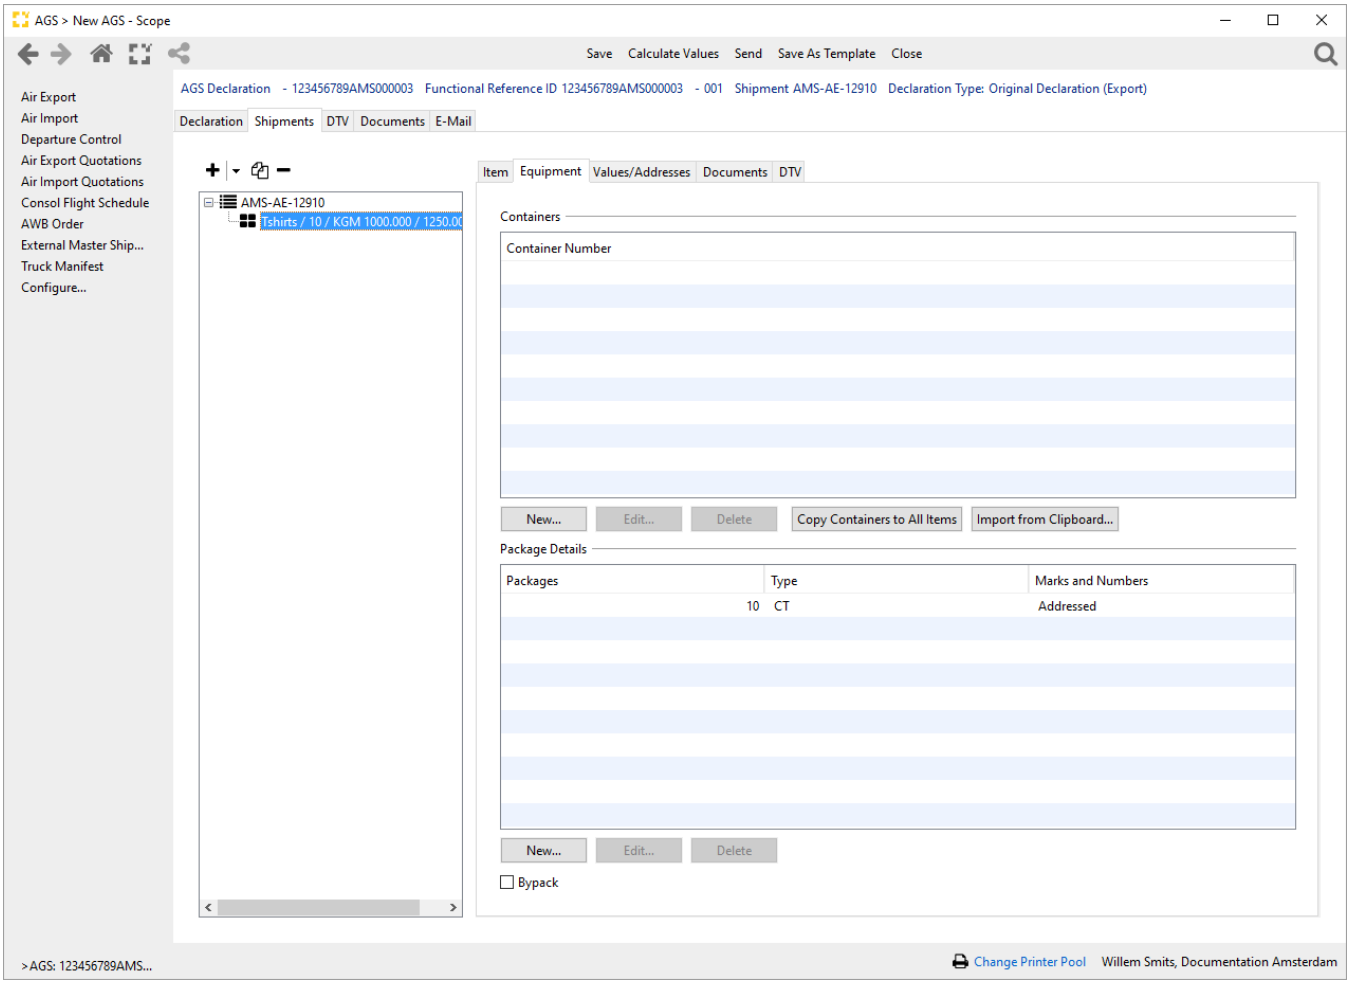
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Export - Declaration - Shipments - Items - Equipment

- Introduction
- Description

Introduction

On tab Equipment, the details of the used equipment, containers and packaging information are registered.



Description

Containers

Grid where the applicable container numbers are registered. The total number of container to be registered in AGS per declaration is 99.

New

Add a container number

Edit

Change a container number

Delete

Delete a container number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copy Container to All items

Option to copy all container numbers to all items, should it be required as such

Import from Clipboard

Using the option import from clipboard allows to copy container numbers from workstation clipboard.

This option will check whether there are container details in the active windows clipboard (CTRL-C) and if so paste them in the grid.
The format of the clipboard details should be:
<container number> as per below sample

Sample Clipboard Value

AMZU4973612
TCKU3053279
TCLU5860678
YMLU8754628
SUDU6512934
HJCU8423064
SUDU5807355

Packaging Details

The packaging details of the specific item with the following details

Packaging Type	Codes
Unpacked	All packaging type codes starting with N
Bulk	All packaging type codes starting with V
Packed	All other packaging type codes

Number of Packages

Total number of packages applicable for the selected item, a mandatory value for packed cargo.

Type of Packages

Code to indicate the type of packaging

Marks and Numbers

Identifying markings on packaged goods, a mandatory value for packed cargo.

Multiple Goods Identification Codes in One Package (OMIH)

If multiple Customs goods identification codes (HS codes, commodity classification details) are combined in a package, you can mention the number and type of packages on the first item of your AGS import declaration. On all other items of the declaration you can check "OMIH/BYPACK" option (OMIH = onder meer inhoudende). This will disable the packaging details for manual editing and generate the packaging line according to NL Customs specification.

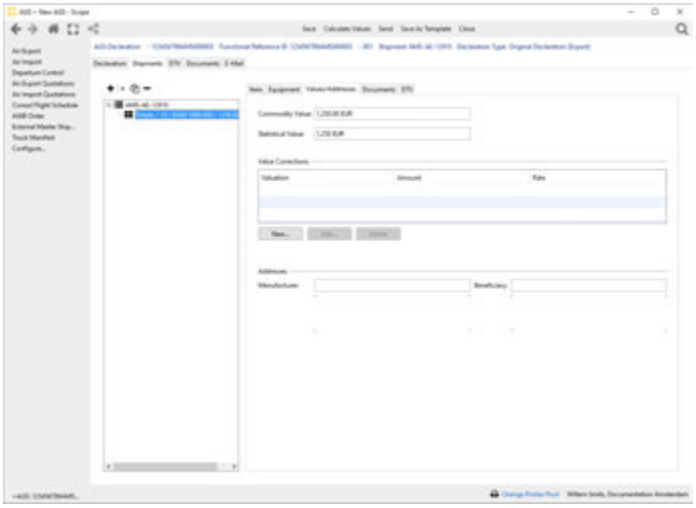
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Export - Declaration - Shipments - Items - Values

- Introduction
- Description

Introduction

The monetary specification for 1 single item within a declaration.



Description

Commodity Value

The value of the goods specified in the item.

Statistical Value

Statistical value applicable for the item, calculated by Scope as the FOB/FCA EU border value of the goods.

More details regarding customs values etc. can be found in the Customs manual (Handboek Douane).

Value Correction

Value correction items influence the calculation of the Customs value. Below overview comes from Customs code list A11, adding in the last column the impact on the Customs
value calculation. Only the items VK, KN and VZ are also dependent of the applicable Incoterms.

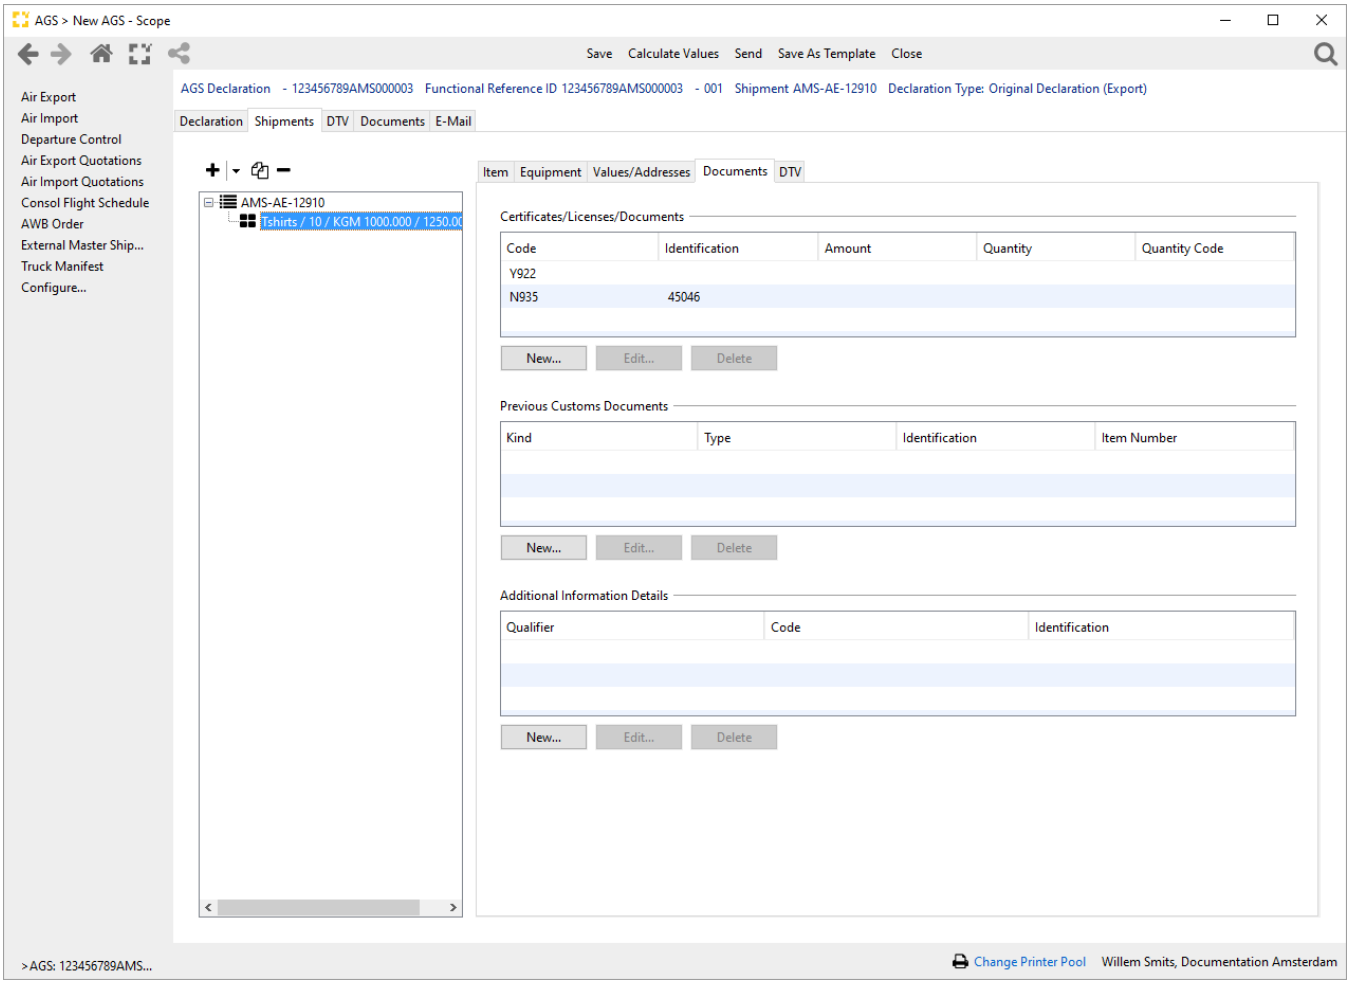
AGS Export - Declaration - Shipments - Items - Documents

- Introduction
- Description

Introduction

On the documents tab of the AGS declaration, all applicable regulations, preceding documents and certificates are registered.

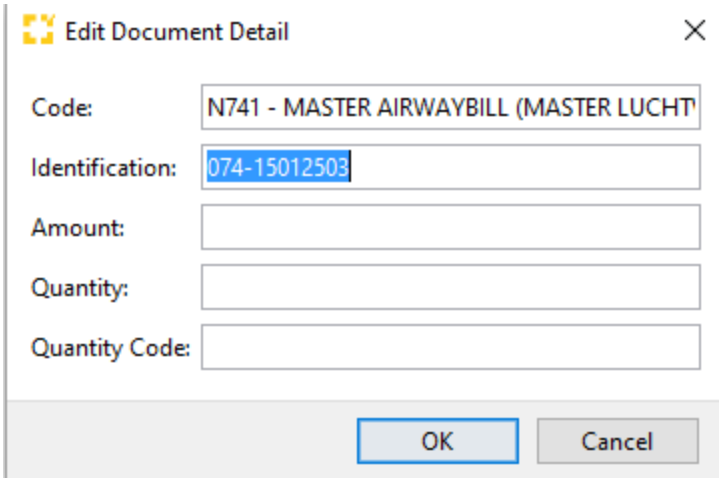


Description

Certificates / Licenses / Documents

In this segment documents accompanying the shipment are listed.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Label	Description
Code	Code of the reported certificate or licence
Identification	The number identifying the document, in case of a "fictitious (Fictief)" document the identification field must remain empty, NL customs does not specify which codes are "fictitious" and which codes are not so not validation is available
Amount	Monetary value for the document, optionally required
Quantity	Non-monetary value for the document, optionally required
Quantity code	Code identifying the non-monetary quantity type, optionally required

Note: As per request of NL Customs, in case of air shipments, the AWB number (if available) will be defaulted here. In case no linked shipment is available, the user will have to manually fill in these details:
(M)AWB number code is N741 and HAWB number code is N703.

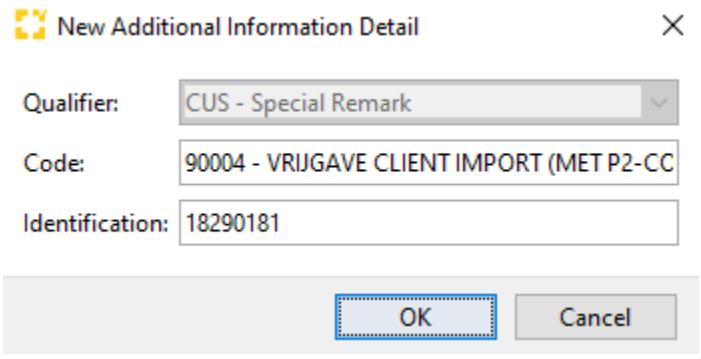
Previous Document Details

In this section reference is made to the preceding Customs document details of goods which are currently registered with NL customs, such as an original import declaration number in case of re-exportation.

Label	Description
Kind	Kind of the previous document (X, Y or Z)
Type	Type / code of the previous document
Identification	The number of the preceding document
Item	Item number on the previous document, mandatory in case of a the type is set to 705

Additional Information Details

In the this box any other applicable regulations are to be registered.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

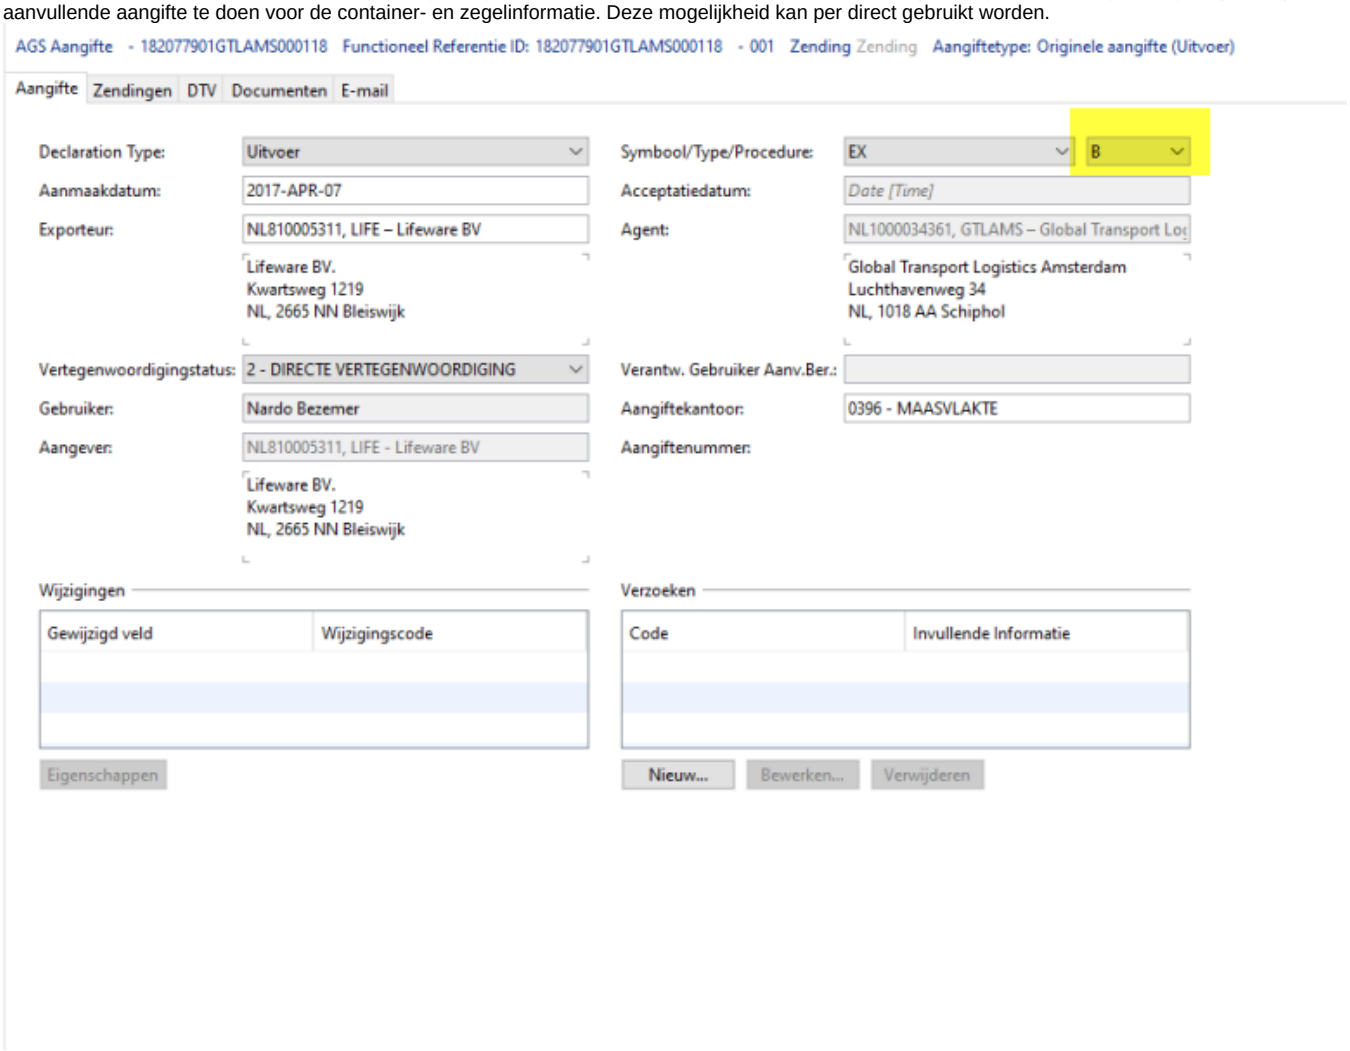
Label	Description
Qualifier	Identify the type of additional information, e.g. a special remark (CUS)
Code	Code to identify the special remark
Identification	Further details regarding the special remark (CUS)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS - Exports Containers

Onvolledige AGS-uitvoeraangifte gevolgd door aanvullende aangifte met containergegevens

De Douane heeft in AGS uitvoer een aanpassing doorgevoerd waarmee het mogelijk is om na een oorspronkelijke "onvolledige" aangifte ("EX-B") een aanvullende aangifte te doen voor de container- en zegelinformatie. Deze mogelijkheid kan per direct gebruikt worden.



Hiermee is het mogelijk om een AGS-uitvoeraangifte onvolledig te doen voordat de container daadwerkelijk is aangekomen, zolang de goederen maar beschikbaar zijn. Met deze methode kan een AGS-uitvoeraangifte volledig worden afgehandeld, inclusief fysieke controle van de goederen. Het risico op wachturen kun je hiermee terugbrengen.

Na de daadwerkelijke belading kunnen aanvullende gegevens gemeld worden via de aanvullende aangifte, het betreft dan gegevens zoals :

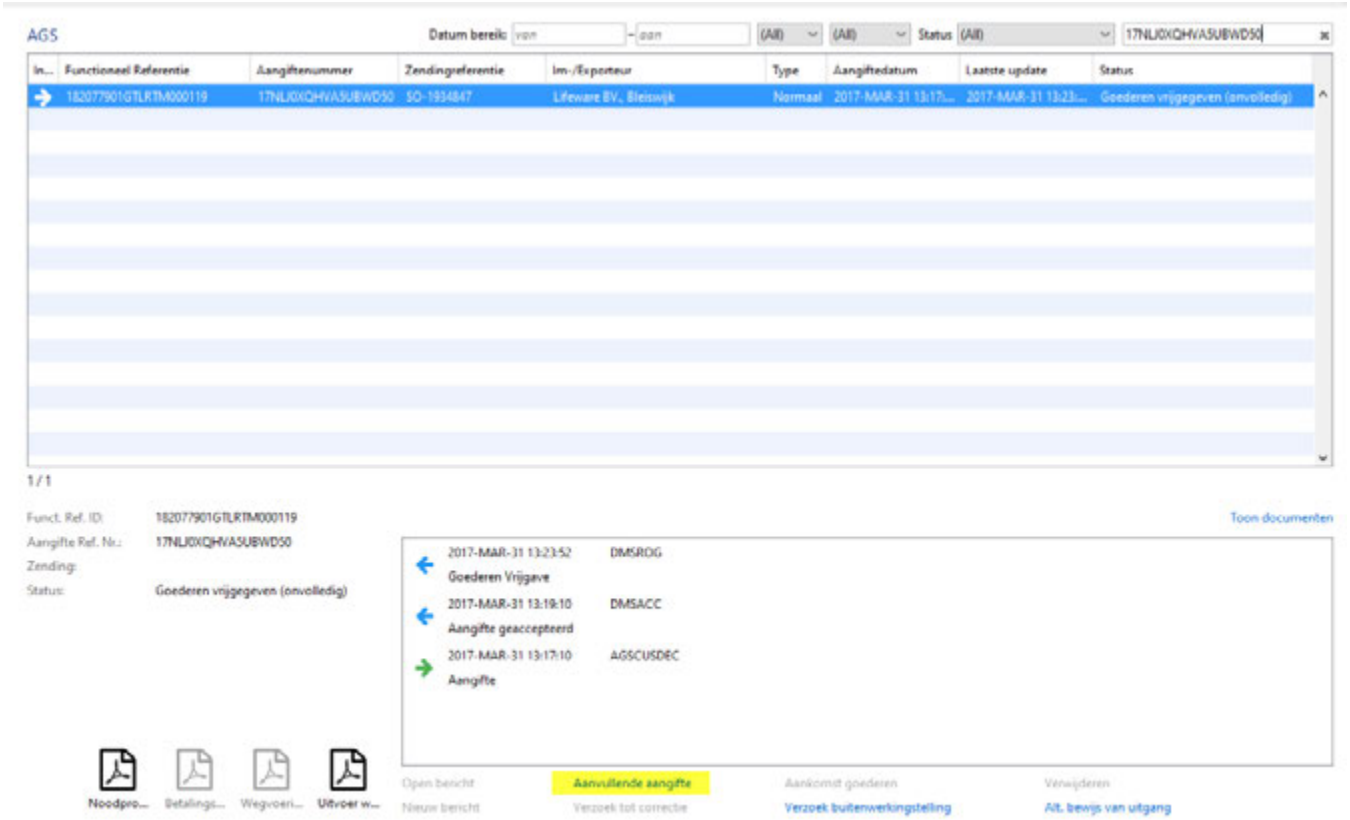
- Containernummer
- Zegelnummer
- Exact beladen gewicht
- ...

Na verwerking van deze gegevens kan er een hernieuwd EAD geprint worden met de aanvullende gegevens. Scope genereert automatisch een nieuwe EAD-PDF-bestand op TAB Documenten en als er een e-mail adres is ingesteld voor de exporteur (NL Douanepartner rol van de Partner, veld Exportdocumenten aan) zal het nieuwe EAD automatisch gemaild worden.

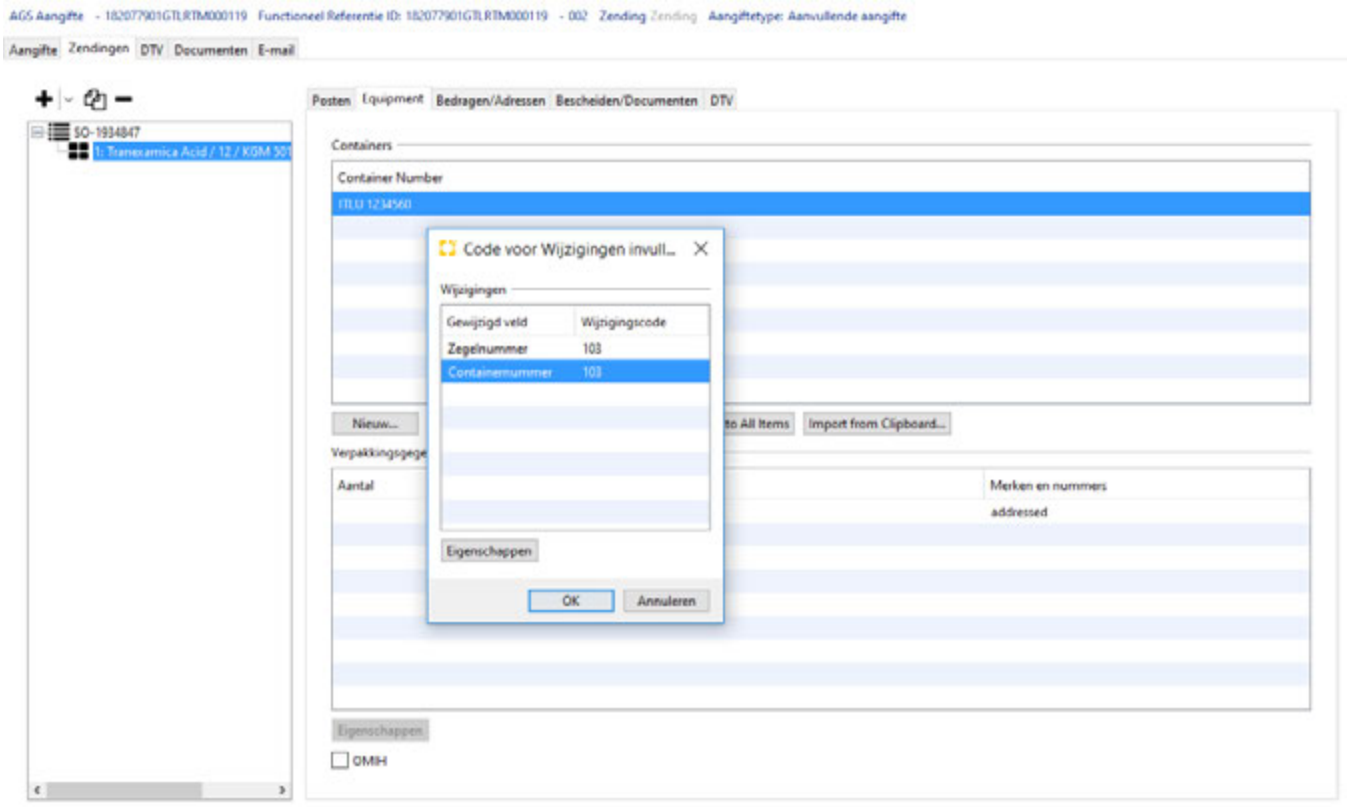
Het proces in Scope ziet er als volgt uit:

- Een AGS-uitvoeraangifte wordt aangemaakt waarbij de procedure wordt gezet op "B"of op "E".
- Let op: geen dummy-zegel- en/of containernummers vermelden in de oorspronkelijke aangifte; het is niet mogelijk om deze nummers aan te passen, alleen toevoegen van de nummers is toegestaan.
- AGS-uitvoeraangifte versturen naar de Douane en de reactie van de Douane afwachten:
    - DMSDOC: Overleg de gevraagde bescheiden aan de Douane, volgens de normale procedures.
    - DMSCTL: Fysieke inspectie: volg de richtlijnen van de Douane om de fysieke controle te regelen.
    - DMSROG: De aangifte is geaccepteerd en de goederen mogen beladen en weggevoerd worden.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Na de belading van de container dient het aanvullende bericht verzonden te worden (blauwe link "Aanvullende aangifte"), waarbij het containernummer en zegelnummer worden vermeld. Tijdens het versturen wordt om een wijzigingscode gevraagd; voor deze aanvullingen dient code "103" gebruikt te worden.
- Na vrijgave door de Douane kan de EAD nogmaals geprint worden. Deze is dan voorzien van de aangevulde container- en zegelinformatie.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Import

- Introduction
- Description

Introduction

This section of the manual describes the implementation of AGS Import declarations.

Description

This section described the general flow, business logic and declaration status of AGS Import declarations.

General Business Rules

Declarant / Importer Logic (AGS3)

In AGS the roles of Partners consist of the following roles:

Importer: Partner, who is legally responsible for the information in the declaration.
Declarant: Partner, who is financially responsible for the declaration.
Customs Agent: Partner, who is doing the actual creation and sending of the message.

Partner Validation and Defaulting Schema

From Shipment Defaulting

Consignee Declaration	Importer
Has no NL Customs Partner Role	The consignee Partner
Has NL Customs Partner with "acts as importer" active	The consignee Partner
Has NL Customs Partner with different Partner as importer	The importer Partner from the consignee

Validation

Importer Partner Setup	RS in the Declaration	Allowed	Action
no NL customs Partner Role	1	✓	
no NL customs Partner Role	2 or 3	✗	Update of the NL customs Partner Role required
NL customs Partner Role without Importer setting,	1,2,3,	✗	Update of the NL customs Partner Role required
NL customs Partner Role with RS 1	1	✓	
NL customs Partner Role with RS 2	1 or 2	✓	
NL customs Partner Role with RS 2	3	✗	RS code in de Partner setting must be equal to the RS code in the declaration
NL customs Partner Role with RS 3	2	✗	RS code in de Partner setting must be equal to the RS code in the declaration

Actually Sent in the Message

Definition of "Aangever"

Aangever http://www.belastingdienst.nl/bibliotheek/handboeken/html/boeken/HD/toepassingsgebied_en_basisdefinities-de_douanewetgeving_omvang_en_begrippen.html#HD-d117e672

Onder "aangever" verstaat het CDW de persoon die op eigen naam aangifte doet of in wiens naam een aangifte gedaan wordt (de zogenaamde directe vertegenwoordiging, zie ook onderdeel 2.00.00, paragraaf 2.2.1 van dit Handboek).

Wie mag als aangever optreden? Dit kan iedere persoon zijn die de goederen bij de douane aan kan brengen (zie voor het begrip "aanbrengen" hierna) of kan laten aanbrengen en alle bescheiden kan overleggen die voor de toepassing van de betreffende regeling zijn voorgeschreven. Dat wil dus zeggen ieder die de (juridische of feitelijke) beschikkingsmacht over de goederen heeft. (artikel 64 CDW)

Customs Value Calculation

Under AGS the user has the choice with regards to the Customs Value Calculation.
In Scope this has been indicated by the "Use DV1" indicator. The following validation is active in the AGS declaration for the options.

Field	AGS to Calculate Customs Value	Customs Agent to calculate Customs Value
Use DV1	not active	active
Seller Partner	must be empty	mandatory, will be defaulted from shipment
Buyer Partner	must be empty	mandatory, will be defaulted from shipment
Invoice Number	must be empty	mandatory
Invoice Date	must be empty	mandatory
Invoice Amount	mandatory	mandatory
Commodity Value	mandatory	mandatory
Customs value	will be sent to AGS	will be calculated but not sent
Statistical value	mandatory	mandatory
DV1 - invoice Nett Price	disabled	mandatory, defaults with the commodity value
Seller/Buyer Relation	disabled	enabled, activate if applicable
Price affected by relation	disabled	enabled, activate if applicable
Comparable transaction value	disabled	enabled, activate if applicable
Limited use of goods	disabled	enabled, activate if applicable
Price affected by imponderables	disabled	enabled, activate if applicable
Royalties	disabled	enabled, activate if applicable
Profit afterwards	disabled	enabled, activate if applicable
Document references	disabled	enabled, optional

Customs Value Components

The following codes are available as Customs Value adjustment components and the impact they have on the customs value calculation.

CODE	DV1 Number	AGS Message code	NL Description	EN Description	Operator (import)

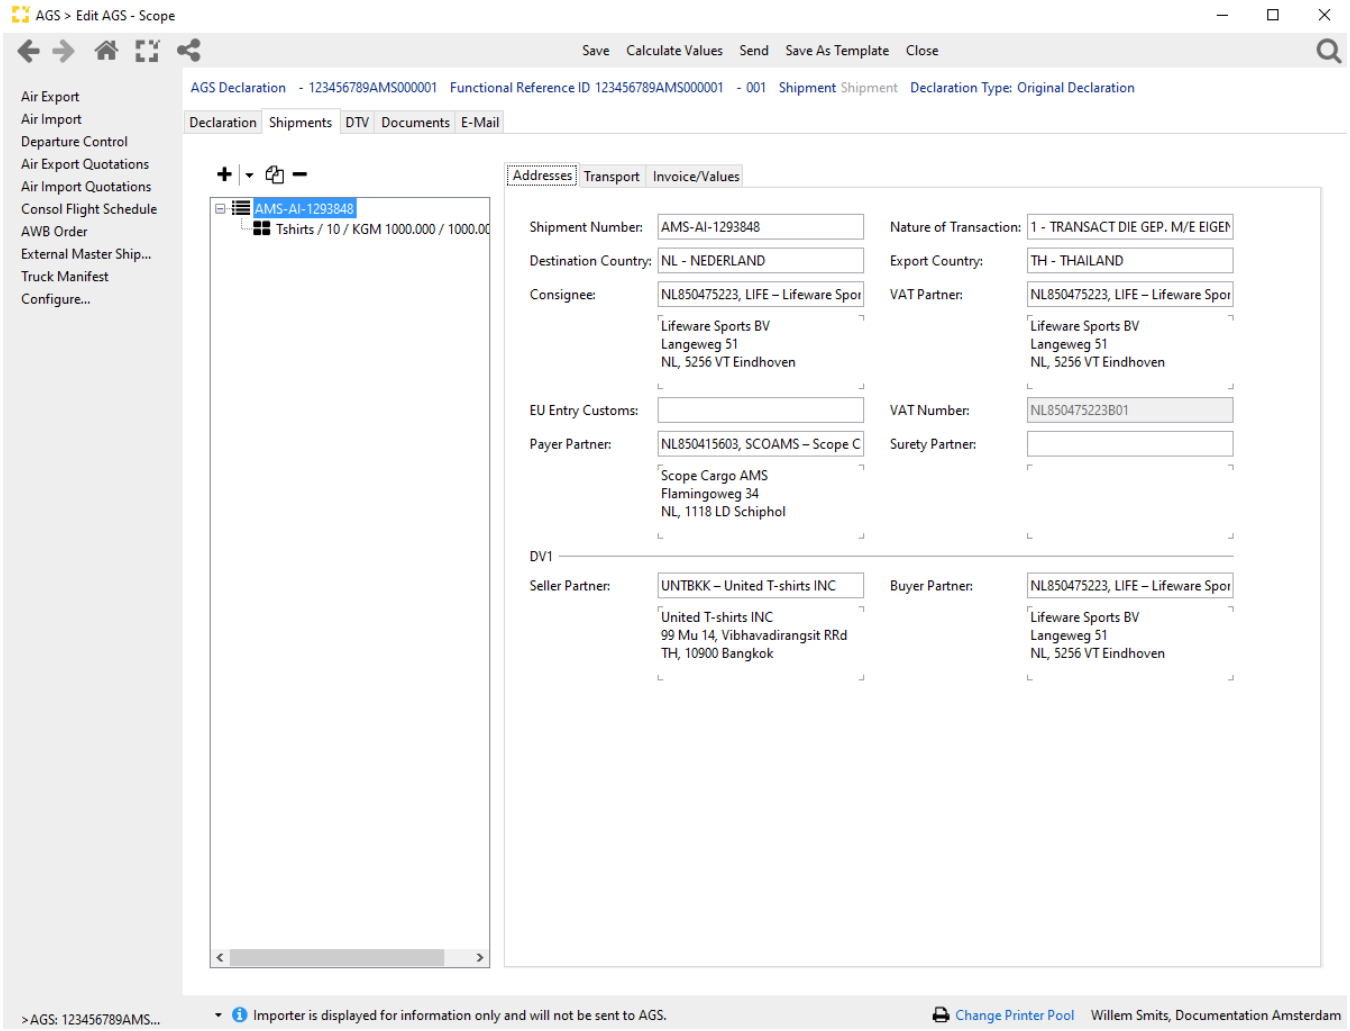
AGS Import - Declaration - Shipments - Addresses

- Introduction
- Description

Introduction

In the shipments section of a AGS declaration the details regarding the actual shipment involved partners are registered, AGS in principle supports multiple shipment under one declaration,
however this is not yet supported by EU - UCC customs laws. Until that time to option to add multiple shipments has been disabled.

Description



Shipment number Reference

The shipment reference number which will be transmitted to AGS the defaulting rules are set by the configurarion in the role NL Customs License Holder of branch partner

Nature of transaction

Nature of transaction code, indicating the financial transaction linked to the goods (customs code list A22)

Destination country

Final destination country code in the EU

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Export Country

The code for the country where the transport originated.

Consignee

The Receiver of the goods as indicated in the transport documentation, Consignee will be validated against the importer as described the general section.

EU Entry Customs

Under certain conditions it might be needed to indicate the customs office code where the goods first entered the EU, only allowed when the EU entry offfice is different from the declaration office.

VAT Partner

The Partner responsible for the payment / listed of the VAT applicable upon imports. will be defaulted from the Importer settings, only the following partners are allowed.

- Any partner without "Article 23 license" is allowed as it has no impact on the declaration, and applicable VAT with be payable on the declarartion.
- The same partner as the importer.
- The same partner as the consignee.
- The partner mentioned in the field "OB responsible" of the customs partner role of the importer.
- The partner mentioned in the field "OB responsible" of the customs partner role of the consignee.

Not allowed is:
- An unrelated Partner with Art 23 licence.

VAT Number

The Vat number of the the VAT partner when the VAT indication of "Art 23, diversion" is active.
If the "Art 23" is not active the VAT number is not defaulted.
Since AGS does not validate the "Art 23" in the declaration no manual input of VAT numbers is allowed, forcing users the update the Partner details.

Payer Partner

The payer partner specifics the partner (EORI number) who is responsible for the payments of import duties and taxes. Is only required when the payer party is different from the importer,
and the payer partner has a bond posted at customs. For cash payments this field is not used.

Surety Partner

The Surety partner specifics the partner (EORI number) who is responsible for the surety for temporary imports etc from the importer, and the partner has a bond posted at customs.

Seller Partner

The actual seller for the goods covered by the shipment, must be supplied in case of DV1, else it should remain empty.

Buyer Partner

The actual seller for the goods covered by the shipment, must be supplied in case of DV1, else it should remain empty.

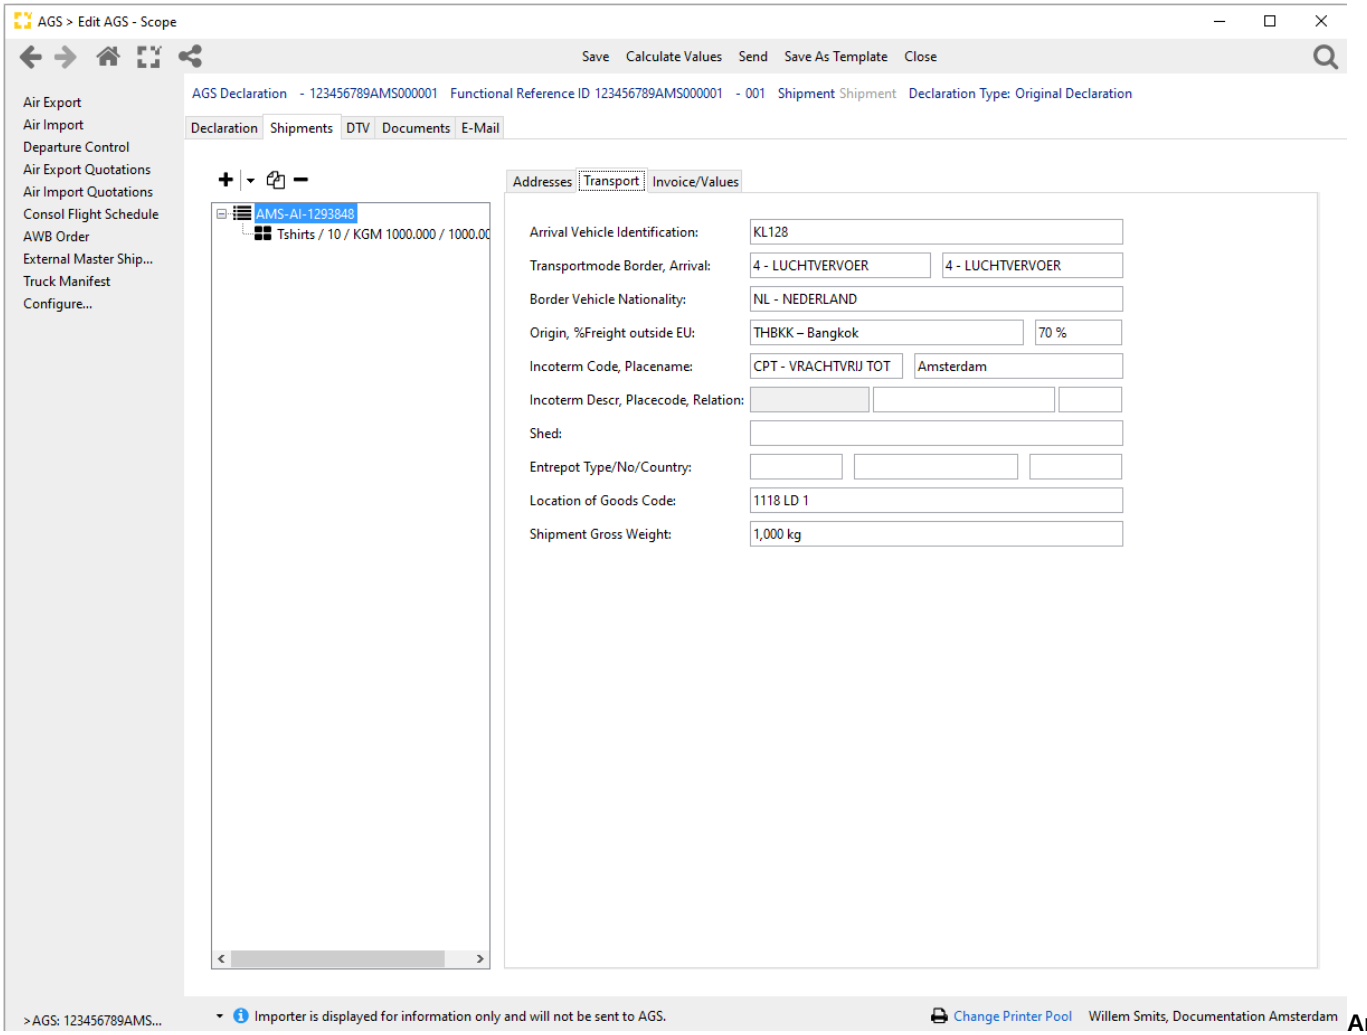
AGS Import - Declaration - Shipments - Transport

- Introduction
- Description

Introduction

Description



Arrival Vehicle Identification

Arrival Vehicle identification

Identification of the transport means with which the goods arrive

Transport mode Border

The coded type of transport by which the goods crossed the EU border

Transport mode arrival

The coded type of transport by which the goods arrived at the clearance location.

Border Vehicle Nationality

The nationality of the transport means by which the goods crossed the EU border

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Origin, %freight outside EU

The origin code (IATA airport code) to determine the applicable airfreight discount percentage

Inco terms

The inco terms under which the goods have been sold, shipped.

code

The inco-term code as listed in the code list

place

The place name corresponding with the inco-term, most common used in inco-term declarations.

description

Textual description of the incoterm applicable, only enabled when the code is set to XXX

placecode

The UNLO-code for the place applicable on the inco terms, either the name or the code is used, not both together

relation

The relation of between the entered place name / place code and the location where the declaration is done, this field is optional.

Shed

The Partner where the goods are at stored at the moment of the declaration, the actual AGS details are defaulted from this partner.

entrepot details

The entrepot (custom warehouse details) where the goods are stored, these details are listed below, the entrepot details must be correct since they are validated in AGS and should only be used if the previous regulation requested equals 71 or 78.

- Entrepot Type
- Number
- Country code

Location of goods code

The textual description of the location where the goods declared are located at the time of customs clearance, validated formatting by customs
9999 XX 99999 XXXXXXX

Position	Value
1 - 4	Digits of the postal code
5	space
6 - 7	Letters of the postal code
8	space
9 - 13	Digits of the house number (no letters
14	space
15 - 35	Additional information

Shipment Gross weight

Total Gross weight of the shipment, is validated against the sum of the gross weight of the individual items

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

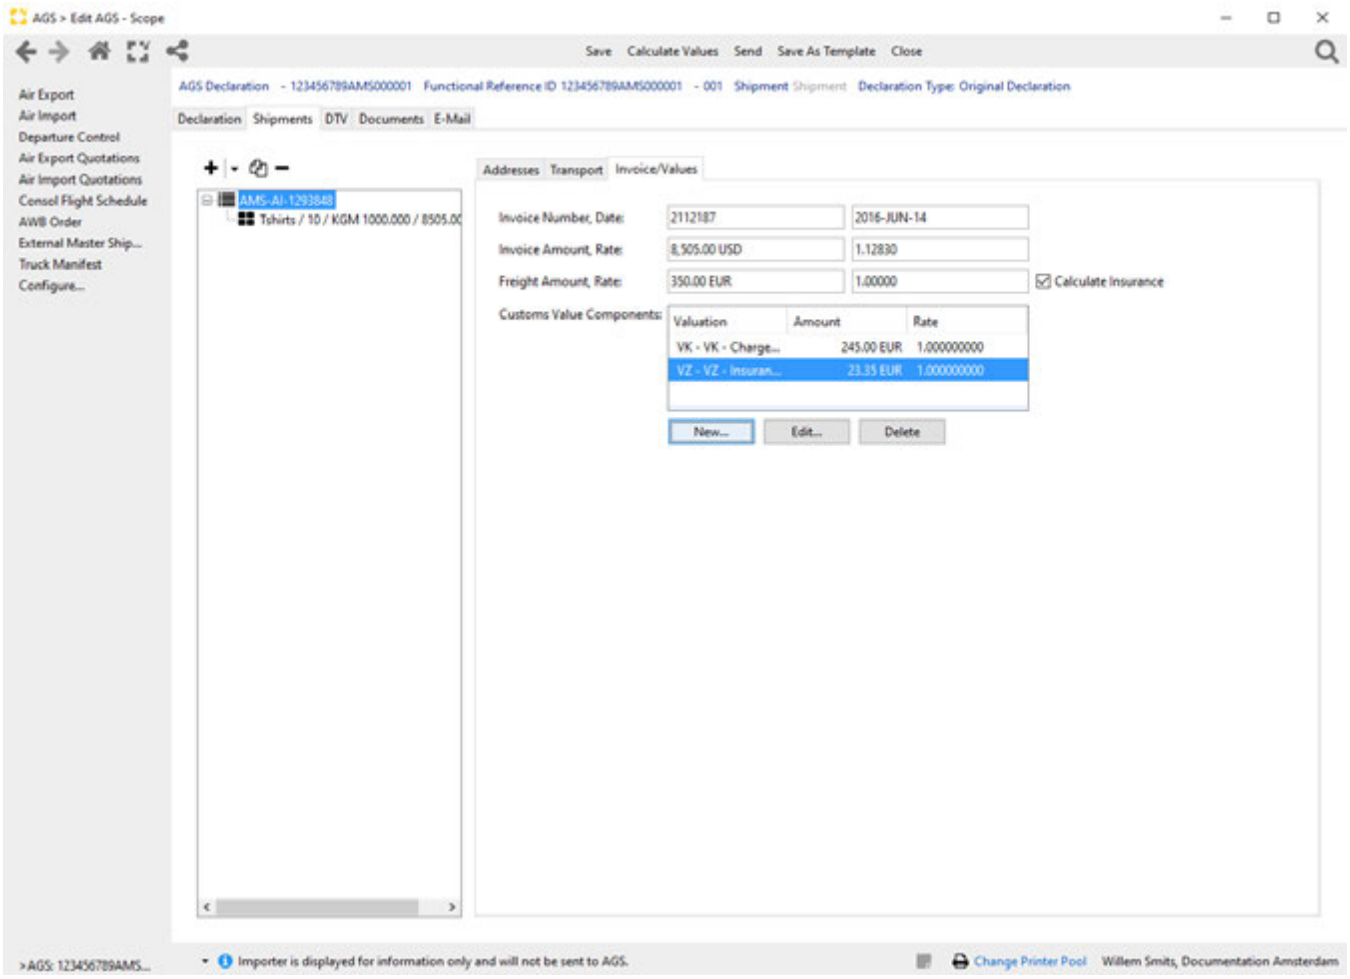
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Import - Declaration - Shipments - Invoice Values

- Introduction
- Description

Introduction

On the tab "Invoice/values" the financial details of the whole shipment are registered and will be used as the base amounts for calculation the values on item level



Description

Invoice number

The invoice number of the commercial invoice, which uniquely belongs to the shipment covered in the declaration, mandatory in case (use DV1 is active) where NL Customs should calculate the customs value else it should remain empty.

invoice date

The invoice issue date of the commercial invoice, which uniquely belongs to the shipment covered in the declaration, mandatory in case where NL Customs should calculate the customs value else it should remain empty.

Invoice Amount

The invoice amount applicable for the whole declaration, the full amount will be validated against the sum the commodity value of the items.

Invoice Exchange rate

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Applicable exchange rate for the entered currency value, The exchange rate is determined by NL customs and will be updated in Scope automatically through a system background process.

Freight Amount

The total freight amount applicable for the whole declaration, not adjusted for the discount

Freight Amount exchange rate

Applicable exchange rate for the entered currency value

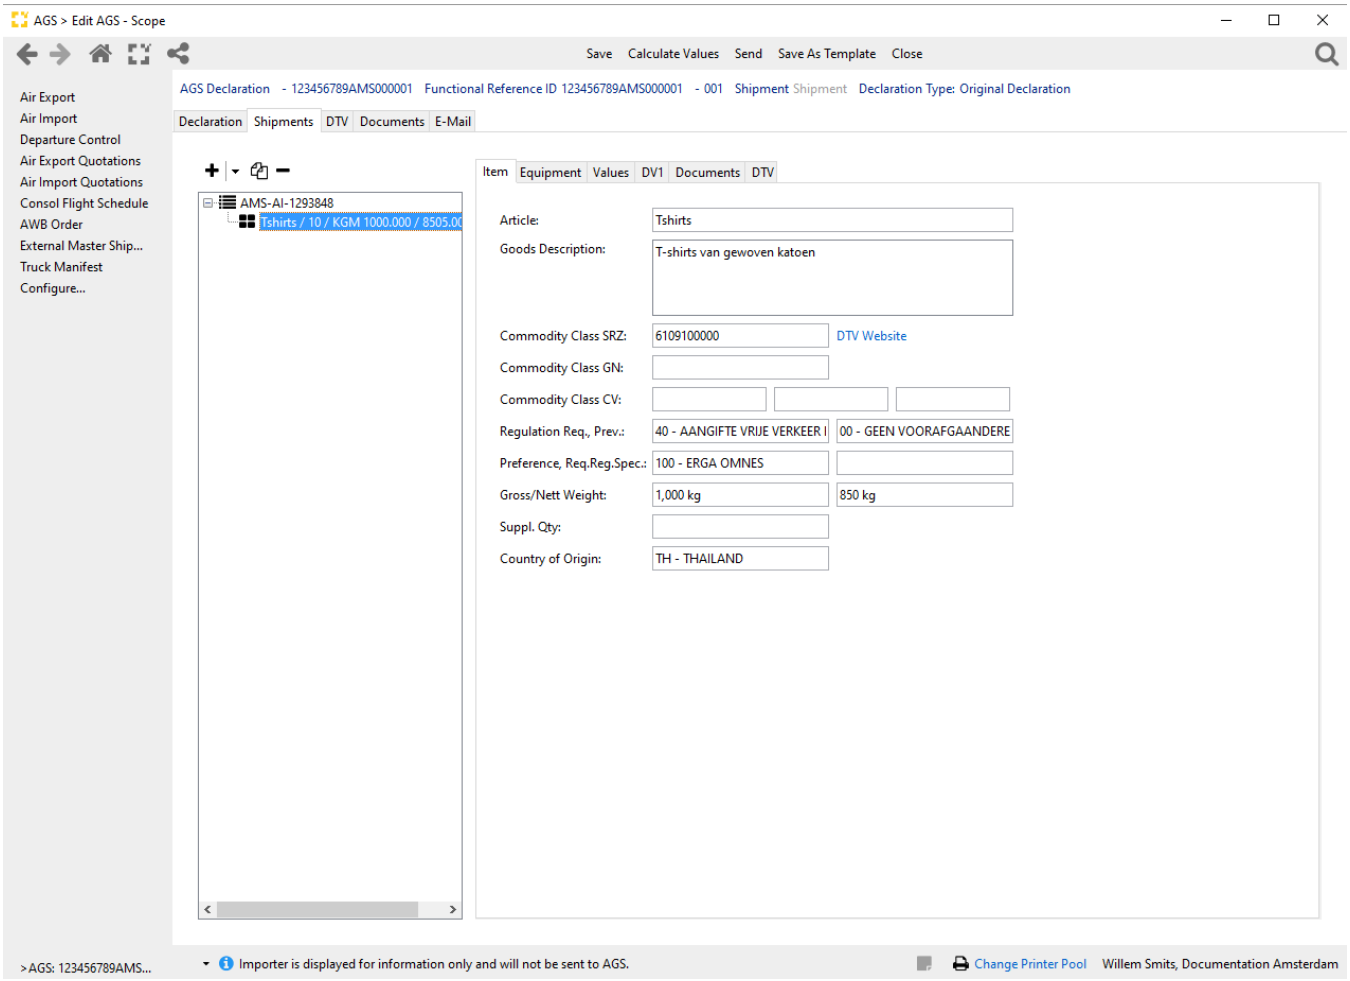
AGS Import - Declaration - Shipments - Items - Item

- Introduction
- Description

Introduction

In the items section the details of each declared goods item are provided. AGS declarations can contain a maximum of 99 items per declaration.
In the item tab of the items, the specification of the items declared is given.



Description

Article

Selection of a master data article and the corresponding defaulting
This field also allows to enter a new article code and store it in the master data base.
Save actions when available will be indicated by a icon.

Goods Description

The textual description of the goods, can be defaulted from Article Maintenance.

Commodity Class SRZ

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The goods classification code (EU) applicable in AGS, minimum length 10 positions , maximum length 18 positions, replaces the old HS number from Sagitta Import.
The new NL Customs website for the SRZ numbers is DTV (tarief.douane.nl/tariff/index.jsf)

Commodity Class GN

The commodity class GN indicates national regulations for the item and specifications can be found at DTV (tarief.douane.nl/tariff/index.jsf)

Commodity Class CV

Specification for Category / Item number as published, linked to import and/or export licenses (CDIU)

Requested Regulation

The requested regulation under which the declaration is done, only displayed here, actual value set on declaration level.

Previous Regulation

The code for the previous customs regulation, will determine whether the entrepot details are mandatory (71,78) or left empty (00)

Preference

The possible preferential community code, mandatory field, when no preference applicable then the value 100 - Erga Omnes should be used.

Exemption Regulation

The possible exemption regulations applicable on the item declared.

Gross weight

Gross weight for the item, will be defaulted by the total gross weight registered on the declaration of the first item and on additional items by the remainder or the gross weight.

Nett weight

Nett weight for the item, will be defaulted at 85% of the entered gross weight.

Supplemental Quantity

The supplemental quantity of the item, if so specified for the selected SRZ commodity class code.

Supplemental Unit

The unit in which the supplemental quantity is to be specified, not required to be sent to Nl customs, can be defaulted from the article details and serve as a validation aid.

Country of Origin

The country of origin applicable for the goods declared.

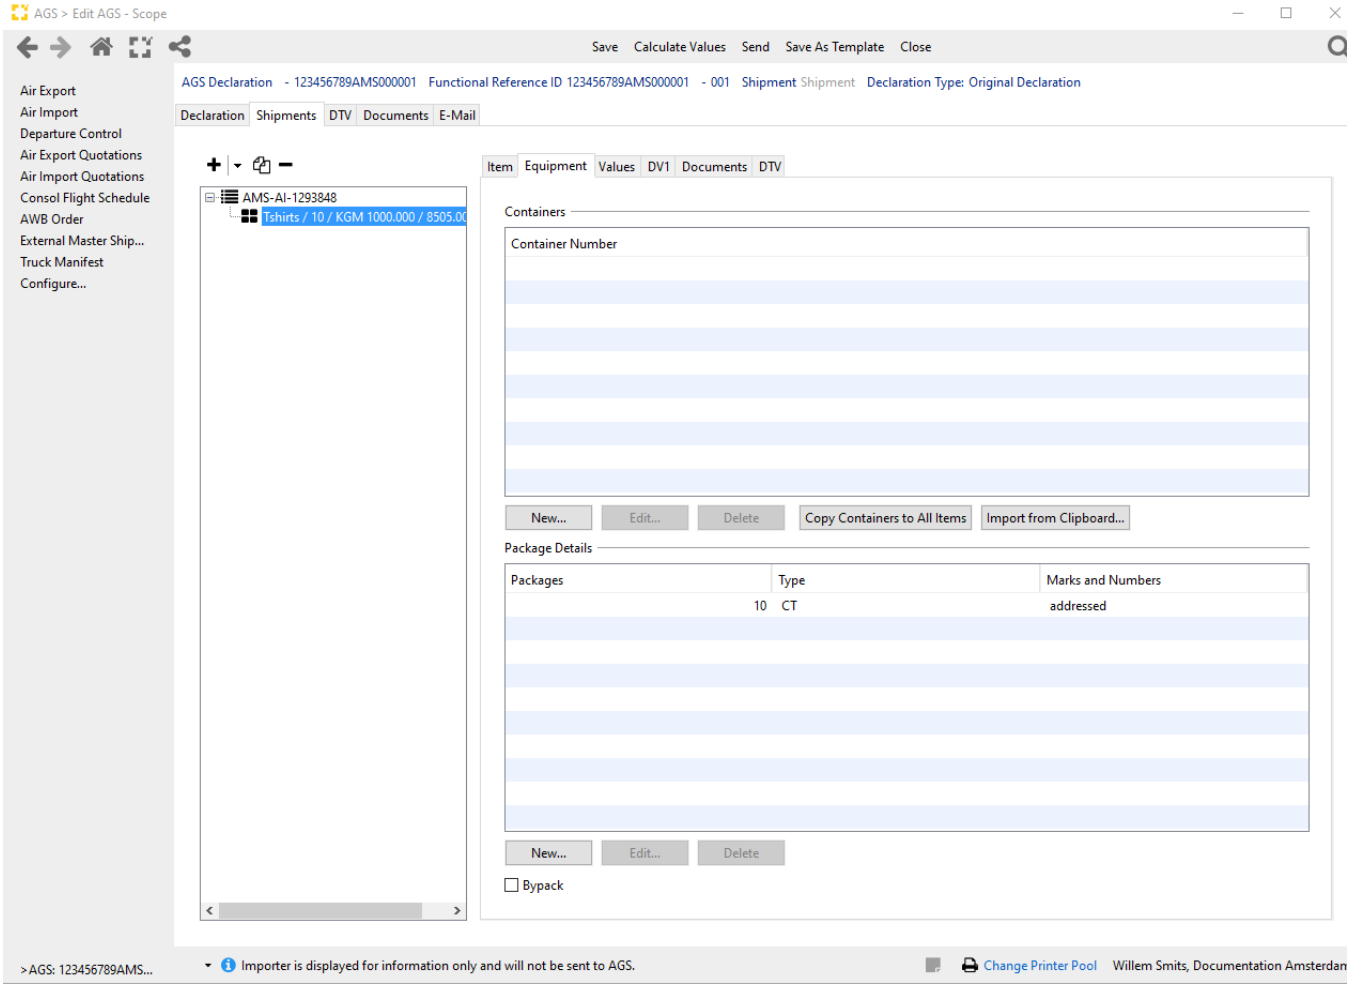
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Import - Declaration - Shipments - Items - Equipment

- Introduction
- Description

Introduction

On the tab of the Equipment, the details of the used equipment, Containers and packaging information is registered.



Description

Containers

Grid where the applicable containers are registered. for each container the following details can be registered.
The total number of container to be registered in AGS per declaration is 99.

- Container number

New

Add a container number

Edit

Change a container number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

Delete a container number

Copy Container to All items

Option to copy all container numbers to all items, should it be required as such

Import from Clipboard

Using the option import from clipboard.allows copy container numbers from workstation clipboard

This option will check if there are container details in the active windows clipboard (CTRL-C) and if so paste them in the grid.
The format of the clipboard details should be:
<container number> as per below sample

Sample Clipboard Value

AMZU4973612
TCKU3053279
TCLU5860678
YMLU8754628
SUDU6512934
HJCU8423064
SUDU5807355

Packaging details.

The packaging details of the specific item with the following details

Packaging Type	codes
Unpacked	All packaging type codes starting with N
Bulk	All packaging type codes starting with V
Packed	All other packaging type codes

Number of packages

Total number of packages applicable for the selected item, a mandatory value for packed cargo.

Type of packages

Code to indicate the type of packaging

Marks and numbers

Identifying markings on packaged goods, a mandatory value for packed cargo.

Multiple Goods Identification Codes in One Package (OMIH)

If multiple Customs goods identification codes (HS codes) are combined in a package, you can mention the number and type of packages on the first item of your AGS import declaration. On all other items of the declaration you can check "OMIH/BNYPACK" option (onder meer inhoudende).
This will disable the packaging details for manual editing and generate the packaging line according to NL Customs specification.

AGS Additional Messages

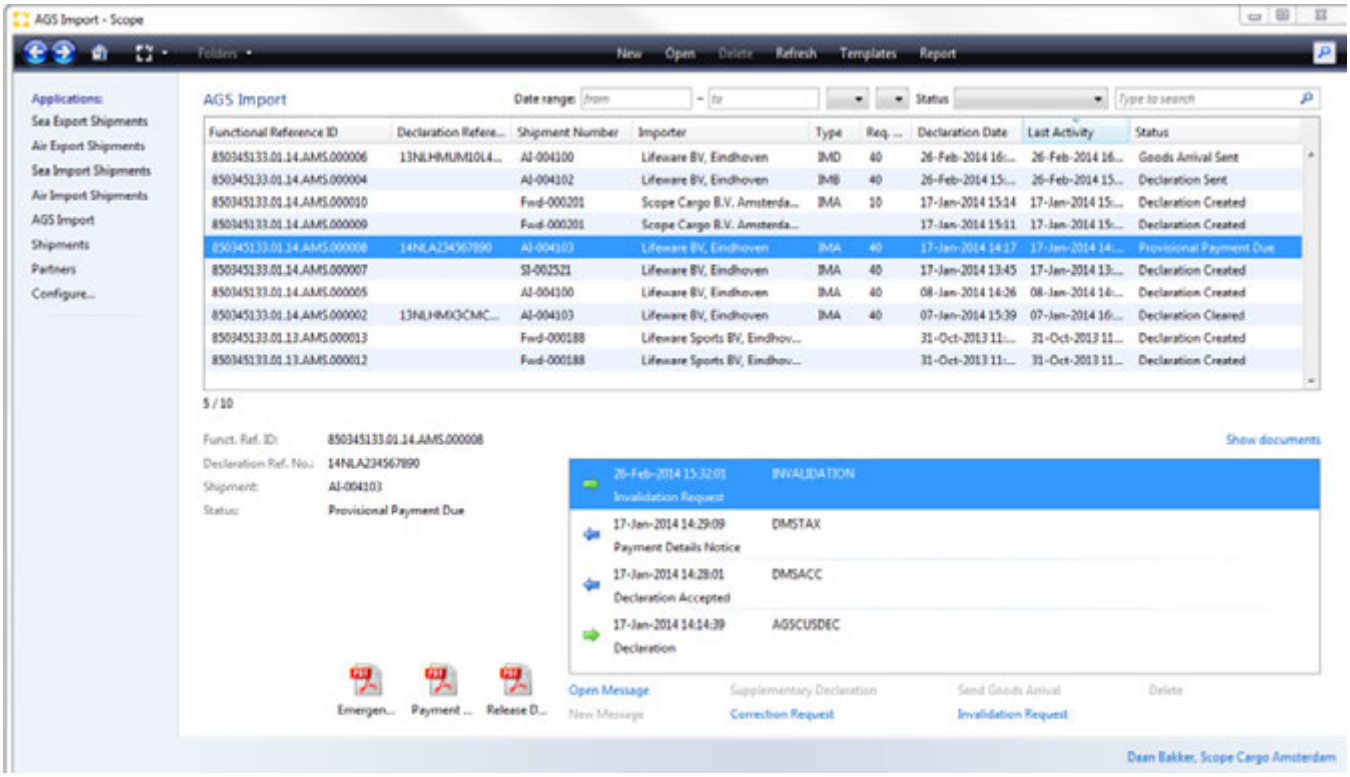
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS - Additional message - Supplemental

- Introduction
- Description

Introduction

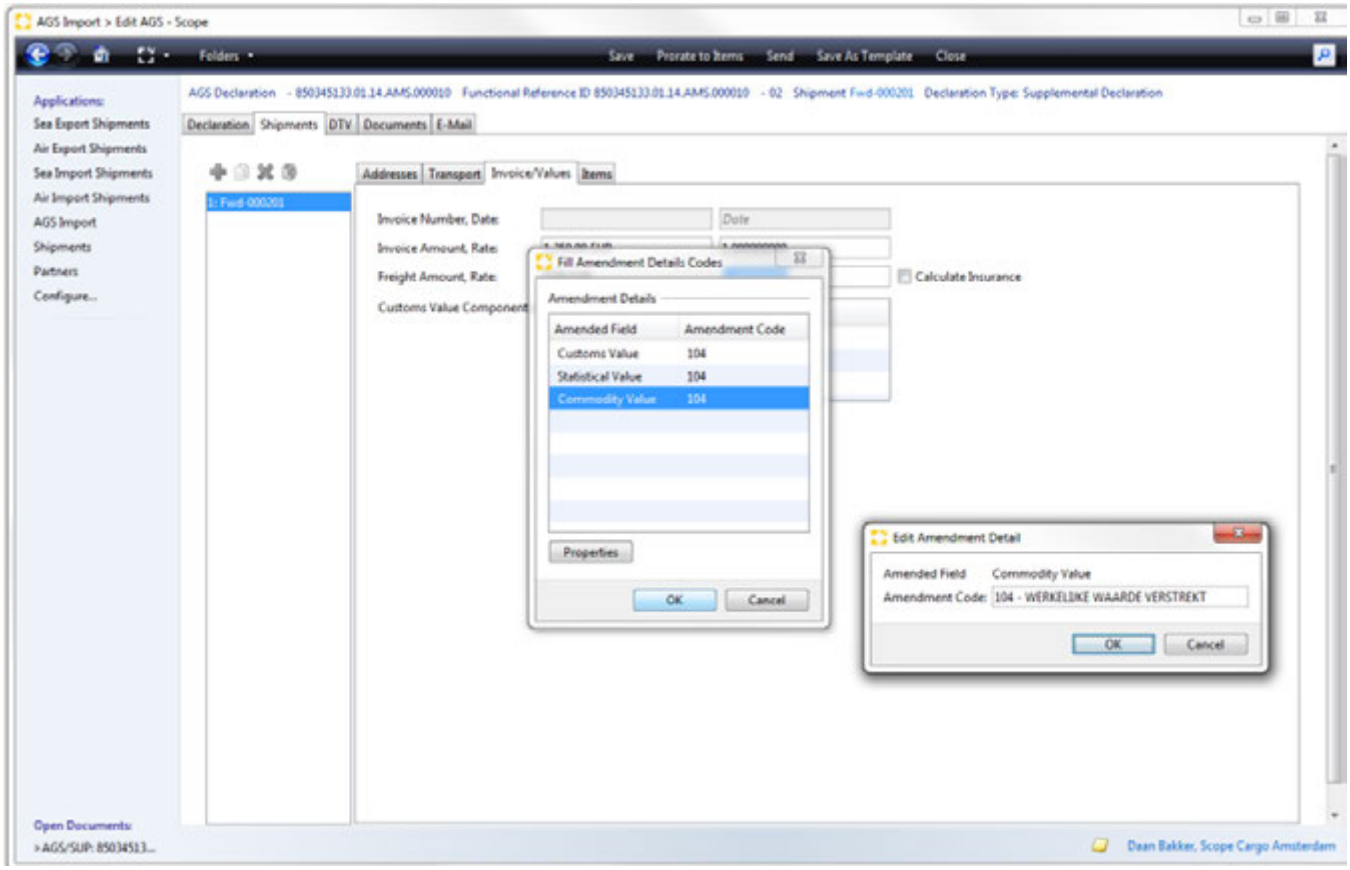
When a AGS declaration with the type is IM-B and in the proper state the link to send a supplemental message will be active. the supplemental message will open
the declaration in a separate state where the fields that are allowed for supplementation will be enabled.



Description

Any detail that is to be supplemented can be adjusted by simply entering the correct required details.
When the supplemental details have been added the message can be send, prior to sending the actual message,the user is asked per changed item to indicate a
reason why the data has been Supplemented .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Values to be updates

The following values may be updated in the ADDSUP message

Value	Comments
Vehicle ID (Border)	
Mot of Transport (Border)	
Vehicle Nationality (Border)	
Customs Value	If send the customs
Statistical Value	
Document Identification	Documents may not be removed or added
Invoice Date	
Invoice Number	
Item \ Commodity Value	
Item \ Gross Weight	
Item \ Nett Weight	
Item \ Supplemental Quanity	
Item \ Number of packages	Only number of packages, not the packaging code or shipping marks
Item \ Value Correction	Only the amount may be changes , no correction to be added / removed

AGS from Excel - CSV

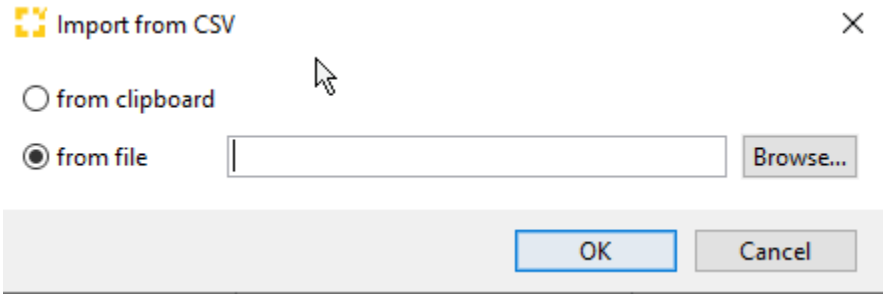
Introduction

This page described how the option AGS from Excel/CSV works

Description

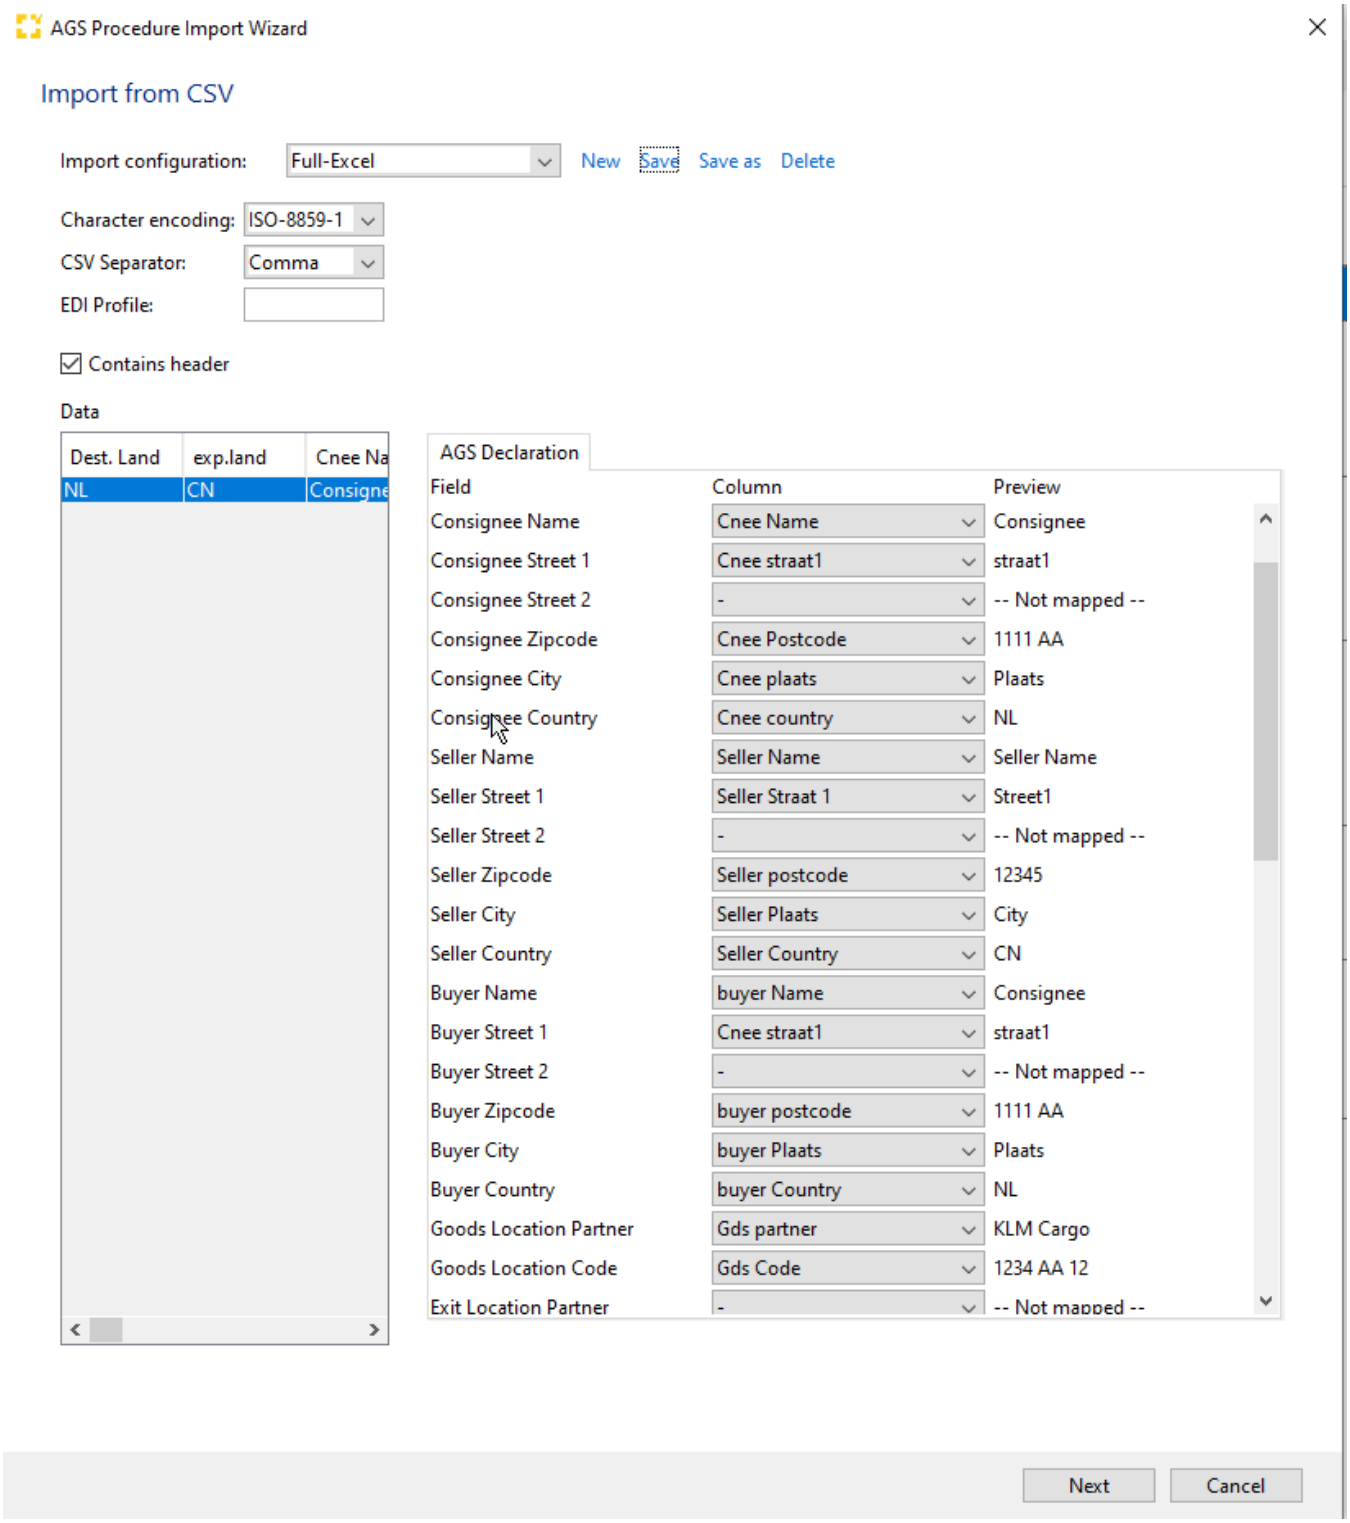
When, payable, add-on AGS from Excel has been activated the this function can be started via the Customs option in a Shipment.

In the window the first action is to select a Excel/CSV file or paste values from your clipboard.



In the second Window the actual mapping is done between the selected file and Scope AGS .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Import Configuration

it is possible to save a definition in order for efficient re-use of the mapping

New

Create a new definition

save

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Save a definition after making a change

Save as

Save a changed definition with a new name

Delete

Remove a definition

Character Encoding

Define which character-set is used in the selected file

CSV Separator

Sets the character which determines that a new field begins, Comma, Tab , Semicolon or Vertical Bar,
when selecting an excel sheet it depends on your localisation settings.

EDI Profile

Link to a Masterdata \ EDI profile where mappings between codes used in the selected file and the appropriate codes in Scope.

Contains Header

When activated the first row of the selected file will be used as column headers in the data mapping

Data

The available columns for mapping from the originating file to the corresponding field in AGS declarations, Mapping for each column is Optional, the regular AGS validation will take place in
the created AGS declaration.

Indicate that no template is required or a select the required template

Automatically Send Declaration

Scope will validate and directly send the created declaration when not validation errors are found,
Note, validation warnings will be ignored.

Apply Special Regulation code

Indicate, when applicable, Scope should set the special regulation code 107/C07,
Note, applicable to "real e-commerce" AGS declaration, Consignee / importer must be an private person.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Supplemental Information

Gebruikstarief versus DTV

With the introduction of AGS, NL customs will also implement a new system for the goods identification (Nomenclatuur).

In AGS the goods identification will no longer exist as separate fields as in the Sagitta but 1 single number of 18 positions and an additional field for national (VAT / Excise) regulations.
A direct link from Scope / AGS to DTV has been established, Description of the system integration of DTV can be found in this manual

The new DTV details can be consulted at tarief.douane.nl/tariff/index.jsf.

In AGS the goods classification is divided over 2 fields:

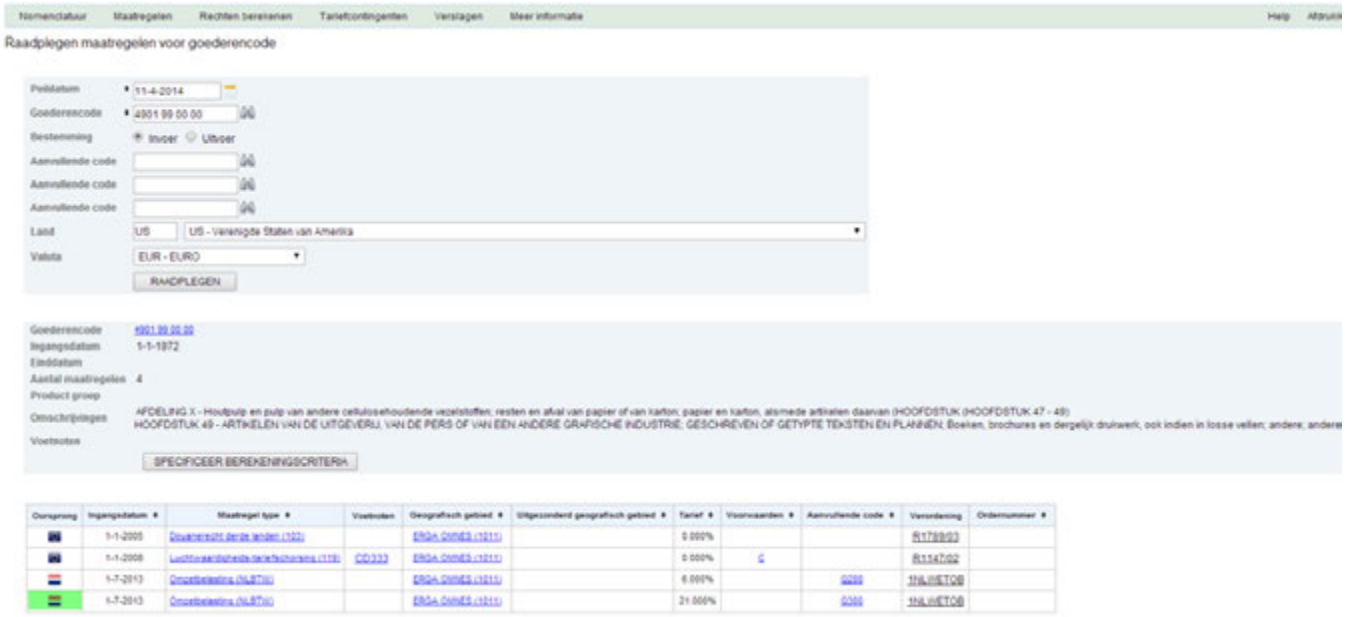
Goods Classification SRZ : Being the generic EU number as found in the DTV, Listed on the DTV as "Commodity Code" , main number of 10 digits for imports and 8 digits for Exports

Goods Classification GN ： Being the national additional codes, for instance VAT regulations, listed on the DTV as "Additional code".

Additional Codes

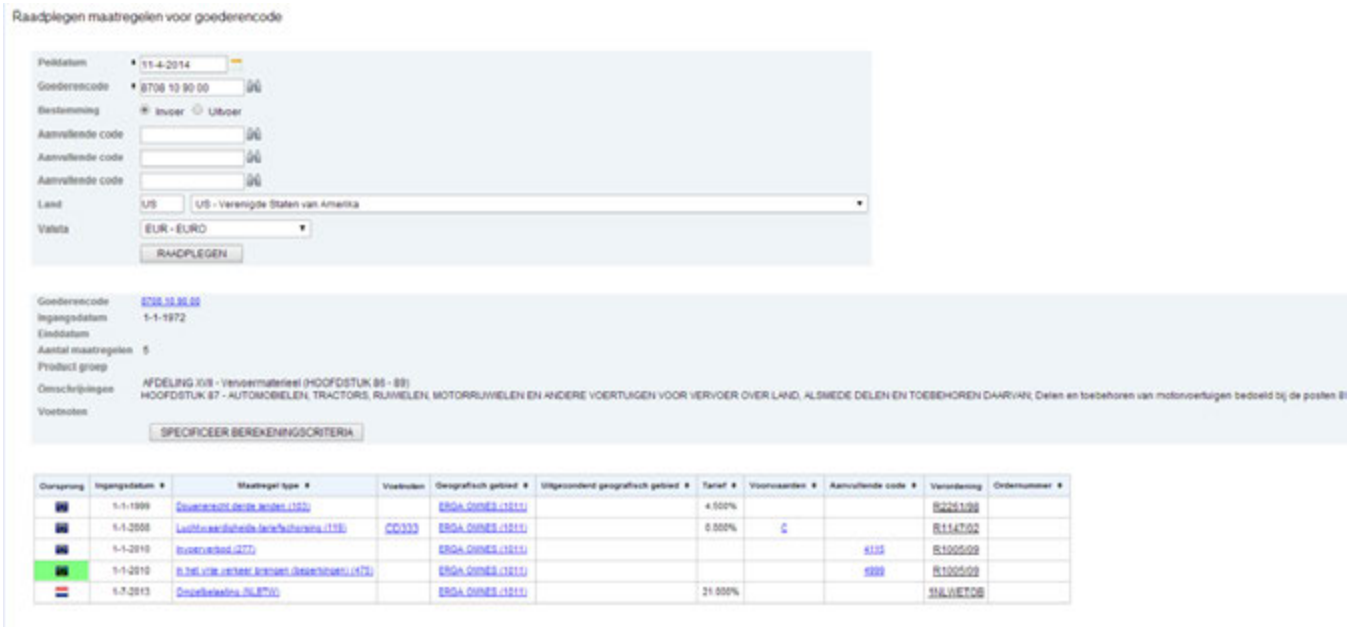
The additional codes need to be used on two different places, depending of the kind of regulation.

If the line containing the additional code has the Dutch flag, it needs to be populated in the Goods Classification GN.



if the line containing the additional code has the EU flag, it needs to be populated in the Goods Classification SRZ.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Multiple Goods Identification Codes in One Package (OMIH)

If multiple Customs goods identification codes are combined in a package, you can mention the number and type of packages on the first item of your AGS import declaration. On all other items of the declaration you can check "bypack" (NL "OMIH" is an abbreviation of "onder meer inhoudende"). Scope will send this to Customs in the proper way.

AGS Declaration Statuses Explained

Status	Description	Message Code	User Action
Accepted	The declaration has been accepted by NL Customs and is awaiting the next message	DMSACC	No action possible - declaration awaits next message from NL customs
Alternative Proof Created	The declaration received notice of non-Exit and message with alternative proof has been created	-	Send the Alternative Proof message, Delete the alternate proof message
Alternative Proof Sent	The declaration received notice of non-Exit and message with alternative proof has been sent	ADDALT	No action possible - declaration awaits next message from NL customs
Created	The declaration has been created but not yet sent	-	Declaration can be modified, deleted or sent
Confirmation of Exit	The declaration has been processed in ECS and goods have left the EU correctly	DMSEOG	No Action Possible - Declaration completely handled
Correction request Created	A Correction Request has been created but not yet sent	-	Correction request can be modified, deleted or sent
Correction request Sent	A Correction Request has been sent	ADDCOR	No action possible - declaration awaits next message from NL customs
Correction request Honored	A Correction Request has been honored and the corrections will be applied to the declaration	DMSRES	No action possible - declaration awaits next message from NL customs
Finished	The declaration has been Cleared, the whole procedure has been finalized	DMSCLE	A invalidation request can be send to NL customs
Rejected	The preceding outgoing message has been rejected by NL customs	DMSREJ	Correct the last message and resend to customs
Sent	The declaration has been sent to NL customs	AGSCUSDEC	No action possible - declaration awaits next message from NL customs
Definite Payment Due	The definite payment details due on a declaration	DMSTAX	No action possible - declaration awaits next message from NL customs
External Declaration	The declaration will be finished / further handled outside AGS	DMSEXT	No action possible - final stage of an declaration
Goods Arrival Created	A Goods Arrival has been created but not yet sent	-	Message can be modified, deleted or sent
Goods Arrival Sent	A Goods arrival has been sent	ADDGRP	No action possible - declaration awaits next message from NL customs
Goods Released	The goods covered by the declaration have been released but the declaration has not yet been finalized	DMSROG	A invalidation or correction request can be sent to NL customs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Goods Release (incomplete)	The goods covered by the incomplete declaration have been released but the declaration has not yet been finalized	DMSROG	The supplemental declaration can be created or A invalidation or correction request can be sent to NL customs
Invalidated	The declaration has been invalidated by NL Customs	DMSINV	No action possible - final stage of an declaration
Invalidation Request Created	A request to invalidate the declaration has ben created but not yet sent	-	Request can be modified, deleted or sent
Invalidation Request Honored	A Correction Request has been honored and the declaration will be invalidated by customs	DMSREQ	No action possible - declaration awaits next message from NL customs
Invalidation Request Sent	A Invalidation Request has been sent	ADDINV	No action possible - declaration awaits next message from NL customs
Manually Voided	The declaration will not be finished technically and has been invalidated by Scope Admin	-	No action possible - final stage of an declaration
Not Exited	Special Filter (not an actual status) All declarations which have one of the following statuses: DMSROG, DMSCLE,DMSEOG	-	Check documentation whether ECS process was followed correctly, if status is DMSGER send ADDALT message with alternative proof of exit.
Notification of Not Exited Goods	The Goods registered in this declaration have not yet been registered correctly as having been exported outside the EU	DMSGER	Check documentation if ECS process was followed correctly, and send ADDALT message with alternative proof of exit.
Payment Instructions	Request by customs for payment due to insufficient funds on the guarantee	DMSCPI	Arrange payment (outside the system) and declaration awaits next message from NL customs
Payment Reminder	A previous payment instruction has not yet been fulfilled	DMSCPR	Check / Arrange payment (outside the system) and declaration awaits next message from NL customs
Physical Inspection	The declaration has been selected for physical inspection by NL customs	DMSCTL	No action possible - declaration awaits next message from NL customs
Pre-Declaration Received	The pre-declaration has been received and validated by customs	DMSRCV	Goods arrival message is to be sent to NL Customs upon arrival of the goods
Pre-Declaration Sent	A Declaration of the type Pre-declaration has been sent to NL Customs	AGSCUSDEC	No action possible - declaration awaits next message from NL customs
Produce Documents	Customs has requested to receive a physical copy of the documentation mentioned in the declaration	DMSDOC	A invalidation or correction request can be send to NL customs
Provisional Payment Due	The provisional payment details due on a declaration	DMSTAX	No action possible - declaration awaits next message from NL customs
Reminder Incomplete	On the incomplete declaration, the supplemental details are overdue	DMSINC	The supplemental declaration is to be created
Supplemental Created	A Supplemental declaration has been created but not yet sent	-	Message can be modified, deleted or sent
Supplemental Sent	A Supplemental declaration has been sent.	ADDSUP	No action possible - declaration awaits next message from NL customs
Syntax Error	A technical error has been found in the preceding message of the declaration	CTRL	Correct the last message and resend to customs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AGS Voorafaangiften

- Aangeven voor aankomst van de goederen
  - AGS vooraf-aangiften
  - Meerdere aangiften selecteren om tegelijk in te sturen
- AGS - Exports Containers

Aangeven voor aankomst van de goederen

Recente aanpassingen bij de Nederlandse Douane, in AGS en in Scope - NL Douane maken het mogelijk om efficiënter AGS-aangiften te maken. De Douane kan bij vooraf-aangiften eerder informatie geven wat de planning bij import kan vergemakkelijken. In Scope kun je meerdere voorbereide aangiften tegelijk selecteren om in te sturen en voor meerdere vooraf-aangiften tegelijkertijd de aankomst melden. Daarnaast kun je op een onvolledige uitvoeraangifte een aanvullende aangifte doen om de containergegevens aan te vullen.

AGS vooraf-aangiften

De Douane heeft met enkele douane-aangevers een pilot gedraaid met vooraf-aangiften. De Douane informeert de aangever vooraf over een eventuele selectie voor document- en/of fysieke controle. De pilot is officieel geëindigd per 1 april 2017. Neem contact op met uw KLACO om u aan te melden voor deze faciliteit.

De huidige berichtenstroom is:

Douane-agent	richting	NL Douane
Originele AGS-vooraf-aangifte IM - D of IM - E	->	
Aangifte is correct gevalideerd in AGS	<-	DMSRCV
Aankomst goederen	->	
	<-	DMSACC
Optioneel: kennisgeving overleggen bescheiden	<-	(DMSDOC)
Optioneel: goederen dienen te worden geïnspecteerd	<-	(DMSCTL)
Vrijgave		

De nieuwe berichtenstroom is:

Douane-agent	richting	NL Douane
Originele AGS-vooraf-aangifte IM - D of IM - E	->	
Optioneel: kennisgeving overleggen bescheiden	<-	(DMSDOC)
Optioneel: goederen dienen na aankomst te worden geïnspecteerd	<-	(DMSCTL)
Aangifte is gecontroleerd en niet voor controle geselecteerd	<-	DMSRCV
Aankomst goederen	->	
	<-	DMSACC
De normale stroom van de aangifte is verder: fysieke controle, indien zo aangegeven, anders vrijgave		

Dit nieuwe scenario betekent dat een invoeraangifte kan worden verzonden naar de Douane voorafgaand aan de aankomst van de goederen.
Het is dan direct duidelijk:

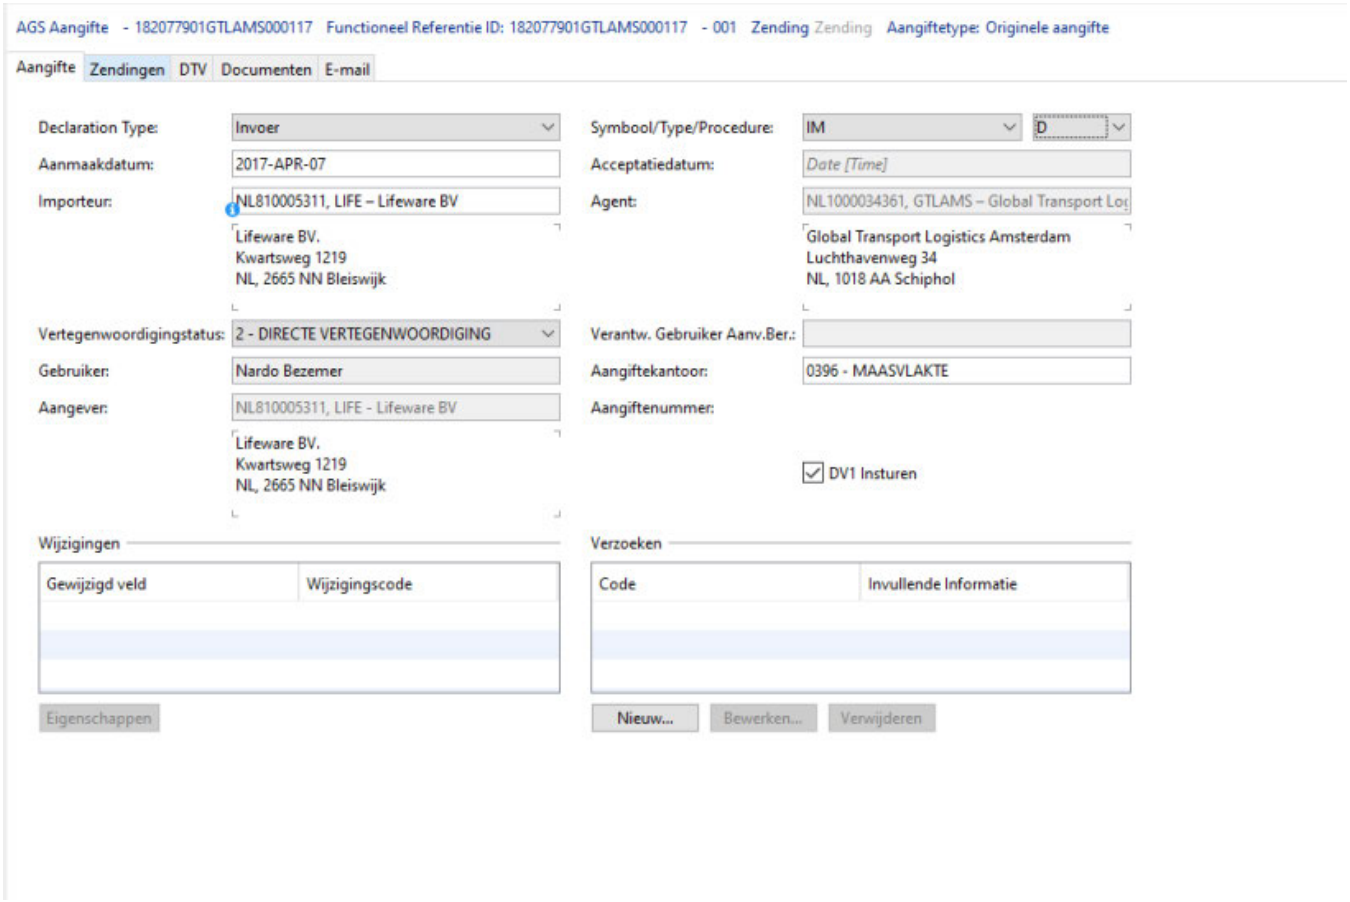
- Of de aangifte nog fouten bevat en gecorrigeerd dient te worden.
- Of de aangifte correct is maar bescheiden dienen overlegd te worden aan de Douane; indien reeds beschikbaar, kan ook dit al gedaan worden voorafgaand aan de fysieke aankomst van de goederen.
- Of de aangifte correct is, maar geselecteerd is voor fysieke controle na aankomst, zodat de klant, voor aankomst van de goederen, geïnformeerd kan worden dat de goederen niet direct bij aankomst beschikbaar zullen zijn in verband met controle.
- Of de aangifte correct is en niet geselecteerd is voor inspectie; de goederen zullen direct na aankomstmelding vrij worden gegeven, de aflevering kan aansluitend ingepland worden.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Een AGS-aangifte wordt als een "vooraf-aangifte" gezien als het veld voor Aangifteprocedure gevuld is met:

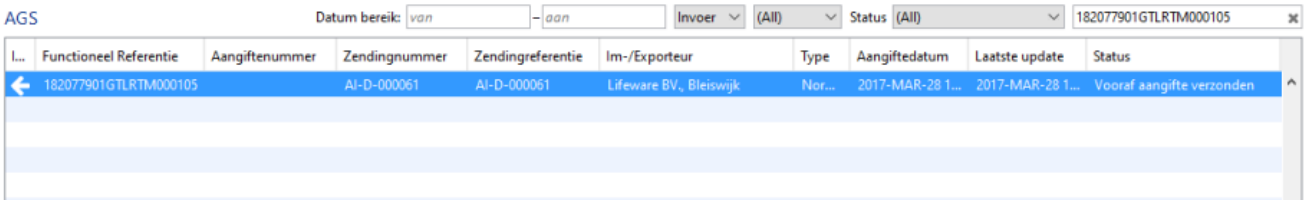
"D" = Een reguliere vooraf-aangifte.

"E" = Een onvolledige vooraf-aangifte, na aankomst dienen er nog aanvullende ontbrekende gegevens te worden ingezonden.



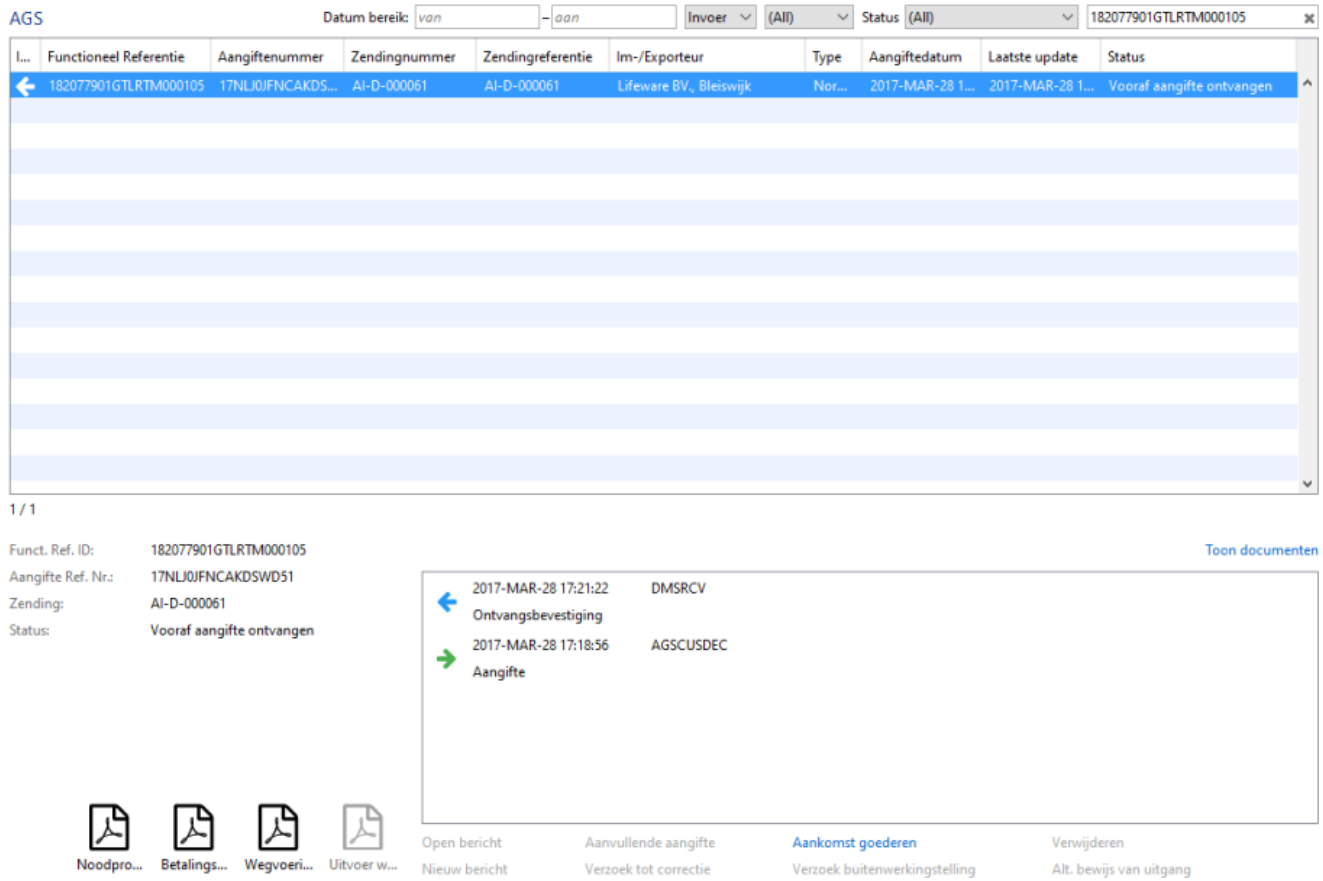
Na het versturen van een vooraf-aangifte naar de Douane, waarbij de aangifte niet geselecteerd is voor fysieke of documentcontrole, zal het statusverloop van de aangifte zijn :

Verzonden:



Ontvangen :

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Na de ontvangst van de DMSRCV, DMSDOC of DMSCTL wordt de optie voor het verzenden van het goederenaankomstbericht ("Aankomst goederen") actief. Zodra de goederen daadwerkelijk zijn aangekomen is een enkele klik zonder verdere invoer van gegevens voldoende om de aankomst te melden en zal de aangifte zijn normale gang vervolgen (vrijgave of fysieke inspectie).

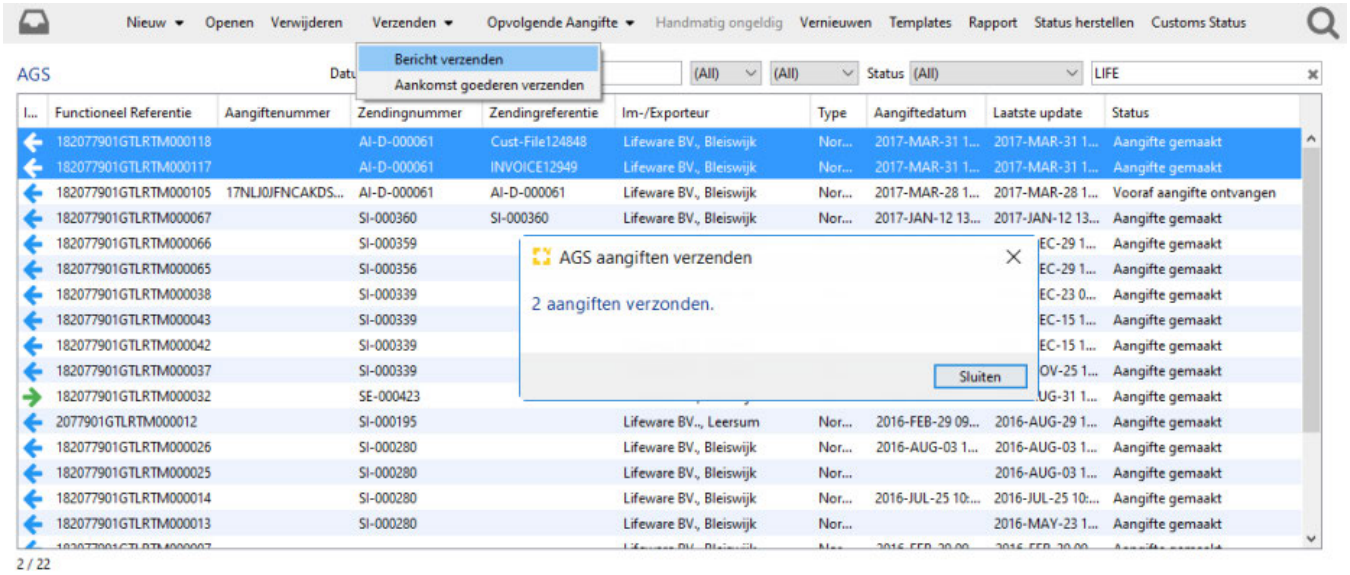
Omdat er voor het goederenaankomstbericht geen verdere gegevens geregistreerd dienen te worden is het door middel van permissies (NL Customs: Send AGS Goods Presentation) mogelijk om "niet-declaranten" een op zichzelf staande permissie te geven om de aankomst te melden.

Meerdere aangiften selecteren om tegelijk in te sturen

Naast bovengenoemde aanpassing is er ook een aanpassing gedaan waarmee je vanuit het beginscherm van AGS meerdere tegelijkertijd geselecteerde aangiften in één keer kunt versturen. Deze optie kan gebruikt worden om eerder voorbereide AGS-aangiften in één keer in te sturen. De optie kan ook gebruikt worden om voor AGS-vooraf-aangiften de aankomst van de goederen te melden.

Bij het versturen van nieuwe aangiften voert Scope eerst een validatie per aangifte uit. Wanneer er fouten worden geconstateerd zullen deze specifieke aangiftes niet verzonden worden.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Een mogelijk scenario om deze functionaliteit voor invoer te gebruiken is als volgt:

- Gedurende de week kunnen AGS-aangiften voor goederen die gedurende het weekend aankomen, worden voorbereid met procedure "IM-D".
- Vrijdagmorgen kunnen alle voorbereide aangiften in één keer worden verzonden naar de Douane.
- Na het versturen kunnen de benodigde acties worden ondernomen:
  - Aangiften met fouten corrigeren
  - Voor aangiften met melding tot bescheiden overleggen de documentatie versturen naar de Douane
  - Voor aangiften met fysieke controle de klant informeren over de fysieke controle en aangepaste aflevering
  - Aangiften met ontvangstbevestiging kunnen definitief ingepland worden voor aflevering
- Gedurende het weekend of op maandagmorgen kunnen alle "vooraf-aangiften", welke zijn aangekomen, in één keer geselecteerd worden om de aankomst te melden. waarmee in een zeer korte periode veel AGS-aangiften vrij kunnen vallen.

DTV

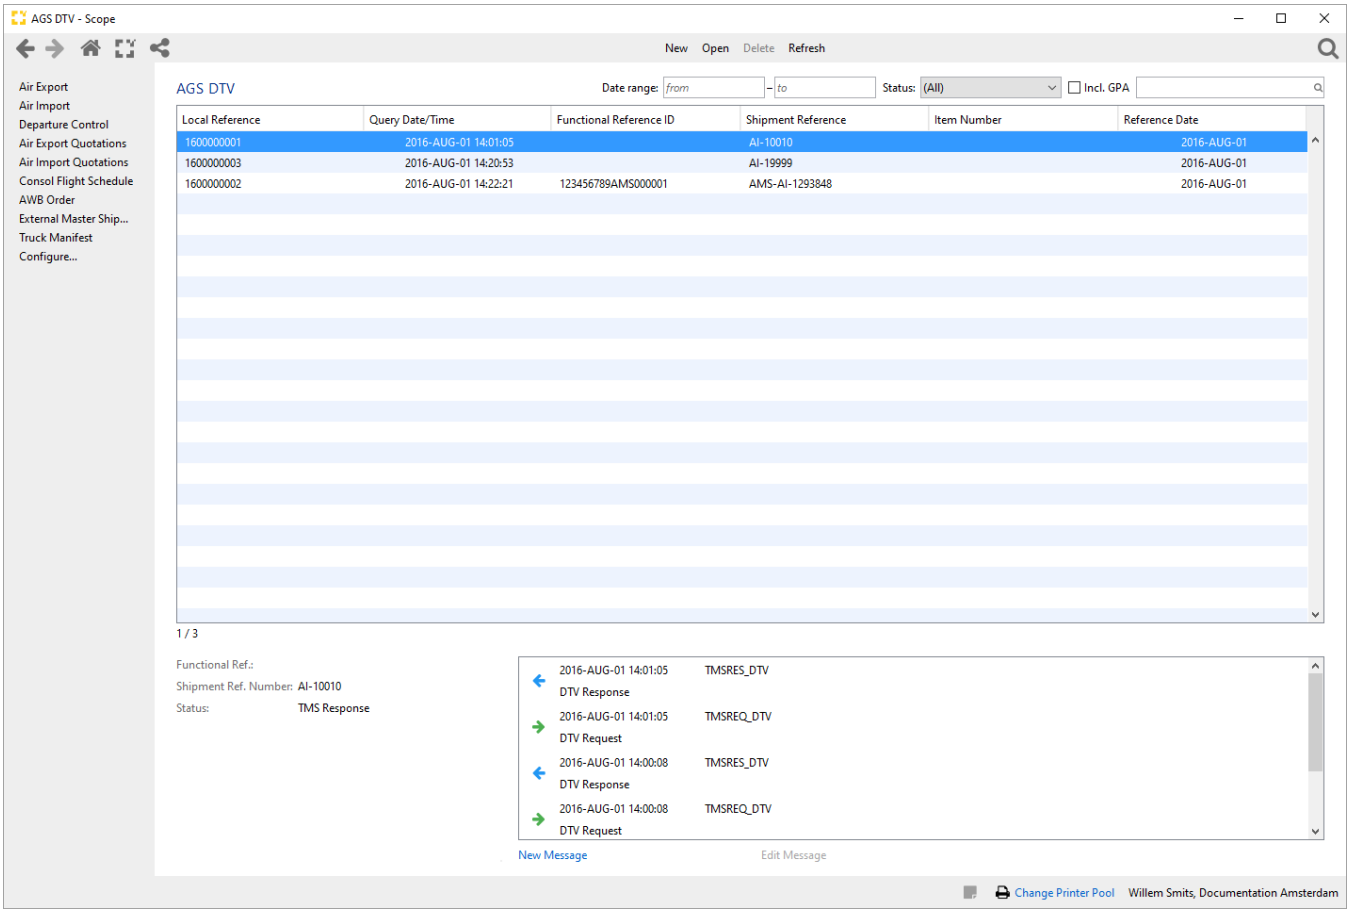
Introduction

With the introduction of AGS, NL customs also release a new Tariff website, to retrieve import duty and regulatory information, this new DTV is also accessiable via a webservice, which is integrated into Scope.
this section describes the DTV option of Scope.

Note: At this moment only Import information is availble via the webservice, Details of regulations for export goods is to be retrieved via the website.

Description

The DTV function is availble as standalone option and integrated in the AGS declaration.



Application Actions

New

Option to create a new stand-alone DTV request

Open

Opens the selected DTV request.

Delete

Option to delete a not sent DTV Request

Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Option to refresh the screen

Search Bar

in the search bar filtering for DTV request can used to find a specific DTV request

Date Range

To filter DTV requests from a certain period.

Status

Filter on the Status of DTV request

Incl GPA

This indicator, if active, will show also all DTV request send from the GPA application

Quick search

Search field to filter on data in the DTV request

Homeview

In the homeview of the DTV the following columns will be displayed

Local reference

Local reference Id to identify the DTV request

Query Date/Time

Date time when the response message on a query was processed

Functional Reference ID

The local reference of a AGS declaration if the DTV request was created from within AGS declaration

Shipment Reference

Reference number of the shipment, Free field in case of a stand alone request for administrative purposes, defaulted with shipment number of AGS declaration

Item Number

The item number of AGS declaration should the DTV request be created from a specific item instead of the full declaration

Reference Date

The date used in the DTV request to determine the calculation date.

Declaration detailed information

In the section of the detailed information more information regarding the selected Request is displayed.

Functional refererence ID

The functional reference Id is the indentification assigned by Scope to the declaration. this is a unqiue number for the Netherlands

Shipment number

The shipment number on which the declaration has been created

Status

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The current status of the Request.

Message

In the messages box a chronological overview of all incoming and outgoing message are displayed

Action Links

Under the message are shown the available action links, if an action link is enabled or disabled depends on the state of the declaration and if a message is selected.

Action link	Active	description
Edit Message	Whenever a message has been selected	opens the declaration message related to the selected message.
New Message	When on the last message is DTV response and a update request is to be send	Allows modification and sending of a new message

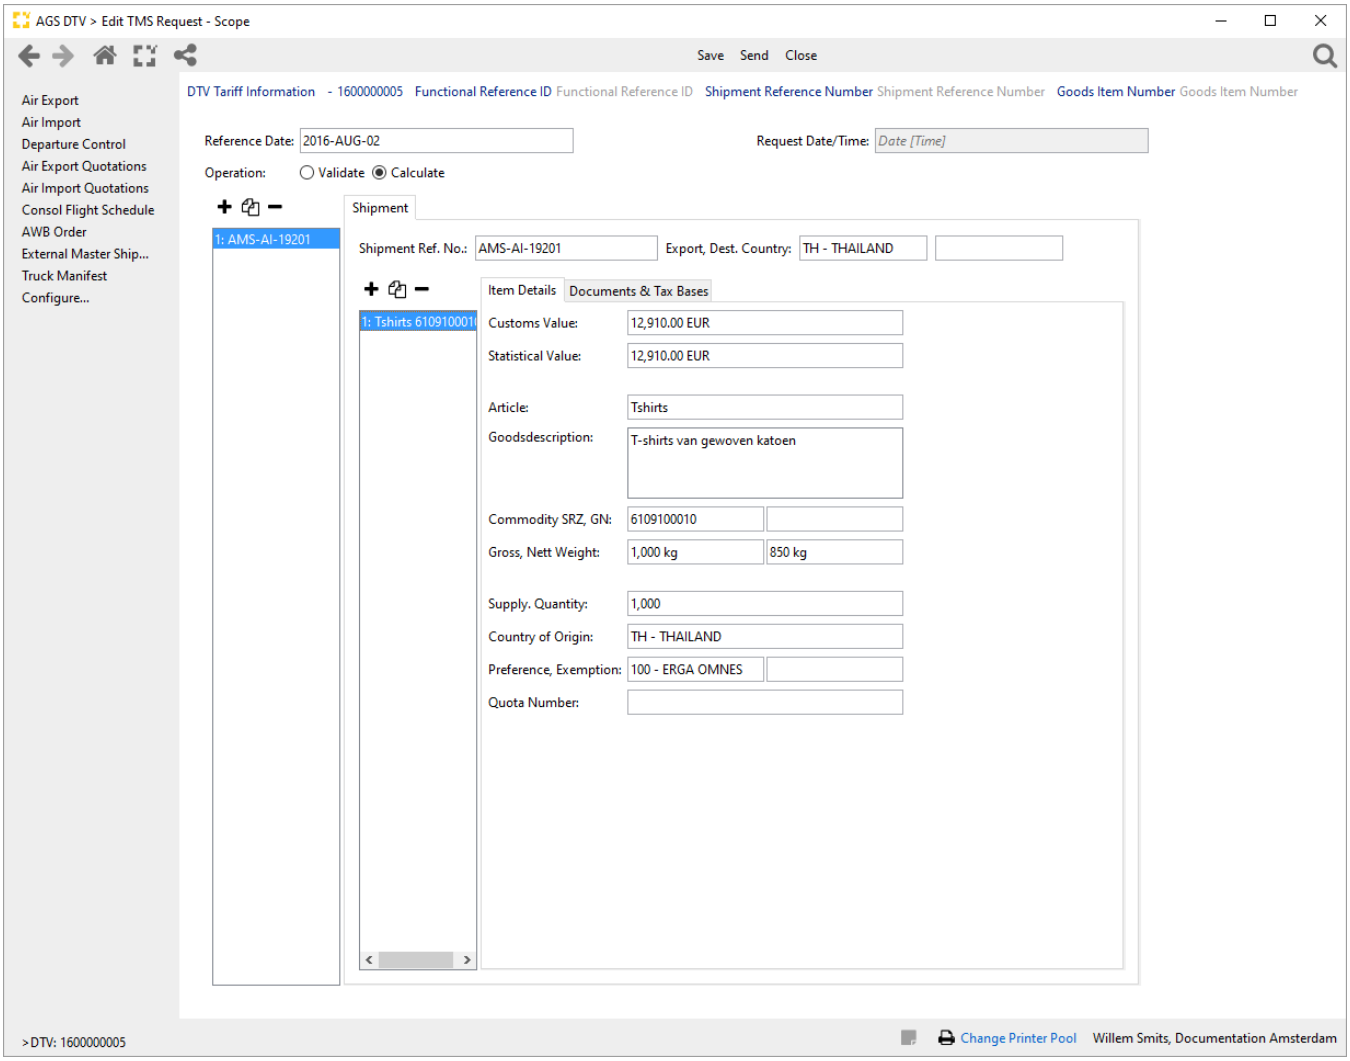
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

DTV Request

Introduction

This page described the possibilities of a DTV Request

Description



Reference date

The validity date for which you issue your request, the DTV request allows both historical information, or future information although future information is subject to change by Customs.

Operation

Choice between **validate**, check if all information and required documentation is correct or, **calculate,** check and calculate the applicable duties and taxes.

Shipment Ref.No.

Field where a reference number, such as a shipment number can be entered for future reference and tracebility

Export Country

Country where the goods have been/will be shipped from

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Destination Country

Destination country, should remain and for correct results

Customs Value

The Customs value which should serve as basis for the calculation of duties by customs

Statistical Value

The statistical value of the goods

Article

Selection of a master data article and the corresponding defaulting
This field also allows to enter a new article code and store it in the master data base.
Save actions when available will be indicated by a icon.

Goods Description

The description of the goods, not required for the actual request

Commodity class SRZ

The EU Common commodity class (HS) code

Commodity class GN

the NL specific coding for the goods concerning VAT or excise

Gross weight

The gross weight of the item, in the DTV request optional

Nett Weight

The nett weight of the item,

Supplemental Quantity

Additional quantity if required for the specific Commodity class

Preference

The Preference code, either ERGA OMNES (full duties) or deduction reason

Exemption

Exemption reason why duties / taxes should not be applicable

Quota number

The quota number is applicable to the Commodity Class

Documents Tab

In the Document Tab additional document and tax items which are needed for the duties calculation are registered here, for the documents only a document code is required.

DMS

Introduction

This section of the manual describes the implementation of DMS. DMS replaces the AGS system.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Global overview of changes in Scope for DMS

In many ways DMS looks similar as AGS. However DMS has extra data elements. DMS offers also the ability to specify details on shipment level in case these are the same for all items. Also the codelists are different from AGS, so the user will have to search again for the correct codes.

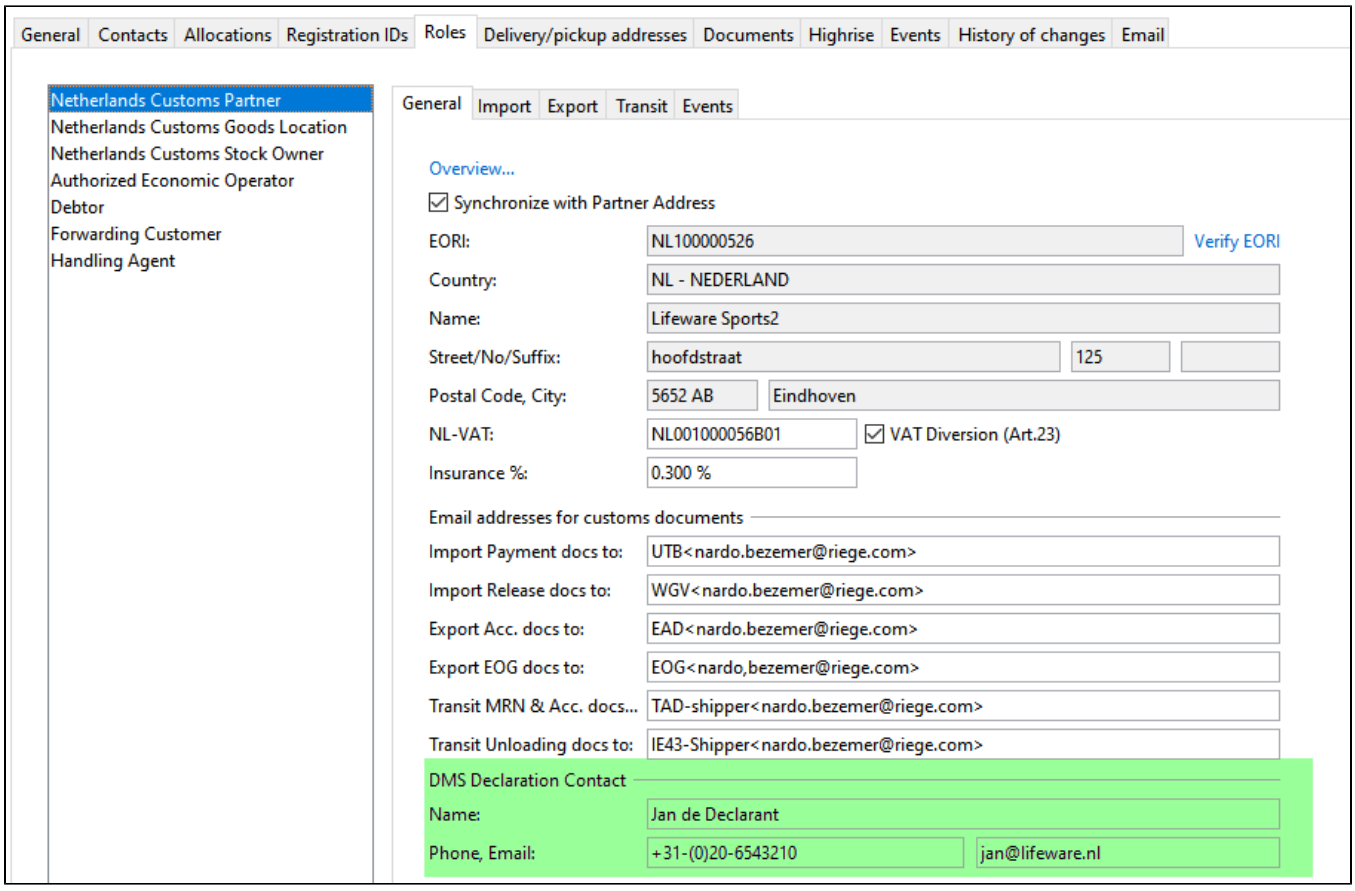
The following changes for DMS have been implemented in Scope.

- Partner
  - Role NL Customs Partner
  - Role NL Customs Goodslocation
- DMS-module
  - DMS Declaration Screenlayouts
    - DMS Home/Overview
    - Details on declaration level
    - Details on shipment level
    - Details on Item level
    - Templates
  - Reporting import-/export declarations

Partner

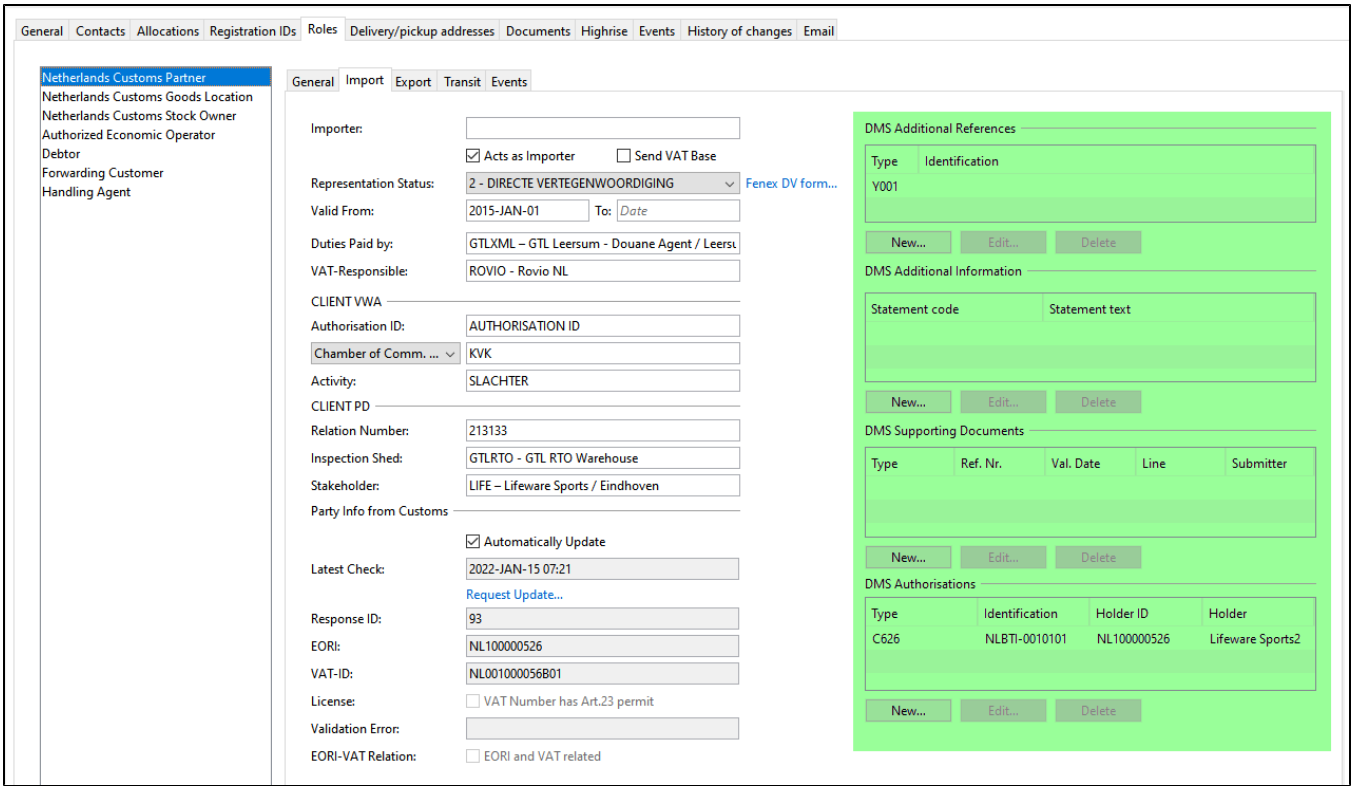
Role NL Customs Partner

For import and export the user can now define several standard values for authorisations and additional references. It are details that can be specified in the declaration itself, but when these are re-occurring for specific Partners, these can be defined in the Partner file and will be automatically takenover into the declaration when that partner is used.



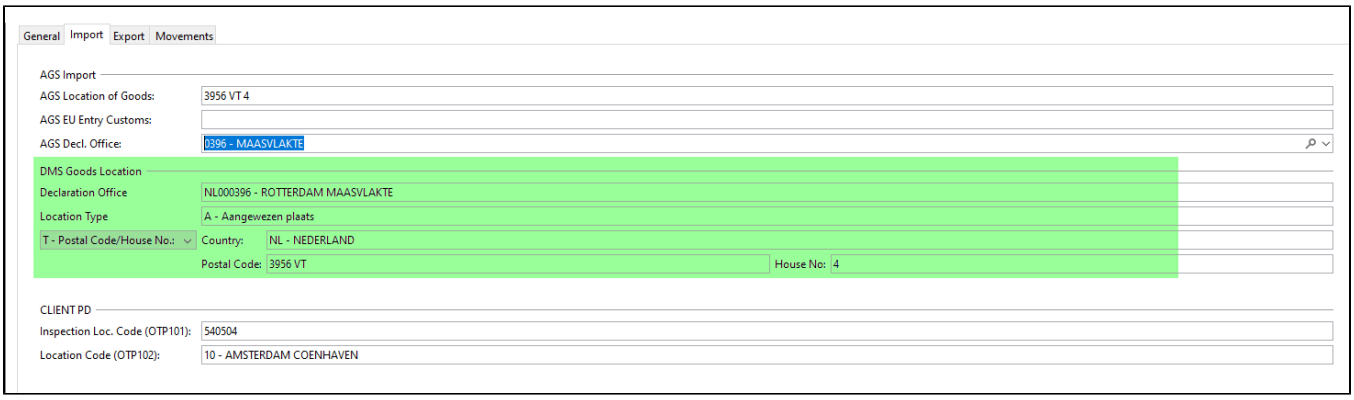
When the partner acts as a declarant in the declaration, its possible to define a standard contact person for this partner. It will be copied into the declaration when this partner is used as declarant.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Role NL Customs Goodslocation

The format of how the goods location is specified in the declaration is changed. There are now several ways to indicate the location. Customs will still use the well-known Postalcode + housenumber in most cases. However for DMS these fields are now split in separate fields: country, postal code and housenumber. In Scope these DMS goods locations will be migrated from the AGS goods location.



DMS-module

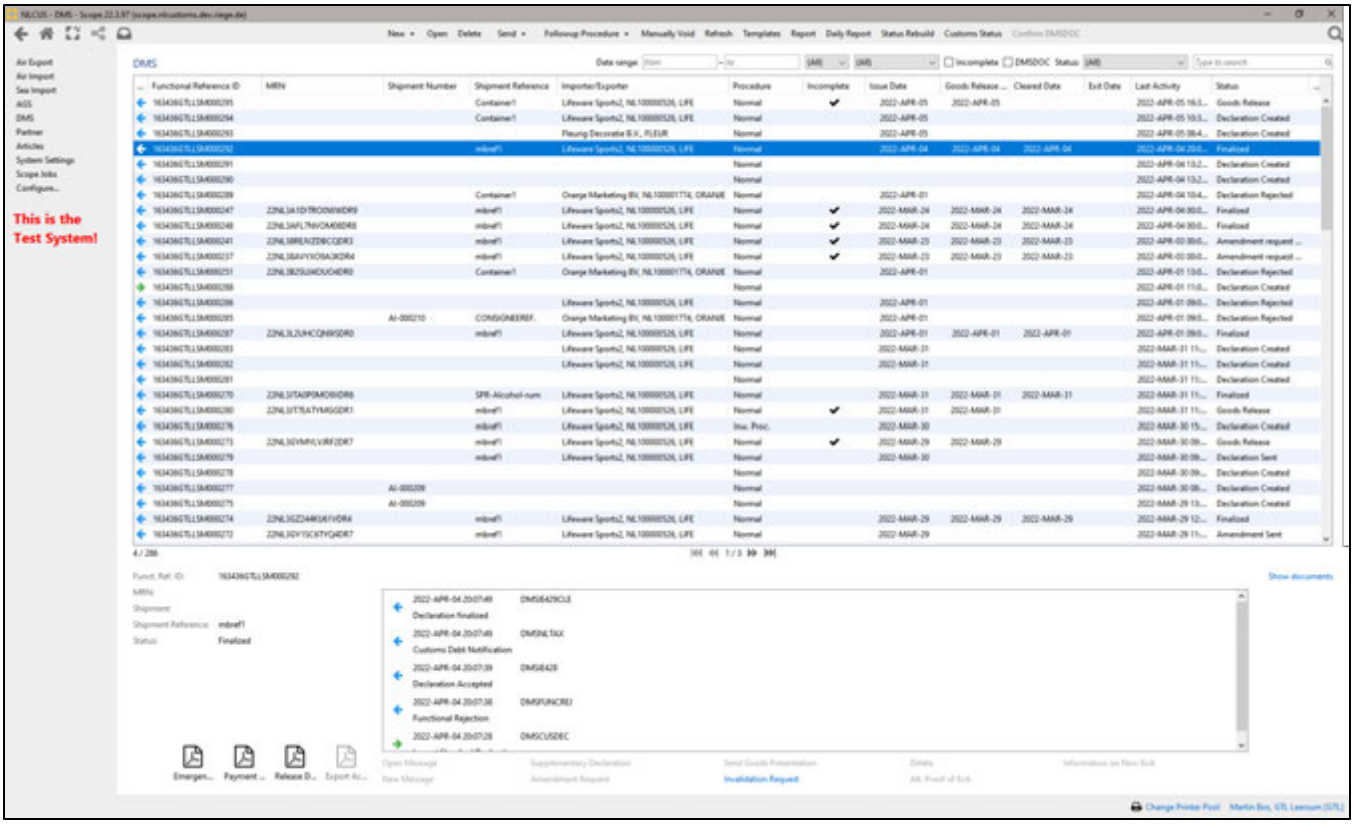
A new DMS module/appliance will be visible, next to the existing AGS module. It will have the same look-and-feel as the existing declaration appliances.

DMS Declaration Screenlayouts

The screens of the DMS declaration will be as mentioned below.

DMS Home/Overview

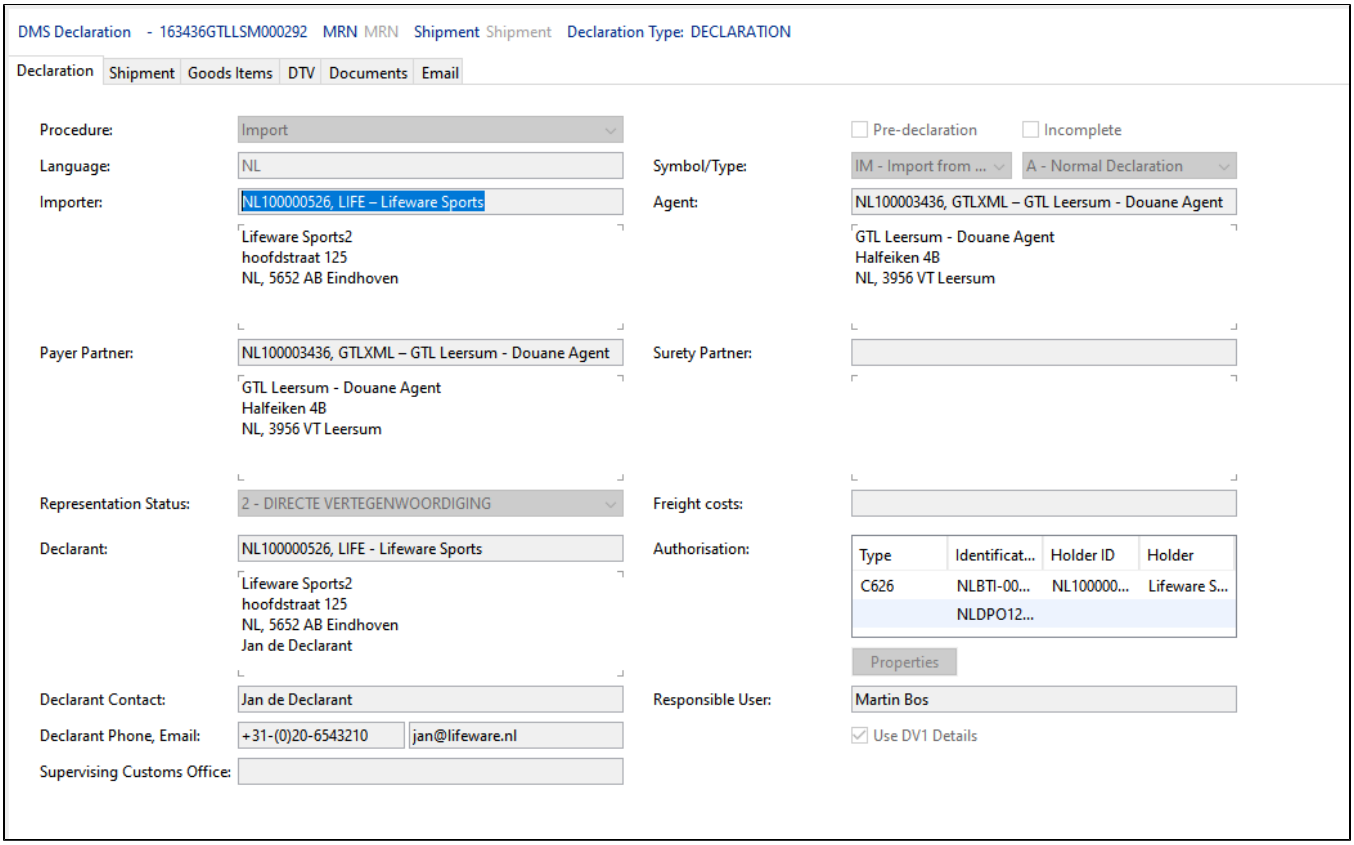
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- There will be an extra filter field to filter on "Incomplete" declarations. The user can see and filter on declarations for which a supplemental declaration still has to be made. Once the supplemental declaration is accepted, the Incomplete indicator will disappear.
- DMS uses new message codes:
  - DMSCUSDEC = Normal import declaration
  - DMSCUSDEC_INC = Incomplete import declaration
  - DMSCUSDEC_PRE = Advance declaration
  - DMSCUSDEC_SUP = Supplemental declaration
  - DMSCUSDEC_AMD = Declaration with changes
  - DMSIE428 = Acceptance (procedure will gets its MRN)
  - DMSNLTAX = Duty and Taxes (for the UTB/Paymentdetails form)
  - DMSIE429CLE = Cleared/Released
  - DMSIE429ROG = Goods released. Declaration not finalized yet.
  - DMSFUNCREJ = Declaration rejected due to functional errors

Details on declaration level

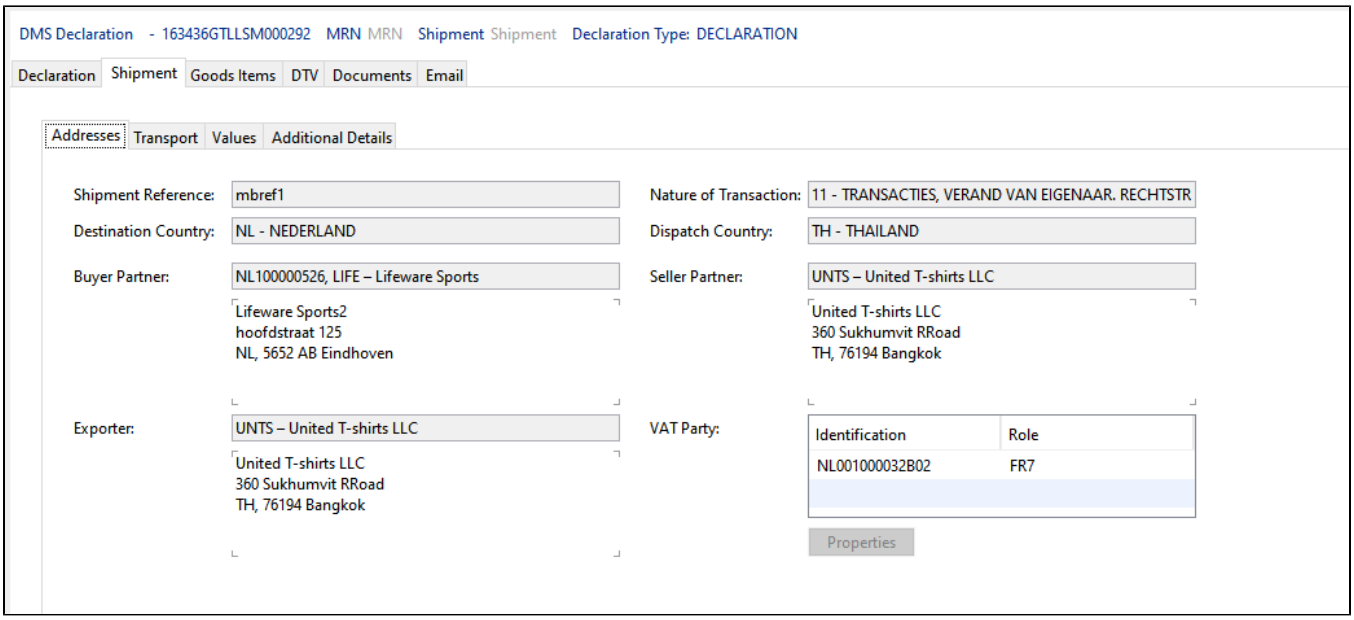
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Seperate fields to indicate a pre-declaration and/or a incomplete declaration
- Authorizations: permits/licenses. F.e. for deferred payment

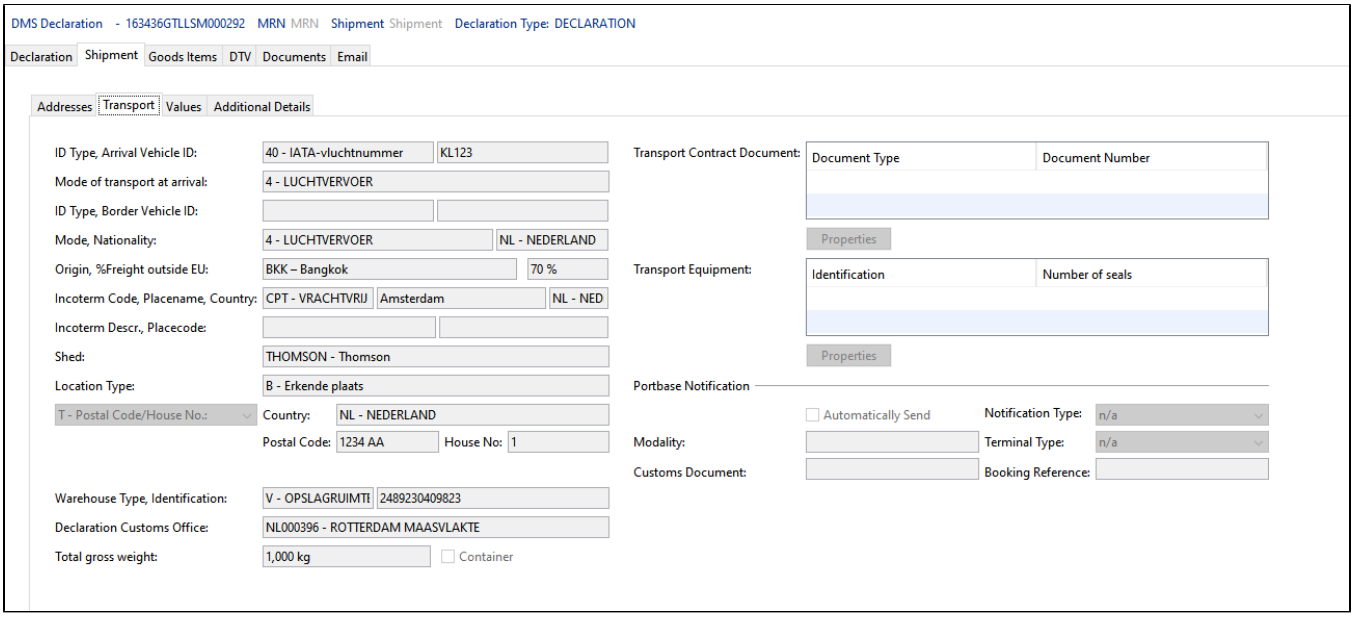
Details on shipment level

Like in AGS, a DMS declaration will also have only 1 shipment level.

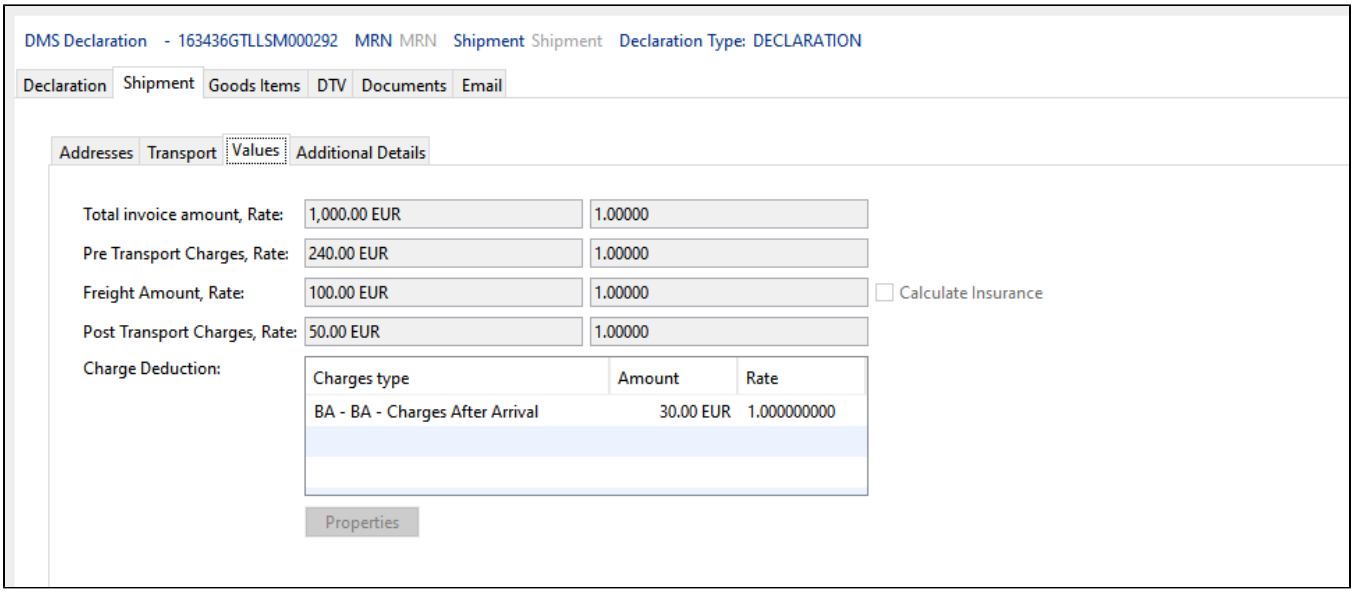


- Nature of Transaction: This has now different codes than in AGS.
- VAT Partner: Its possible to define multiple, although the use case is not clear yet.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

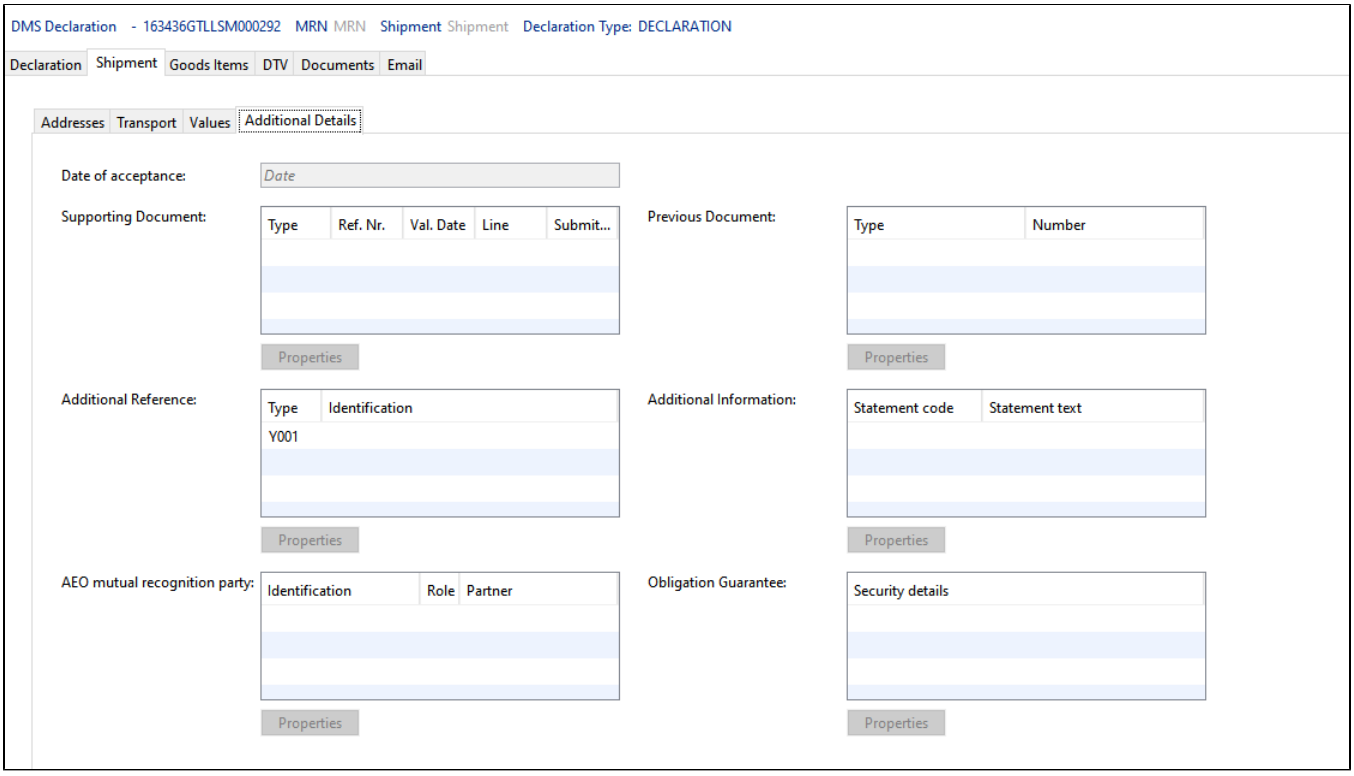


- Transports Means: Extra field to indicate the type of identification (like Vesselname or Flightnumber)
- Goods Location: Now split in separate fields.
- Transport Documents: Transport documents that are applicable for a items, can now be specifed once on shipment level instead of the first item
- Transport Equipment(Containers); Containers for this shipment. On item level the user can select in which container(s) the item is stored.



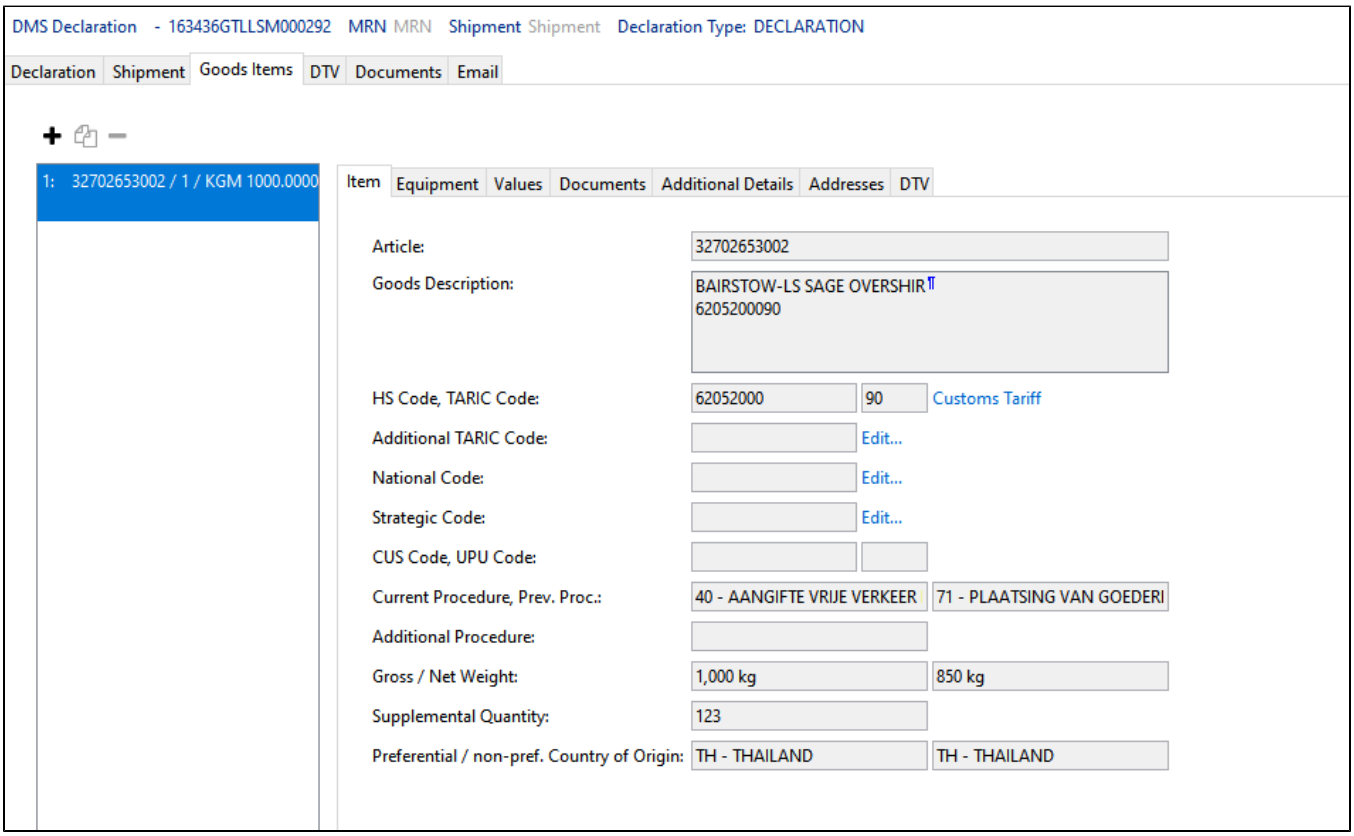
- Codes (Charge Deduction/type) for valuation adjustments are different than in AGS.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



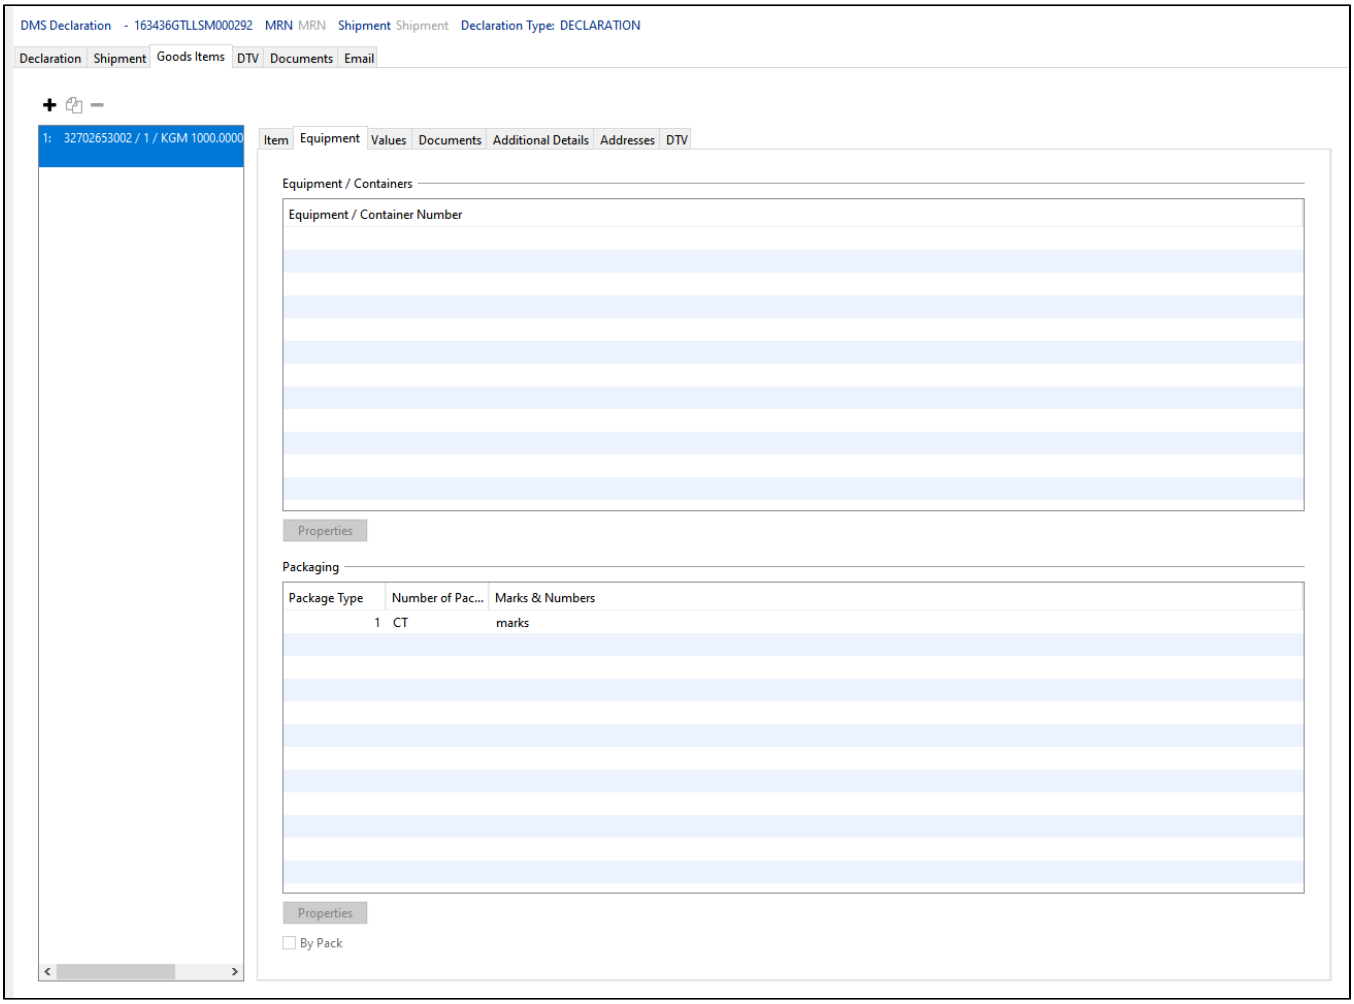
- Previous documents: Its now possible to define these on shipment level in case these are the same for all items.
- Certificates/Documents in AGS are in DMS split into 3 types:
  - Transport Documents
  - Additional References
  - Supporting Documents
- Its now possible to define these on shipment level in case these are the same for all items.

Details on Item level

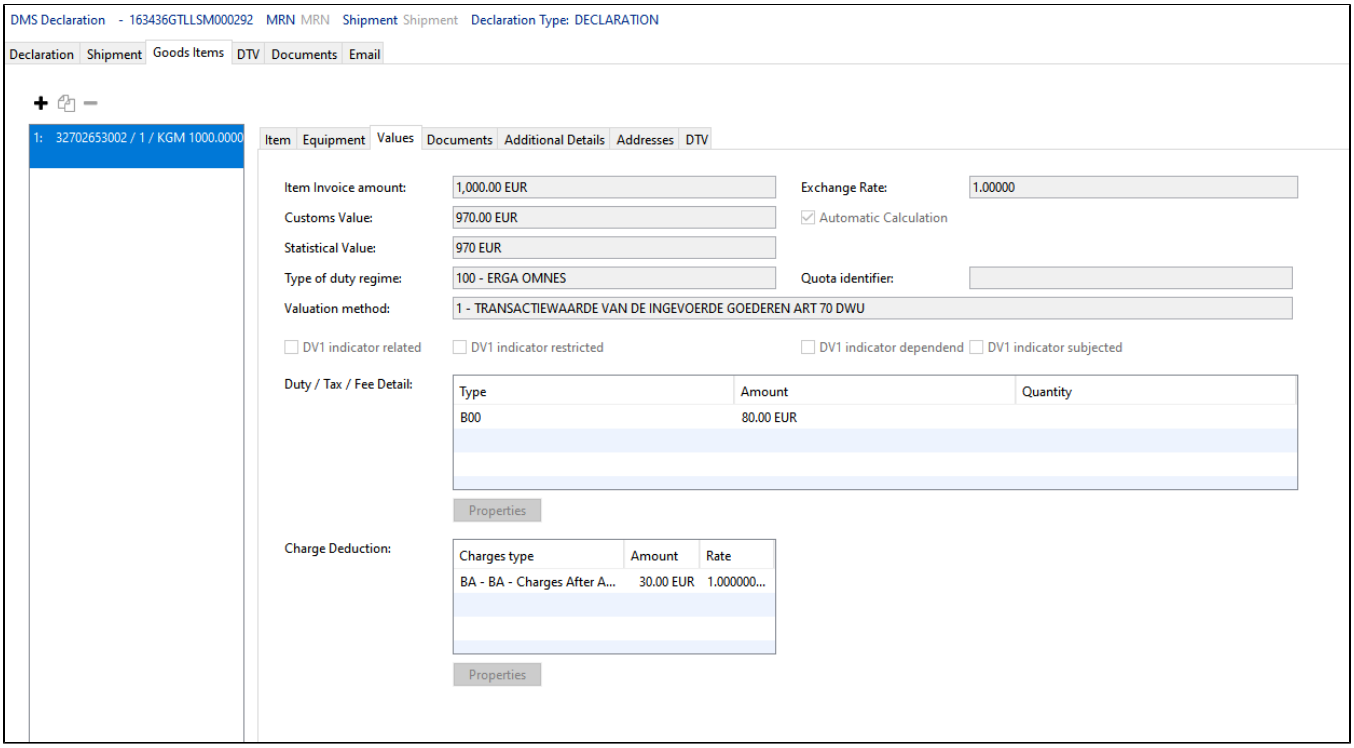


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

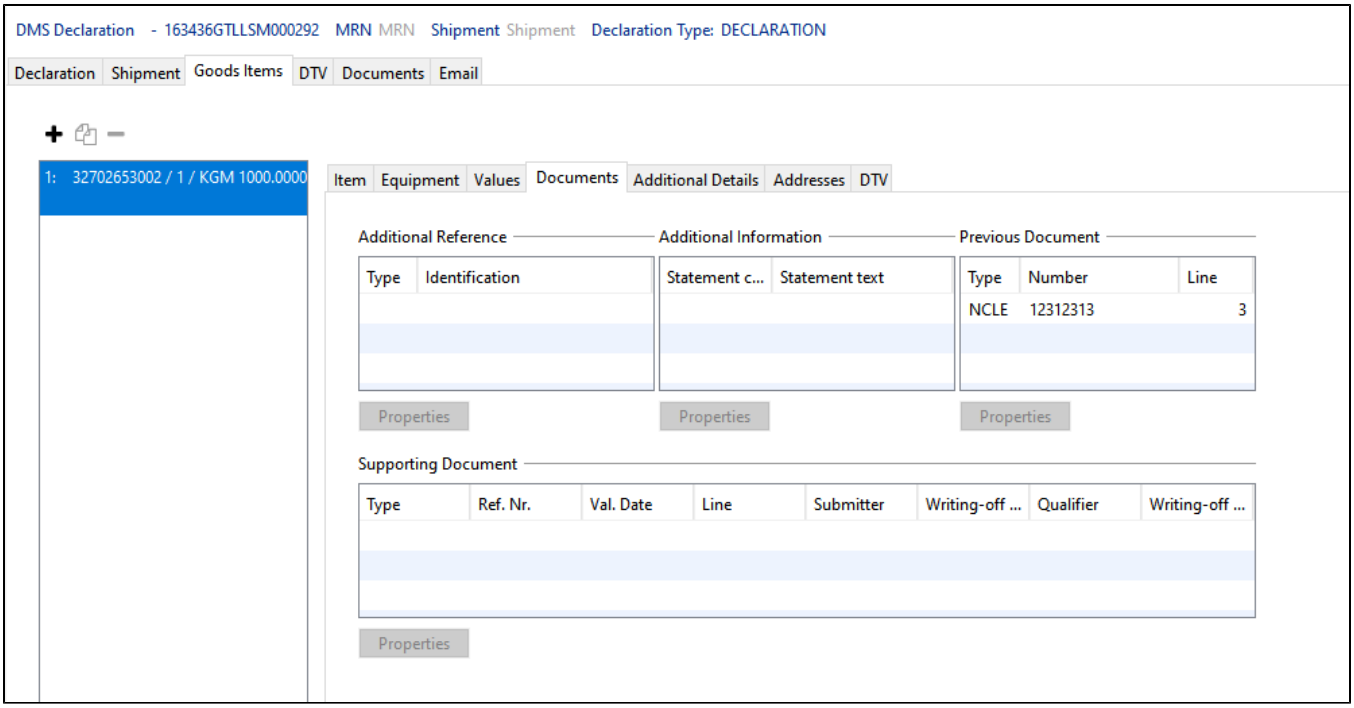
- The commodity code in DMS is now split in separate fields:
    - HScode (8 positions)
    - Taricccode (2 positions)
    - Additional Taric codes (multiple: each 4 positions)
    - National code (multiple: each 4 positions)
    - Strategic Codes (multiple)
    - CUS and UPU codes: used for special purposes like postal shipments
- There are now 2 types of country of origin: preferential and non-preferential



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

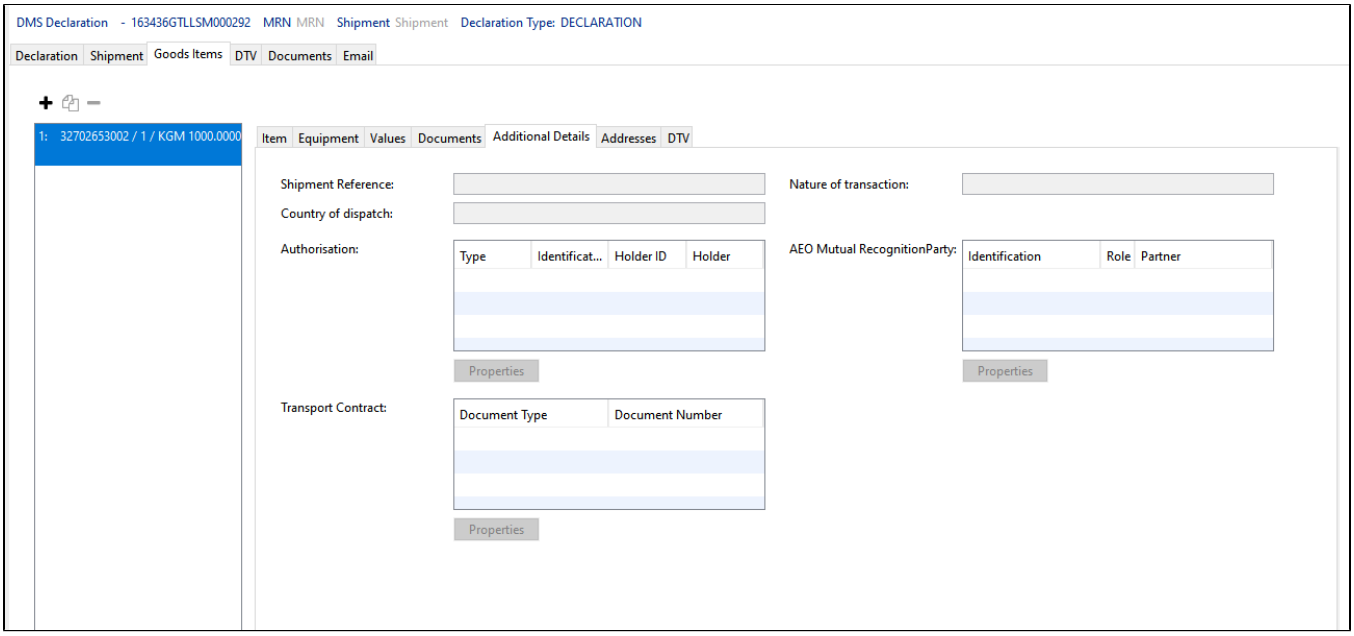


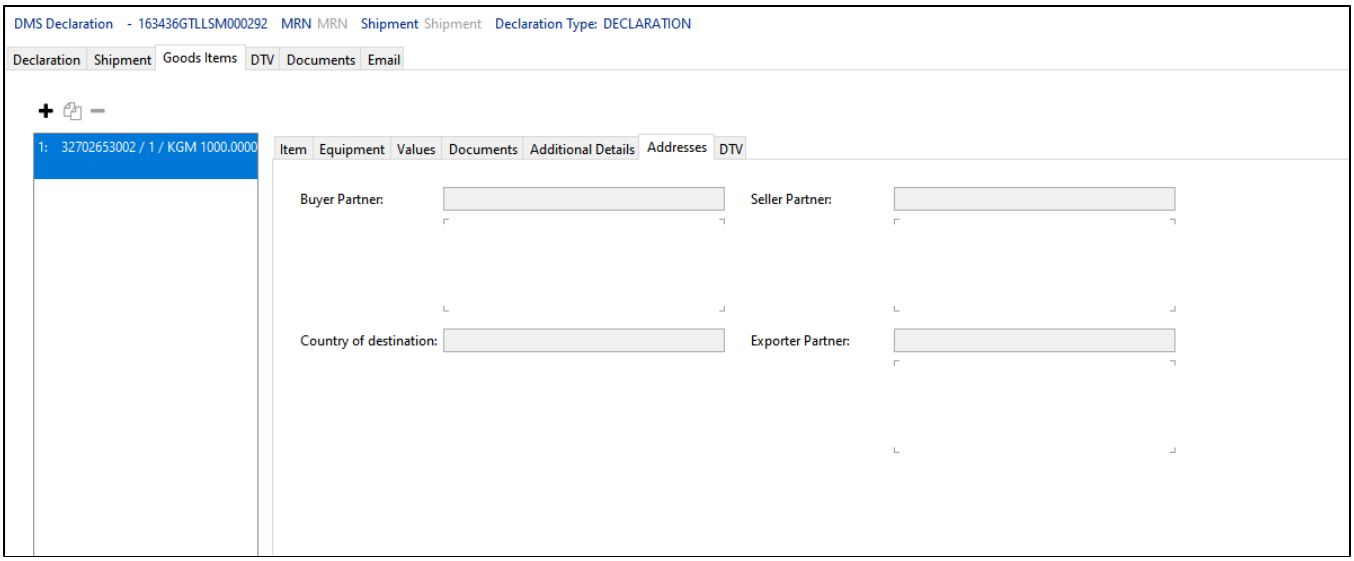
- Valuation method is a new field in DMS
- DV1-indications are now limited to 4 fields



- Certificate/Documents on item level are now split into 2 different groups
  - Additional Reference
  - Supporting Document
  - Transport Document

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





- Like in NCTS, the buyer, seller and exporter can now differ per item

Templates

AGS-templates will not be converted to DMS templates. Like in AGS, the user can save DMS declarations as template

Reporting import-/export declarations

With DMS, there will be a separate reporting/statistics appliance for import/export declarations. This will include both the AGS and DMS declarations. This new appliance also supports creation of layouts so the user can define which columns will be in the report.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

NL Customs Basetables

- Introduction
- FAQ

Introduction

Besides the NL Customs modules several base tables consist of NL Customs specific details, such as partners & Articles, the specifics for this can be found in the Maintenance Chapter of the user guide.

Base table	Description	Link
Nl Customs Partner Roles	details of shippers / Consignees in Declarations	Nl Customs Partner
NL Customs Goods Location	details of warehouse / shed where used in declarations	NL Goods Location
NL Customs Declarant	details of the declarant (local branch details for customs declarations	NL Declarant
NL Customs Article Details	Product details with NL customs specifics	NL Customs Profile

Ecs Arrival at Exit Message

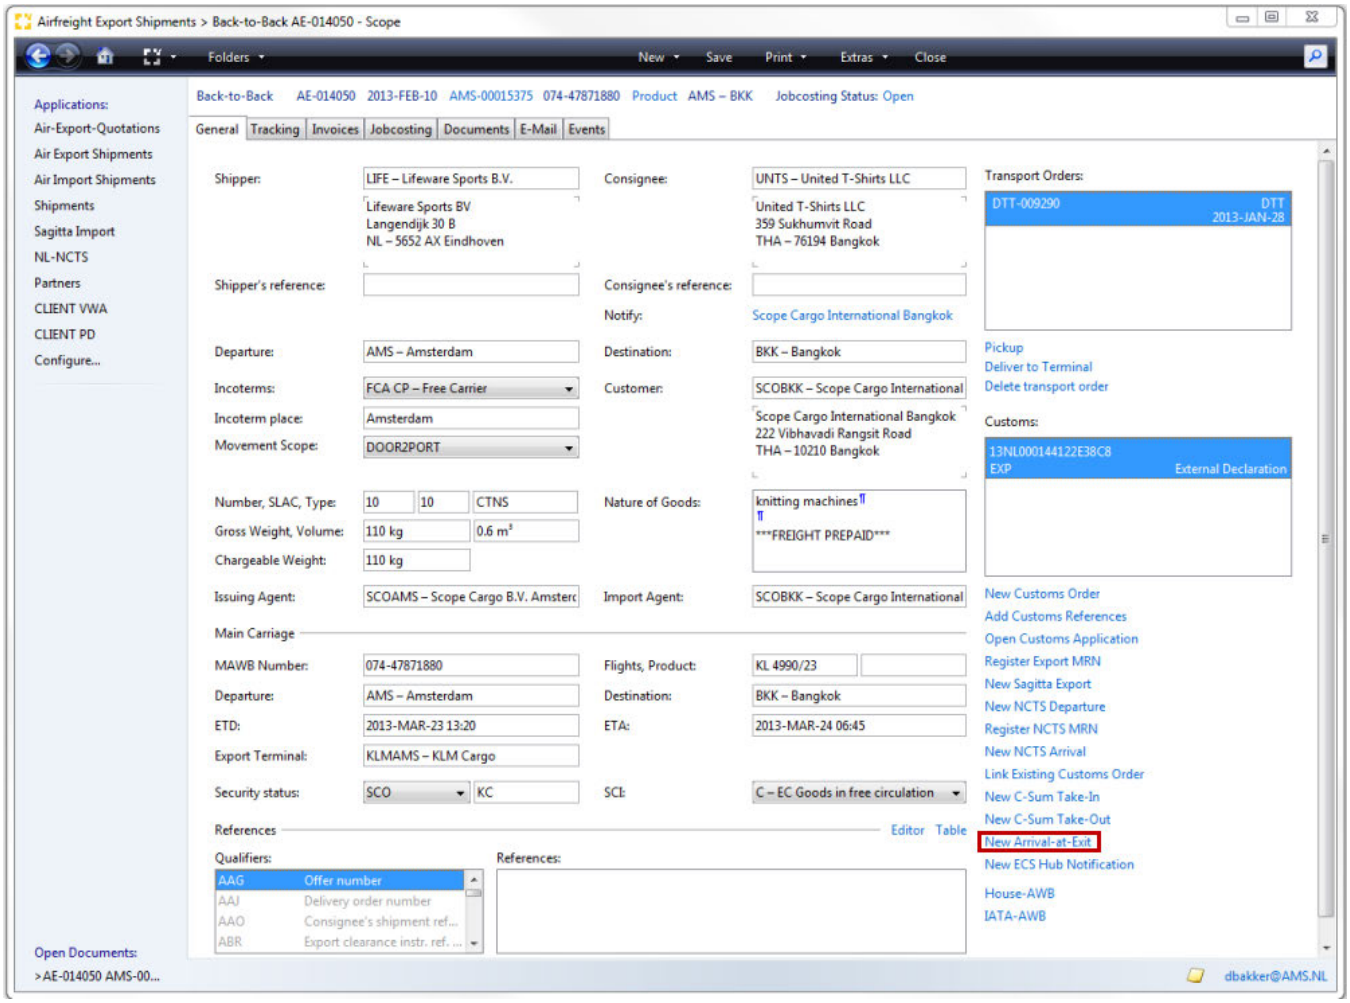
- Introduction
- Description

Introduction

The Arrival at Exit message is used the inform NL Customs that a shipment under coverage of an EU Export Declaration, with valid MRN number, \has arrived at the final goods location prior to leaving the EU via Air, Road or Seafreight.

Description

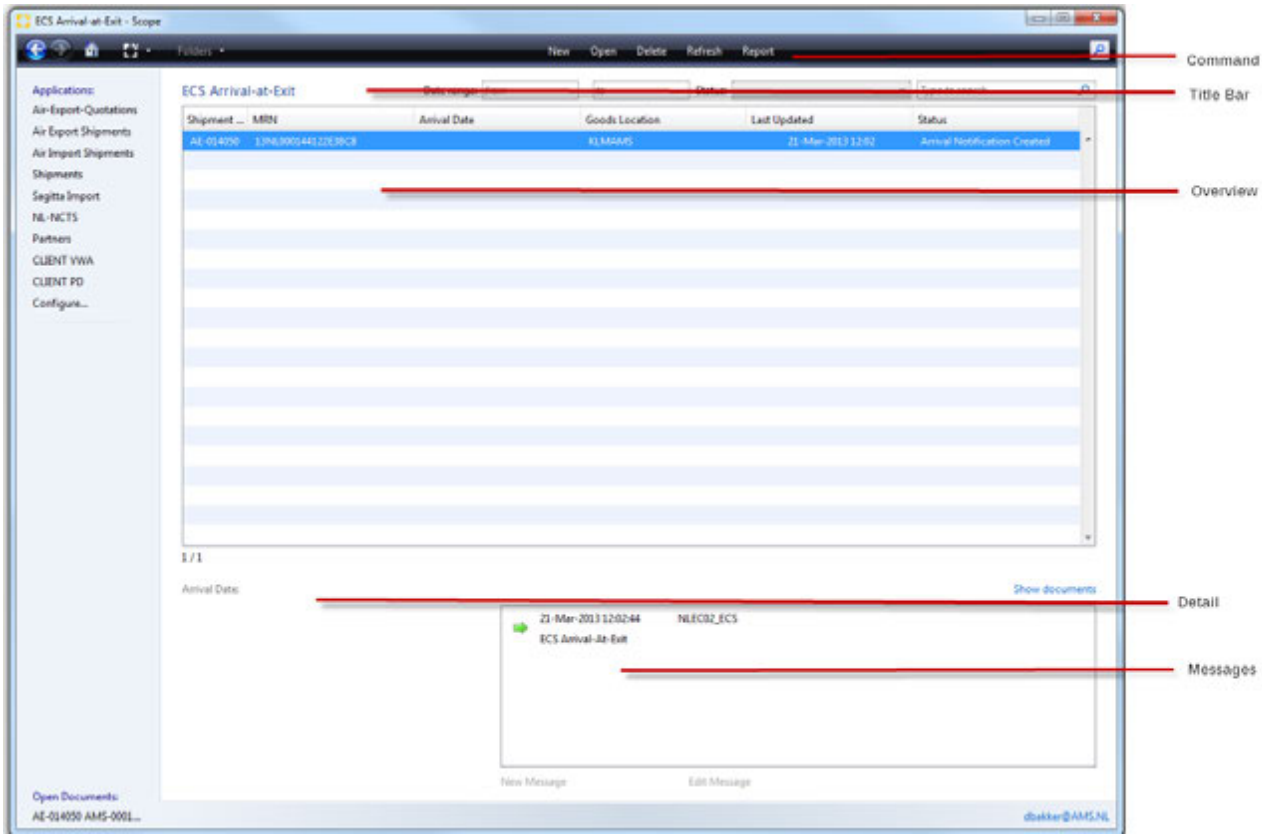
Sending ECS-AaE from Shipment



ECSAaE Procedure window

The ECSAaE function is also available as a stand - alone application, started via Netherlands Customs \ Ecs Arrival at Exit.
This gives a total overview of all the ECSAaEprocedures/messages sent to NL Customs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Application commands

New

Creates a new manual ECSAaE message

Open

Opens an existing ECSAaE messsage

Refresh

Updates the status of the declarations in the window

Delete

Deletes an existing ECSAaE message, if this is still has only the status Created

Report

Exports the active Selection as an CSV file which will be opened in the default defined editor for CSV.

Title bar

Date Range

Selection of a period, will select the Exit date time as selection criteria

Status

Allows filtering on specific states of ECS HUB message

Status	Meaning
Arrival Notification Created	The entry only has been created and not send

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Arrival Notification Sent	The entry has been sent but no response has yet been received
Arrival Notification Accepted	The message has been accepted by NL customs
Arrival Notification Rejected	The message contained an error and has been rejected by NL Customs further Action of the user is required
Control Notification	The shipment under the MRN number has been selected for ECS compliance control
Release Notification	The shipment previously selected for ECS compliance control has been release for departure
Syntax error	A technical message error has occurred

Overview

Shipment Number

Shipment number to which the arrival at exit message has been linked

Reference Number

Arrival date, the date entered as date/time when the goods have arrived at the goods location

Goods Location

Partner code of the location of goods where the shipment is located

Last Updated

Date/time the last update in the message has been received, this is also the default sorting in a descending order display the last updated declaration first

Status

The current status of the ECSHUB Declaration.

Detail

in the detail section the arrival date is displayed

Message

In the message overview the applicable message are displayed in a chronological order.

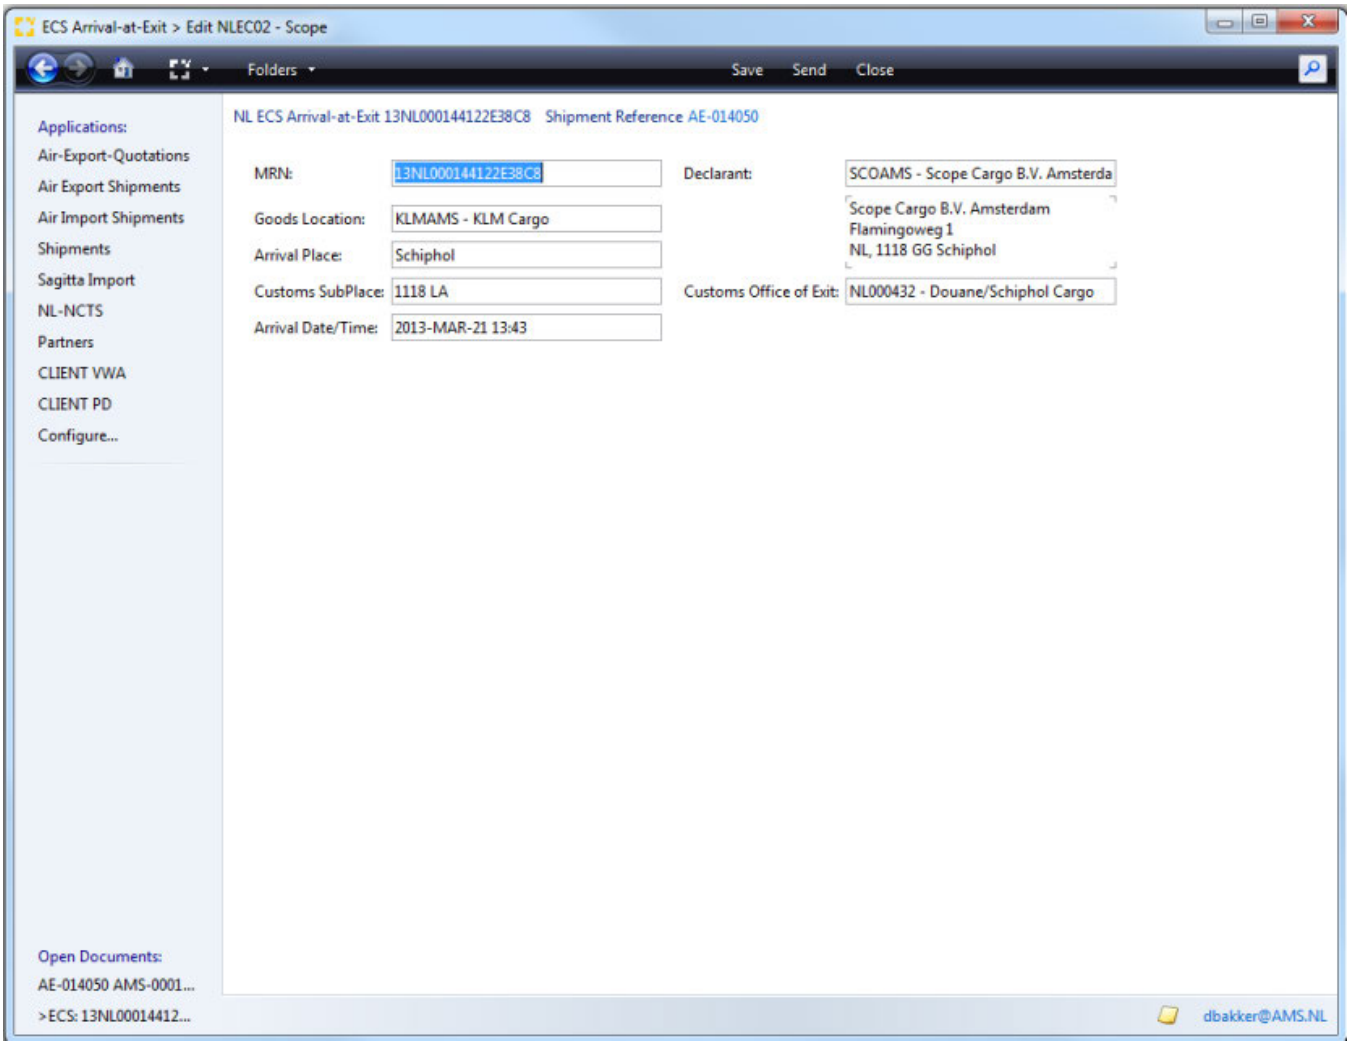
In case the declaration is in rejected state, the edit message will be active allowing to correct the error, if possible, and resubmit the message.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECS Arrival at Exit Entry

Description

The entry for the ECS Arrival at Exit message requires the following details to be entered, when the entry is is created from the shipment most fields will be populated directly.



MRN

The Applicable MRN number for which the arrival at exit is done.

Goods Location

The Partner code of the goods location, will be defaulted to the exit terminal

Arrival Place

The City name of the arrival location, will be defaulted with the master data details of the Goods location Partner

Customs Sub Place

The applicable customs code for the arrival location, will be defaulted with the master data details of the Goods location Partner

Arrival Date / Time

The date/time the goods are available for inspection at the entered goods location, this date/time should not be in the future at the time of sending.

Declarant

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The partner who is acting as Trader at Exit (declarant) for this entry, will be defaulted with the Branch declarant partner.

Customs office of exit

The customs office responsible for the ECS handling at the goods location.

Save

Will save the entry and will allow closing with out losing data

Send

Will send the message to NL Customs for further processing

Close

Will close the entry, if unsaved details are present will ask the user to save the changed details of discard them

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECS-hub Procedure

Introduction

To inform Cargonaut about the export MRN's related to an AWB, a ECSHUB (755) message needs to be sent to Cargonaut for each AWB.

This is normally done from the Air Export Shipment entry, for Master, Direct and Back-to-Back shipments.

- Introduction
- Description
  - Sending ECSHUB from Shipment
  - ECSHUB Procedure window
    - Homeview
    - ECSHUB General

ECSHUB Sent	The entry has been sent but no response has yet been received
ECSHUB Accepted	The message has been accepted by cargonaut and will be further processed
ECSHUB Rejected	The message contained an error and has been rejected by Cargonaut, further Action of the user is required
ECSHUB Notification Alert	The message has been accepted by cargonaut but in the further processing it is found that 1 or more MRN documents mentioned in the ECSHUB message is missing additional information such as FHL, DGVS USL etc.

Overview

Local Reference

Local Reference only used in the application to identify the ECSHUB declaration

Reference Number

Unique message reference number, will be populated at time of sending

Exit Date Time

Exit date / time , will be populated at / with the date / time of sending

Shipment number

The shipment number on which the ECSHUB declaration has been created

AWB number

The AWB number which was used in the ECSHUB declaration.

Exit Location

The Exit Location (airline shed) which was used as addressee in the ECSHUB declaration

Status

The current status of the ECSHUB Declaration.

Detail

In the detail overview the applicable message are displayed in a chronological order.

In case the declaration is in rejected state, the edit message will be active allowing to correct the error, if possible, and resubmit the message.

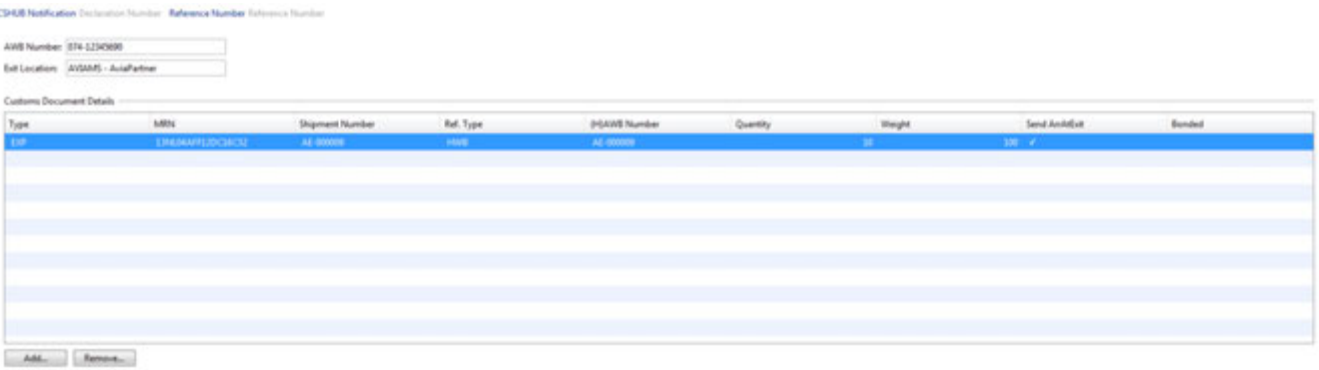
ECSHUB General

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECSHUB General

Description

This will start the ECSHUB Procedure, where the collected information is displayed and can be verified before sending.



AWB Number

If the ECSHUB is created from a shipment it will be defaulted with the shipment AWB number, else the AWB number is to be entered manually.

Exit Location

The Exit location will contain the Airline shed where the goods will be delivered for departure, when created from a shipment it will defaulted with the export terminal, if this export terminal has the role NL Customs Goods Location and
is the flag "first line shed" set to active. The Exit location can also be manually entered, available are only first line shed Locations.

Customs Document Details

In this grid the selected customs document that will be send in the ECSHUB message to cargonaut.

Type

The type of the selected customs document number, this can be either EXP or NCTS,

MRN

The mrn number of the selected customs document number

Shipment Number

The shipment number on which the selected document was created

Ref. Type

The reference code type of the selected shipment, either HWB or AWB. will be used to link MRN number to electronic AWB messaging (FWB / FHL)

Ref. Number

The reference number of the selected shipment, will be used to link MRN number to electronic AWB messaging (FWB / FHL)

Quantity

Sum of number of packages mentioned the selected document.

Weight

Sum of weight mentioned the selected document.

SendArrAtExit

Indicator whether or not Cargonaut is to send the Arrival at Exit message to NL Customs or not,
When the is set then a M will be send in the message, indicating that the Arrival at Exit message is to be send,
In principle this field will be set to unless Scope detects that the Arrival at Exit Message has been send from scope directly.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECSRTM Export notification

Introduction

To inform the terminal in advance about the ECS EU Export declaration a ECSRTM message send via Portbase to the appropriate Terminal per declaration

Description

The message is send from the Shipment entry or the Sagitta Export Home view. There is no additional function for THE ECSRTM messaging and the statuses will be linked to the corresponding EU Export declaration.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

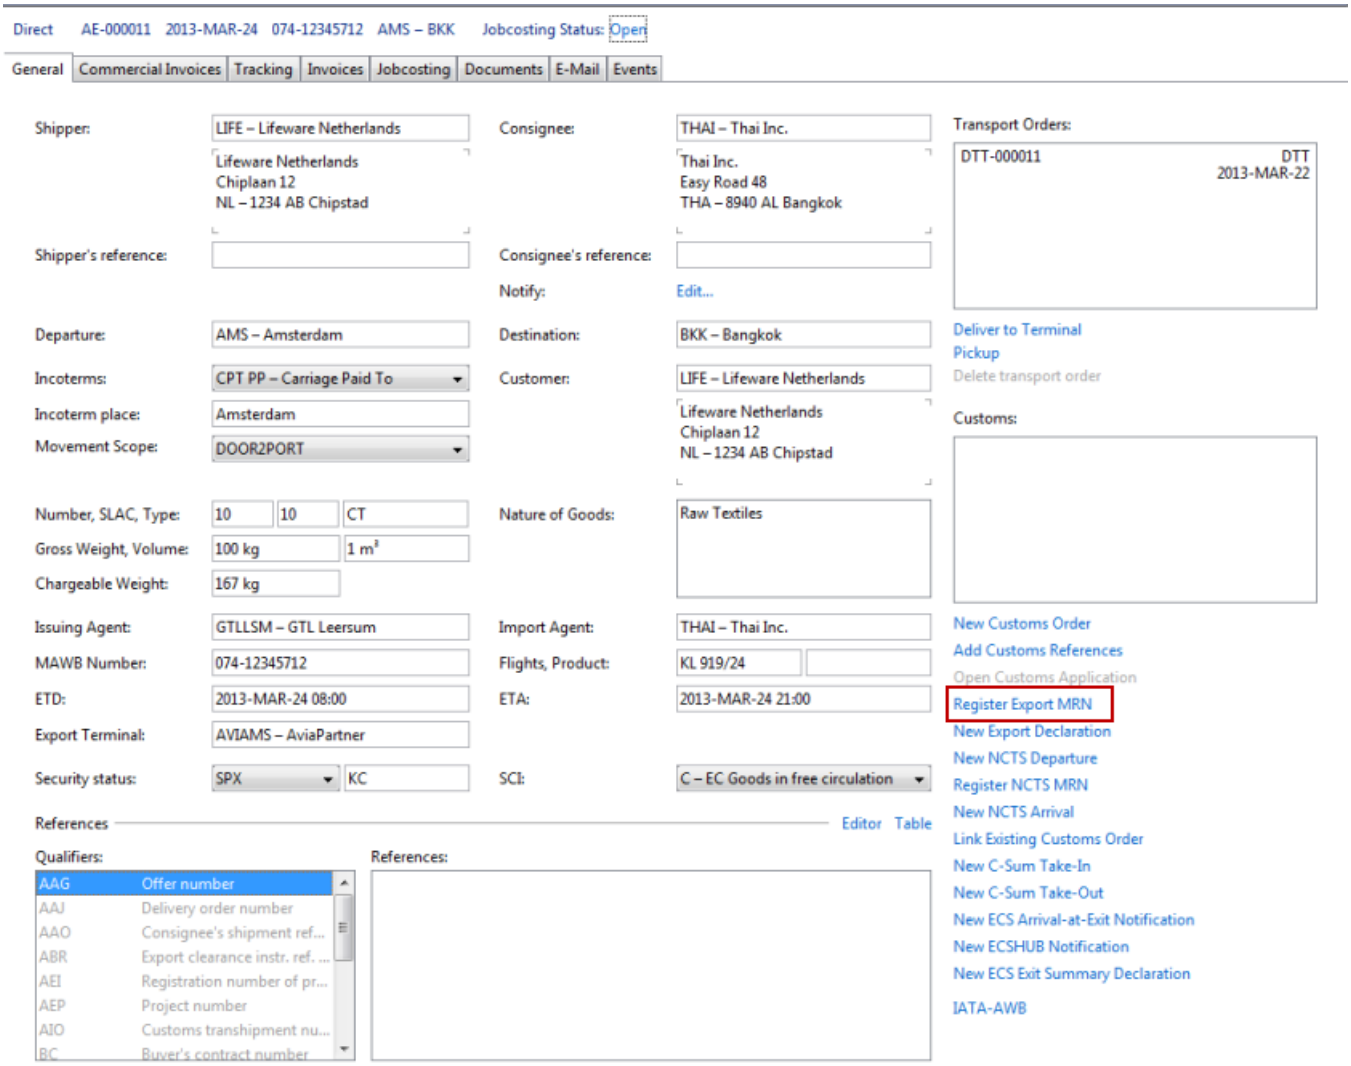
MRN Registration - Export

Introduction

ECS handling actions should not only be done performed on own created EU Export declarations but also for EU Export declarations issued by third parties.
This page described the prodecure in Scope how to register a third party EU Export declartion, with a valid MRN, to a shipment.

Description

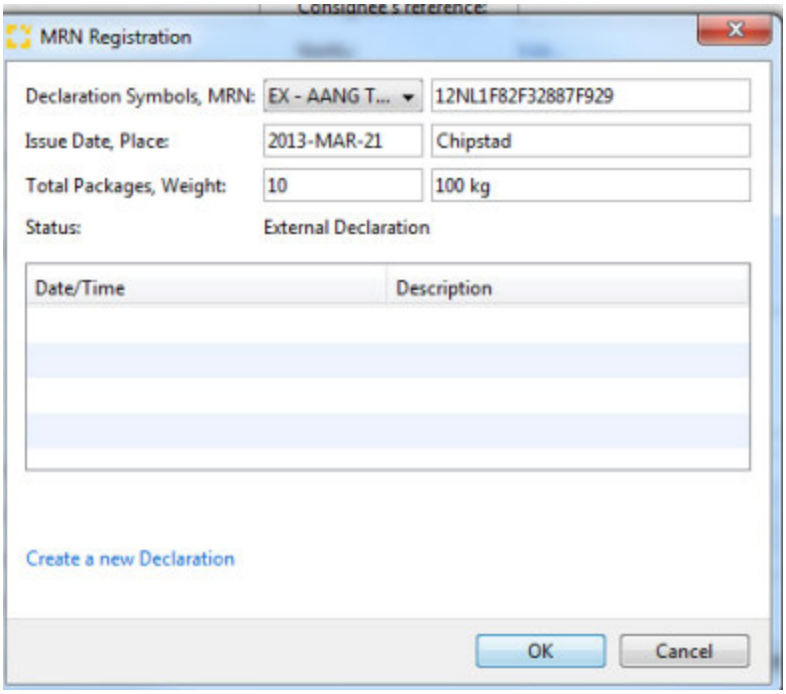
To register a third party EU Export Declartion , the action link "register Export MRN" in the shipment entry is used.



This action link will open the following Dialog

Export MRN registration

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Declaration symbol

The type of export declartion, EU, CO or EX, is to be selected.

MRN

Registration of the MRN number of the Export declaration, the MRN number will be validated for its uniqueness and the correct check-digit.

Issue Date

Date of Issue of the Export declaration

Issue Place

Place of Issue of the Export declaration

Total Packages

Total number of packages covered by the export declaration

Total Gross Weight

Total Gross Weight covered by the export declaration

OK

Store the details of the 3rd party export declaration.

Cancel

Cancel the registration of the 3rd party export declaration

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

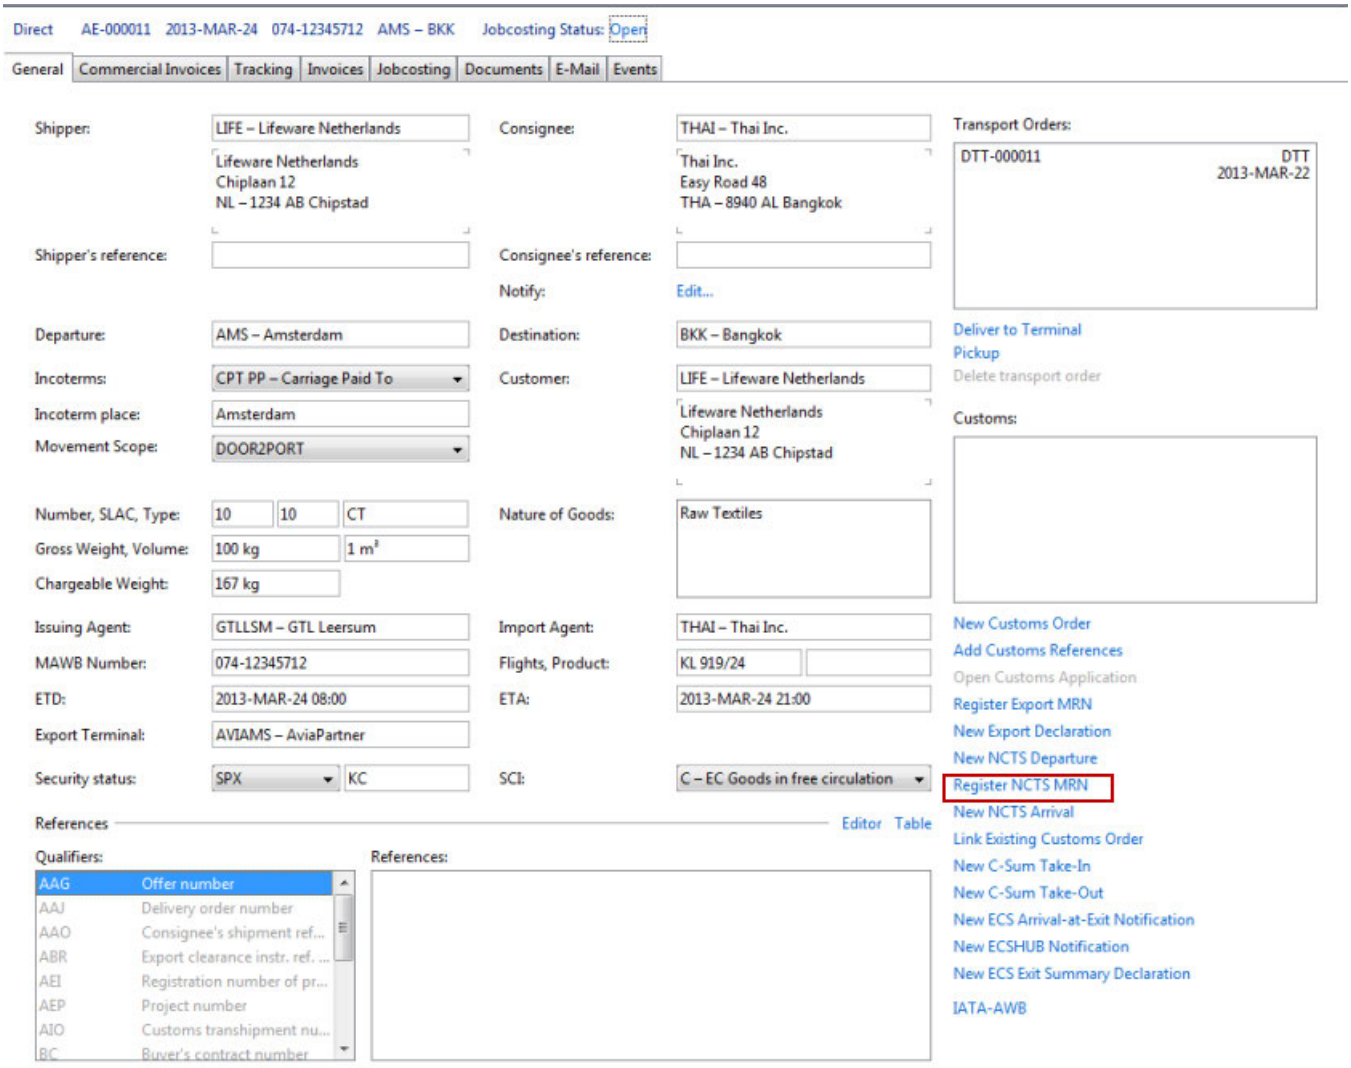
MRN Registration - NCTS

Introduction

ECS handling actions should not only be done performed on Export declarations but also on bonded goods arriving under NCTS coverage.

Description

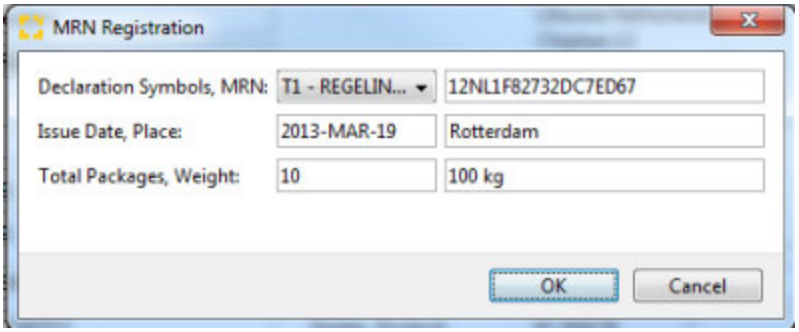
To register NCTS Declartion , the action link "register NCTS MRN" in the shipment entry is used.



This action link will open the following Dialogue

NCTS MRN registration

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Declaration symbol

The type of NCTS Declaration, T1, T2 , TIR. etc.. is to be selected.

MRN

Registration of the MRN number of the NCTS declaration, the MRN number will be validated for its uniqueness and the correct check-digit.

Issue Date

Date of Issue of the NCTS declaration

Issue Place

Place of Issue of the NCTS declaration

Total Packages

Total number of packages covered by the NCTS declaration

Total Gross Weight

Total Gross Weight covered by the NCTS declaration

OK

Store the details of the NCTS declaration.

Cancel

Cancel the registration of the NCTS declaration

Provisioning - On board deliveries

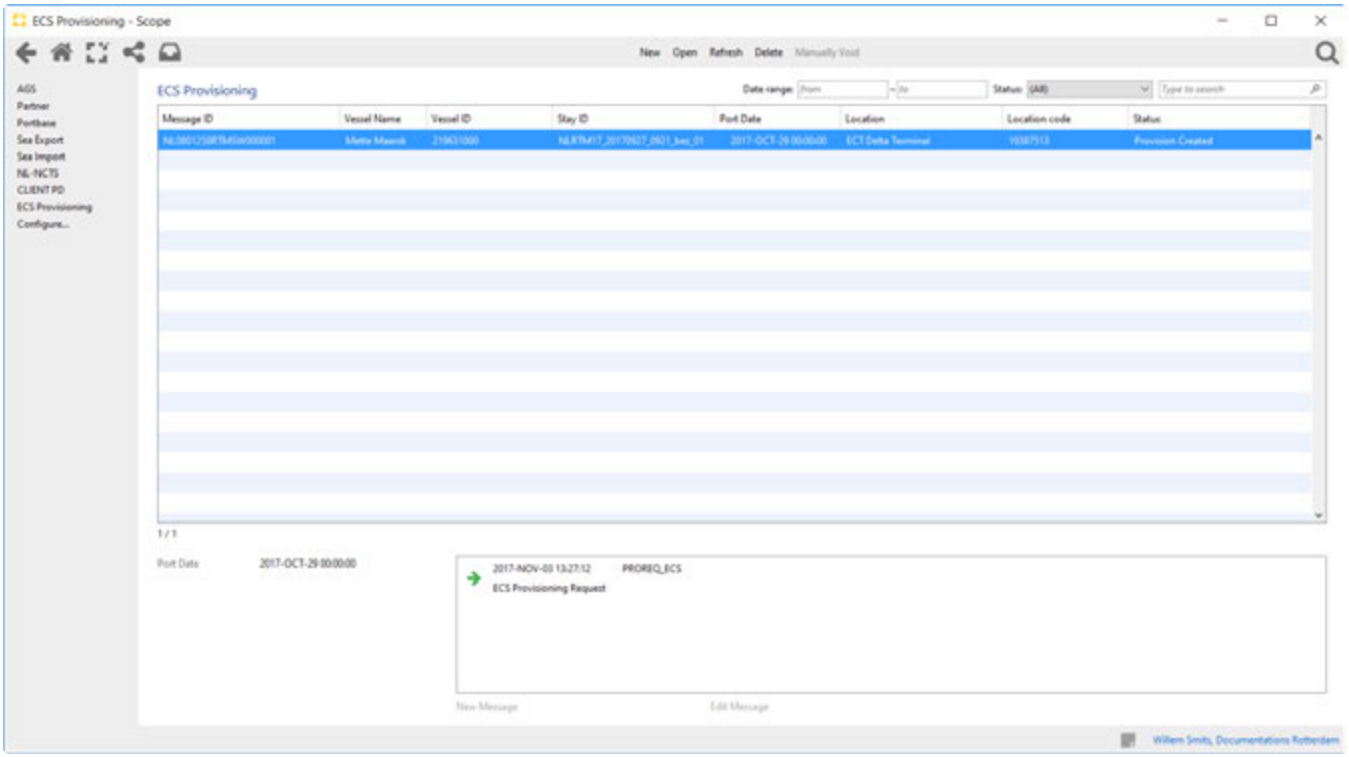
Introduction

With the introduction of "Single Window" based on EU-Guideline Richtlijn 2010/65/EU, provisioning (Proviandering) is no longer possible without formal notification to NL customs.
To report the delivery of goods and the correct clearing of the accompanying document(s), being either NCTS or AGS Export, Scope has the function ECS Provisioning to provide the users with the option to arrange a correct provisioning notification.

Description

This page will describe to usage of the provisioning procedure.

Homeview



Title Bar

New

The option to create a new Provisioning procedure

Open

The option to open an existing Provisioning procedure

Refresh

The option to refesh the homeview

Delete

The option to delete a provisioning procedure, only allowed for procedures which have the status "Created" and have never been sent to customs.

Manually Void

The option to manually void a provisioning procedure that will for some reason never reach the end status.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Search Bar

Date Range

The date range search for all procedures of which the In Port Date is within the given range.

Statuses

Manually voided

User has set the status of an uncompleted procedure to void.

Provision created

Message has been created but not been sent to Single Window / NL Customs yet.

Provision sent

Message has been sent to Single Window / NL Customs.

Provision accepted

Message has been accepted by Single Window / NL Customs.

Provision not accepted

Message has been not been accepted by Single Window / NL Customs, errors were reported and need to be corrected before sending again.

Provision not processed

Message has been not been processed by Single Window / NL Customs, errors were reported and need to be corrected before sending again.

Provision notification received

Procedure has received a notification.

Quick Search

Quick Search will allow searching a procedure on the following items

- Vessel name
- Stay ID
- Message ID
- MRN mentioned in the procedure
- Ship chandler in the procedure
- Location name

Columns

Message ID

The local reference number assigned to the prcoedure by Scope

Vessel Name

The name of the vessel to which the goods are delivered

Vessel ID

The unique identification of the vessel to which the goods are delivered

Stay ID

The unique identification of the arrival in port assigned by the port authorities

Port Date

Date / Time the goods will be delivered on board

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Port Location

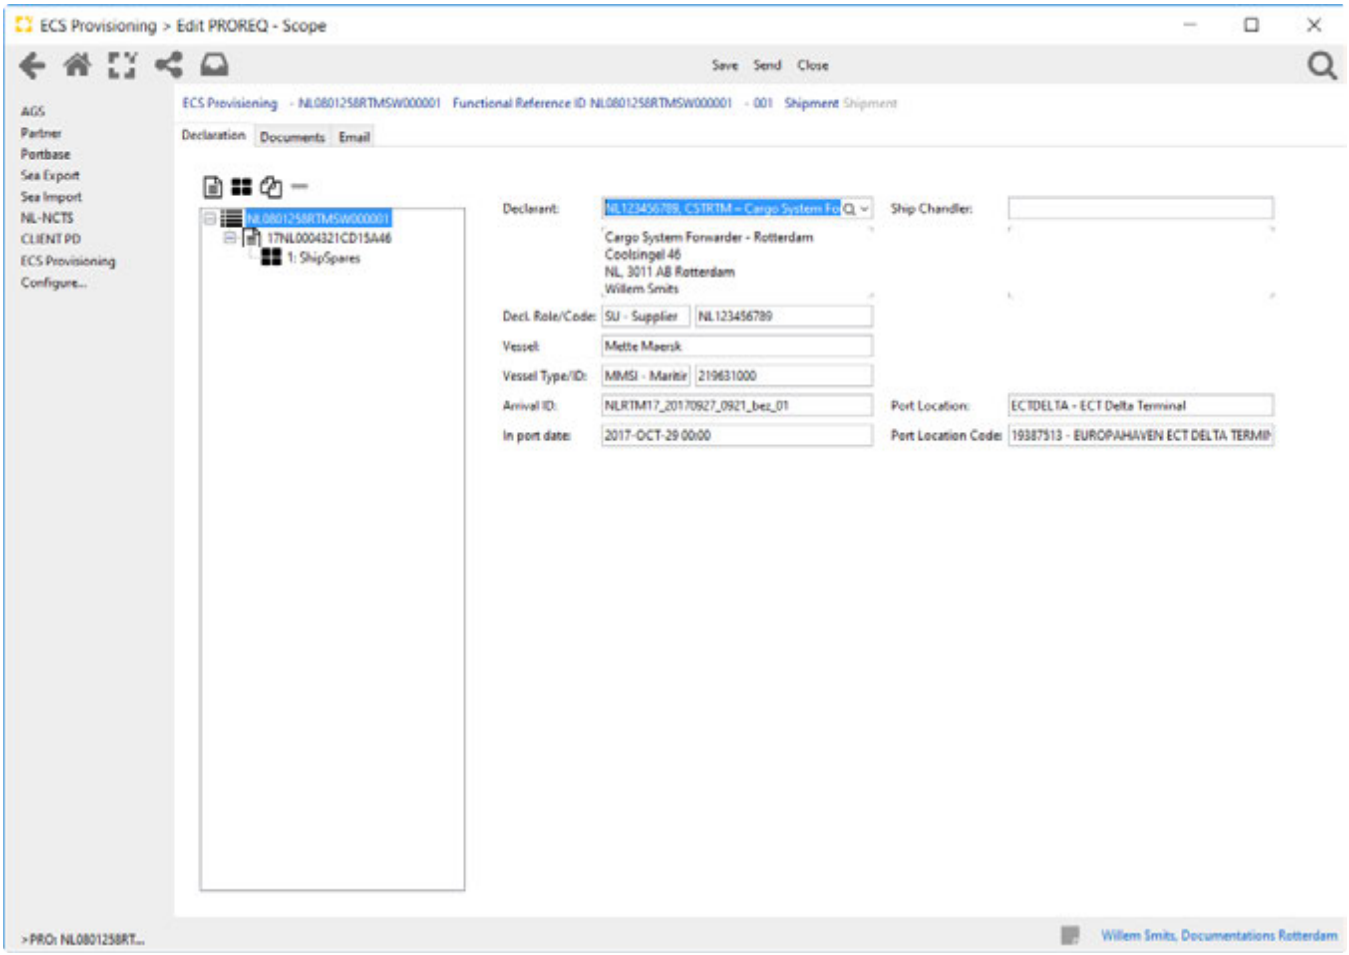
The partner name of the location where the vessel is berthed.

Port Location Code

The unique code assigned by Single Window to the location where the vessel is berthed.

Declaration

In the declaration screen the general details of the provisioning are registered.



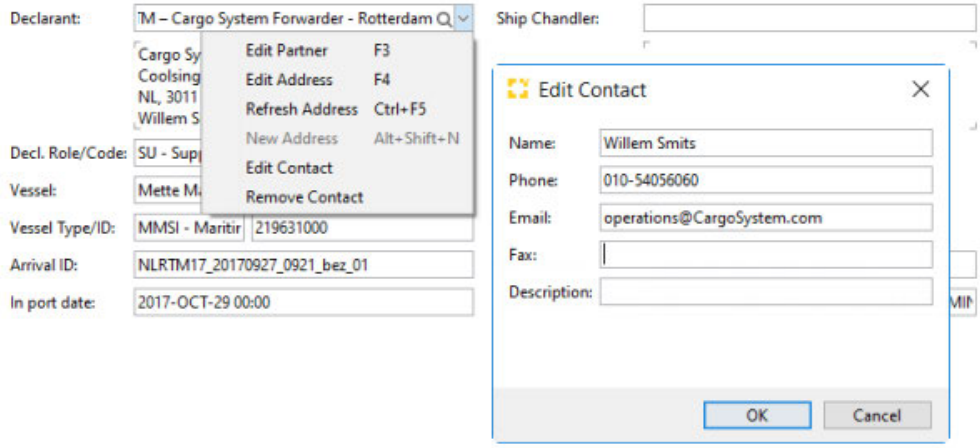
Declarant

The partner responsible for sending the message to Single Window, should have a Single Window registration that can be obtained from NL Customs. It is defaulted with the branch partner.

Contact Details

Contact details for the declarant are mandatory, and they are defaulted with the details of the user creating the registration. The contact details can be added through the edit partner options.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Decl. Role (declarant)

The declarant role indicates in which capacity the declarant is acting,
AG as Agent for a ship chandler or SU as Supplier himself.

Decl. Code (declarant)

The EORI number of the declarant

Ship Chandler

The ship chandler who is requesting the on board delivery. If a Ship Chandler is to be added, the Declarant Role should be AG.

Vessel

The name of the vessel to which the goods are provided, only mandatory if the Arrival ID is not known.

Vessel ID Type

The type of the unique ID number, and its corresponding validation:

Type	Validation
MMSI	a code of exactly 9 digits
CSI	a code between 2 and 7 digits
EXT	a code of exactly 6 digits, without spaces
ENI	a code of exactly 8 digits

Vessel ID

Identifying code unique for the applicable vessel. Type and ID are mandatory if the Arrival id is not known.

Arrival ID

Arrival or Stay ID is a unique code assigned to a vessel stay in the port assigned by the port authorities of the actual port (Rotterdam, Amsterdam, Flushing..)

In Port Date

The date when this specific arrival started.

Port Location

The partner corresponding to the location where the vessel is berthed.

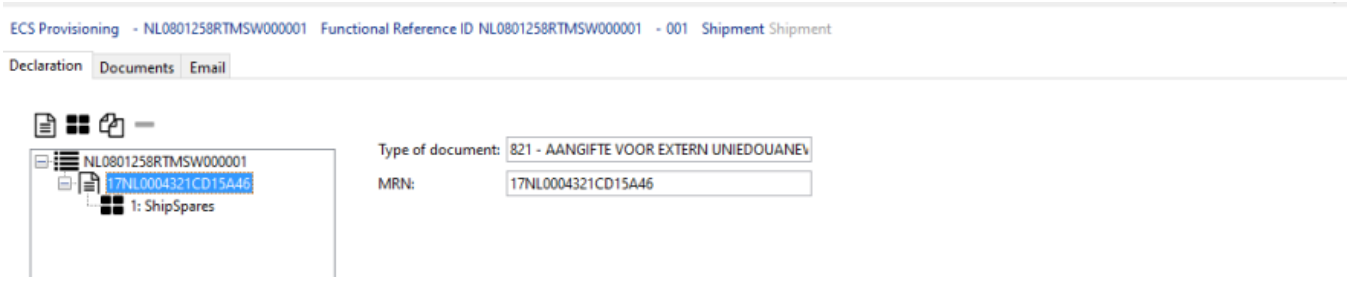
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Port Location Code

The unique code assigned to the port location by the Single Window authorities, this value can be stored and defaulted from the Port location partner.

Document details

On the next level of the tree structure all documents to be reported in a provisioning messages are registered.



Type of Document

Code identifying the type of customs document which is being reported

Clearance Procedure

Please note following procedures to clearance reported Customs documents

Export :

Confirmation of Exit will be triggered automatically, either by departure of the vessel or automated timers.

NCTS :

For NCTS documents 2 procedures are available

- TG Procedure : If there is a TG licence available for the delivery location of the vessel then the NCTS arrival procedure should be followed. (sending IE07 / IE044)
- Normal Procedure : IF there is no TG licence available then the NCTS declarations can be cleared by NL Customs,
  The document should be send by mail to : NL Douanepost Maasvlakte, afdeling Proviand, Bosporusstraat 5, 3199 LD, Rotterdam Maasvlakte

Please note following procedures to clearance reported Customs documents

Export Documents : Confirmation of Exit will be triggered automatically, either by departure of the vessel or automated timers.

NCTS Documents : For NCTS documents 2 procedures are available

- TG Procedure : If there is a TG licence available for the delivery location of the vessel then the NCTS arrival procedure should be followed. (sending IE07 / IE044)
- Normal Procedure : IF there is no TG licence available then the NCTS declarations can be cleared by NL Customs,
  The document should be send by mail to : NL Douanepost Maasvlakte, afdeling Proviand, Bosporusstraat 5, 3199 LD, Rotterdam Maasvlakte

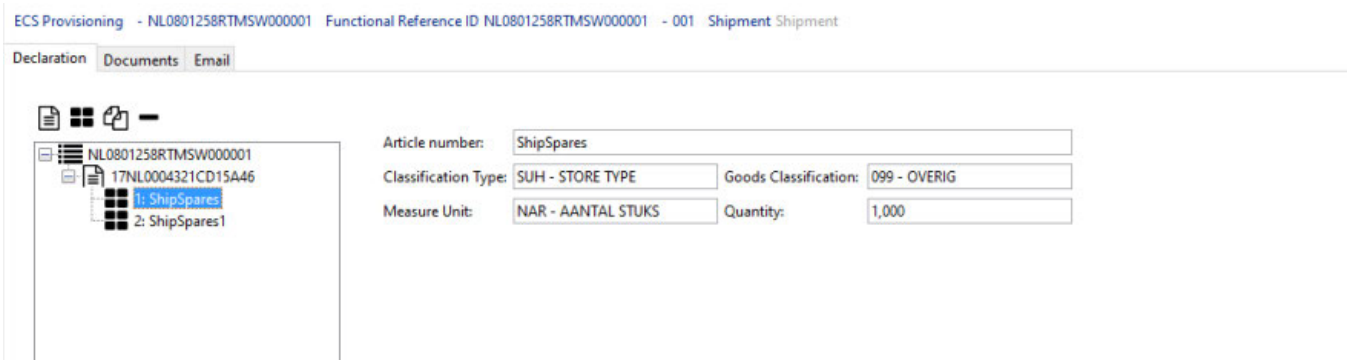
MRN

The MRN number of the document being reported

Items

On the third level of the tree structure the items of an MRN are specified, these are not the exact items of the corresponding MRN but a consolidation of the items on an MRN according to their classification in Provisioning Single Window.
Goods are classified in Provisioning and within one MRN document each Classification Type/Goods Classification combination may only appear once.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Article Number

Field linked to the master data - article for defaulting details of the goods classification

Classification Type

Code to identify the type of goods classification

Goods Classification

Code to identify the type of goods delivered to the vessel

Measure Unit

The qualifier to identify the quantity delivered to the vessel
Only 3 qualifiers are allowed:

- NAR - total number of pieces
- KGM - total number of kilos
- LTR - total number of liters

Quantity

The total actual quantity of the goods delivered to the vessel.

ECS Process Flows

- Introduction
- Description

Introduction

Description

Process Flows

ECS- Seafreight : Seafreight - Rotterdam & Amsterdam sea ports
ECS- Airfreight : Airfreight - Amsterdam airport
ECS- Road freight : Roadfreight exports

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECS - Airfreight - Schiphol

Introduction

For the ECS handling at Amsterdam Airport the trade association has designed a system where Cargonaut will be the hub for collection and sorting of the data for ECS and sending the required messages to Customs.
The freight forwarder is expected to send the ECSHUB message (755) to inform Cargonaut about the Export MRN's related to each AWB.

This page the describes the implementation of this function in Scope.

Description

The basis for the ECSHUB message is the registration of export declarations with MRN number on the shipment. This registration can happen in 3 different ways:

- Create and finish an Export declaration on the shipment - AGS Export
- Register a 3rd party issued Export declaration on the shipment - Export MRN Registration

- Optional on both own export declarations and registered third party export declarations it is possible to do an own Arrival at Exit notification if the proper customs authorisations have been given.
  This option is used by Freight Forwarders for which their warehouse location has been added as an ECS control location.

- After the correct registration of MRN numbers the ECS-hub Procedure is started to inform Cargonaut with the MRN numbers applicable on a (m) Awb number.
  Depending on the preceding details Cargonaut will do a Arrival at Exit notification to NL customs.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECS Road freight

Introduction

For the ECS handling for shipments which will be leaving the EU via a land border there are two options of handling the ECS procedure.

1. Present the EU Export Declaration with MRN number to the local EU customs office at the border, however this will cause delays and limited control of the actual proper handling.
2. Replace the EU Export Declartion with an NCTS declaration, after doing an Arrival At exit notification.

This page the describes the flow implemented in scope for the second scenario.

Description

Create / Link EU Export declartion to shipments

- Create and finish an Export declaration on the shipment - AGS Export
- Register a 3rd party issued Export declaration on the shipment - Export MRN Registration

ECS Arrival Registration

- On the applicable EU MRN create and send Arrival at Exit notification

ECS clearance

- Create a NCTS declaration for the shipment of the previous steps whereby the following details are import to be followed
  - The Location of goods in the NCTS declaration should be the same as the Location of goods in the Arrival at Exit
  - The MRN number of the Export declartion mentioned in the Arrival at Exit should be listed as previous customs document
  - For each Arrival at Exit declaration one NCTS declaration should be created, no consolidation on Arrival at Exit messages in the NCTS declaration.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECS - Seafreight

Introduction

For the ECS handling at the Dutch seaports Rotterdam and Amsterdam, the container terminals will arrange the proper ECS notification and handling for EU Export Declarations however
in order to expedite the actual arrive of the containers at the terminal, a message containing the MRN number can be sent to the terminals.

This page the describes the implementation of this function in Scope.

Description

The basis for the ECSHUB message is the registration of export declarations with MRN number on the shipment. This registration can happen in 3 different ways:

- Create and finish an Export declaration on the shipment - Sagitta Export (DSU)
- Register a 3rd party issued Export declaration on the shipment - Export MRN Registration

- After the correct registration of MRN numbers the ECSRTM Export Notification is started to inform the Terminal with the MRN numbers applicable on a container/booking number.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Noodprocedure - ECS

Introductie

Op basis van de, door de douane, beschreven noodprocedure's DSU en ECS wordt hier een toelichting gegeven over de ondersteuning van deze nood-procedures in Scope.

Sagitta Uitvoer

In geval van een storing bij Sagitta uitvoer dient men een Enig document per email naar de douane te sturen.
Om dit te ondersteunen print je in Scope het E.D. enig document zoals beschikbaar in de functie Sagitta Uitvoer (Sagitta export).

? Unbekannter Anhang

Vervolgens zal deze E.D. ook beschikbaar zijn op de zending, in het tabblad Documenten. Vanuit de zending, tabblad Email kan nu de email verzonden worden
met het E.D. als bijlage..

De email dient verstuurd te worden naar Douane.noodprocedure.dsu@belastingdienst.nl met als onderwerp het storingsnummer en het kantoor van aangifte.

In versie 5.6 (gepland eind 2013) is het mogelijk om direct vanuit de export aangifte te mailen.

ECS

In de ECS Noodprocedure is het niet nodig om een document te sturen. Het volstaat om een email naar Douane.noodprocedure.ecs@belastingdienst.nl te sturen met als onderwerp het storingsnummer en het kantoor van aangifte.
In versie 5.4 (oktober 2013) kan de email automatisch vanuit Scope worden verzonden. Dit kan vanuit de volgende functies:

- SAGITTA Export, indien deze de status "Toestemming tot vertrek" of hoger heeft en geen MRN toegekend heeft gekregen.
- ECSHUB, Indien de geselecteerde ECSHUB niet de status geaccepteerd heeft.
- ECS Arrival at Exit, Indien de geselecteerde Arrival niet de status geaccepteerd heeft.

? Unbekannter Anhang

Cargonaut

Let op, de ECS Noodprocedure is ook voor U van toepassing als de ECS meldingen normaal gesproken via Cargonaut gaan, of wanneer er een storing is bij Cargonaut op de ECSHUB functionaliteit

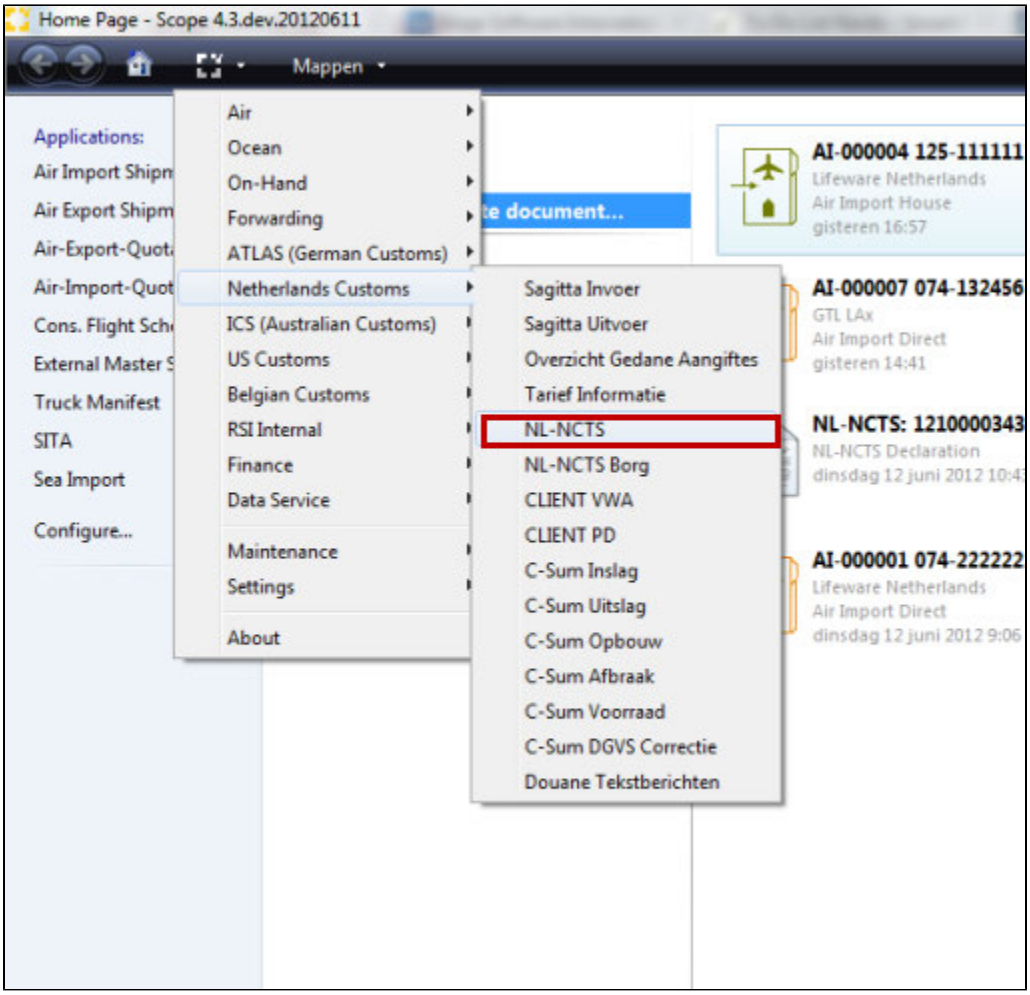
NL NCTS

- Introduction
- Description
  - Homeview
- FAQ

Introduction

The NL NCTS Application can be found as a child in the NL CUSTOMS menu option. In the NL NCTS application the options for NCTS Arrival, clearing a received NCTS declaration under the TG license and NCTS Departure are integrated into one single function .



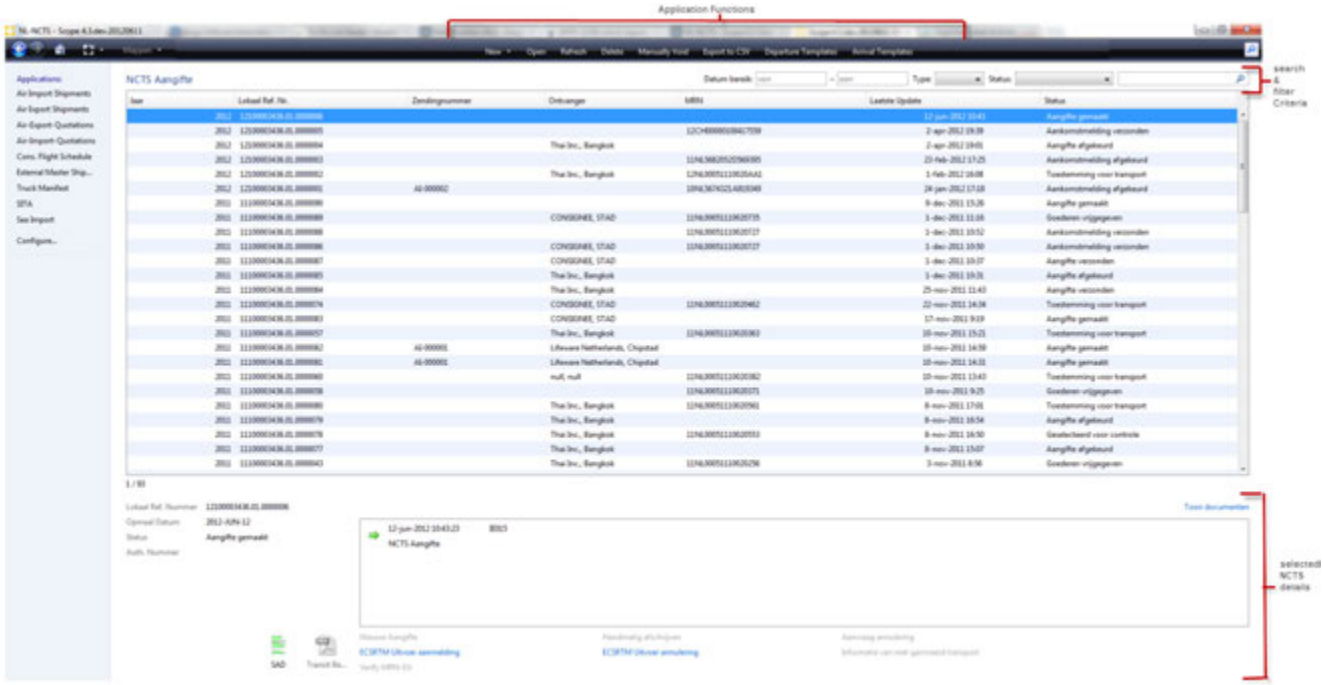
Description

Application Actions
Filter- and searchfunction(s)
Details of Selected Declaration

Homeview

In the Home view of the NL NCTS the consist of following details

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Application Actions

New

Under the action new a choice can be made between creating a new Departure NCTS declaration or a new Arrival NCTS declaration, where it should be noted that a NCTS arrival message on a previously in the system created NCTS Departure message, should not be done as a new option but on the original procedure.

Open

With the option new, the selected declaration can be open, the system will then open the last version of the procedure.

Refresh

Refresh will update the home-view with the latest status, in principle not required since scope home-view are being refreshed automatically.

Delete

Through the delete option it is possible to remove procedures (NCTS Arrival only) from the application. Deletion is only possible for those procedures, which have not yet been send or only a error message has
been received.

Manually Void

With the manually void option, selected declaration can be voided (declared invalid by the user), this option can be used to close,incorrect. not accepted, departure declarations.

Export to CSV

Using the option "export to csv" will create/open excel with an report showing the details of the NCTS declarations available in the current selection.
The export will contain the following columns

Column
Shipment Number
Local Reference Number
Movement Reference Number
Issue/Arrival Date
Shipper Code
Shipper Name

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Consignee Code
Consignee Name
Reference
Number of Items
Total Pieces
Total Gross Weight
Customs Value
Reference Amount
Goods Location
Departure Customs Office
Destination Customs Office
Master Document Number
House Document Number
Status

Departure Templates

Under this option template(s) for NCTS declaration departure(s) can be created and maintained.

Departure Templates

Under this option template(s) for NCTS declaration arrival can be created and maintained.

Filter- and searchfunction(s)

The NCTS home-view offers several methods of filtering on NCTS declarations

Date Range

The date range allows the selection of NCTS declarations on basis of the create date.

Type

Through the filter option Type the declaration can be filtered on the type:

- NCTS Arrival
- NCTS Departure

Status

It is also possible to filter the declarations on basis of the status of the declaration.

The following statusses are available

Status	Description	Message	Departure / Arrival Process
Arrival Advice Created	NCTS Arrival created / not send	-	Arrival
Arrival Advise Send	NCTS Arrival send	IE007	Arrival
Arriival Advise Rejected	NCTS Arrival Rejected	IE008	Arrival
Arrival Advise Issues	NCTS Arrival started by the Consignee	IE006	Departure
Cancellation Requested	NCTS Departure Cancellation Requested	IE014	Departure
Declaration Canceled	NCTS Departure Procedure has been canceled	IE009	Departure
Cancellation Denied	NCTS Departure Cancellation has been denied	IE009	Departure

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Declaration Rejected	NCTS Departure Rejected	IE016	Departure
Declaration Send	NCTS Departure Send	IE015	Departure
Declaration Submitted	NCTS Departure Accepted by customs. Normal procedure (no TG) with out a customs Sub Place	IE928	Departure
Declaration Created	NCTS Departure Created / not send	-	Departure
Expired Documents	This selection will filter all NCTS depature documents with MRN which are not yet finalized and the expiry date on the declaration is earlier then today	-	Departure
Goods released	NCTS Arrival process has been closed	IE025	Arrival
Guarantee Invalid	NCTS departure fails the Guarentee validation at Customs	IE055	Departure
Information on Non-Arrived Movement	NCTS departure answer on a Request for information on a Non-Arrived Movement has been send	IE141	Departure
Information on Non-Arrived Movemen Rejected	NCTS departure answer on a Request for information on a Non-Arrived Movement has been rejected	IE141	Departure
Request for information on a Non-Arrived Movement	The Arrival Process on a NCTS departure has not yet stared, whilst departure document has expired	IE140	Departure
MRN Allocated	NCTS Departure is accepted and has been assigned a MRN number	IE028	Departure
Manual Write off	NCTS Departure has been manually set to the status Write Off	-	Departure
Manual Voided	NCTS procedure has been manually voided	-	Departure/Arrival
Not released for transport	NCTS Departure has been halted by customs and not allowed to departure	IE051	Departure
Release Request Rejected	NCTS Depature release request has been rejected by customs	IE062	Departure
Release For Transit	NCTS Departure is released for transit	IE029	Departure
Request for Release	NCTS Departure request customs for a release	IE054	Departure
Selected for Control	NCTS Departure Customs wants to physically inspect the shipment	IE060	Departure
Syntax Error	Technical Error found in message	IE917	Departure/Arrival
Unloading Permission	NCTS Arrival permission to start unloading	IE043	Arrival
Unloading Remarks Created	NCTS Arrival Unloading remarks created	-	Arrival
Unloading Remarks Rejected	NCTS Arrival Unloading remarks contained functional errors	IE058	Arrival
Unloading Remarks Send	NCTS Arrival Unloading remarks send	IE044	Arrival
Write-off Movement	NCTS Departure cleared	IE045	Departure

Details of Selected Declaration

In the lower half of the screen, the details of a selected NCTS declartion are being displayed and consist of the following items

Field / Link	Description
Local Ref. Number	The unique local reference number assigned to the declaration by Scope
Issue Date	Date the declaration was created / accepted
Status	The last status of the declaration
Auth. Number	
SAD	Hard copy print of the NCTS declaration, Also to be used in the emergency Procedure. When double clicking on the document , Scope will ask if the SAD to be printed in Final state. If chosen for Final state (to be used when Customs have announced an emergency procedure) the SAD document will be stamped and assigned with a document number. This will be then the final state of a declaration.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Transit Accompanying document	Print of the NCTS - accompanying document
Message box	in the message box the flow of message are displayed in a chronological order. When double clicking on a outgoing message will open the corresponding entry, if an double click is done on a incoming message the corresponding (if applicable) print will be outputted to the PDF reader.
New Declaration	The "new declaration" option will be enabled for those declarations on which a error message has been received and will open the procedure screen in enabled state, in order to correct and resend the declaration.
New Arrival	on a NCTS declaration in a goods release state (IE029) the option "new arrival" is enable on the position where normally the option "New declaration" is found. The new arrival option must be used to create a Arrival Notification (IE007) for NCTS departure procedures created in the system. For these declaration a new "Arrival" declaration is not possible.
Manual Write-off	The option manual write-off allows , authorized users, to set the state of a declaration to finished, with-out actual message from customs, this option is used to allow correct status of declarations after disruption of communications with Customs.
Cancellation request	A NCTS declaration for which only a MRN allocated (IE028) has been received a cancellation message (IE009) can be send to void the declaration.
Information on Non-arrived movement	NCTS declarations for which Customs did not receive an IE007 within the timed period , a Request for non-arrived movement will be send and this option is then used to send a reply to customs
ECSRTM Export Notification	With the ECSRTM message a Notice will be send to PortInfoLink to pre-advise the terminal of delivery of an export shipment with the corresponding customs documentation.
ECSRTM Export Cancellation	Through this option a previously pre-advised delivery message can be cancelled.
Verify MRN-EU	This link will open a browser link to the EU website allowing the verification of status of a MRN as known in the EU NCTS Database. Verification of MRN numbers is only possible for declarations which are covering a border crossing transport. http://ec.europa.eu/taxation_customs/dds2/tra/transit_home.jsp?Lang=en
Show Documents	Under the option show document, the box with message will be changed into an overview of all documents generated on the declaration.
Show Message	Under the option show messages, the box with documents will be changed into an overview of all messages, in chronological order, on a declaration.

NCTS Arrival

- Introduction

Introduction

Under NCTS Arrival a new NCTS Arrival declaration can be created.An NCTS Arrival enables an TG-License holder to self-declare the receipt of goods under customs bond without direct supervision of customs This chapter describes to specifics for creating such a declaration.

The Arrival Process consist of 2 steps

The registration of the arrival upon arrival of the goods.

The registration of the Unloading Remarks after unloading of the shipment

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Arrival Notice

- Introduction
- Description
- FAQ

Introduction

The arrival Process registration is the first step in the process

Description

- Introduction
- Description
  - Important Note

  - NCTS declaration information
  - Templates.
- FAQ

A NCTS declaration can be created by using the new option in the home-view, using the customs order option in the shipment entry, or directly from a Take -in

⚠ Important Note

A NCTS Arrival Declaration which is to be created for an NCTS declaration created under the same branch in the same entity should not be as a new declaration but using the option "New Arrival" on the original NCTS departure declaration.

Applications functions

In the NCTS declaration the following application functions are available.

Save

Save the application , storing the details entered in the application.

Save as Template.

Allows the active NCTS declaration to be stored as a template.

Send

The NCTS declaration will be validated and if successful will transmit the message to NL Customs

Close

With close the entry will be closed, after the user has indicated that all last changes are to be saved or discarded, when the entry should be saved, Scope will validate if any details deemed mandatory are missing, for proper save.

NCTS declaration information

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In top of the NCTS declaration screen the following information, regarding the declaration.

Year

The year in which the NCTS declaration was created

Declaration number

The unique number (LRN) identifying the declaration at customs, generated by the system after the first save.

Shipment reference

The shipment number on which the declaration has been created, if the customs order option was used.

Templates.

During the creation of a new NL-NCTS declaration, the system will validate if a applicable template is available, if this is the case the template will be offered to be used, and default the details from the template, or skipped and only use the details from the shipment, when created through the customs order.

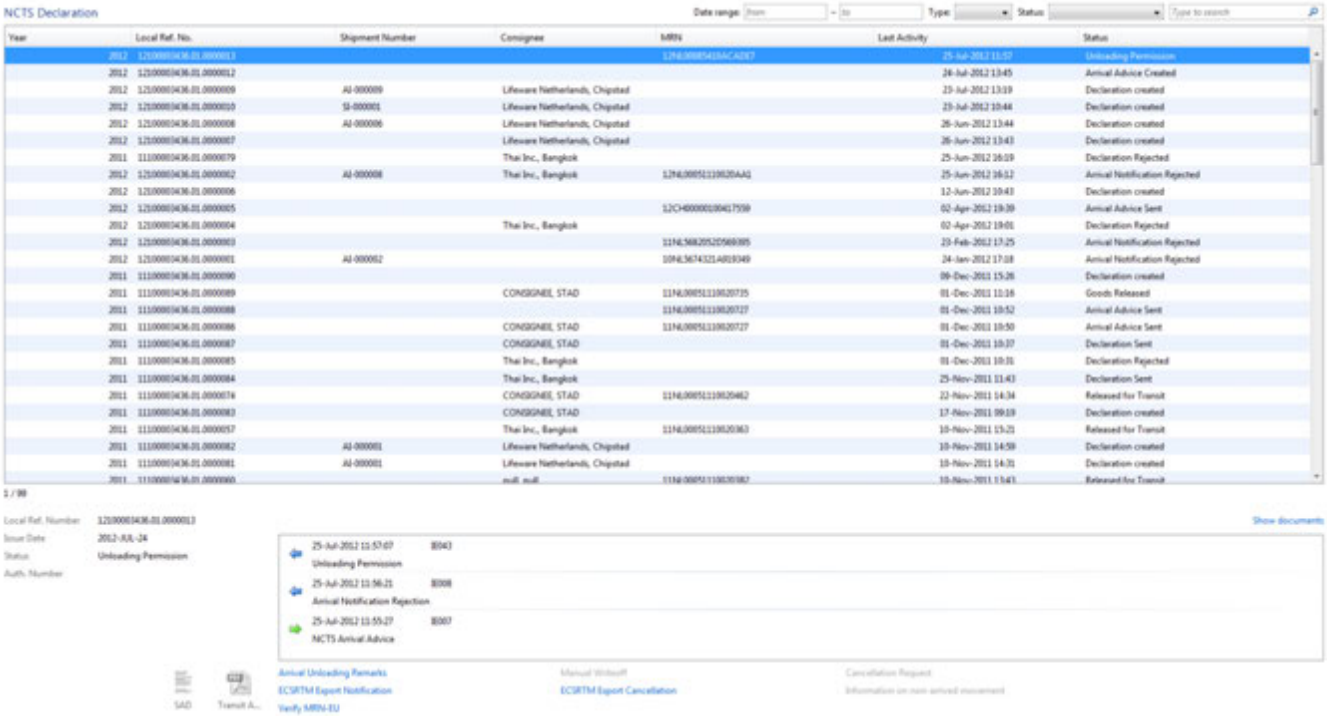
Unloading Remarks

- Introduction
- Description
- FAQ

Introduction

After the NCTS arrival message has been send an customs has responded with a the unloading permission , the actual unloading can take place.
When the unloading has finished the unloading permission remarks can be entered.

Description



Unloading remarks

Use the hyperlink Arrival unloading remarks to start the procedure for the unloading remarks

FAQ

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

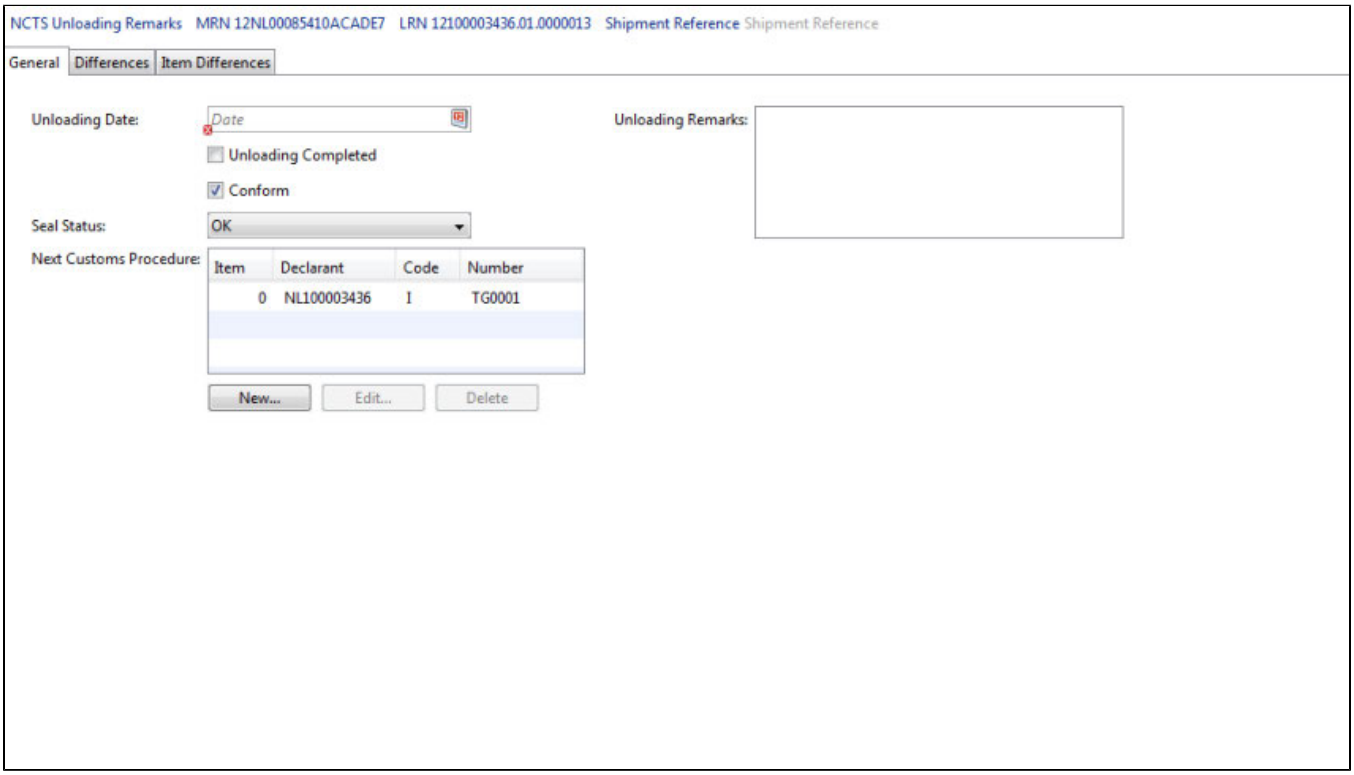
Tab 1 - General - Unloading - NL NCTS

- Introduction
- Description
- FAQ

Introduction

On the tab general the main details of the Unloading remarks are registered.

Description



Unloading date

The date the actual unloading was finished.

Unloading completed

Indication that the unloading was completed at time of sending the remarks

Conform

Indication whether the unloaded goods and documentation are conform to the details indicated in the NCTS document.
If all is conform the option must be activated, else it should be de-activated and the differences must be noted in the applicable tabs.

Seal Status

Details confirming the status of the seal when the unloading process was started.

Seal Status codes	description
OK	the seal was present and untouched
Damaged	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

	the seal was present but not complete condition
Missing	the seal was no longer present

If seal exemption is applicable the seal status must be set to "OK".

Next Customs procedure grid.

In this Grid the next customs procedure must be registered with the following details

field	description
item	item number for which the customs procedure is applicable, if only 1 procedure applicable for all items then set to 0
Declarant	the EORI number of the party liable for issuing the customs procudure , will be defaulted with branch eori number
Code	either I or O depending on the applicable customs license under which the customs procedure is issued
Number	depending on the agreement with customs, will be defaulted with the TG license number of the declarant + in case of CSUM the take in number

Unloading remarks

Additional remarks regarding the unloading

NCTS Departure

- Introduction
- Description
- FAQ

Introduction

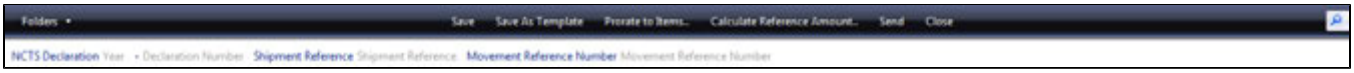
Under NCTS Departure a new NCTS document, to transport goods through the Netherlands or destined for any of the other member countries under customs bond. This chapter describes to specifics for creating such a declaration.

Description

- Introduction
- Description
  - Applications functions
  - NCTS declaration information
  - Templates.
- FAQ

A NCTS declaration can be created by using the new option in the home-view or by using the customs order option in the shipment entry

Applications functions



In the NCTS declaration the following application functions are available.

Save

Save the application , storing the details entered in the application.

Save as Template.

Allows the active NCTS declaration to be stored as a template.

Prorate to items..

The prorate option divides the freight charges over the items on basis of gross weight.

Calculate Reference Amount..

This option will calculate the reference amount applicable on the NCTS declaration on basis of either :
Invoice amounts , import duty and vat rate.
or
selected reference amount forfait rule.

Send

The NCTS declaration will be validated and if successful will transmit the message to NL Customs

Close

With close the entry will be closed, after the user has indicated that all last changes are to be saved or discarded, when the entry should be saved, Scope will validate if any details deemed mandatory are missing, for proper save.

NCTS declaration information

In top of the NCTS declaration screen the following information, regarding the declaration.

Year

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The year in which the NCTS declaration was created

Declaration number

The unique number (LRN) identifying the declaration at customs, generated by the system after the first save.

Shipment reference

The shipment number on which the declaration has been created, if the customs order option was used.

Movement Reference Number

The MRN number assigned by customs on the NCTS declaration.

Templates.

During the creation of a new NL-NCTS declaration, the system will validate if a applicable template is available, if this is the case the template will be offered to be used, and default the details from the template, or skipped and only use the details from the shipment, when created through the customs order.

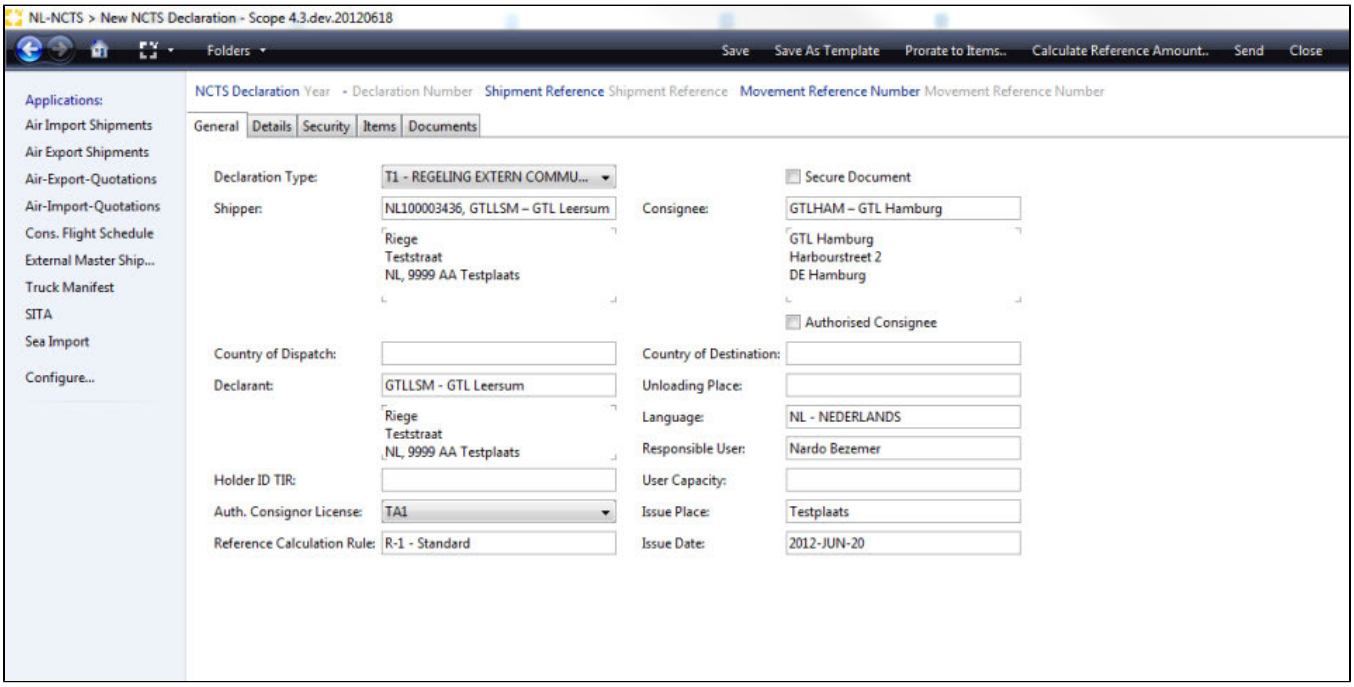
Tab 1 - General - Departure - NL NCTS

- Introduction
- Description
- FAQ

Introduction

In the first tab of the NCTS depature declaration general details regarding the sender, receiver and declarant of the NCTS declaration are registered.

Description



Declaration Type

The type of declaration applicable in the NCTS declaration, The supported types are:

Type	Description
T1	General T1 Document
T2	Transit document for European goods
T-	NCTS declaration which contains T1 & T2 goods
TIR	TIR declaration
T2F	NCTS declaration consigned to the French Fiscal regions
T2SM	NCTS declaration consigned to San Marino

Shipper

The loading partner of the NCTS declaration.

Country of Dispatch

Country code of the country where the NCTS declaration movement will start.

Declarant

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The partner responisble for the NCTS declaration, This partner requires the role Declarant

Holder ID TIR

License number assigned by customs allowing the declarant to issue NCTS - TIR declarations.

Auth Consignor License

The licence number applicable when the declaration is done under the "Toegelaten Afzender" licence, the license numbers are maintained at Declarant

Reference Calculation Rule

The calculation rule to be applied for the calculation method of the reference amount (forfait), when the declaration does not hold all relevant information to calculate the reference amount specified.

secure document

Indication if the NCTS declaration is to be issued as an secure document. An secure document can be used for NCTS declaration which will be the last EU customs movement document before leaving the EU.

Consignee

The recipient, delivery address for the shipment under the NCTS Movement

Authorised Consignee

Indication if the consignee has a valid authorisation to receive the goods directly on the indicated address.
For authorised consignees the EORI number is mandatory.

Country of Destination

Country code of the destination of the movement

Unloading place

Address details where the shipment will be unloaded , only relevant in secure declarations.

Language

Language code indicating in which language addresses, city names, goods description etc.. will be send in the message.

Responsible user

The user name of the user bearing the responsibility of issuing the NCTS declaration

User Capacity

The function held by the responsible user

Issue place

City name of the place where the NCTS declaration is issued.

Issue date

Date of issuing the NCTS declaration.

FAQ

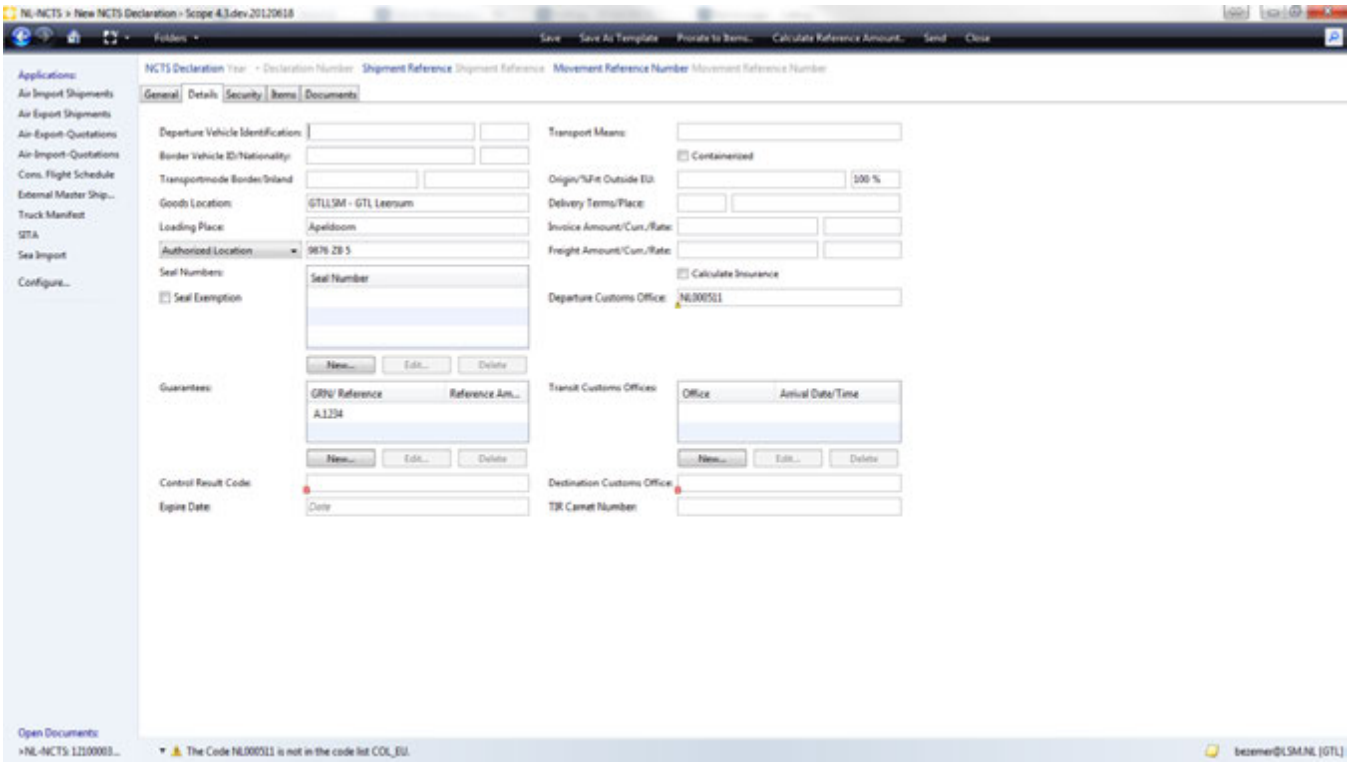
Tab 2 - Details - Departure - NL NCTS

- Introduction
- Description
- FAQ

Introduction

In details more specific information regarding the shipment to be covered by the NCTS declaration.

Description



Departure Vehicle Identification

Identification of transport means with which the NCTS declaration will start the movement and the corresponding nationality

Border Vehicle Identification

Identification of transport means with which the NCTS declaration will cross a border between EU and other NCTS member states and the corresponding nationality

Transport Mode Border / Inland

The code identifying the type of transport is applicable at departure and / or border crossing.

Goods Location

The partner code identifying the location of the goods where the shipment covered in the NCTS declaration are stored before departure.
The partner can store defaulting information under Goods Location

Loading place

City name of the location where the NCTS declaration will start, can be defaulted from the Goods location partner.

Location type.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type of location on basis of the Customs licence applicable for the NCTS declaration

Type	description
AUT	Authorized Location Code - Code applicable for TG declarations
CUS	Customs sub place - Code Applicable for normal procedure declarations
AGR	Agreed location name - name of the location agreed.
ALC	Agreed location code - Code for the agreed location.

The location type can be defaulted from the Goods location partner.

Location code

The location code applicable for the selected type on the goods location.
The location code can be defaulted from the Goods location partner.

Seal Numbers

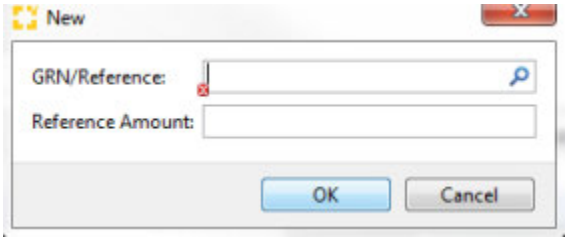
Grid which allows the registration of seal-numbers with which the transport means has been closed.

Seal Exemption

Indication,to be set to active when the declarant holds permission to load consignments without closing the transport means with a seal

Guarantees

In the Guarantee Grid, the applicable Guarantee Reference numbers (GRN) or other Guarantee references.
The Grid also contains the field where the reference amount is stored (when calculated automatically), manual entry of a reference amount is allowed.



Control Result

Code for the type of control which is/has been enforced on the NCTS declaration, this field is populated with the code A3 under TA otherwise the field remains empty.

Expiry date

The Expiry date of the NCTS declaration, the time frame in which the declarant expects the declaration to be cleared by the consignee.

Transport Means

Further specification of mode of transport.

Containerized

Indicator which needs to be activated when the declared shipment is loaded into a container

Origin

The port code of departure, used to calculate the EU freight discount as applicable on airfreight shipments.

Freight Discount percentage

The percentage of freight discount default on basis of the origin.

Delivery Terms & Place

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The applicable incoterm code and the corresponding place

Invoice Amount / Curr. / Rate

The total invoice amount for the shipment covered in the declaration and the corresponding currency,
to be used as basis for the reference amount calculation.

Freight Amount / Curr. / Rate

The total Freight amount for the shipment covered in the declaration and the corresponding currency
to be used as basis for the reference amount calculation.

- Introduction
- Description
- FAQ

Introduction

On the documents tab all document generated on the NCTS declaration are shown and documentation, relevant to the declaration can be uploaded here. All document generated and/or linked to the NCTS declaration will also be available on the documents tab of the original shipment (if declaration created on a shipment)

Description

The function of the documents tab is generic throughout Scope and described on General Functions - Documents

FAQ

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

T2L - T2LF printing

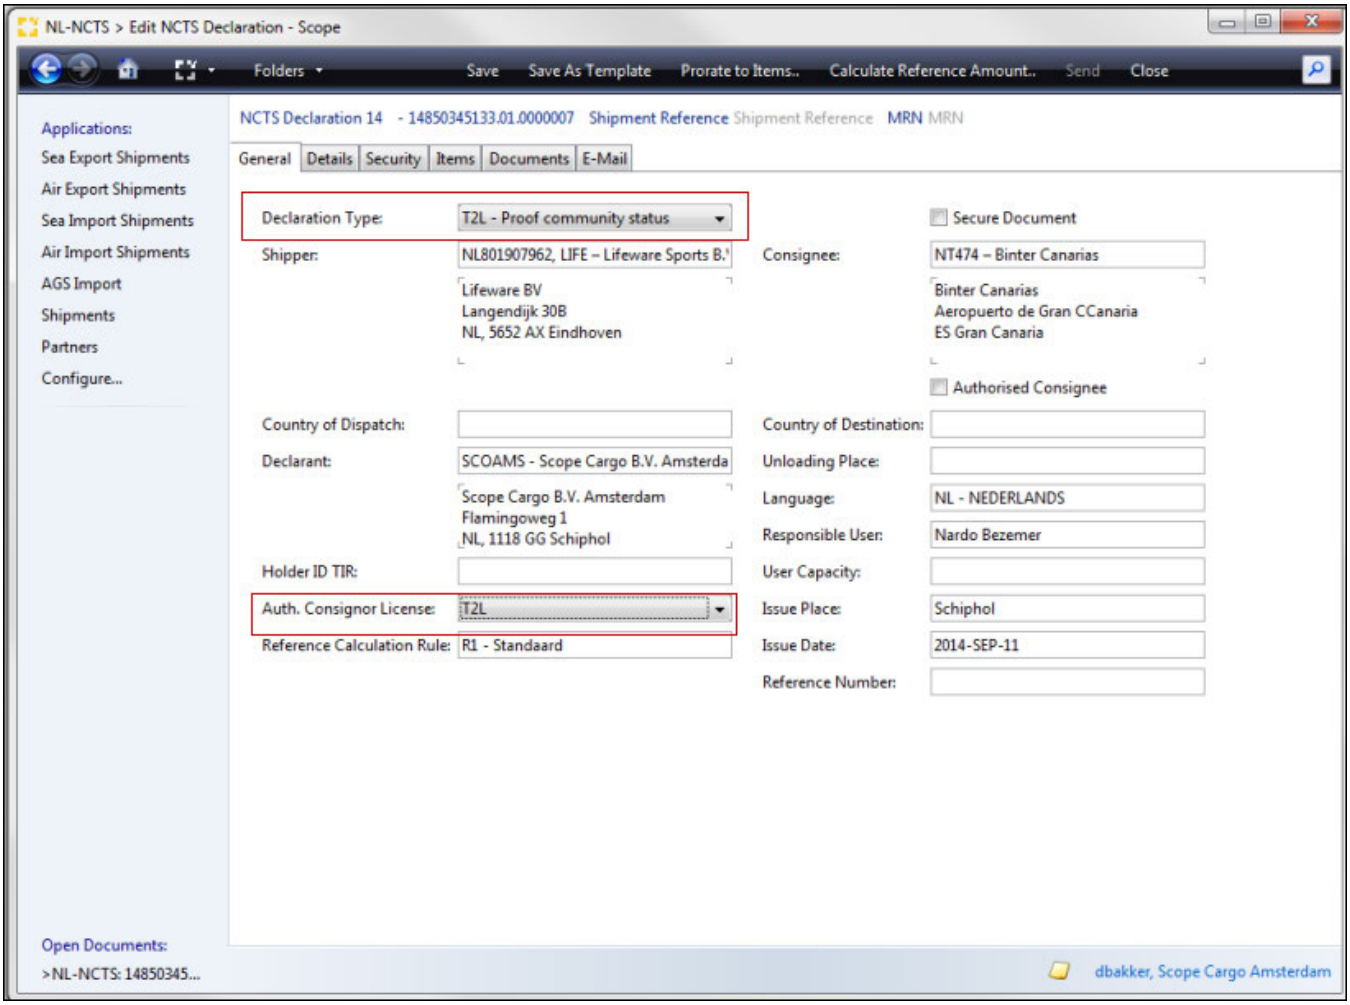
Introduction

In the NCTS module it is also possible to issue a T2L / T2LF document. Such documents are used to proof the status of the goods as "free EU Community goods" when transported between 2 EU countries (intra-community movements) in such as manner that during transport they actually are outside of the EU, for instance sea transport from the Netherlands to the Canary island.

Description

To issue a T2L document a new NCTS declaration entry is created whereby in the field declaration type the selection is set to either "T2L" or "T2LF". Setting the declaration to the selected type will also disable all validations and warnings, furthermore the send button will also be disabled.

Should the T2L(F) be issued under a self -issuance license then the licence field should be set to the correct licence,
the licence is set up under the partner role declarant



If all required data has been entered, the entry can be closed and the SAD document can be printed. If a license has been added the system will ask if a definitive print should be made. A definitive print will result in a print with stamp and can no longer be modified.

Responsible Partner.

The partner name on which the Guarantee has been registered in Scope.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Branch

The Branch code where the NCTS declaration was issued

MRN

The by customs assigned MRN number

Shipment number

The Shipment number (if available) on which the NCTS declaration was issued.

Amount

The reference amount declared in the NCTS Declaration

Debited

The date when the declaration was accepted and the reference amount was debited against the Guarantee of the declaration.

Cleared

The date when the NCTS declaration was cleared (write of movement) and the reference amount is credited on the Guarantee

Expired

The Date when of the expiration date as entered during that process of the declaration.

Value of the goods.

The sum of the value of the goods (items) as entered in the declaration (optional)

GRN

The GRN number used in the NCTS declaration

Date range

To filter a criteria of a period on basis of the issue date

Guarantee

Option to filter declaration on basis of registered GRN numbers

Show only open

When active all non-cleared declaration will be shown, if not active all declarations clear/non cleared will be displayed.

search window

The standard scope search box allowing to select an declaration.

Totals per Guarantee

debited

Total open amount debited to the guarantee of the active filter.

Cleared

Total Amount debited and credited again to the guarantee of the active filter.

Expired

Total amount debited on expired documents to the guarantee of the active filter.

NCTS - Request for Non-arrived movements

- Introduction
- Description
- FAQ

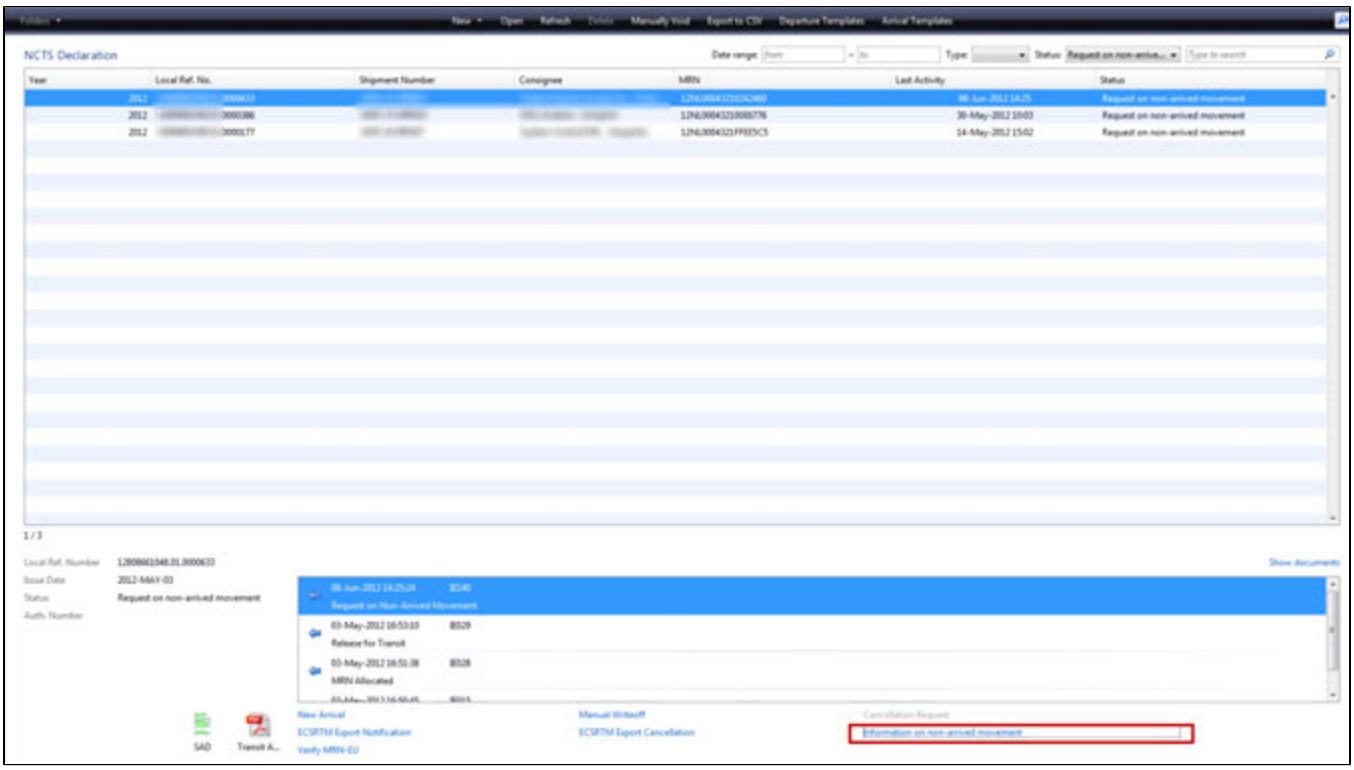
Introduction

If an NCTS declaration has not been cleared with in the given period, Customs can send a request to supply a an explanation for non-Arrived Movements, The chapter describes how to respond to such a request.

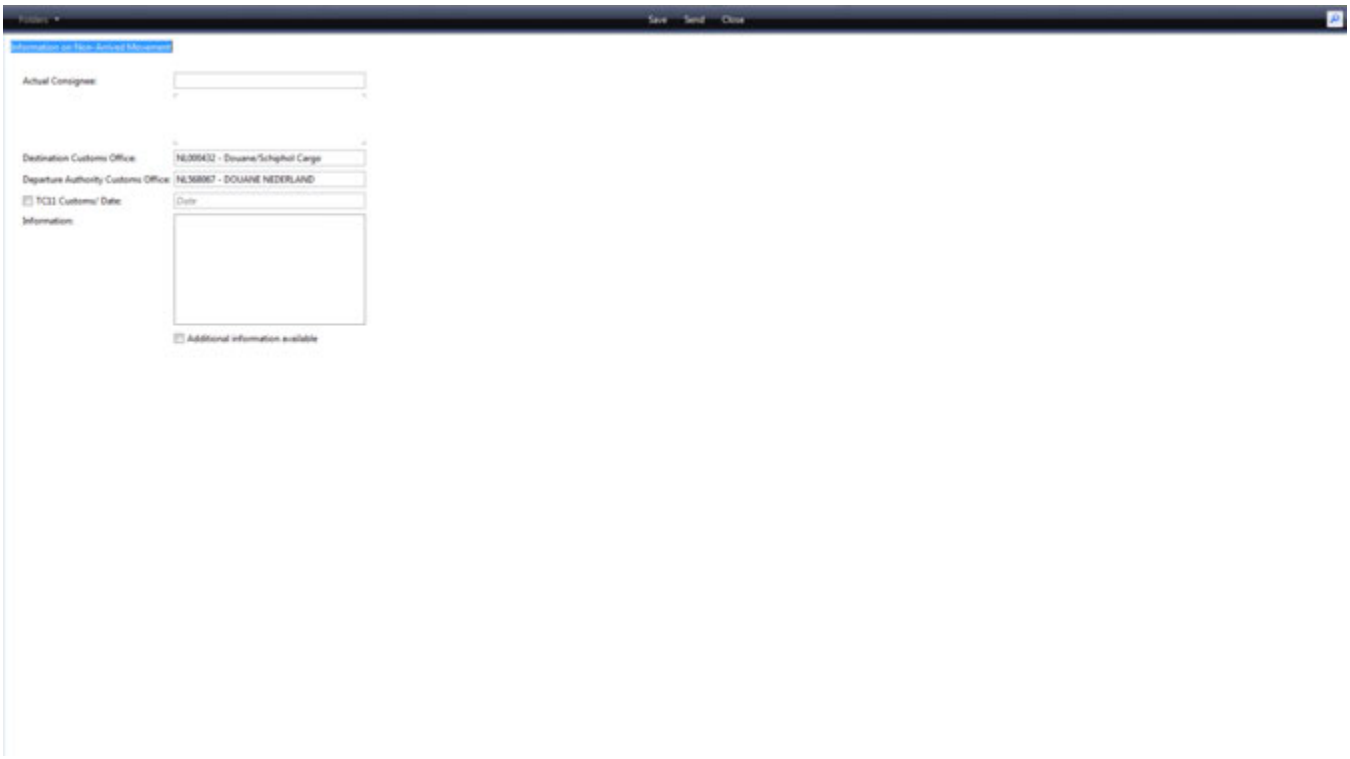
Description

Create a response

The Homeview with the status on request on non-arrived movement , activate the indicated link to open the response dialog



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Response Dialog

Actual Consignee

In this field the partner or document address of the actual receiver of the NCTS declaration

Destination customs office

Customs office of destination which issued an TC11 to confirm receipt of the declaration

Departure Authority Customs Office

The customs office responsible for the investigation of non-cleared NCTS declarations (customs office mentioned in the original message) should not be changed, For reference on NL declarations this will be NL568067.

TC Customs

to be activated when a TC11 has been issued by Customs

TC Date

The date on which the TC11 has been issued

Information

Textual information about the reasons why the NCTS declaration has not yet been submitted for arrival

Additional information available on Paper

Indication that any other proof of arrival (on paper) is available and can be provided to Customs upon request.

Response entry Schedule

field	actual consignee	Destination Customs office	Departure Authority	TC11	TC 11 Date	Information	Additional Info

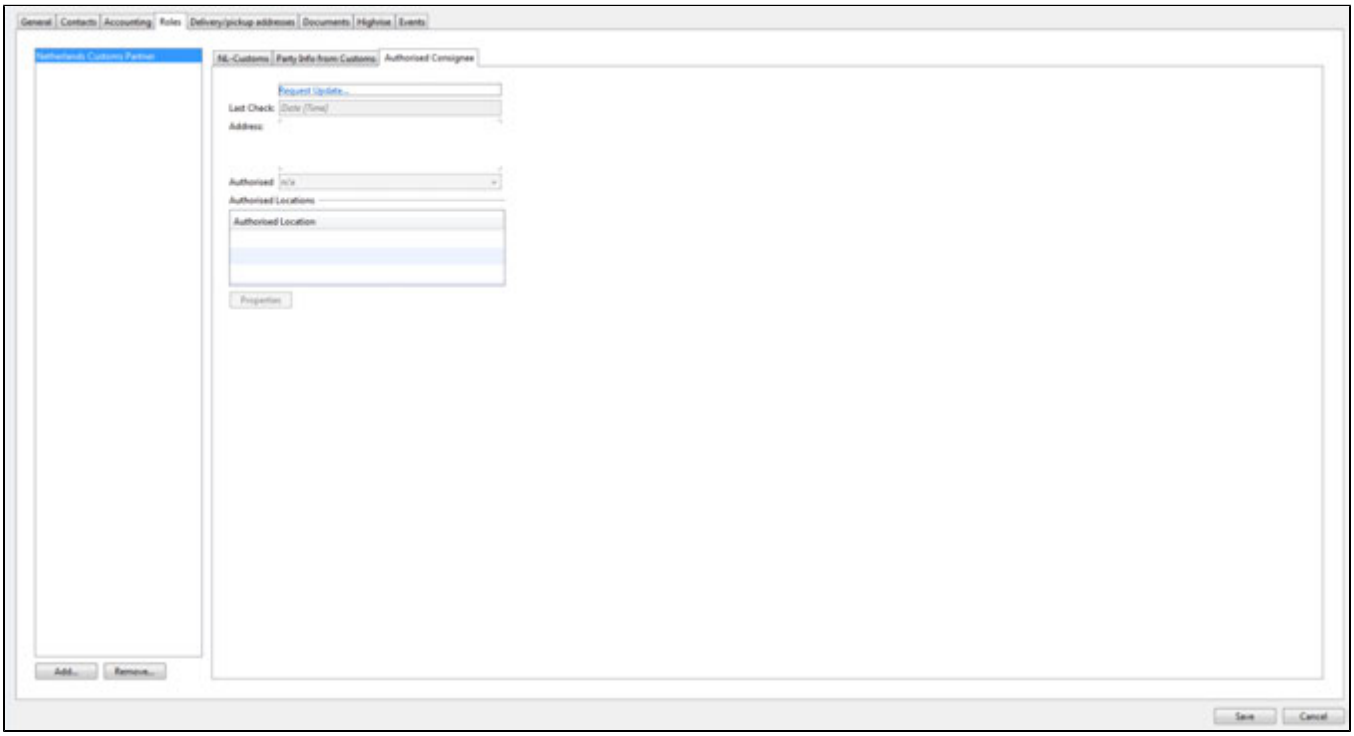
NCTS - TG validation

- Introduction
- Description
- FAQ

Introduction

Under NCTS a message is available with which the user can verify the TG locations are available under a EORI number. This message is send and stored on partner - NL Customs Partner

Description



Request Update

With the link Request update the message can be send. Requirements for the message to be send is that the partner has an Eori Number and a valid customs office transit on the tab NL-Customs.

Last Check

Will display the last date / time the check was successfully performed

Address

The address details as provided by NL customs as the address details of the send EORI number.

Authorised

Will be updated with the status if the send EORI number has a license TG or not

Authorised Locations

Will be populated with the codes assigned to the TG locations.

Properties

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Under the button Properties, there will be displayed the full address details of the TG location code.

FAQ

PDE - RTO - PGTS

- Introduction
- Description
- PGTS Prenotification
- Background information

Introduction

The PDE/RTO module is used to maintain a summarized administration for Public Douane Entrepots(PDE) and RTO warehouses.
This administration maintains on shipment level the in- and outgoing movements and related customs declarations.
For RTO warehouses that participate in PGTS, the system updates the PGTS system with the transactions taken place in this module.

NOTE: PGTS was formerly known as: DGVS

Description

The basic operations in this module are:

- PGTS Prenotification
  This function is only used in case the RTO is participating in PGTS.
  Using this function the user can inform the handling agent (or any other PGTS participant) via which customs procedure a shipment will be picked up.
  This function is accessible from the menu (seeing all PGTS Prenotifications) and via de Air Import Master, Direct and Back-to-back shipments.
- Take In
  The TakeIn appliance allows the registration of goods received in the entrepot.
  In case of PGTS this includes the messaging for receiving goods from both PGTS -participants (ISL) and non-PGTS-participants (ISC).
  A Take-In can be combined with a Breakdown.
- Breakdown
  The Breakdown appliance allows the split of a master shipment into house shipments.
- Buildup
  The Buildup appliance allows the merge of 1 or more house shipments into a single master shipment.
- TakeOut
  The TakeOut appliance allows the registration of goods shipped from the entrepot.
  In case of PGTS this includes the messaging for shipping goods to both PGTS-participants (USL) and non-PGTS-participants (USC).

In addition the following functions are available:

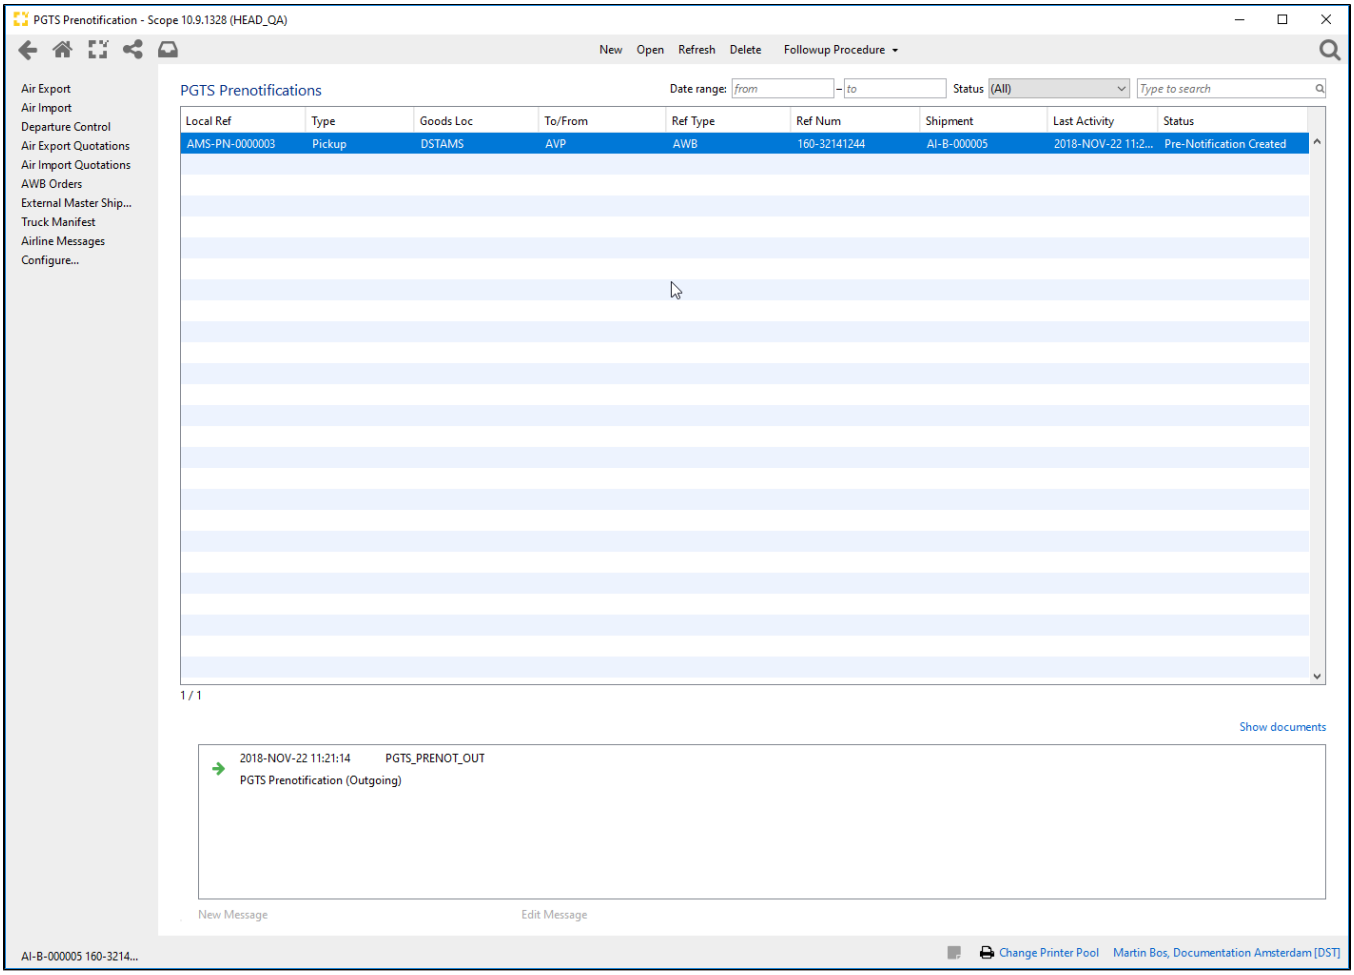
- Inventory
  Shows the current (and past) inventory and allows the user to export it to XLS.
- PGTS Corrections
  This appliance allows the user to do corrections that are not directly related to a TakeIn or Takeout. It will be used in case of loss or damage of goods or special corrections after consulting Customs.

PGTS Prenotification

Compared to old system DGVS, PGTS has an additional message: Prenotification to inform the other party (mostly ground handlers) about the goods that will be picked up.

PGTS Prenotification - Home View

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Application Actions

New

Allows the creation of a new Prenotification procedure and starts the editor so the details can be supplied.

Open

Opens the selected Prenotification to view/edit the details.

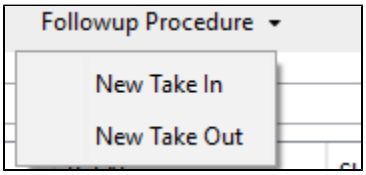
Refresh

Refreshes the screen with the latest information.

Delete

Allows the deletion of a non-sent Prenotification

Followup Procedure



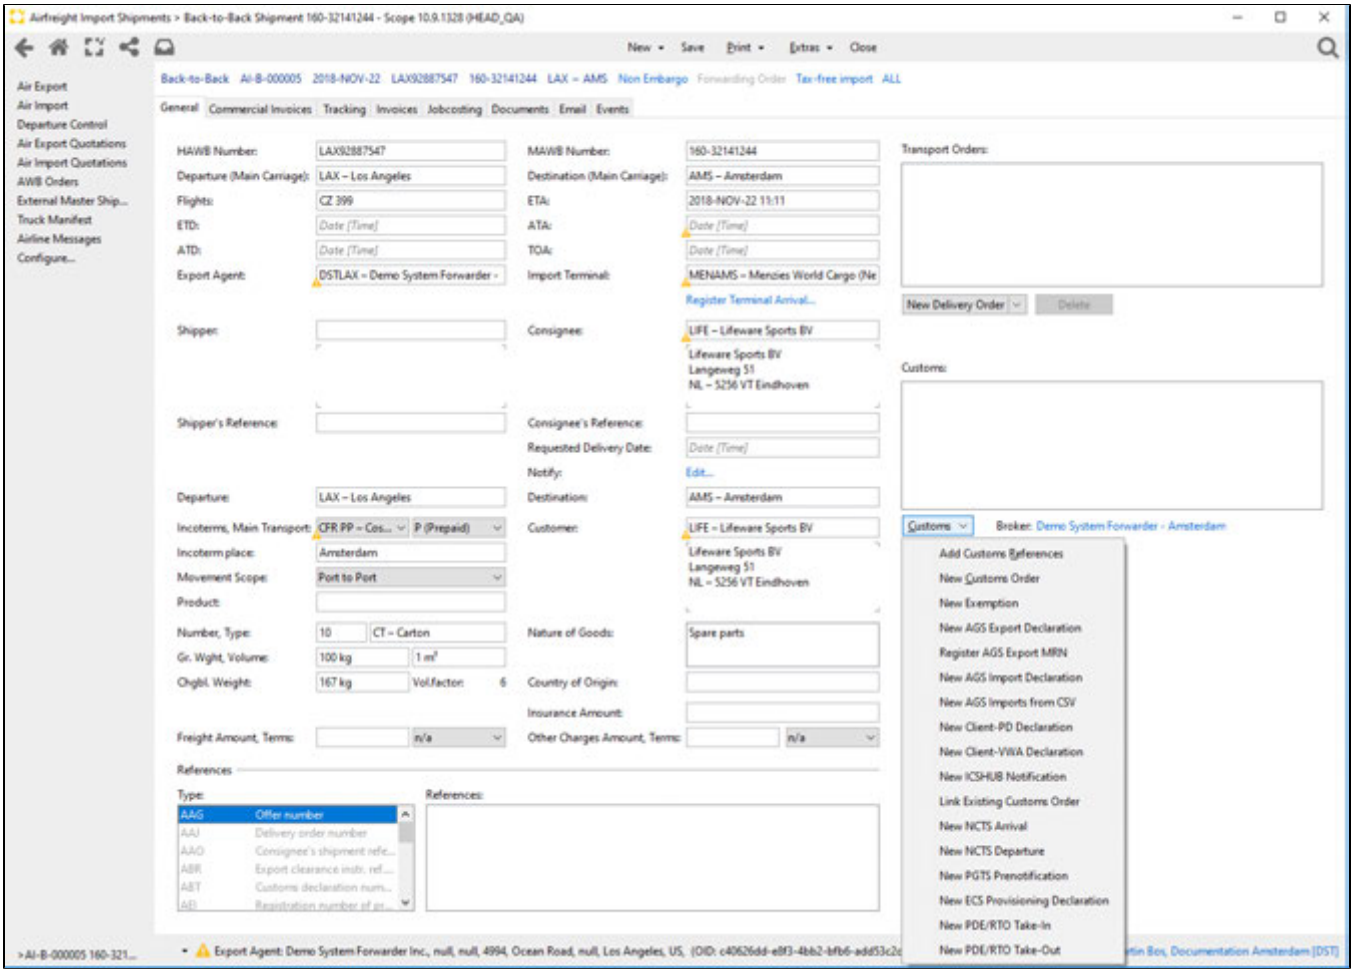
Allows the user to create a Take In or Take Out on the selected Prenotification.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

By creating the Take In from the Prenotification, you can make sure the Take In contains the same details as the Prenotification.

From Air Import shipment

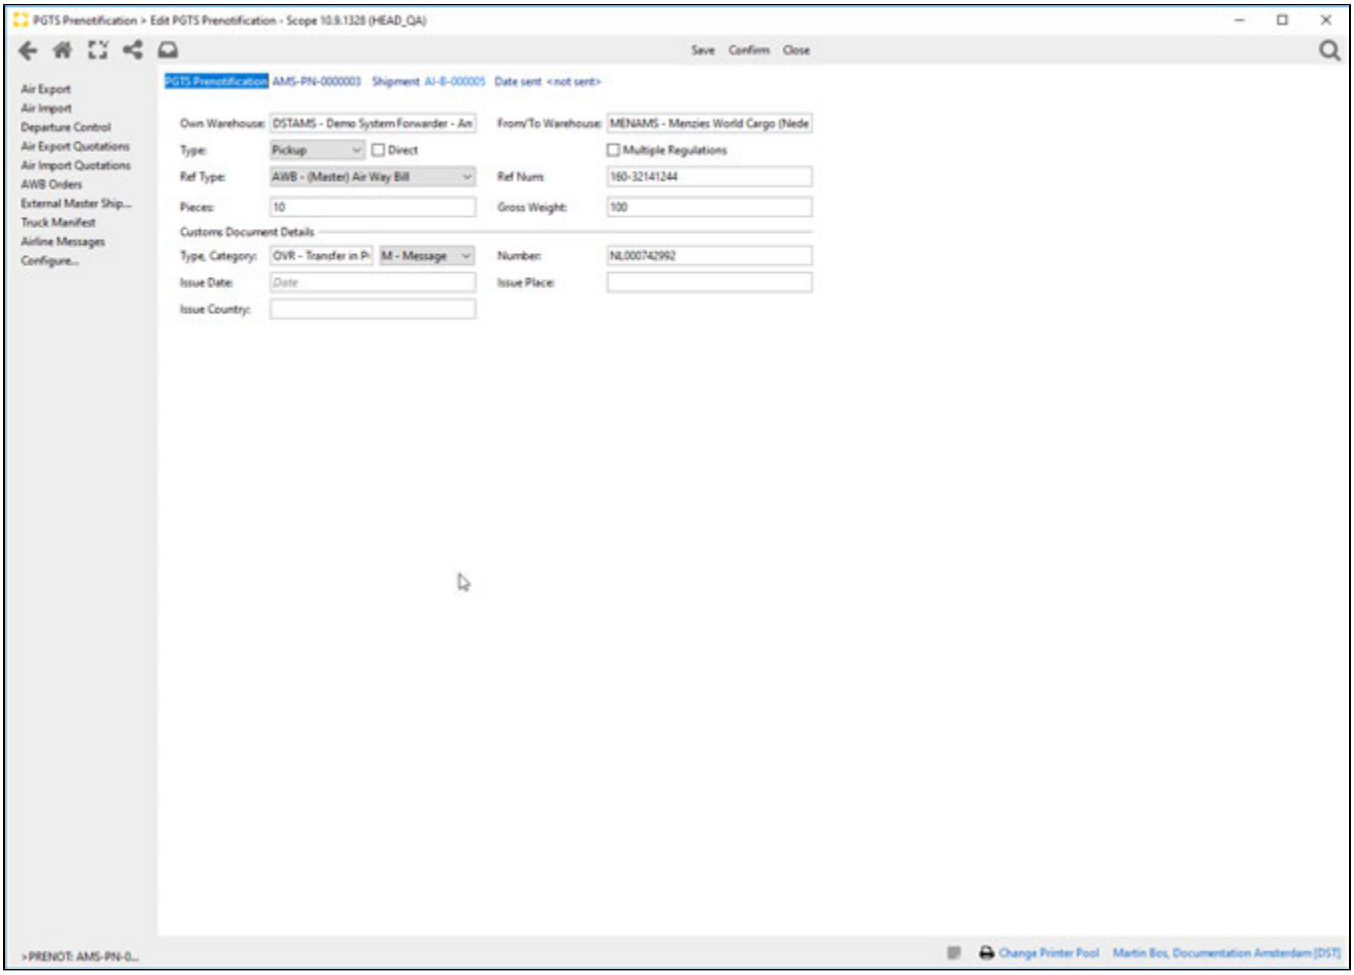
The Prenotification can also be created directly from the Air Import Shipment screen, via de Customs drop-down menu.



This brings you to the Prenotification editor.

Prenotification Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Own Warehouse

This is the Partner code of your own RTO warehouse.

From/To Warehouse

For Pickup: this is the warehouse where you want to pick up the shipment (import)
For Delivery: this is the warehouse where you want to deliver the shipment (export)
In most cases it will be the ground handler/terminal.
When the Prenotification is created from an Air Import shipment, this field is defaulted with the Terminal of the shipment.

Type

A Prenotification can be made to either Pickup(import) or Deliver(export) the goods.
Because the PGTS system will automatically send the Prenotification(Delivery) for export, these will hardly be used from Scope; it will be Pickup(import) in most cases.
See the Cargonaut manual for PGTS.

Direct

Indicates that the goods are not picked up by the forwarder/agent but by the customer directly. This means that no Take In (import) will follow.
In the customs document details the type and number of the customs document used should be specified. Most probably an Import Clearance or NCTS declaration.

Multiple Regulations

In case the shipment is directly picked up with multiple customs declarations this toggle needs to be set and an ICSHUB(755-INO) message should be separately created.
This can be done in the ECS/ICS Hub Appliance.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Reference Type / Number

In this field the reference to the shipment should be mentioned. This should be the same reference as in the Take In that will follow (import).

Pieces / Gross weight

These are the fields that indicate how many pieces and how much weight will be picked up(import). When created from a shipment, the system defaults with the total pieces and weight of the shipment.

Customs Document Details

Type / Number

The type and number of Customs Document used to transfer the goods. Special options here:

- OVR
  Means bringing goods over using the PGTS Take In.
  The Customs Document Number must be the RTO entrepot number.
- DPU (=Direct Pickup)
  Used when a Pickup is Direct and multiple regulations are involved.
  The Customs Document Number should contain "755" indicating that an ICSHUB message will be sent separately.
- DDL (=Direct Delivery)
  Used when a Delivery is Direct and multiple regulations are involved.
  The Customs Document Number should contain "755" indicating that an ECSHUB message will be sent separately.

Issue Date and Place

Optional fields indicating the issue date and place of the customs document.

Background information

Here some information about what messages have to be sent in what case.

Entrepot Type	PGTS member	=>	Send PGTS Prenotification?	Send PGTS RTO-messages (ISL,ISC,USL,USC,OPB,AFB,COR)
RTO	No		✗	✗
RTO	Yes		✓	✓
PDE	No		✗	✗
PDE	Yes		✓	✗
None	No		✗	✗

Forwarders in the last category, can still get their goods from the ground handler, but they will probably issue an instant Prenotification when truck arrives at the ground handler desk to pickup the goods.
Depending on the ground handler, additional charges might be applicable.

Introduction

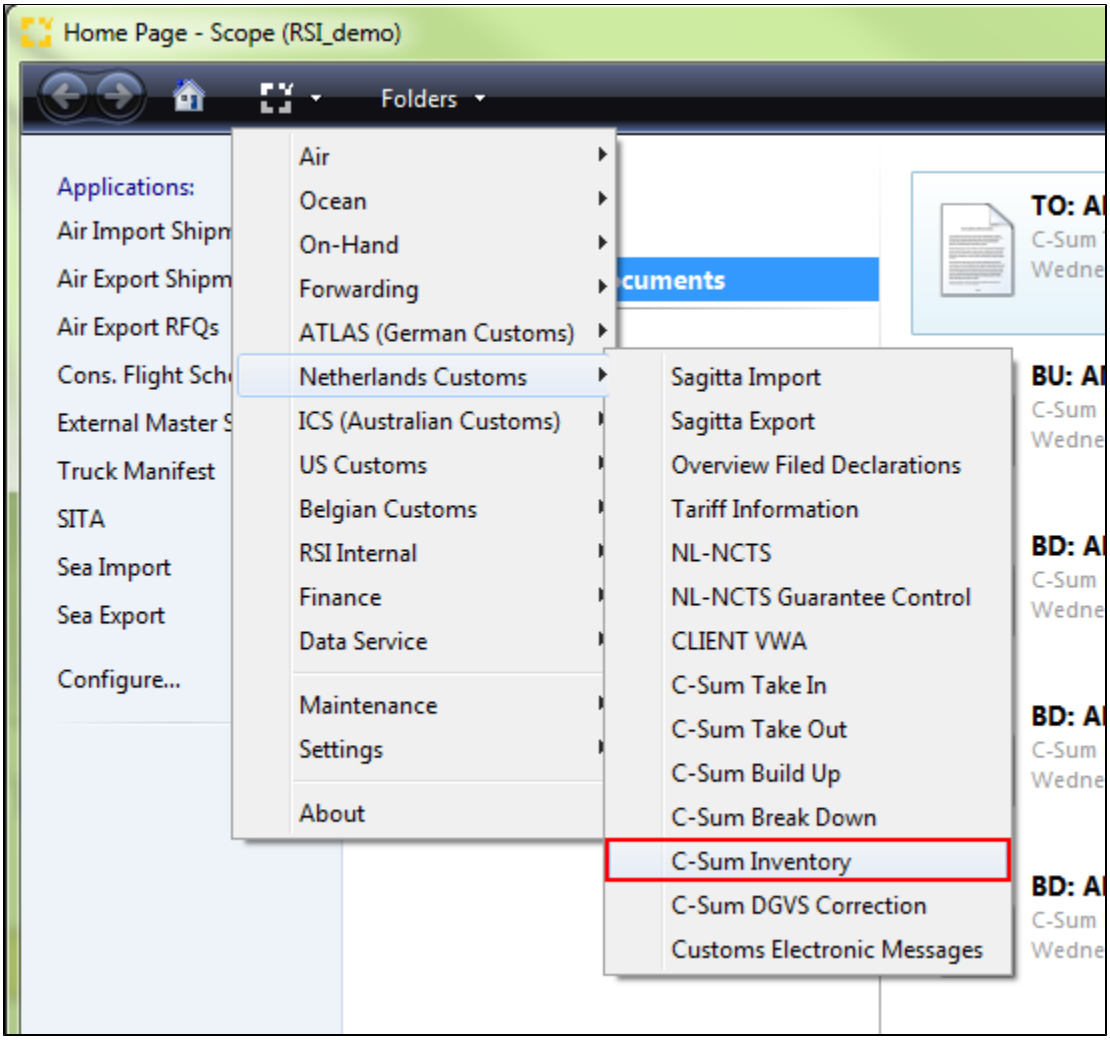
In the Inventory Appliance of the Csum-DGVS module, you can see the current and past state of the Csum/DGVS inventory.

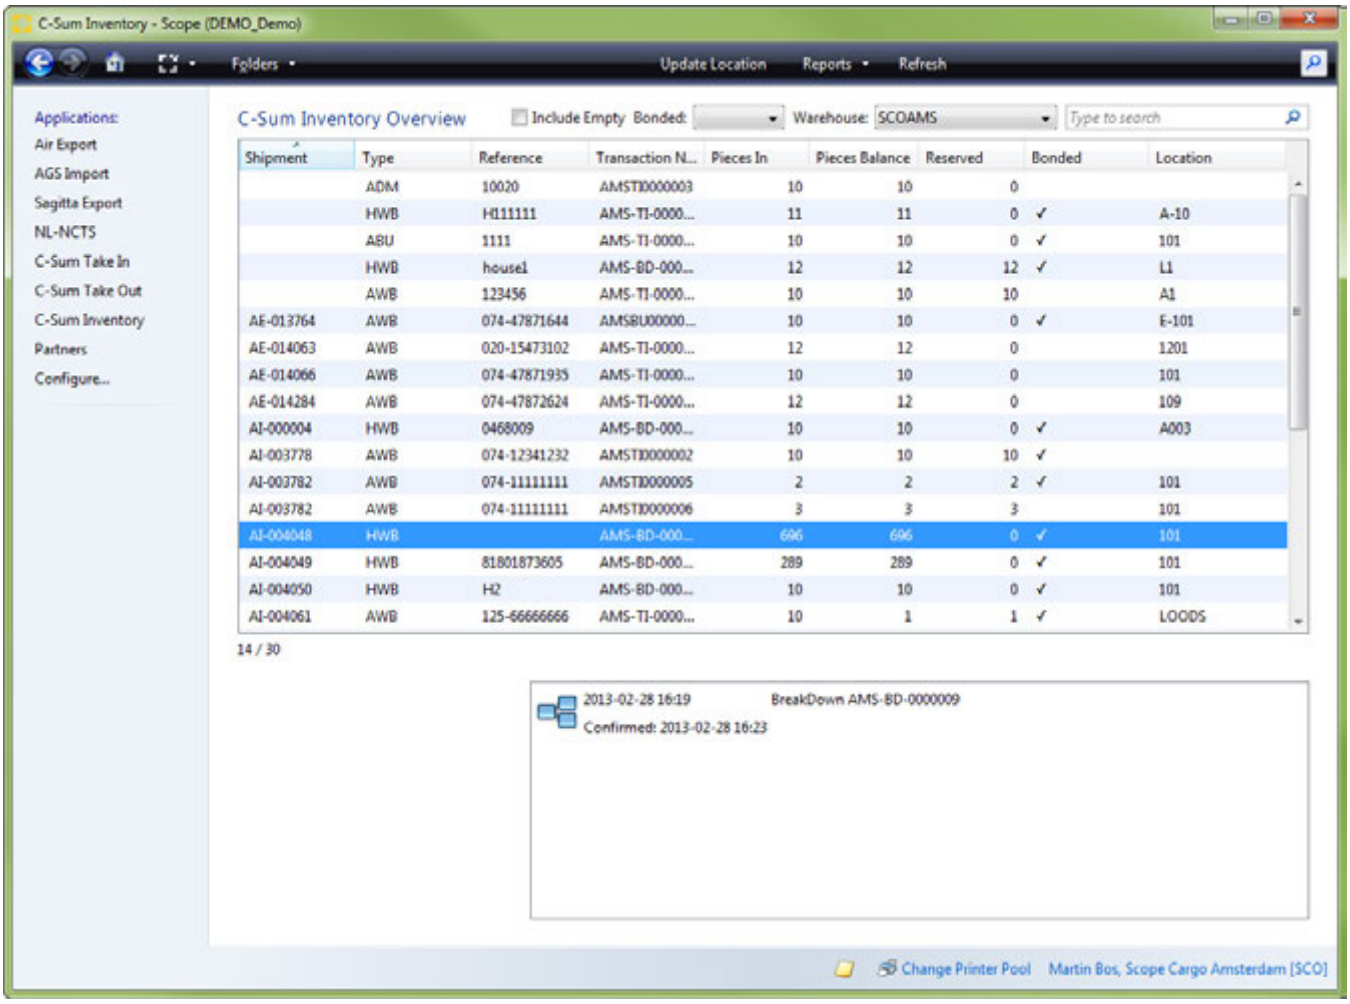


Description

Application Actions
Filter and Search
Inventory Transactions

Homeview

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Application Actions

Update Location

Allows the user to update the location of the selected Inventory record.

Reports

From the Inventory Home view, the user can select the Report menu and run the following reports:

Inventory Report

This report gives an overview of the current Inventory in C-sum/DGVS. The following columns are listed:

- Warehouse
- Receipt Number
- Shipment Number
- Reference Type / Number
- Customs Document
    - Type
    - Category
    - Number
    - Date
    - Place
- Pieces in Stock
- Gross Weight in Stock
- Bonded (EU / NEU)
- Location
- Creator (user that created the inventory record)

DGVS Comparison Report

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Compares the current Inventory with an inventory report created from the DGVS portal.
As the new DGVS portal uses a different format than the old DGVS portal there are 2 options.

Once this DGVS Comparison Report is chosen, it prompts for the file with from the DGVS portal.

The result report shows the discrepancies between the Scope Csum/DGVS inventory and inventory from the DGVS portal.

Inventory Comparison Report

This function produces a report with the differences between the Scope Csum/DGVS inventory and a cycle-count report.

The cycle-count report (XLS) should have the following columns:

- Transaction : The number of the transaction creating the stock in Scope (Take-in, Break-down, Buildup)
- Number of pieces : The count of packages for that transaction number.

The result is a report with the following columns:

- Scope transaction : The transaction where Scope still has balance not equal to the reported stock in the uploaded file
- Scope number of pieces : The balance of the Scope transaction
- Inventory transaction: The transaction where the uploaded file still has balance not equal to the balance is Scope
- Inventory Number of pieces : The number of pieces reported by the uploaded file.

History Report

Based on a given date-span, this report shows all the Scope Csum/DGVS transactions within that period.

The excelsheet with the results contains the following tabs: Take In, Breakdown, Buildup, Takeout
For each of the different transactions the relevant columns are shown.

- Take In
    - Take In number
    - Confirm Date
    - Shipment
    - DGVS Reference Type/Number
    - Departure (from Shipment)
    - Pieces
    - Gross Weight

Editor Fields

Receipt Warehouse

TakeIn Date/Time

Date and time this TakeIn is created. This field is readonly and automatically filled by the system.

Receipt Date

Date (and optionally time) the goods (will be) received in the warehouse.

Confirm Date/Time

Date and time this TakeIn is confirmed. This field is readonly and automatically filled by the system when the user selects the action: Confirm

BreakDown

When this toggle is checked, this TakeIn transaction will also include a Breakdown transaction. The fields on the tab: BreakDown become enabled.
This is typically used in cases where a master shipment is received, which needs to be split into the individual houses. This is typically for the Import flow.

Shipment Details

Select Shipment

This action link allows the user to select a shipment from the Scope Air, Ocean or Simple shipments.
In case the breakdown toggle is checked and a master shipment is select, the system will automatically fill the lines on the BreakDown tab with the corresponding house shipment details.

Shipment

Readonly field to show the shipment number to which this TakeIn is related.

Reference Type, Number

Type of reference and number.
In case the reference type is "AWB" any dashes will be removed while sending the DGVS message.

Pieces

Pieces of the shipment received.

Gross Weight

Gross weight of the shipment received.

Goods Handling Code

Indication of the type of treatment of the goods.

Bonded Goods

Indicates whether the goods are bonded or in free circulation.

Location

Free format field to enter a location where the goods are stored in the warehouse.

Customs Document Details

In these fields the user can enter the details of the Customs Document that relates to this shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type, Category

Type and Category of the Customs document.

Number

Number of the Customs Document

Issue Date

Issue date of the Customs Document

Issue Place

Issue place of the Customs Document

Issue Country

Issue country of the Customs Document

From Warehouse

In case the goods come from another DGVS warehouse, that warehouse should be specified here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

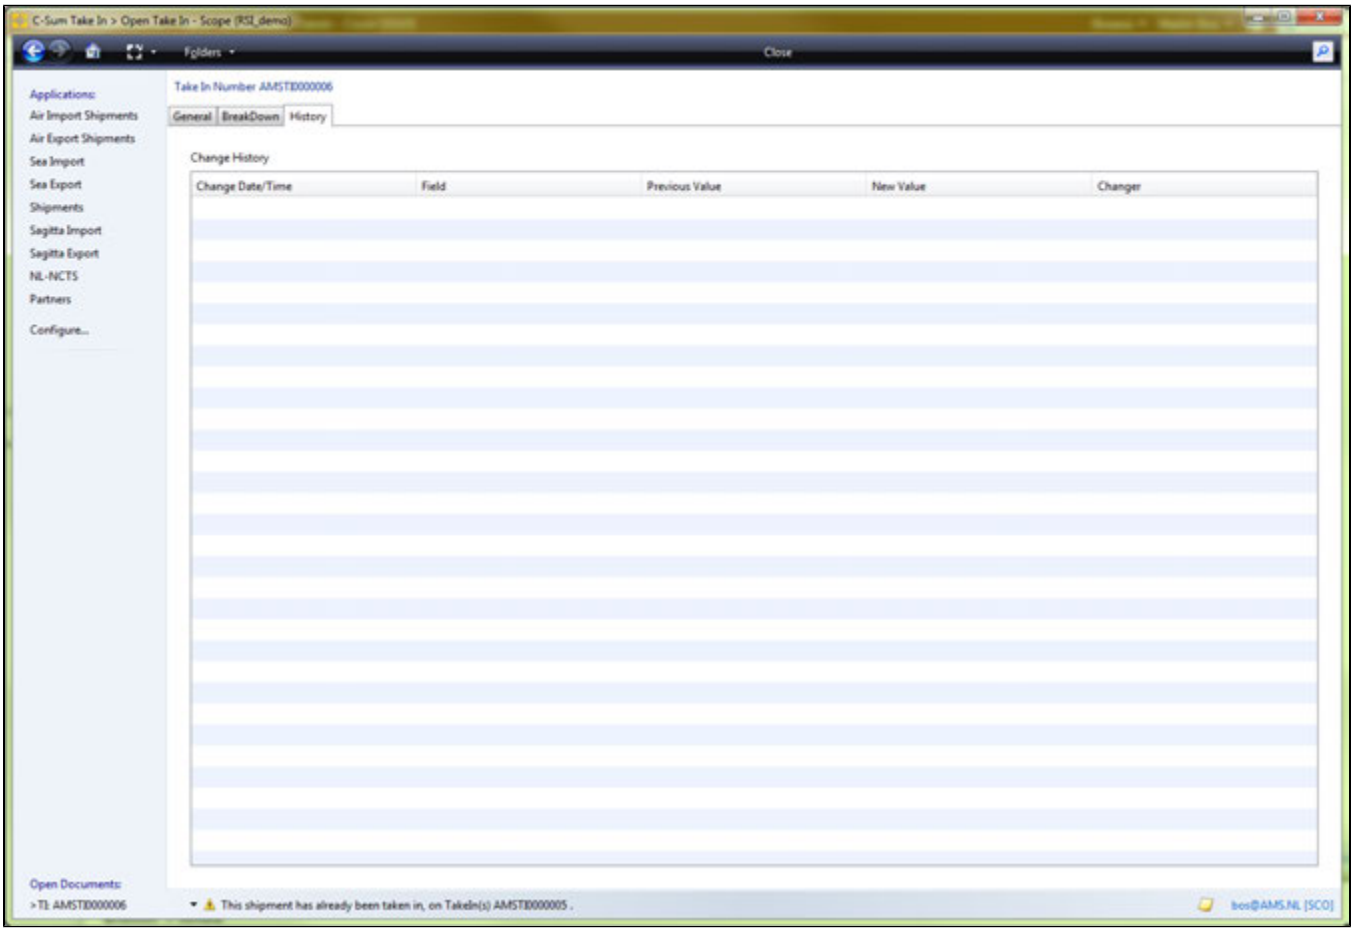
History - TakeIn - DGVS - C-sum

- Introduction
- Description

Introduction

In this tab of the TakeIn appliance shows the user all the corrections that have been made after confirmation of the TakeIn.

Description



Grid Fields

Change Date/Time

Date and time the correction was done

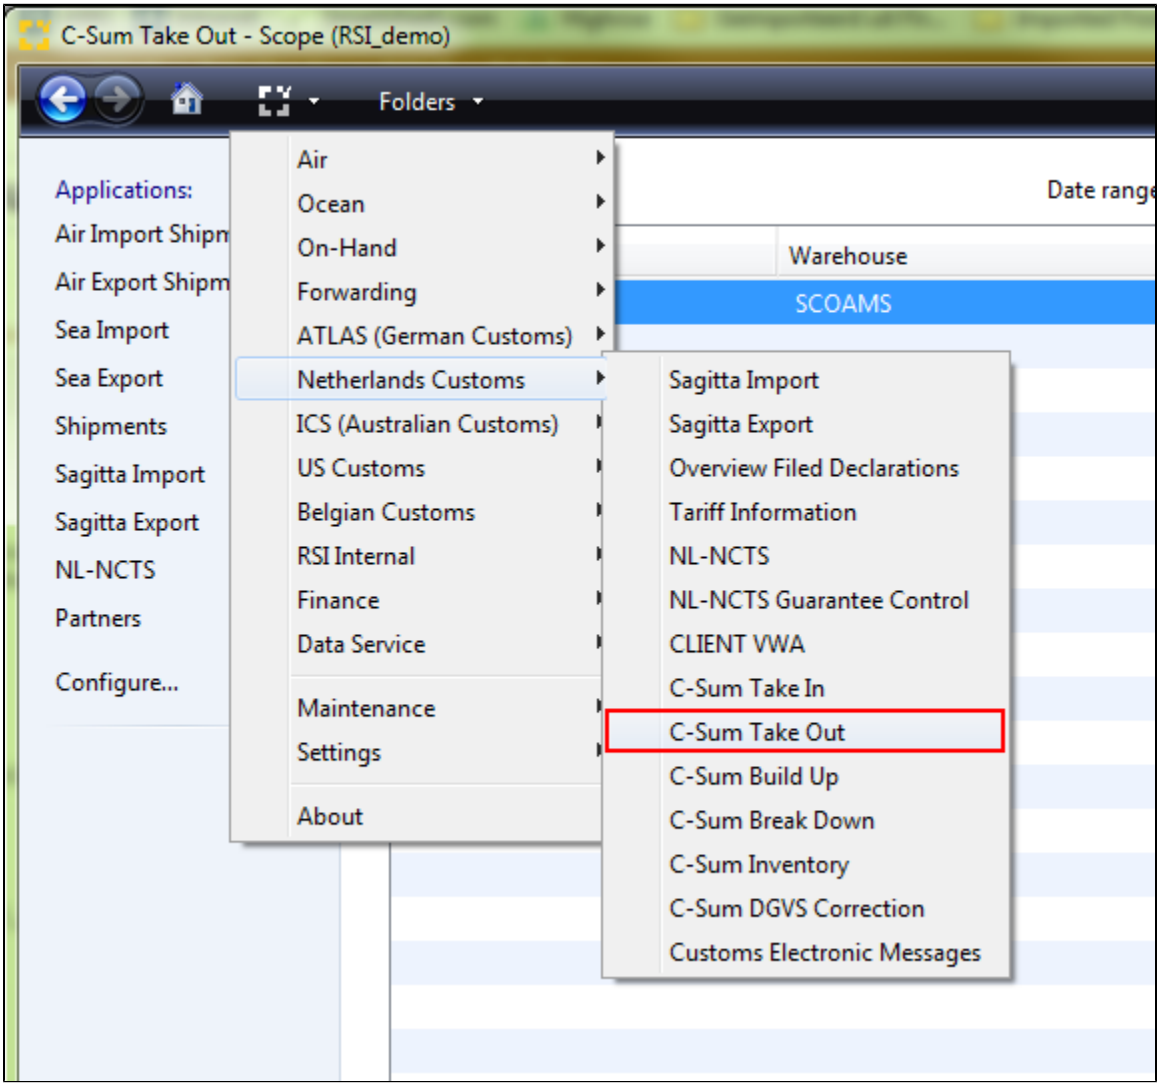
TakeOut - DGVS - C-sum

- Introduction
- Description
- FAQ

Introduction

In the TakeOut Appliance of the Csum-DGVS module, you can register goods that are shipped from the entrepot.
Optionally you can include a buildup to first buildup multiple inventory items into 1 new before that is taken out.

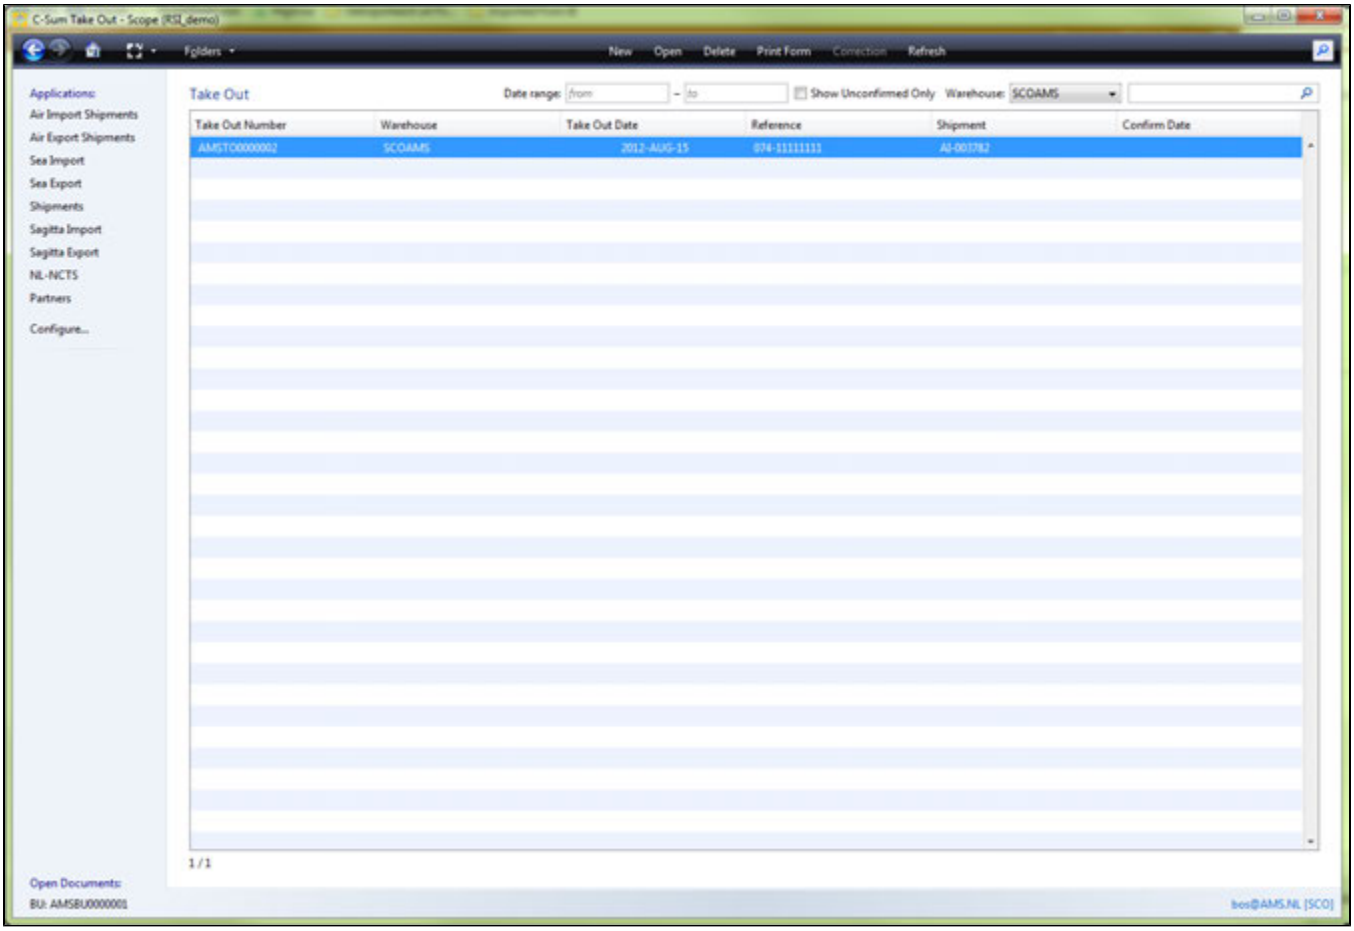


Description

Application Actions
Filter- and searchfunction(s)

Homeview

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Application Actions

New

Creates a new TakeOut transaction.

Edit

Opens selected transaction for editing. In case the transaction was already confirmed the transaction is opened readonly.
When changes are needed after confirmation, the Correction action must be used.

Delete

Deletes the selected TakeOut. This is only possible when the TakeOut was not confirmed yet.

Print Form

Prints a TakeOut Form, showing the details of this TakeOut.

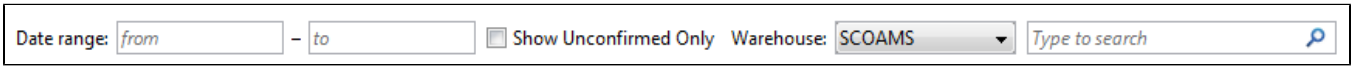
Correction

Allows the user to correct a TakeOut that was already confirmed.

Refresh

Refreshes the grid from the database.

Filter- and searchfunction(s)



Date Range

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Filters the record on TakeOut Date

Show unconfirmed only

When ticked, the system shows only TakeOut records that are not confirmed.

Warehouse

Shows only the TakeOut for the selected Warehouse-partner. By default this is the Branch-Partner of the branch the user is logged in to.

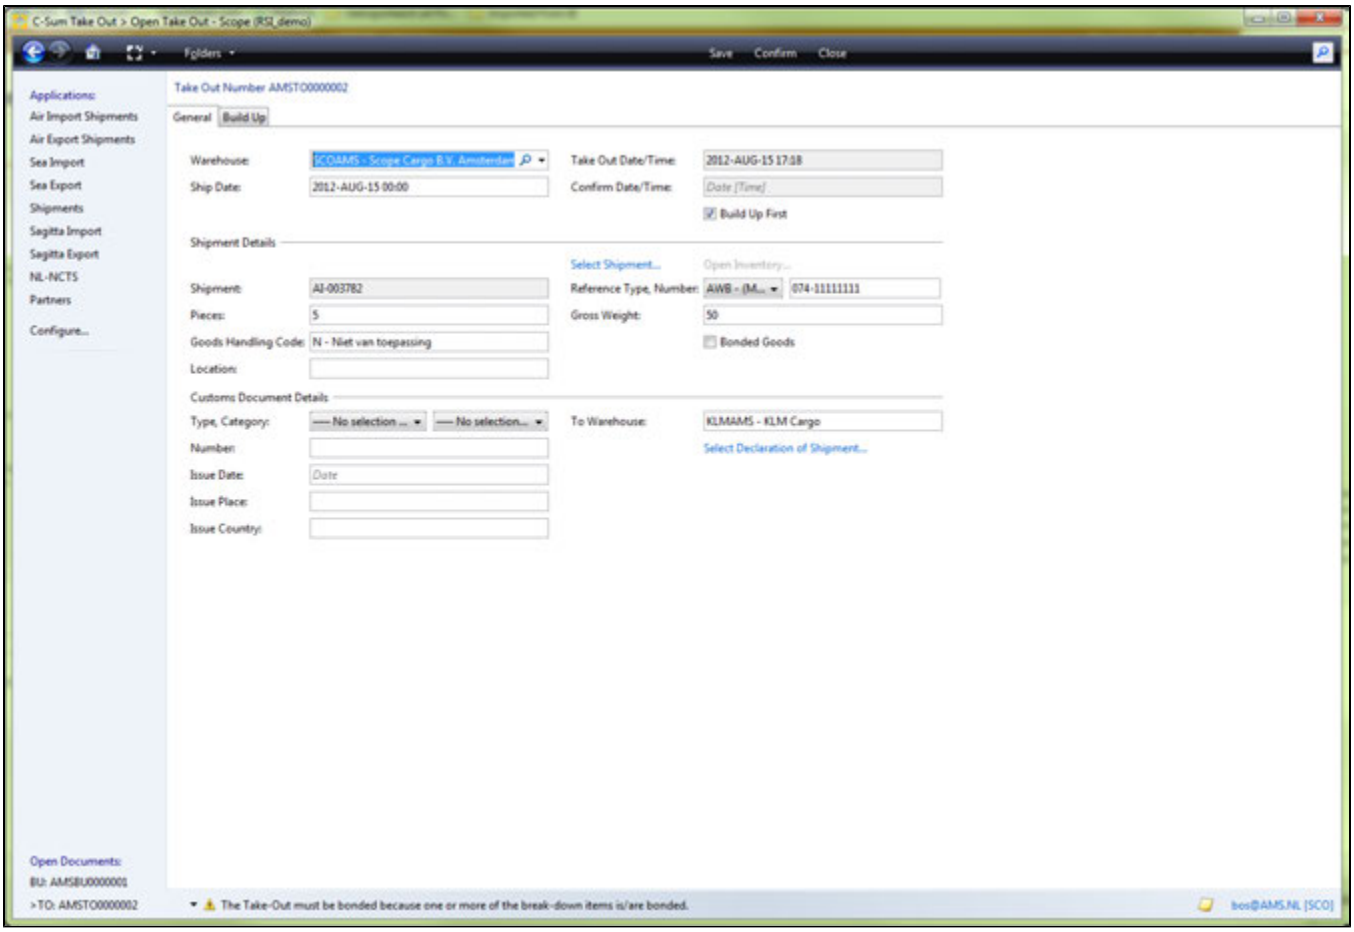
General - TakeOut - DGVS - C-sum

- Introduction
- Description

Introduction

In this tab of the TakeOut appliance the user can select the Inventory which has to be taken out.
Optionally the user can include a BuildUp first which is then taken out.

Description



Editor Actions

Save

Saves the current TakeOut record in case all required fields are specified.

Confirm

Confirms the TakeOut. After Confirmation the record cannot be changed; only Corrections can be done.
In case the Warehouse participates in DGVS, related DGVS messages will be sent:

- USC (WriteOut)
  or
- USL (TransferTo)

Close

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Closes the current TakeOut record. System will prompt when there are unsaved changes.

Editor Fields

Warehouse

TakeOut Date/Time

Date and time this TakeOut is created. This field is readonly and automatically filled by the system.

Ship Date

Date (and optionally time) the goods (will be) shipped.

Confirm Date/Time

Date and time this TakeOut is confirmed. This field is readonly and automatically filled by the system when the user selects the action: Confirm

BuildUp First

When this toggle is checked, this TakeOut transaction will also include a BuildUp transaction. The fields on the tab: BuidlUp become enabled.
This is typically used in cases where a master shipment is shipped, which needs to be buildup first from the individual houses. This is typically for the Export flow.

Shipment Details

Select Shipment

Only active in case BuildUp First is checked.
This action link allows the user to select a shipment from the Scope Air, Ocean or Simple shipments.
In case a master shipment is selected, the system will create the BuildUp Lines for the inventory of the the related houses.

Select Inventory

Only active in case BuildUp First is unchecked.
This action link allows the user to select the Inventory that is taken out.

Shipment

Readonly field to show the shipment number to which this TakeOut is related.

Reference Type, Number

In case BuildUp First is unchecked:
It shows the reference type/number of the Inventory takenout.

In case BuildUp First is checked:
It allows the user to specify the reference type/number of the Inventory that is build up (and taken out).

Pieces

Pieces of the shipment shipped.

Gross Weight

Gross weight of the shipment shipped.

Goods Handling Code

In case BuildUp First is unchecked:
Indication of the type of treatment of the goods from the selected Inventory.

In case BuildUp First is checked:
The user can indicate the Goods Handling Code of the Inventory created by the build up.

Bonded Goods

In case BuildUp First is unchecked:
Indicates whether the goods of the selected Inventory are bonded or in free circulation.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In case BuildUp First is checked:
The user can indicate whether the goods of the Inventory created by the BuildUp are bonded or free.

Location

In case BuildUp First is unchecked:
Free format field to enter a location where the goods are stored in the warehouse.

In case BuildUp First is checked:
The user can specify the location for the goods of the inventory created by the build up. Please note that the goods are also taken out immediately, so location is not very important here.

Customs Document Details

In these fields the user can enter the details of the Customs Document that relates to this shipment.
In order to TakeOut bonded goods either:

- the To Warehouse must be a DGVS warehouse
- or the Customs Document Fields have to be specified

Type, Category

Type and Category of the Customs document.

Number

Number of the Customs Document

Issue Date

Issue date of the Customs Document

Issue Place

Issue place of the Customs Document

Issue Country

Issue country of the Customs Document

To Warehouse

In case the goods are shipped to another DGVS warehouse, that warehouse should be specified here.

Select Declaration of Shipment

This action link allows the user to select an Import or NCTS declaration of the related shipment. After selection the Customs Documents Fields are defaulted from the selected Declaration.

Customs Order

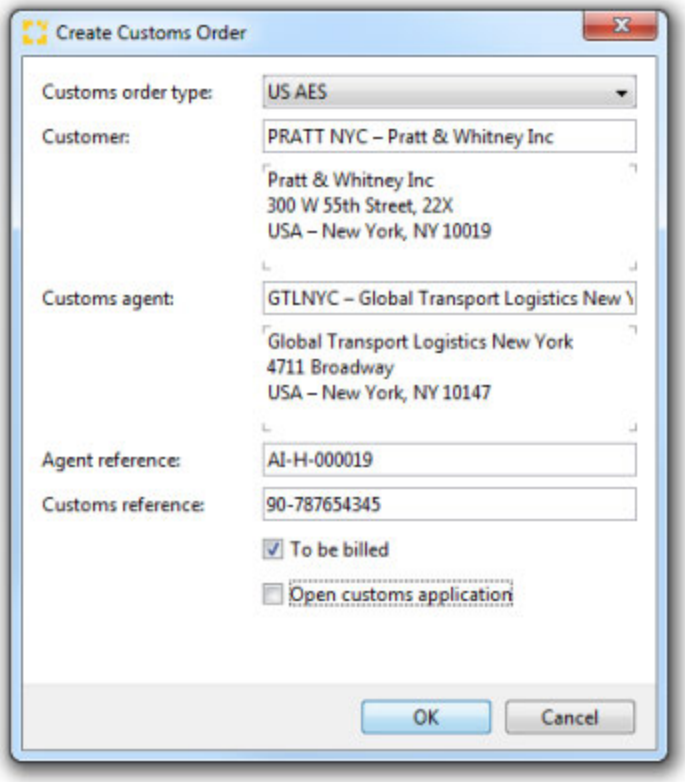
- Introduction
- Description

Introduction

This application appears as an action link in the various shipment editors and this action link serves as a means launch the Customs Order editor and enter customs specific information or to launch a customs application where a specific customs operation may be undertaken.

Description

Create Customs Order



Customs Order Type

This is a drop down list that will display all possible types of customs orders. The application will try to default the correct customs order based on the type of shipment and the location of the branch office.

Customer

The customer is defaulted from the main shipment entry and will be the shipper or the consignee depending on if the shipment is an import or export shipment. This is a text search field and any partner details may be entered to locate the correct partner alternately the context menu can be used to add or edit partner details.

Customs Agent

The name of the customs agent or customs broker who is responsible for creating any customs entries required by the customs authorities. This is a text search field and any customs partner details may be entered to locate the correct customs partner alternately the context menu can be used to add or edit customs partner details.

Agent Reference

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The reference number created by the the import agent to identify the shipment. This will default to the shipment number.

Customs reference

When the shipment is processed by the customs authorities, they will issue a customs reference for the shipment which should be stored in this field.

To be billed

Check this field if charges for customs processing the shipment are to be billed to the invoice party for the shipment.

Open customs application

If there is a Scope module to customs process the shipment, check this field. On clicking *OK* this application will be started in order for further customs processing to be completed. The application to be launched will be based on the *Customs order type* that has been selected earlier.

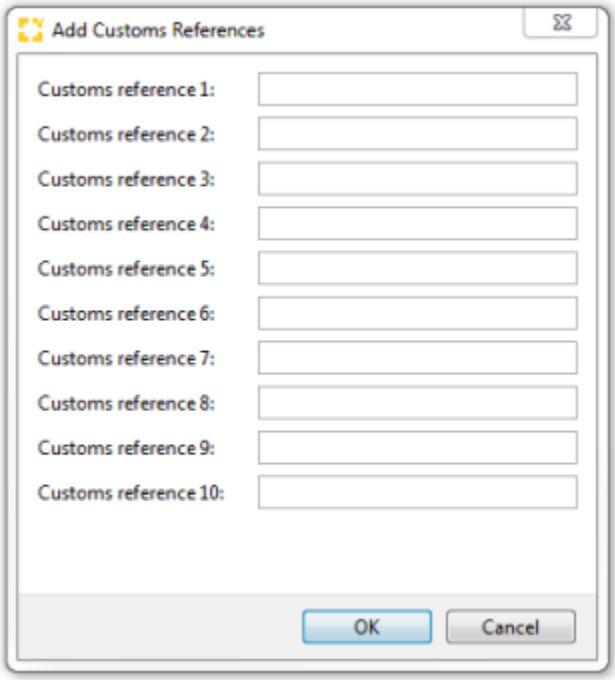
OK

Save the data and exits the editor. If the the *Open customs application* has been checked, the required application will launch.

Cancel

Exits the customs order without saving any data.

Additional Customs References



Customs References 1 - 10

Up to 10 additional customs references may be entered using the application. Typically these are additional customs references provided by third parties.

OK

Saves the data and exits the application, returning to the main shipment entry.

Cancel

Exits the application without saving any data and returns to the main shipment entry.

Customs Switzerland

- Introduction
- Description

Introduction

Scope offers several applications for Swiss customs.

Description

The description of the Swiss customs applications is currently only available in the German version of the Scope User Manual.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Customs USA

- Introduction
- Description

Introduction

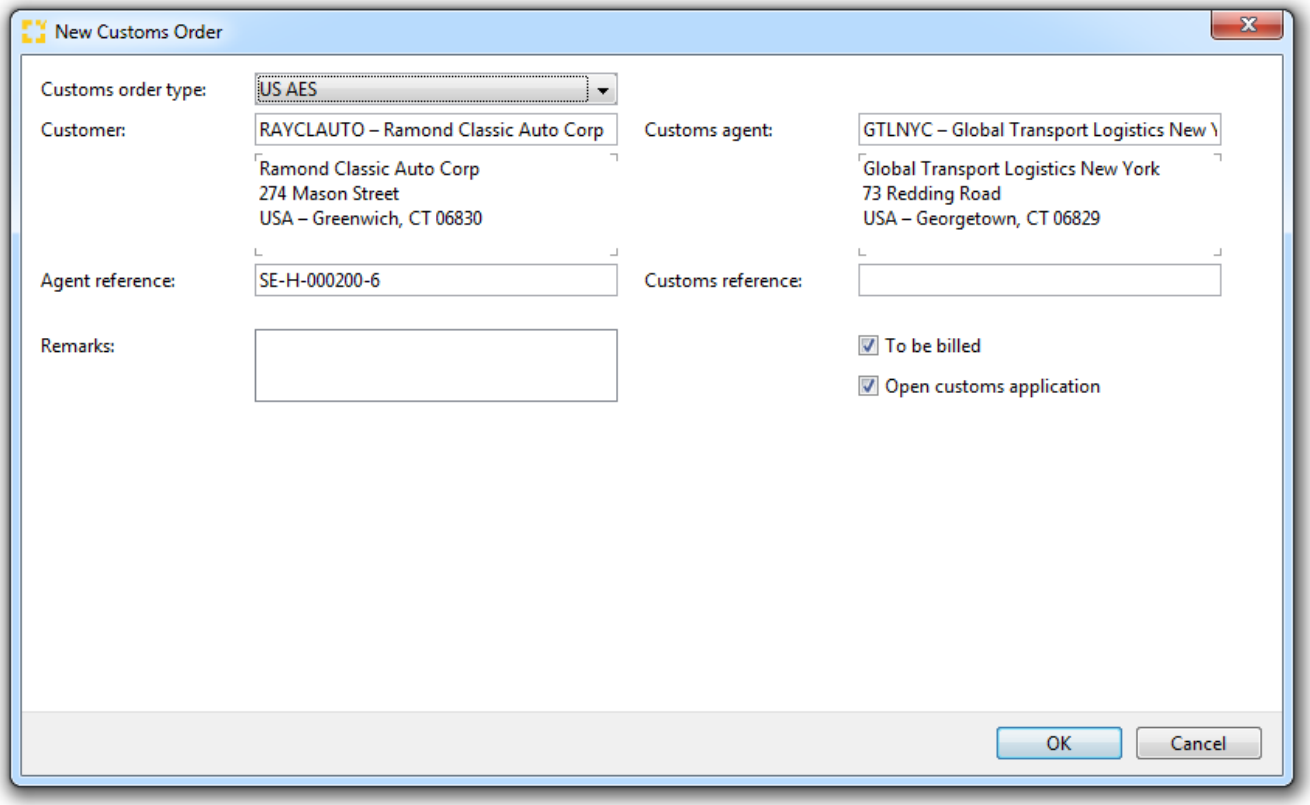
Scope has a USA electronic export declaration (AES/EEI) integrated within the air and sea export applications. This allows the export declarations to be created and transmitted during the creation of the export shipment. By the time the shipment is complete a response should be available from CBP indicating if the export entry or multiple export entries are successful and the required ITN numbers available for printing on export documentation.

Description

To open the USA AES application from the menu, select **US Customs, US AES** from the main menu. This application can also be added to the list of frequently used applications on the left of the screen by using the **Configure** option.

Alternatively the application can be opened by selecting the New Customs Order link within an air or sea export shipment. This will launch the New Customs Order dialogue:

New Customs Order



Customs order type

Only the default *US AES* should be available and can be selected.

Customer

The customer used in the air or sea export shipment will default to this field. This is a full text search field and a different customer address can be used by simply entering in any part of the customers name or address to locate the new customer to be used.

Customs Agent

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The agent for the branch will default as the Customs Agent. This is a full text search field and a different Customs Agent address can be used by simply entering in any part of the agent name or address to locate the new agent to be used.

Agent Reference

The shipment number will automatically appear in this field and should be used as the agent reference for the EEI.

Customs reference

Once the entry has been submitted to customs and accepted, the customs reference will appear in this field.

Remarks

Any remarks to be associated with this EEI should be entered in the remarks field.

To be billed

Check this box if a charge is to be billed for creating this EEI entry.

Open customs application

This box will be check by default to ensure that on clicking OK, the next step of the customs entry is completed.

OK

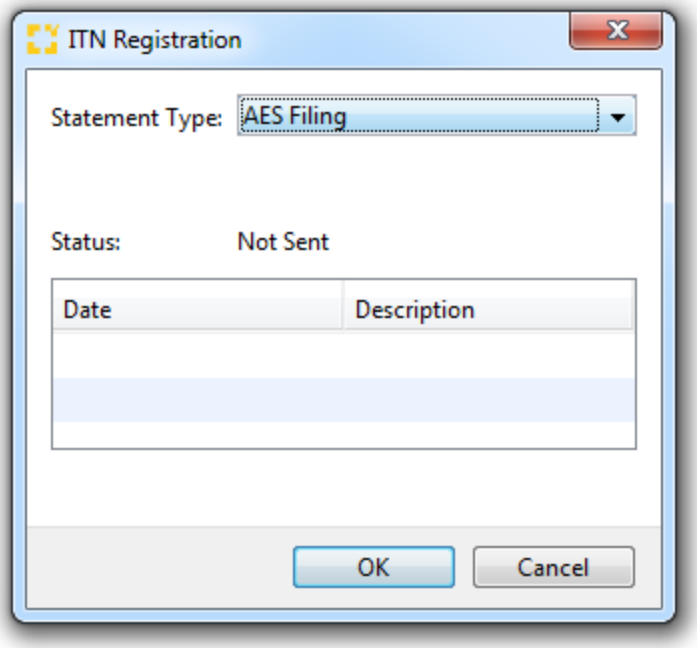
Click *OK* to proceed with the new customs entry.

Cancel

Click *Cancel* to terminate the new customs entry and return to the shipment.

ITN Registration

Once a new customs order dialogue has been completed, the *ITN Registration* appears:



Statement Type

The statement type drop down menu will offer a list of ITN entry types:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **AES Filing** - Full EEI entry
- **EEI Option 2** - ITN number provided by option 2 filer
- **FTSR** - FTSR exemption for low value shipments for example
- **EEI Option 4** - ITN number provided by option 4 filer
- **In Transit** - Goods transiting the USA
- **Domestic** - no AES required, domestic goods
- **Split Shipment** - goods already on an existing ITN shipment was split.
- **AES Down** - exemption statement for when customs system is down

AES filing will be offered as the default option and should be selected when creating a new EEI.

Status

The current status of the EEI will be displayed.

Date

The date the last time the EEI was modified.

Description

A brief description of the last activity on the EEI.

OK

Select *OK* to begin EEI creation.

Cancel

Select *Cancel* to return to the air or sea export shipment .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Importer Security Filing

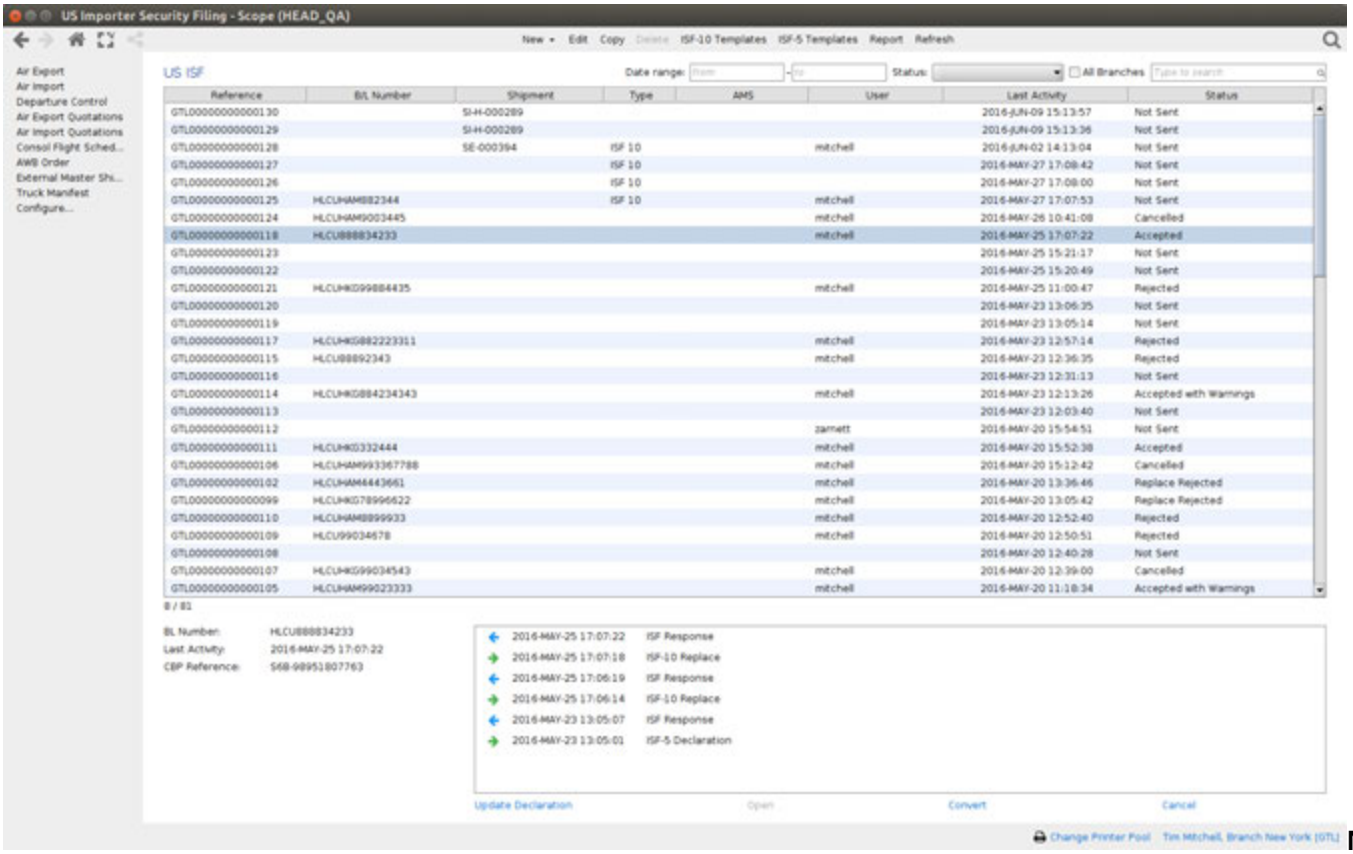
- Introduction
- Description

Introduction

In the US Customs sub-menu, the Import Security Filing (ISF) menu option opens a overview of all ISF entries in an application called **US ISF** and this is used to create, edit and monitor importer security filings which are required for all ocean import shipments arriving at US ports.

Description

Program Actions



New

The **New** action will allow the creation of a new US ISF entry.

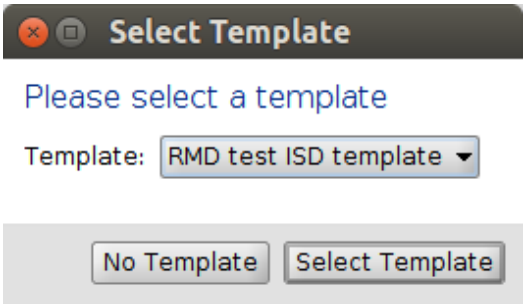
There are 4 possible ISF entry types:

- New ISF-10 - These are full ISF entires
- New ISF-5 - These are ISF entries for FROB (Foreign on Board), I.E. and T&E. These entries require only 5 data elements.
- New ISF-10 (Late) - These are ISF-10 entries submitted after the required deadline.
- New ISF-5 (Late) - These are ISF-5 entries submitted after the required deadline.

Select Template

On selecting any of the **New** functions, the *Select Template* pop-up shown below will appear.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Template

If a template is to be used to create the ISF, then select the desired template using the the drop-down menu to show as list of available templates.

No Template

When the ISF is to be created from scratch, choose the *No Template* option.

Select Template

When a template is highlighted from the drop-down list, click *Select Template* to launch the ISF editor. This ISF entry will use the template to prefill the required data.

The ISF editor will open for entry of the ISF details.

Edit

Select Edit from the menu bar to make changes to the ISF entry highlighted in the overview. Only edit ISF entries that have not been sent or have been rejected by US Customs.

Copy

Copy the ISF entry highlighted in the overview and use it as the basis for a new ISF entry.

Delete

Delete the ISF entry highlighted in the overview. Only ISF entries that have not been sent to CBP can be deleted and this option will not be available for ISF entries with other status'. To cancel an ISF entry that has been accepted by US Customs, use the Cancel option in the status window at the bottom of the ISF overview.

ISF-10 Templates

This will list all templates for ISF-10 shipments and these ISF-10 templates can be managed here with the menu options:

- New - make a new ISF-10 template
- Edit - Edit the highlighted ISF-10 template
- Delete - Delete the highlighted ISF-10 template
- Refresh - Refresh the list of ISF-10 templates
- Close - Close the view of ISF-10 templates and return to the overview of ISF entries.

ISF-5 Templates

This will list all templates for ISF-5 shipments and these ISF-5 templates can be managed here with the menu options:

- New - make a new ISF-5 template
- Edit - Edit the highlighted ISF-5 template
- Delete - Delete the highlighted ISF-5 template
- Refresh - Refresh the list of ISF-5 templates
- Close - Close the view of ISF-5 templates and return to the overview of ISF entries.

Report

Use the Report option to generate a spreadsheet of the entries listed in the overview.

Refresh

The refresh option will update the overview with the latest ISF entries available.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Filter and Search Functions

Date Range

An ISF entry creation date range may be entered in order to restrict the listed ISF entries to a defined period.

Status

By default ISF entries of all status' will be listed. This is a drop down menu that will allow the user to filter the results according to the status of the ISF entry. The types of status' available from the drop-down menu are:

Satus	Meaning
Accepted	Entry successfully reported US Customs without any warnings. The ISF entry will have an ISF transaction number.
Accepted with warnings	The entry has been accepted but with warnings. An error code may be shown indicating the information that must be updated in a timely manner.
Accepted; No Bill	Entries that have been accepted but have not been matched to a Bill of Lading.
Cancellation Denied	The entry has been accepted and an attempt to cancel it has been denied.
Cancellation Request	The entry has been accepted and a request ahs been made to cancel it.
Cancelled	Entries that have been successfully cancelled with CBP
External declaration	Shipments that either have additional statements in lieu of AES entries or where some other agency had made the AES entry.
FR Accepted	An Entry with a flexible range of data (FR) has been accepted. The entry should be updated to a complete transaction (CT) as soon as better information is available.
FT Accepted	An Entry with a flexible timing (FT) has been accepted. The entry should be updated to a complete transaction (CT) as soon as better information is available.
FX Accepted	An Entry with a flexible timing (FT) and flexible data (FR) has been accepted. The entry should be updated to a complete transaction (CT) as soon as better information is available.
Not Sent	The ISF entry has not been transmitted to CBP
Rejected	The ISF entry has been rejected by CBP and therefore is not on file with them.
Replace Rejected	The user has tried to replace an accpeted ISF entry and this has been rejected by CBP
Sent	Transmitted to CBP but still awaiting a response from them
Update Sent	A change has been made to an accepted ISF entry and is awaiting a CBP response

All Branches

By default only the ISF entries created in the current branch will be listed. Check the *All Branches* box to show all entries made by all branches.

General Search

The **Type to search** field can be used to find an ISF entry or to filter the ISF entries shown in the overview. Most of the information used when creating an ISF entry can be used as a search term. For example the carrier code or name can be entered to restrict the list of ISF entries to only those shipped on the defined carrier.

Entry Overview

The application by default presents the most recent entries and displays a summary of their contents in each of the columns described below. The Search function can be used to filter the entries displayed and the columns can be clicked to change the sort order of the displayed results.

Reference

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The system generated reference number for the entry. There is no access to this reference number.

B/L Number

The house or ocean bill of lading number on the ISF entry.

Shipment

The shipment number of the linked Scope Ocean Export or Import shipment.

Type

The type of ISF entry. These can be:

- ISF-10
- Late ISF 10
- ISF 5
- Late ISF 5

AMS

The AMS bill of lading number

User

The name of the user who created the ISF entry.

Last Activity

The last time any update was made to the ISF entry.

Status

The status of the ISF entry.

ISF entry detail information

As each ISF entry in the list is highlighted, additional information about the entry will be shown in the lower section of the screen.

BL Number

The BL of the ISF entry

Last Activity

The last time any update was made to the ISF entry.

CBP Reference

The CBP assigned unique ISF id issued for accepted ISF entries.

Transmission Log

As ISF entries are created, transmitted, updated, converted or cancelled, a log of these activities is shown on the bottom right of the screen. This screen is important since it will display CBP responses, including dates and times of the responses.

Update Declaration

If the ISF entry has been accepted by CBP then the *Update Declaration* action will be available

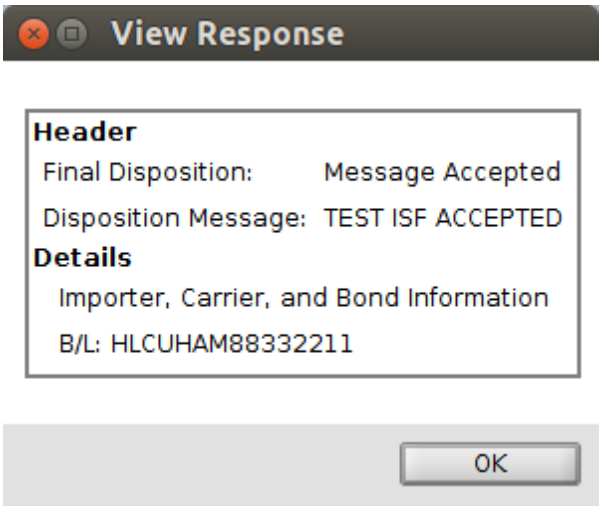
Open

The entry log shows a summary of of the transmissions to and from CBP. The **Open** function can be used to obtain complete details of each transmission.

CBP Responses

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When a *Response* is highlighted in the transmission log and the **Open** function is selected, the full response including any warnings, errors or information will be displayed in a pop-up window.



Convert

USe the Convert option to convert an ISF-10 into and ISF-5, or to convert and ISF-5 to and ISF-10.

Cancel

If the status of an entry is **Accepted** the *Cancel* action may be used to send a notice of cancellation to CBP.

- Additional Parties - ISF10
- Parties - ISF10
- References & Containers - ISF10
- Shipment & Bond - ISF10

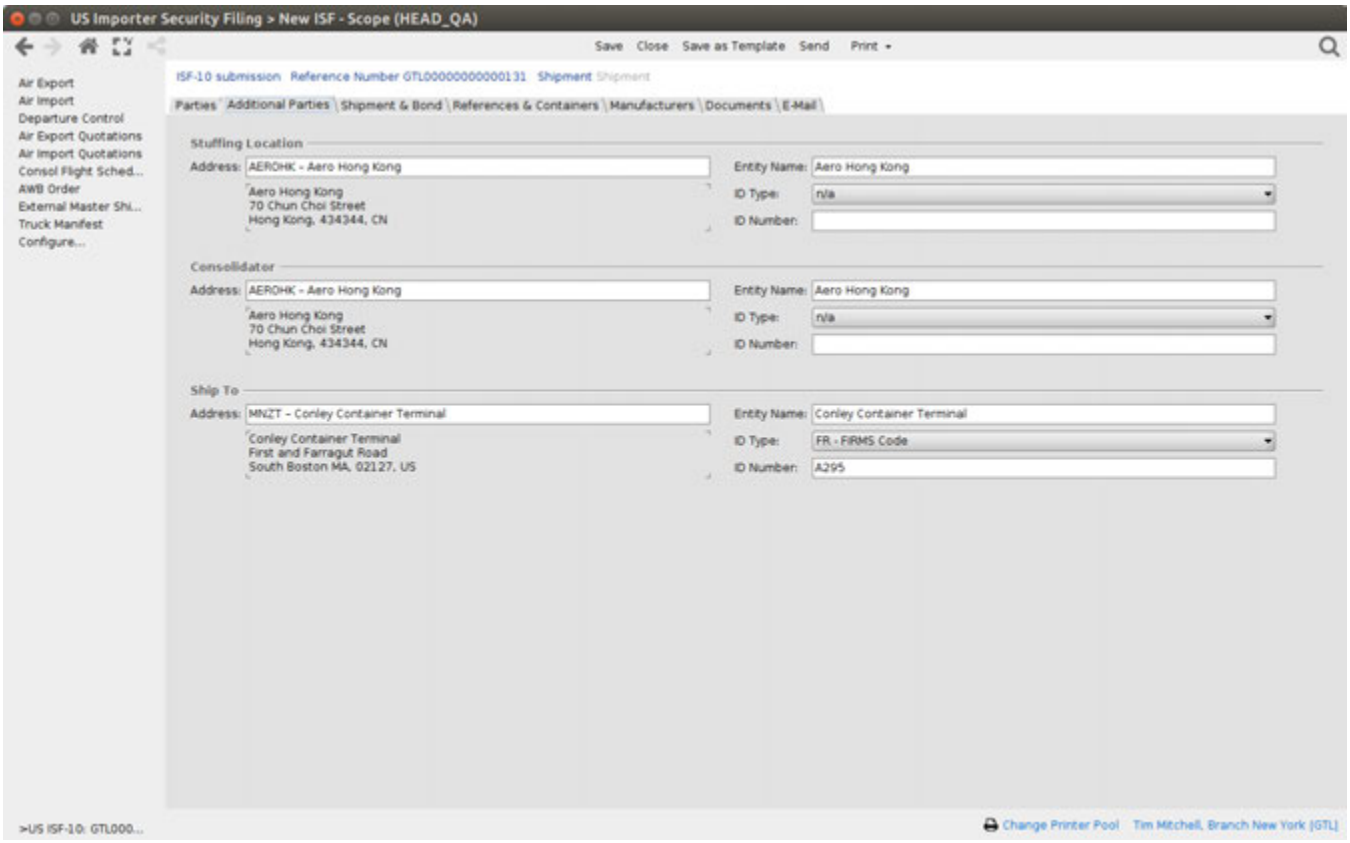
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Additional Parties - ISF10

- Introduction
- Parties

Introduction

When an ISF entry is created, the additional parties screen is where the 2nd set of parties are entered.



The menu bar of the application provides a set of actions:

Save

Any changes to the ISF will be saved and the application will return to the Overview of ISF entries. This action is only available if:

- The ISF has not been sent to CBP
- The Update Declaration has been used to open an ISF.
- The ISF entry has been rejected by CBP

Close

This action will close the ISF and return to the Overview of ISF entries. If changes have been made to the ISF that have not been saved, a prompt will appear asking if changes should be saved, discarded or if the close action should be cancelled.

Save as Template

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Any ISF entry can be used as the basis of a template. If this option is selected, the Edit Template application will launch to create a new template using all the fields from the ISF as the basis of the new template.

Send

If the ISF has not been sent to CBP or if changes have been made to an existing ISF, once all required fields are correct, the **Send** option will be available to transmit the ISF to CBP.

Print

Print the 10+2 form. This is a printed version of the ISF entry. Once printed, this document will appear as a pdf in the Documents tab of the ISF entry.

Parties

The application lists three additional parties whom must be declared to CBP when making an ISF-10 entry.

Stuffing Location

The **Stuffing Location** is name and address of the location where the goods were stuffed into a container. When goods are not containerized, provide the details of the final location where the goods were prepared for loading aboard the vessel. If stuffing has not occured, then the best estimate of the stuffing location can be provided but the ISF entry must be updated with the correct location as soon as available.

When the Action Reason Code of the ISF entry is FT or FX, this indicates flexible timing for the ISF entry and the Stuffing Location can be omitted if it is not yet known. Complete details should be provided as soon as these are available.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the Stuffing Location in the ISF entry.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Stuffing Location)

The name of the Stuffing Location will default as the Stuffing Location entity name and this will be sent to CBP. This can be manually edited if the Stuffing Location is not the same as the partner name.

ID Type (Stuffing Location)

The Stuffing Location can have any of the following ID types selected from the drop-down menu, select N/A is there is not ID number available:

Code	Description	Notes
N/A	No ID	No ID available
DUNS	DUNS Number	
DNS	DUNS+4 Number	

ID Number (Stuffing Location)

This is the ID number of the Stuffing Location and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is DUN, then the ID number must be in the format NNNNNNNNN. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

This field will be blank if there is no ID type available.

Consolidator

The **Consolidator** is the party who stuffed the goods into the container. For non-containerized goods, this is the party who prepared the goods immediately prior to loading aboard the vessel.

When the Action Reason Code of the ISF entry is FT or FX, this indicates flexible timing for the ISF entry and the Consolidator can be omitted if it is not yet known. Complete details should be provided as soon as these are available.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the Consolidator in the ISF entry.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Consolidator)

The name of the Consolidator will default as the Consolidator's entity name and this will be sent to CBP. This can be manually edited if the Consolidator's name is not the same as the partner name.

ID Type (Consolidator)

The Consolidaor can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
N/A	No ID	No ID available
DUN	DUNS Number	
DNS	DUNS+4 Number	

ID Number (Consolidator)

This is the ID number of the Consolidator, and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is DUN, then the ID number must be in the format NNNNNNNNN. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

This field will be blank if there is no ID type available.

Ship To

The **Ship To** is the first party to receive the goods as soon as they are released by US Customs.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the buyer of the goods in the ISF entry.

When the Action Reason Code of the ISF entry is FR, this indicates the Ship To party may be the best available information at the time of ISF filing. The final Ship To party should be submitted to Customs in a full CT (complete transaction) filing no later than 24 hours prior to arrival.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Ship To)

The name of the Ship To will default as the Ship To's entity name and this will be sent to CBP. This can be manually edited if the Ship To's name is not the same as the partner name.

ID Type (Ship To)

The Ship To can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
FR	FIRMS Code	
DUN	DUNS Number	
DNS	DUNS+4 Number	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ID Number (Ship To)

This is the ID number of the Ship To and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is DUN, then the ID number must be in the format NNNNNNNNN. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

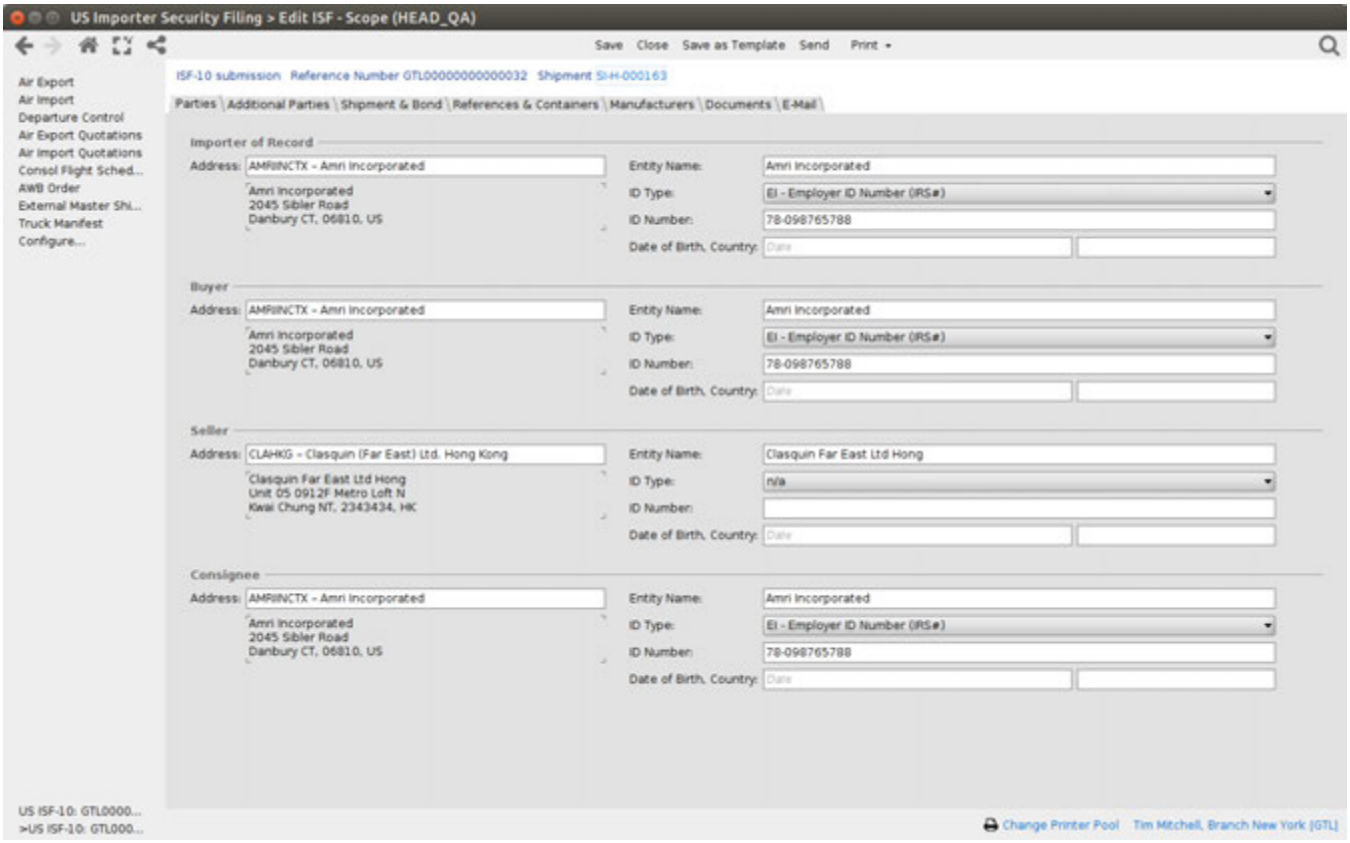
- Introduction
- Parties
- Basic Information

Introduction

When an ISF entry is created, the parties screen is where the first set of parties are entered. On completion of this screen, there are further parties to be entered in the additional parties tab. This will be followed buy the shipment and bond information, the reference details and finally the manufacturers and goods tab.



The menu bar of the application provides a set of actions:

Save

Any changes to the ISF will be saved and the application will return to the Overview of ISF entries. This action is only available if:

- The ISF has not been sent to CBP
- The Update Declaration has been used to open an ISF.
- The ISF entry has been rejected by CBP

Close

This action will close the ISF and return to the Overview of ISF entries. If changes have been made to the ISF that have not been saved, a prompt will appear asking if changes should be saved, discarded or if the close action should be cancelled.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Save as Template

Any ISF entry can be used as the basis of a template. If this option is selected, the Edit Template application will launch to create a new template using all the fields from the ISF as the basis of the new template.

Send

If the ISF has not been sent to CBP or if changes have been made to an existing ISF, once all required fields are correct, the **Send** option will be available to transmit the ISF to CBP.

Print

Print the 10+2 form. This is a printed version of the ISF entry. Once printed, this document will appear as a pdf in the Documents tab of the ISF entry.

Parties

The application lists four parties whom must be declared to CBP when making an ISF-10 entry.

Importer of Record

The I**mporter of Record** is the party liable for payment of any duties on the import and meeting all statutory and regulatory requirements for the import.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the importer of record in the ISF entry.

Often the Importer of Record is the final owner of the goods.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Importer of Record)

The name of the Importer of Record will default as the Importer of Record entity name and this will be sent to CBP. This can be manually edited if the Importer of Record Entity Name is not the same as the partner name.

ID Type (Importer of Record)

The Importer of Record can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
EI	Employer Identification Number or IRS Number	
ANI	CBP assigned number	
CIN	CBP encrypted Consignee ID	
34	Social Security Number	Check current CBP rules before submitting this ID
AEF	Passport Number	Only for shipment types 03,05,06

ID Number (Importer of Record)

This is the ID number of the Import of Record and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is EI, then the ID number must be in the format NN-NNNNNNNXX. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

Date of Birth (Importer of Record)

When the ID type **AEF** or **34** is used this indicates a passport number or SSN is being provided as the ID type of the importer of record. When a passport number or SSN is the ID Type, the date of birth of the passport holder or SSN holder must also be provided in this field.

Country (Importer of Record)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the ID type **AEF** is used this indicates a passport number is being provided as the ID type of the importer of record. When a passport number is the ID Type, the county that issued the passport must be provided in this field.

Buyer

The **Buyer** is the last known party to who the goods are sold or who has agreed to buy the goods. If the goods are not to be sold, the the name and address of the current owner must be entered. If the buyer of the goods changes while the shipment is en-route, then the ISF entry must be amended to show the new buyer.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the buyer of the goods in the ISF entry.

Often the Importer of Record is the same as the buyer of the goods.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Buyer)

The name of the Buyer will default as the Buyer's entity name and this will be sent to CBP. This can be manually edited if the Buyer's name is not the same as the partner name.

ID Type (Buyer)

The Buyer can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
EI	Employer Identification Number or IRS Number	
ANI	CBP assigned number	
CIN	CBP encrypted Consignee ID	
34	Social Security Number	Check current CBP rules before submitting this ID
DUN	DUNS Number	
DNS	DUNS+4 Number	

ID Number (Buyer)

This is the ID number of the Buyer and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is EI, then the ID number must be in the format NN-NNNNNNNXX. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

Date of Birth (Buyer)

When the ID type **34** is used, this indicates an SSN number is being provided as the ID type of the importer of record. When an SSN number is the ID Type, the date of birth of the SSN holder must also be provided in this field.

Country (Buyer)

This field will not be used for the buyer and should remain blank.

Buyer

The **Buyer** is the last known party to whom the goods are sold or who has agreed to buy the goods. If the goods are not to be sold, then the name and address of the current owner must be entered. If the buyer of the goods changes while the shipment is en-route, then the ISF entry must be amended to show the new buyer.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the buyer of the goods in the ISF entry.

Often the Importer of Record is the same as the buyer of the goods.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Buyer)

The name of the Buyer will default as the Buyer's entity name and this will be sent to CBP. This can be manually edited if the Buyer's name is not the same as the partner name.

ID Type (Buyer)

The Buyer can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
EI	Employer Identification Number or IRS Number	
ANI	CBP assigned number	
CIN	CBP encrypted Consignee ID	
34	Social Security Number	Check current CBP rules before submitting this ID
DUN	DUNS Number	
DNS	DUNS+4 Number	

ID Number (Buyer)

This is the ID number of the Buyer and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is EI, then the ID number must be in the format NN-NNNNNNNXX. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

Date of Birth (Buyer)

When the ID type **34** is used, this indicates an SSN number is being provided as the ID type of the importer of record. When an SSN number is the ID Type, the date of birth of the SSN holder must also be provided in this field.

Country (Buyer)

This field will not be used for the buyer and should remain blank.

Seller

The **Seller** is the last known party who sold the goods. If the goods being imported are not to be sold, then the name and address of the current owner must be entered.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the buyer of the goods in the ISF entry.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Seller)

The name of the Seller will default as the Seller's entity name and this will be sent to CBP. This can be manually edited if the Seller's name is not the same as the partner name.

ID Type (Seller)

The Seller can have any of the following ID types selected from the drop-down menu. If there is no ID type then select **N/A**.:

Code	Description	Notes
N/A	No ID	Seller does not have an ID

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

EI	Employer Identification Number or IRS Number	
ANI	CBP assigned number	
CIN	CBP encrypted Consignee ID	
34	Social Security Number	Check current CBP rules before submitting this ID
DUN	DUNS Number	
DNS	DUNS+4 Number	

ID Number (Seller)

When the ID type of the seller is not **N/A** (no ID) and one of the other ID types is used, the ID number is entered in this field and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is EI, then the ID number must be in the format NN-NNNNNNNXX. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

Date of Birth (Seller)

When the ID type **34** is used, this indicates an SSN number is being provided as the ID type of the seller. When an SSN number is the ID Type, the date of birth of the SSN holder must also be provided in this field.

Country (Seller)

This field will not be used for the seller and should remain blank.

Consignee

The **Consignee** is the party in the USA on whose account the goods were shipped.

When the partners Identifying details are stored in the US Partner Profile within the tab **ISF**, these details will default as the identity details of the consignee for the goods in the ISF entry.

Often the Importer of Record is the same as the Consignee of the goods.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Entity Name (Consignee)

The name of the Consignee will default as the Consignee's entity name and this will be sent to CBP. This can be manually edited if the Consignee's name is not the same as the partner name.

ID Type (Consignee)

The Consignee can have any of the following ID types selected from the drop-down menu:

Code	Description	Notes
EI	Employer Identification Number or IRS Number	
ANI	CBP assigned number	
CIN	CBP encrypted Consignee ID	
34	Social Security Number	Check current CBP rules before submitting this ID
AEF	Passport Number	Only for shipment types 03,05,06

ID Number (Consignee)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This is the ID number of the Consignee and the format of this number must correspond to the format specified by the ID Type, for example if the ID type is EI, then the ID number must be in the format NN-NNNNNNNXX. All ID numbers will be checked to ensure the conform to the correct structure and an indication of the correct structure is shown when the wrong format is entered.

Date of Birth (Consignee)

When the ID type **34 or AEF** is used, this indicates an SSN number or passport number is being provided as the ID type of the Consignee and therefore the date of birth of the SSN holder or passport holder must also be provided in this field.

Country (Consignee)

When the ID type AEF is used as the Consignee's ID type, this indicates a passport is being used as the ID type and the country that issued the passport must be entered in this field.

Ultimate Consignee

The party who will ultimately receive the goods. Normally this is the consignee and so the partner who is the consignee on the export shipment will default to this field. This address can be changed if required.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

When the goods are sold en route the ultimate consignee may not be known and the address may be entered as:

Ultimate Consignee Name: SOLD EN ROUTE
Address 1: SEA
City: City of First Port of Call
Country: Country of First Port of Call (ISO Code)

Forwarder

The Name and address of the forwarder who is submitting the AES entry to CBP. There is no access to this field and the address shown will normally be the Forwarders own name and address.

Intermediate Consignee

The party who acts as an agent for a principal party of interest in order to effect the delivery of the goods to the ultimate consignee.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Basic Information

Dates of export, and transport details are entered in the basic information section of the application.

Estimated Export Date

Estimated export date and time of the commodity.

To Be Sold en Route

If the ultimate consignee is unknown because the goods will be sold while in transit, then this box should be checked. In addition the ultimate consignee for the AES entry should be shown as:

Ultimate Consignee Name: SOLD EN ROUTE
Address 1: SEA
City: City of First Port of Call
Country: Country of First Port of Call (ISO Code)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

US State of Origin

The 2 letter state code where the goods originated. This is a search field that will search all valid US states and presents a drop down list of matching states as the state codes or names or part-thereof are typed.

Destination Country

The declared 2 digit ISO country code of final destination for the commodity. This is a search field that will search all valid country codes and presents a drop down list of matching countires as the country codes or names or part-thereof are typed.

Routed

If the goods are controlled by an FPPI (Foreign principle party of interest) then the goods are deemded to be routed and this box should be checked to indicate this.

Hazardous Materials

Check this box when the goods are classed as hazardous goods.

Filing Option

An AES entry can either of the 2 options shown below:

Type	Description
Option2	Full details are to be submitted on export of the goods
Option 4	Post departure. Partial details are submitted on export of the goods. With full details to follow within 10 days of export. Only CBP approved parties can be option 4.

This field will automatically default the correct options according to the details stored in the role US Partner Profile that must be created for the USPPI's. If the USPPI's is may submitted both option 2 and option 4 entries, then both will be offered and the correct method should be selected.

Items on the USML cannot be declared as Post-Departure (option 4).
If any of the commodities being declared on the EEI are on the USML (United States Munitions List) and are therefore being exported using any of the following DDTC license type codes, SAG, SAU, SCA, SGB, S00, S05, S61, S73, S85, S94, then the EEI cannot be option 4 and must be option 2.

Related company

This box is to be checked to if either the USPPI's or the ultimate consignee own 10% or more of the other's voting securities.

Method of Transport

The type of transport on which the cargo will leave the last US port that it departs from. This is a 2 digit numeric code followed by the actual description of the method of transport. The application will default the most appropriate code according to the mode of the export shipment, an air export shipment for example will result in the code **40 - Air** defaulting to this field.

This is a search field in which either the code or a description of the type of transport can be entered. A corresponding matching list will automatically be shown from which the correct code can be selected. The complete list can be shown by pressing **F3** or selecting this option from the drop-down list on the right of the field. This will display the following transport types:

Code	Transport Type
10	Sea
11	Sea Containerized
12	Sea (Barge)
20	Rail
21	Rail Containerized
30	Truck
31	Truck, Containerized
32	Auto

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

33	Pedestrian
34	Road,Other
40	Air
41	Air containerized
50	Mail
60	Passenger,Hand-carried
70	Pipeline,Powerline

Carrier ID

For Air shipments which are method of transport type 40 and 41, the carrier ID will be the 3 digit ICAO code. For All other methods of transport, the 4 digit SCAC code should be entered. This is a search field that will search for results to any data entered by referring to the ICAO code database or the SCAC code database.

Carrier/Vessel Name

If the shipment is an air export shipment and the transport type is 40 or 41, the carrier name will automatically be shown in this field according to the IATA ICAO code that has been selected as the carrier ID and there is no option to change this.

For sea export shipments where the transport type is 10, 11 or 12 this field should be the name of the vessel Transporting the goods.

Truck and rail shipments with are transport types 20, 21, 30 and 31, this field will be filled with the carrier name according to the SCAC code selected, and there is no option to change this unless the transport type is changed.

Port of export

The last port of exit in the USA. This is a full text search field that will search the Schedule D database for port codes or names that match the user input. A port can only be used if it is valid for the method of transport.

Port of Unlading

The port of unlading is only required for sea export shipments where the mode of transport is 10 or 11. It is also required for air export shipments where the Destination Country is Puerto Rico. This is a full text search field that will search the Schedule K database for port codes or names that match the user input.

Inbond Code

The Ibond field can be used to indicate if the export goods are bonded goods. This field defaults to 70 which indicates the the goods are not bonded since this is the most common condition and CBP do not use AES entries to close out in bond shipments.

This field offers a drop down menu from which a bond type can be selected:

Code	Description
36	Warehouse Withdrawal for IE
37	Warehouse Withdrawal for T&E
67	IE from a (FTZ) Foreign Trade Zone
68	T&E from a (FTZ) Foreign Trade Zone.
70	Not In Bond

If the in bond codes 36, 37, 67 or 68 are used, then it will be mandatory to also complete the Import Entry field. Additionally the code 67 and 68 will require the Foreign Trade Zone ID to be entered.

Import Entry

If the export goods being transported under bond, then this should be indicated in the Inbond Code field using the appropriate in bond code. It is also necessary to enter the import entry number in the import entry number field. For in bond codes 67 and 68 which indicate the goods are held in a Foreign Trade Zone, the import entry number will be the entry admission number of the e214 on which the cargo was admitted to the Foreign Trade Zone.

Foreign Trade Zone ID

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Goods being exported from a Foreign Trade Zone will have the Inbond Code 67 or 68. For these types of cargo the ID of the Foreign Trade Zone must be entered in the Foreign Trade Zone field. The foreign trade zone ID should be 5 digits, the first 3 digits of the ID should be numeric and the last 2 should be alphanumeric.

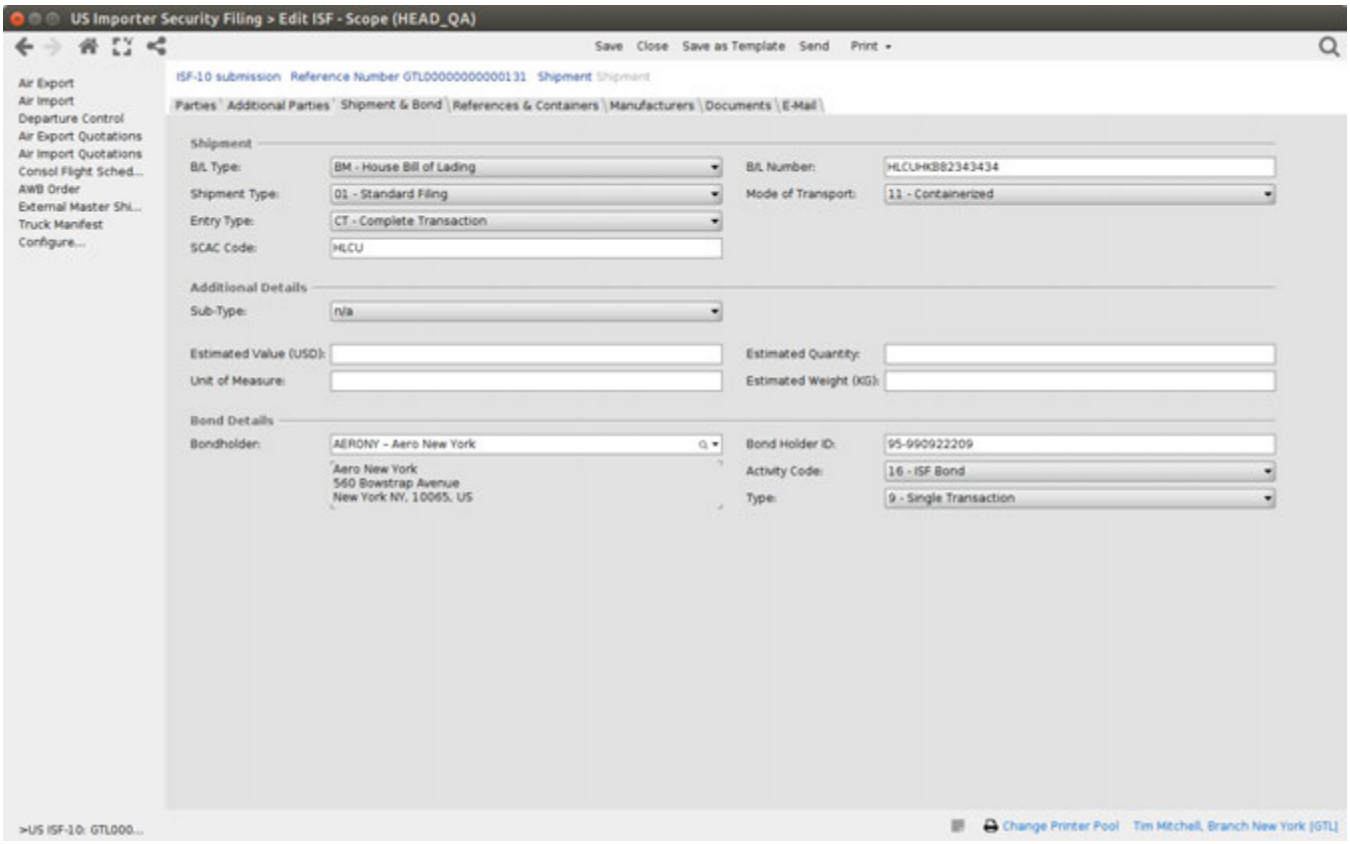
Introduction

When an ISF entry is created, the Shipment and Bond screen is where transport, entry type and bond holder details are entered.



The menu bar of the application provides a set of actions:

Save

Any changes to the ISF will be saved and the application will return to the Overview of ISF entries. This action is only available if:

- The ISF has not been sent to CBP
- The Update Declaration has been used to open an ISF.
- The ISF entry has been rejected by CBP

Close

This action will close the ISF and return to the Overview of ISF entries. If changes have been made to the ISF that have not been saved, a prompt will appear asking if changes should be saved, discarded or if the close action should be cancelled.

Save as Template

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Any ISF entry can be used as the basis of a template. If this option is selected, the Edit Template application will launch to create a new template using all the fields from the ISF as the basis of the new template.

Send

If the ISF has not been sent to CBP or if changes have been made to an existing ISF, once all required fields are correct, the **Send** option will be available to transmit the ISF to CBP.

Print

Print the 10+2 form. This is a printed version of the ISF entry. Once printed, this document will appear as a pdf in the Documents tab of the ISF entry.

Shipment

The Shipment section requires entry of transport and ISF entry type details.

B/L Type

The **B/L Type** must be selected from the drop-down list:

Code	Description	Notes
BM	House Bill of Lading	This type of bill will be issued under a Master Bill of Lading
OB	Ocean Bill of Lading	This is a non-Master Bill of lading with no underlying house bills of lading. Also known as a Straight Bill or Simple Bill

B/L Number

The B/L Number of the house or ocean bill of lading

Note that either of the B/L types must start with a valid SCAC code. If the B/L from the shipment does not start with a valid SCAC code, then add it to the B/L Number . The B/L Number cannot be transmitted unless it has a valid SCAC code

Shipment Type

Select the shipment type from the drop down menu. Each type is described below along with some additional requirements for each type.

Code Type	Description	Bond Required	Additional
01	Standard or Regular filings	YES	
02	To Order Shipments	YES	Shipments not yet sold to a US buyer. Normally commodities like coffee beans etc.
03	Household Goods /Personal Effects	NO	ISF Import and ISF Importer of Record can use an IRS# or CAN# provided these are registered with CBP using form 5106. HTS may be : 8703.21, 8711.30, 9804.00, 9805.00
04	Military, Government	NO	
05	Diplomatic Shipment	NO	HTS: 9806.00
06	Carnet	NO	Requires carnet issuing country and carnet number
07	US Return Goods	YES	
08	FTZ Shipments	YES	
09	International Mail Shipments	NO	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

10	Outer Continental Shelf Shipments	YES	
11	Informal - see sub codes	NO	

Mode of Transport

The mode of transport for the ISF filing can be selected from the drop down menu and can be:

Code	Description	Notes
10	Break-Bulk	Goods are not containerized
11	Containerized	

Entry Type

The **Entry Type** is also known as the **Action Reason Code.** An entry type must be selected from the drop-down menu and each type is explained in the table below:

Action Reason Codes:

Code	Description
CT	Complete Transaction –All data is present, no special flexibility rules apply. If “CT” is used, the ISF can be updated if necessary, but CBP does not require the ISF to be updated.
FR	Flexible Range – A range of data for the Manufacturer, Ship To party, Country of Origin, or Commodity HTSUS number has been provided. The ISF must be updated as soon as better information becomes available, but never later than 24 hours prior to arrival. If “FR” is used, CBP expects to receive a timely update.
FT	Flexible Timing –The CS (Consolidator) and or LG (Stuffing location) has not been provided. The ISF must be updated as soon as better information becomes available, but never later than 24 hours prior to arrival. If “FT” is used, CBP expects to receive a timely update.
FX	Flexible Range and Flexible Timing - A range of data as described in “FR” has been provided and the CS (Consolidator) and or LG (Stuffing location) has not been provided. The ISF must be updated at a later date as soon as better information becomes available, but in no case later than 24 hours prior to arrival. If “FX” is used, CBP expects to receive a timely update.

SCAC Code

The SCAC code of the vessel operator that is transporting the goods.

Additional Details

For some kinds of shipments some additional details will be required. This section is only required for these special shipments.

ISF entries using the Sub-Types shown below must be shipment type 11

Sub-Type

The Sub-Type field is used to indicate which of the 3 special shipment types is being transmitted. Use the drop-down menu to identify this sub-type:

Code	Description
01	Section 321 (Value Under USD 200.00)
02	Informal Shipments - Value under USD 2,000.00)
03	General Note 3(e) of the Harmonized Tariff

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Estimated Value (USD)

The total monetary value of the shipment in whole US Dollars.

Estimated Quantity

The quantity of the smallest external packing unit of the goods

Unit of Measure

The type of unit the goods are being supplied in. This is a search field.

Estimated Weight (KG)

The whole weight of the cargo in full Kgs.

Bond Details

Bond details must be completed when the shipment type is 01,02, 07, 08, 10 and the ISF submission type is not 5 (Late ISF-5 without bond details) or 6 (Late ISF-10 without bond details). Leave this section empty for all other types of transactions.

Bondholder

The **Bondholder** is the party whose bond is being obligated for the ISF entry.

When the partners bond details are stored in the US Partner Profile within the tab **Bond**, these details will default as the bond details for the ISF entry.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Bond Holder ID

The identification number of the Bond Holder. This Bond Holder ID must be on file with US Customs. This field will accept 3 types of bond holder ID's:

- Internal Revenue Service (IRS) Number
- CBP Assigned Number
- Social Security Number

Activity Code

The CBP code identifying the activity of the code being used for the ISF entry. Select from the drop-down list:

Code	Description
01	Importer or Broker
02	Custodian of Bonded Merchandise
03	International Carrier
04	Foreign Trade Zone Operator
16	ISF Bond

Bond Type

The type of bond that is being used. Select from the drop-down list of available types:

Code	Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

8	Continuous Bond
9	Single transaction for ISF

Bond type 9 may only be used with the Activity Code 16.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

06	Carnet	NO	Requires carnet issuing country and carnet number
07	US Return Goods	YES	
08	FTZ Shipments	YES	
09	International Mail Shipments	NO	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

10	Outer Continental Shelf Shipments	YES	
11	Informal - see sub codes	NO	

Mode of Transport

The mode of transport for the ISF filing can be selected from the drop down menu and can be:

Code	Description	Notes
10	Break-Bulk	Goods are not containerized
11	Containerized	

Entry Type

The **Entry Type** is also known as the **Action Reason Code.** An entry type must be selected from the drop-down menu and each type is explained in the table below:

Action Reason Codes:

Code	Description
CT	Complete Transaction –All data is present, no special flexibility rules apply. If “CT” is used, the ISF can be updated if necessary, but CBP does not require the ISF to be updated.
FR	Flexible Range – A range of data for the Manufacturer, Ship To party, Country of Origin, or Commodity HTSUS number has been provided. The ISF must be updated as soon as better information becomes available, but never later than 24 hours prior to arrival. If “FR” is used, CBP expects to receive a timely update.
FT	Flexible Timing –The CS (Consolidator) and or LG (Stuffing location) has not been provided. The ISF must be updated as soon as better information becomes available, but never later than 24 hours prior to arrival. If “FT” is used, CBP expects to receive a timely update.
FX	Flexible Range and Flexible Timing - A range of data as described in “FR” has been provided and the CS (Consolidator) and or LG (Stuffing location) has not been provided. The ISF must be updated at a later date as soon as better information becomes available, but in no case later than 24 hours prior to arrival. If “FX” is used, CBP expects to receive a timely update.

SCAC Code

The SCAC code of the vessel operator that is transporting the goods.

Additional Details

For some kinds of shipments some additional details will be required. This section is only required for these special shipments.

ISF entries using the Sub-Types shown below must be shipment type 11

Sub-Type

The Sub-Type field is used to indicate which of the 3 special shipment types is being transmitted. Use the drop-down menu to identify this sub-type:

Code	Description
01	Section 321 (Value Under USD 200.00)
02	Informal Shipments - Value under USD 2,000.00)
03	General Note 3(e) of the Harmonized Tariff

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Estimated Value (USD)

The total monetary value of the shipment in whole US Dollars.

Estimated Quantity

The quantity of the smallest external packing unit of the goods

Unit of Measure

The type of unit the goods are being supplied in. This is a search field.

Estimated Weight (KG)

The whole weight of the cargo in full Kgs.

Bond Details

Bond details must be completed when the shipment type is 01,02, 07, 08, 10 and the ISF submission type is not 5 (Late ISF-5 without bond details) or 6 (Late ISF-10 without bond details). Leave this section empty for all other types of transactions.

Bondholder

The **Bondholder** is the party whose bond is being obligated for the ISF entry.

When the partners bond details are stored in the US Partner Profile within the tab **Bond**, these details will default as the bond details for the ISF entry.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Bond Holder ID

The identification number of the Bond Holder. This Bond Holder ID must be on file with US Customs. This field will accept 3 types of bond holder ID's:

- Internal Revenue Service (IRS) Number
- CBP Assigned Number
- Social Security Number

Activity Code

The CBP code identifying the activity of the code being used for the ISF entry. Select from the drop-down list:

Code	Description
01	Importer or Broker
02	Custodian of Bonded Merchandise
03	International Carrier
04	Foreign Trade Zone Operator
16	ISF Bond

Bond Type

The type of bond that is being used. Select from the drop-down list of available types:

Code	Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

8	Continuous Bond
9	Single transaction for ISF

Bond type 9 may only be used with the Activity Code 16.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

US AES

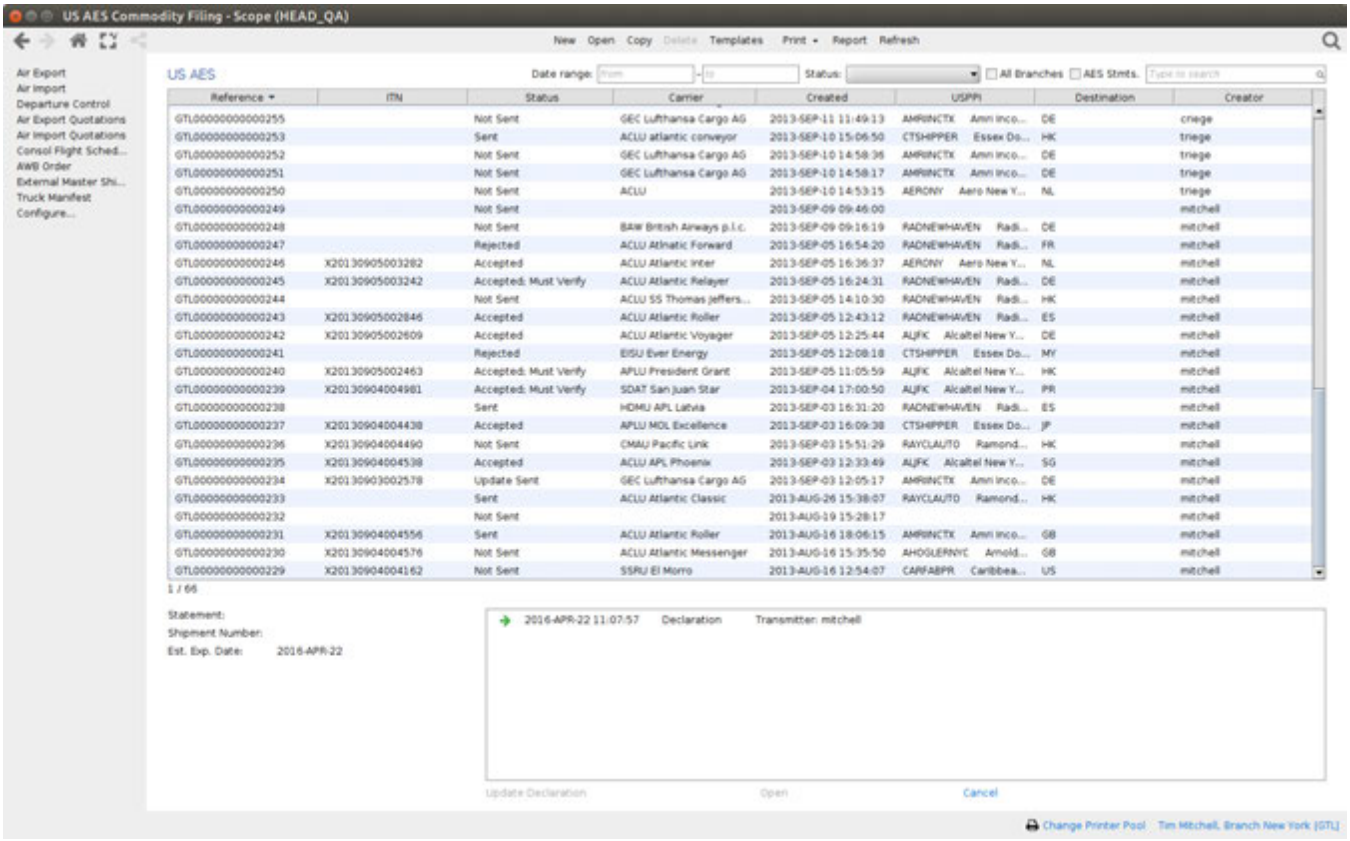
- Introduction
- Description

Introduction

The US AES menu option opens a overview of all EEI entries in an application called **US AES** and this is used to create, edit and monitor commodity filings.

Description

Program Actions



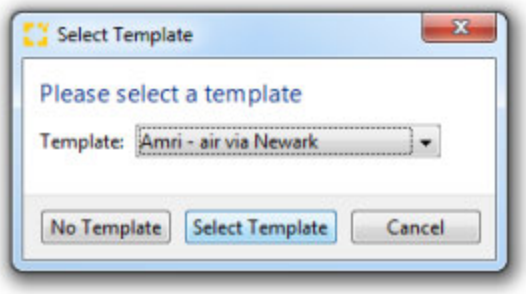
New

The **New** action will allow the creation of a new US EEI (Electronic Export Information) entry for a single USPPI.

Select Template

On selecting the **New** function, the *Select Template* pop-up shown below will appear.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Template

If a template is to be used to create the EEI, then select the desired template using the the drop-down menu to show as list of available templates.

No Template

When the EEI is to be created from scratch, choose the *No Template* option.

Select Template

When a template is highlighted from the drop-down list, click *Select Template* to launch the EEI editor. This EEI will have use the template to prefill the required data.

Cancel

Exit the **New EEI** creation process and return to the overview of EEI's.

The EEI editor will open for entry of the EEI details.

Open

The entry highlighted in the list of export declarations will be opened when the **Open** option is selected. The EEI editor will open in order to edit an EEI entry that has not been sent to CBP. Once and EEI is submitted to CBP the **Open** function will only allow the EEI to be opened in view mode and it is not possible to make any changes to the entry. When changes are required to an EEI that has been transmitted to CBP, the Update Declaration function should be used.

Copy

To create a new EEI entry from an existing EEI, choose the EEI that is to be used as the basis of the new EEI and select the *Copy* function. The EEI editor will open a new EEI entry using the data from the existing EEI as the basis for the new entry. Not all data is copied to the new EEI, for example some transport details must be completed and the quantities of commodities must be entered.

Delete

When an EEI entry has not been sent or is rejected by CBP the **Delete** option will be active to remove the EEI entry.

Templates

Templates are used to generate EEI's from a standard set of data without having to rekey all of the entry data. Generating EEI's from a template can considerably speed up the process of entry creation. The template function will open the Declaration Templates application where templates are created and managed.

> **Example:** The same USPPI ships the same commodity out of LAX every week. A template can be created that stores the data that always repeats in these entries, when the next shipment departs, the EEI can very quickly be created using this template.

Print

Highlight the desired EEI and then click the Print option on the menu bar to print the desired output of the EEI:

- 7525v
- AES Shipment Record*
- Gas Letter
- Cover letter
- Vehicle Cover Letter

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Note: A PDF of the AES Shipment Record will automatically be generated in the documents tabs of the related shipment when the EEI is accepted by CBP. This serves to confirm the EEI is complete with easy access to this document should any party on the shipment require this record.

Report

The filter functions Date range, status, All Branches and General search can all be used to refine the list of EEI's shown in the overview. This list of EEI's can then be exported to a spreadsheet using the **Report** action. The default spreadsheet application (Excel, iWork, calc etc.) on the user's computer will automatically open and load the EEI list into a spreadsheet. This spreadsheet will contain all the information about each EEI that can be included on a single line. This means if there are multiple commodities on an EEI, only the first commodity and it's details will be shown. Similarly, for sea freight entries, if there are multiple containers, only the details of the first container will be shown.

Refresh

Clicking the **Refresh** option will ensure that the latest export entries and responses from CBP are shown in the list displayed.

Filter and Search Functions

Date Range

An AES entry creation date range may be entered in order to restrict the listed AES entries to a defined period.

Status

By default AES entries of all status' will be listed. This is a drop down menu that will allow the user to filter the results according to the status of the AES entry. The types of status' available from the drop-down menu are:

Satus	Meaning
Accepted	Entry successfully reported to AES and without any warnings. This status means the entry has an ITN (Internal transaction number) which is proof of successful transmit.
Accepted with warnings	The entry has been accepted and has an ITN number, but there are warnings which means additional required information must be provided within 4 days of the original transmission.
Accepted; Compliance Alert	Entries that have been accepted and have an ITN number, but these entries are potentially in violation of export reporting requirements. These violations can be reporting the export late or making changes to the accepted entry after the shipment has departed
Accepted; informational message	The entry has been accepted and has an ITN number, but CBP have responded with a message on the entry. The user should read the informational message and respond as necessary
Accepted must verify	The entry has been accepted and has an ITN number, but CBP would like the user to check the data submitted is correct since it is unusual in some way. If necessary the data should be updated but may be left as is if the original details submitted are correct
Cancelled	Entries that have been successfully cancelled in AES
External declaration	Shipments that either have additional statements in lieu of AES entries or where some other agency had made the AES entry.
Not Sent	Entries that have not yet been transmitted to AES
Rejected	Entries that have been reject by AES and therefore have fatal errors. These must be corrected before the shipment may depart from the USA
Sent	Transmitted to AES but still awaiting a response from them

All Branches

By default only the AES entries created in the current branch will be listed. Check the *All Branches* box to show all entries made by all branches.

AES Stmts.

Check this box if AES statements which are not full EEI entries are to be included in the search

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

General Search

The **Type to search** field can be used to find an AES entry or to filter the AES entries shown in the overview. Most of the information used when creating and AES entry can be used as a search term. For example the carrier code or name can be entered to restrict the list of AES entries to only those shipped on the defined carrier. By contrast, searching for an ITN number will produce only the AES entry with that ITN number since these are unique.

Entry Overview

The application by default presents the most recent entries and displays a summary of their contents in each of the columns described below. The Search function can be used to filter the entries displayed and the columns can be clicked to change the sort order of the displayed results.

Reference

The system generated reference number for the entry, also known by CBP as the XTN number. There is no access to this reference number.

ITN

The ITN number provided by CBP when an EEI is accepted.

Status

The state of the entry from the perspective of US Customs. These are detailed above.

Carrier

The 3 digit ICAO airline code or for sea and truck shipments, the 4 digit SCAC code. The carriers name will also be present.

Created

The date the entry was first created. There is no access to this date.

USPPI

The name of the United States Principle Party of Interest for the entry.

Destination

The declared country of final destination for the commodity.

Creator

The surname of the user who created the AES entry.

Entry Count

At the bottom left of the overview of AES entries is a count of the total number of AES entries. The numeric position of the currently highlighted entry within the list of entries will be displayed first.

AES entry detail information

As each AES entry in the list is highlighted, additional information about the entry will be shown in the lower section of the screen.

Statement

When the entry is a statement (not a full EEI) The complete AES exemption statement will appear for the highlighted item.

Shipment Number

The export shipment linked to the highlighted entry. This is an active link and clicking it will open the linked shipment.

Est. Exp. Date

The estimated date of export of the shipment.

Entry Log

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

As AES entries are created, transmitted, changed or cancelled, a log of these activities is shown on the bottom right of the screen. This screen is important since it will display CBP responses, including dates and times of the responses.

Update Declaration

If the AES entry has been accepted by CBP either as Status 3 (Accepted) or Status 2 (Must verify) Then the *Update Declaration* action will be available

Open

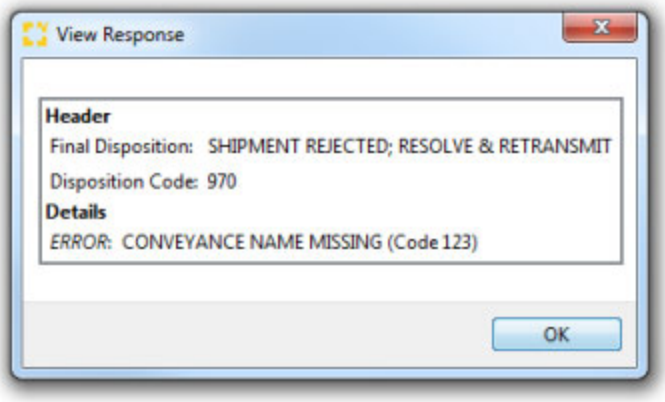
The entry log shows a summary of of the transmissions to and from CBP. The **Open** function can be used to obtain complete details of each transmission.

Initial Declarations

When an *Initial declaration* is highlighted in the list and then the **Open** function is selected, the user will see the complete EEI as it was submitted to CBP. This means it provides a historical record of exactly what was sent to CBP and when.

CBP Responses

When a *Response* is highlighted in the transmission log and the **Open** function is selected, the full response including any warnings, errors or information will be displayed in a pop-up window.



Cancel

If the status of an entry is **Sent** or **Updated** the *Cancel* action may be used to send a notice of cancellation to CBP.

- Commodity Lines - Manage Commodity Filings - US AES - Customs USA
- Container Details - US AES - Customs USA
- Declaration Templates - US AES
- Parties and Basic Information - US AES - Customs USA

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Commodity Lines - Manage Commodity Filings - US AES - Customs USA

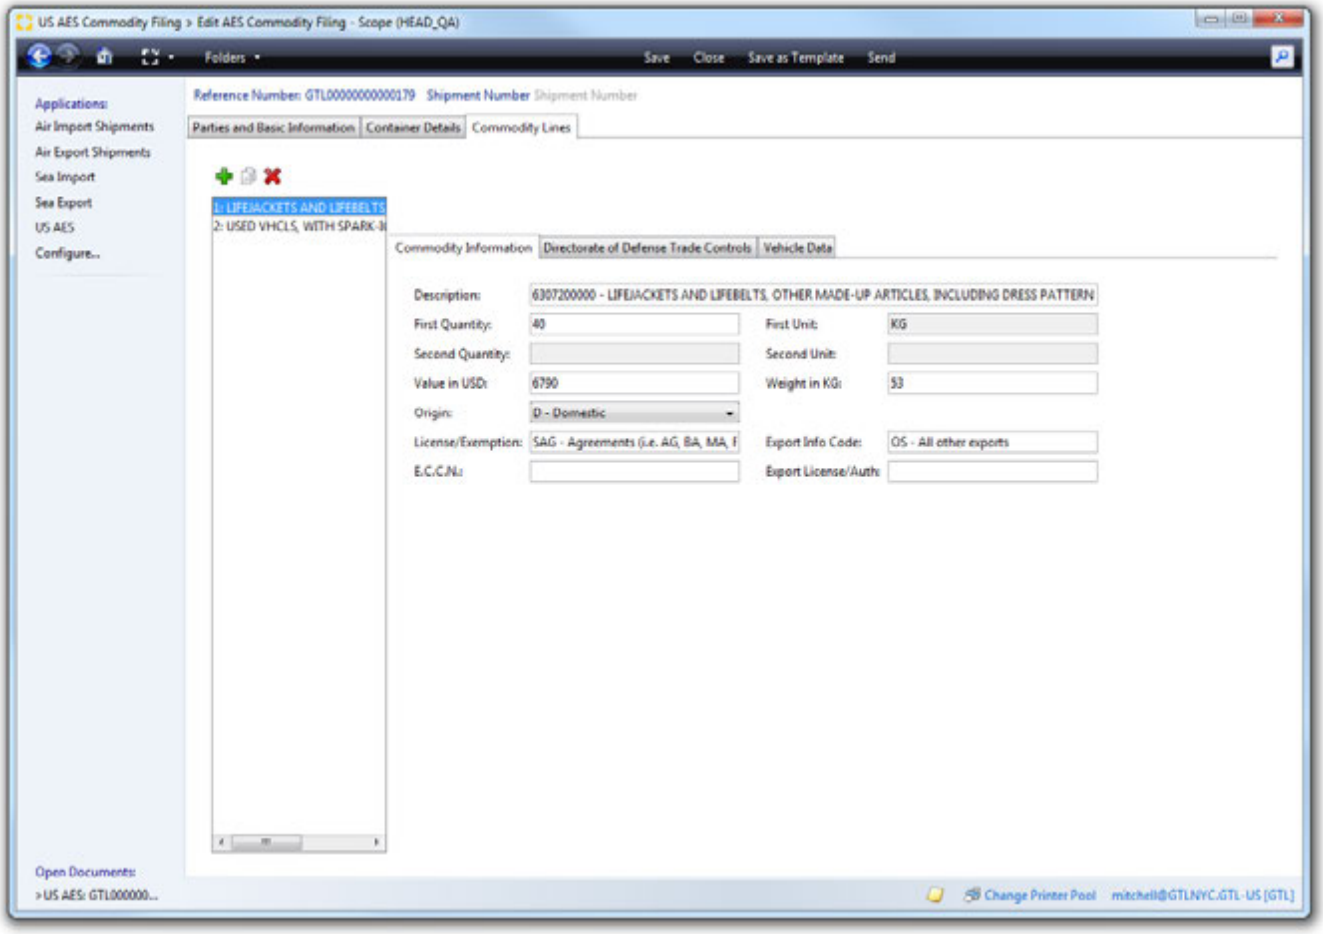
- Introduction
- Commodity Information
- Kimberly Process
- Directorate of Defense Trade Controls
- Vehicle Data
- Vehicle Detail Application

Introduction

Once the parties and basic transportation details have been entered for the AES entry, all the commodities and their associated information can be entered using the *Commodity Lines* tab. Because multiple commodities can be entered, the left hand side of the application has a vertical listing where all commodity lines will be shown and where *add* and *delete* icons can be used to make new commodity line entries or delete existing commodity lines. As each commodity is highlighted in the left hand listing, the details of the commodity will appear to the right in the *Commodity information* tab. In addition to the *Commodity information* tab, there are 2 less used tabs which are the *Directorate of Defense Trade Controls* and the *Vehicle Data* tabs. These will only require completion in special circumstances described for each tab.

The fields to be completed within the *Commodity information* tab will depend on the commodity code selected and the License Exemption and Export Info Codes.

Commodity Information



Save

The menu bar of the application provides the **Save** option. This is available in all areas of the EEI entry and will save all information entered to date. the user may continue editing the EEI after saving it.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Close

The menu bar of the application provides the **Close** option. This is available in all areas of the EEI entry and will close the EEI entry and return the user to the overview of EEI entries. If any changes have been made that have not been saved, a pop-up window will appear where the user will be reminded to save, discard or cancel the *close* operation.

Save as Template

If further EEI's will be created that use much of the same information in the current EEI, then the current EEI can be used as the basis for the creation of a new template. Selecting the *Save as Template* will launch the Declaration Template application where the new template can be created for future use.

Send

Once the EEI has been completed and there are no error messages, the *Send* function will be active and can be used to transmit the EEI to CBP.

Description

The first item that should be entered is the Schedule B number of the commodity since this will begin the process of determining what associated information must be submitted with the commodity. It is possible to enter the Schedule B number directly into the *Description*. If this is not known, then part of the Schedule B number may be entered or the description of the commodity (or part description) may be entered. The application will present a list of matching Schedule B commodities showing both the schedule B number and the commodity description. It should be noted that HTS tariff codes are also included in the search and may be used if no appropriate Schedule B number exists.

First Quantity

The amount of the commodity. The units for this amount will be automatically shown in the field to the right called *First Unit*. "KG" is a fairly common example of the type of unit for the first quantity.

First Unit

As above, when the schedule B code is selected the type of units to be reported as the *First Quantity* will automatically appear in the *First Unit* field

Second Quantity

Some commodities require that a 2nd quantity should be reported. If this is the case, the *Second Quantity* field will be active and the *Second Unit* field to the right will show the type of units to be reported for the 2nd quantity.

Second Unit

As above, if the schedule B code requires a 2nd quantity to be reported, this field will show the type of unit that is to be reported.

Value in USD

The value of the goods should be in excess of USD 2500.00 since anything less than this value does not require an AES entry and can be declared using an additional statement and FTSR 30.37(a).

In general, the amount to be declared as the value of the goods is the value of the commodity itself, any insurance, plus all costs incurred transporting the goods to the last US port of export. The figure should be in dollars. If cents are included in the value, less than 50 cents will be ignored and 50 cents or more will be rounded up to the next dollar.

Determining the correct value of the goods can be complex and where doubt exists part 30.6 item 17 of the foreign trade regulations should be consulted.

Weight in KG

The weight of the commodity including any normal packaging to the nearest full kilo. If the commodity is contained in a substantial outer container such as a shipping container, the weight of this substantial container should not be included. A weight in KG is not required where the method of transport is mail (Code 50) or fixed transport (70).

Origin

The origin of all commodities must be declared, the only exception to this is household goods (Export Code HH). This is a drop down menu that presents the 2 options "Domestic" or "Foreign"

Domestic

These are goods grown, produced or manufactured in the USA. If the commodity contains foreign parts but is assembled in the USA, then it is classified as "Domestic".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Foreign

These are goods grown, produced or manufactured outside the USA and which have not undergone any change within the USA.

License/Exemption

All entries require a *License type* to be selected. The license type will in turn determine if an export license number or ECCN is required. The license code will be cross checked against the method of transport and the export information code to ensure they are compatible.

The license and license exemption type codes are issued in the Appendix F of the AESTIR. Enter in the field either the code or part of the code or description of the code. This is a search field and it will list all results that match the search terms entered. Clicking the drop-down option to the right produces the option to *Show the code list panel*, if selected this will display the complete listing of license and license exemption type codes and their descriptions. The desired code can be selected from this listing.

Export Info Code

All entries require an *export information code* to be selected. The *export information code* will determine which elements of the entry must be reported, for example the code *ZD* will require foreign trade zone ID and Entry Number, *HV* will require additional vehicle details, *HH* will require only a limited data set. In addition the application will check if the **export information code** is compatible with the License type selected.

The export information codes are issued in the Appendix E of the AESTIR. Enter in the field either the code or part of the code or description of the code. This is a search field and it will list all results that match the search terms entered. Clicking the drop-down option to the right produces the option to *Show the code list panel*, if selected this will display the complete listing of export information codes and their descriptions. The desired code can be selected from this listing.

E.C.C.N.

This field is the *Export Control Classification Number* and is used to identify items that are on the Commerce Control List (CCL). This field will depend on the license type used for the entry. When required, the ECCN is a 5 digit alpha-numeric.

Export License/Authorization Symbol

This field is only required for entries that require and export license. Shipments may require export license's for a number of reasons; the type of commodity may require and export license, the country where the goods are being exported, the end user of the goods and the final use of the goods may all have licensing requirements. The license type code will also determine if an export license or authorization symbol are required.

If there is any doubt about licensing of a shipment, the user should refer to the Bureau of Industry and Security at the U.S. Department of commerce.

Kimberly Process

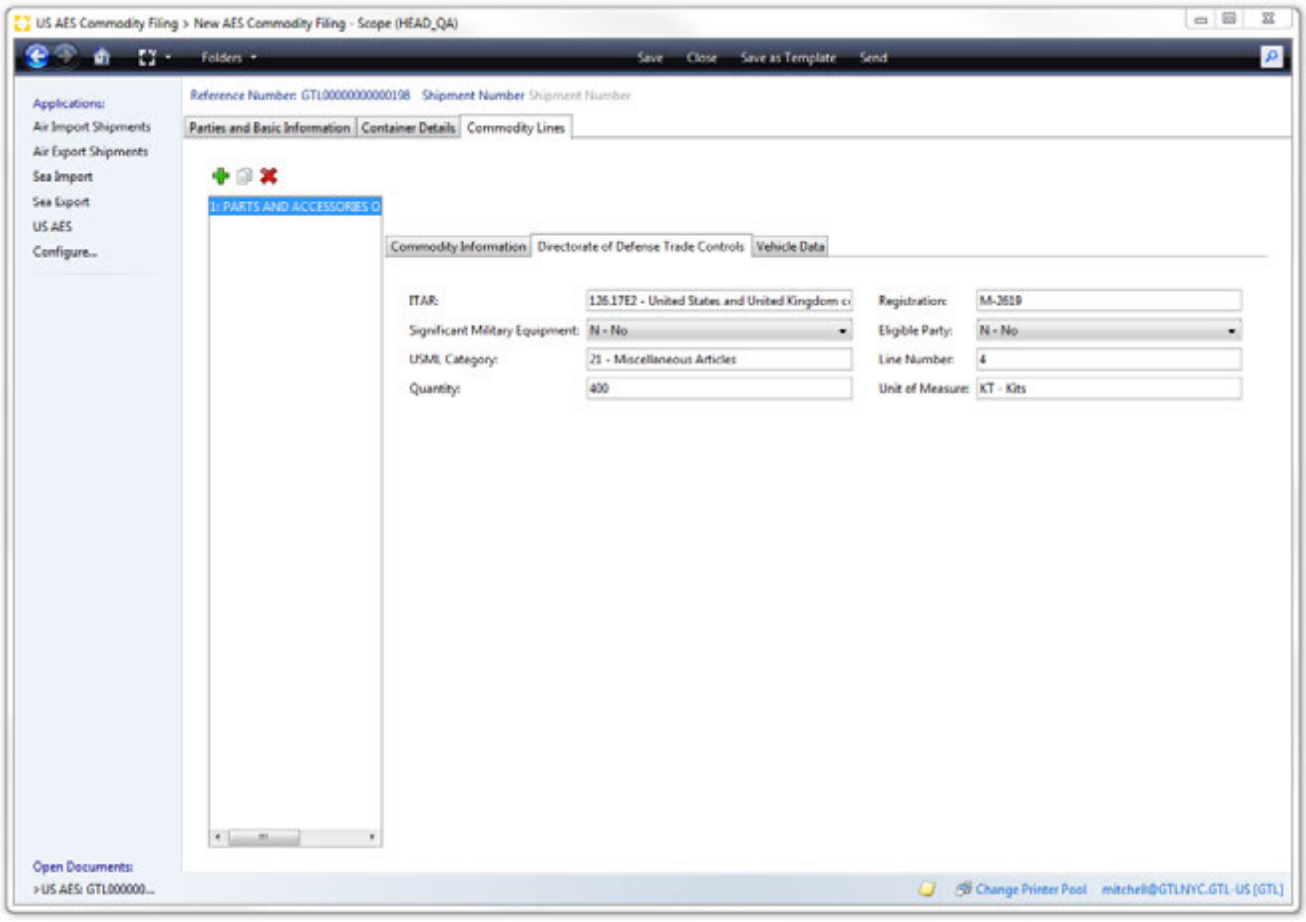
Export of diamonds is checked to ensure conformance with the Kimberly Process:

If the first 6 digits of the Commodity code are 7102.10, 7102.21 or 7102.31, or if the License type used is T12, then the commodity will be subject to Kimberly Process edit checks:

- The Export Info Code must be "OS" or "OI"
- The Export license must be completed. It must be 4-12 numeric positions with no leading spaces.
- The ECCN can be blank or "EAR99"
- The country of destination of the shipment can only be a country on the "Kimberly Process Countries" list.
- License value is required for T12

Directorate of Defense Trade Controls

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Shipments that fall under the control of the Directorate of Defense Trade Controls (DDTC) require additional data to be submitted in the AES entry. Shipments of this type must be declared using the correct Department of State/ Directorate of Defense Trade Control (DDTC) License Type codes.

The table below shows these License Type codes and the additional data elements that must be reported for each (These should be checked since they are subject to change). R indicates the field is required and N indicates the field is not required:

License Code	License Type	Export License Number/ ACM#	DDTC ITAR Exemption Number	DDTC Registration Number	DDTC SME Indicator	DDTC Eligible Party Certification Indicator	DDTC USML Category Code	DDTC Unit of Measure Code	DDTC Quantity
SAG	Agreement	N	R	R	R	N	R	R	R
SAU	Australia ITAR Exemptions	R	R	R	R	R	R	R	R
SCA	Canadian ITAR Exemption	N	R	R	R	R	R	R	R
SGB	United Kingdom ITAR Exemptions	R	R	R	R	R	R	R	R
S00	ITAR Exemption	N	R	R	R	R	R	R	R
S05	DSP-05 Permanent export of unclassified defense articles and services	R	N	R	R	N	R	R	R
S61	DSP-61 Temprorary import of unclassified articles	R	N	R	R	N	R	R	R
S73	DSP-73 Temporary export of unclassified articles	R	N	R	R	N	R	R	R
S85	DSP-85 Temporary or permanent import or export of classified articles	R	N	R	R	N	R	R	R
S94	DSP-94 Foreign Military Sales	R	N	R	R	N	R	R	R

ITAR

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

A DDTC ITAR exemption number. The specific citation (exemption number) under the International Traffic in Arms Regulations (ITAR) from the Code of Federal Register (see 22 CFR 120-130) that exempts the shipment from the requirements for a license or other written authorization from DDTC. This should be an alpha numeric identifier of up to 12 digits.

Enter in the field either the ITAR number or part of the number or description of the exemption. This is a search field and it will list all results that match the search terms entered. Clicking the drop-down option to the right produces the option to *Show the code list panel*, if selected this will display the complete listing of ITAR exemption numbers and their descriptions. The desired number can be selected from this listing.

Registration

The registration identifier assigned by DDTC to the registered manufacturer or exporter that has authorization from DDTC (through a license or exemption) to export the article. This should be a 6 digit alpha numeric identifier.

Significant Military Equipment

This is a drop down menu used to indicate if the articles reported warrant special export controls because of their capacity for substantial military utility or capability (see 22 CFR 121.1 for SME articles). According to the table above this information must always be reported. Therefore select from the following options:

Status	Meaning
No	No. Articles do not warrant special export controls.
Yes	Articles do warrant special export controls.

Eligible Party

This is a drop down menus that is used as a self certification by the exporter for the exemption and a self certification by the exporter that they are an eligible party (per 22 CFR 120.1(c)). As per the table above, this information is not required for some License Type codes. Therefore select from the following options:

Status	Meaning
No	No. The exporter has not both self certified for the exemption and is an eligible party.
Yes	Yes. The exporter has both self certified for the exemption and is an eligible party.
n/a	Not required for this License Type codes

USML Category

The DDTC U.S. Munitions List (USML) category of the article, service, or related technical data as it applies to the article reported.

This is a search field, either the 2 digit numeric category number may be entered or the description or part of the category description may be entered. The application will display a list of matching USML category codes and their descriptions and the correct code can be selected. To the right of the field is the option to show the complete list of USML category codes and these are from the Appendix L of the AESTIR.

Line Number

As per 15 CFR § 30.6 (b)(15)(viii), this field is to be filled with the correct commodity line item number from the list of items shown on the Department of State export license. Each commodity that may be exported using the declared export license will be listed on the export license and will have an item number shown in the **Item** column of the license.

Quantity

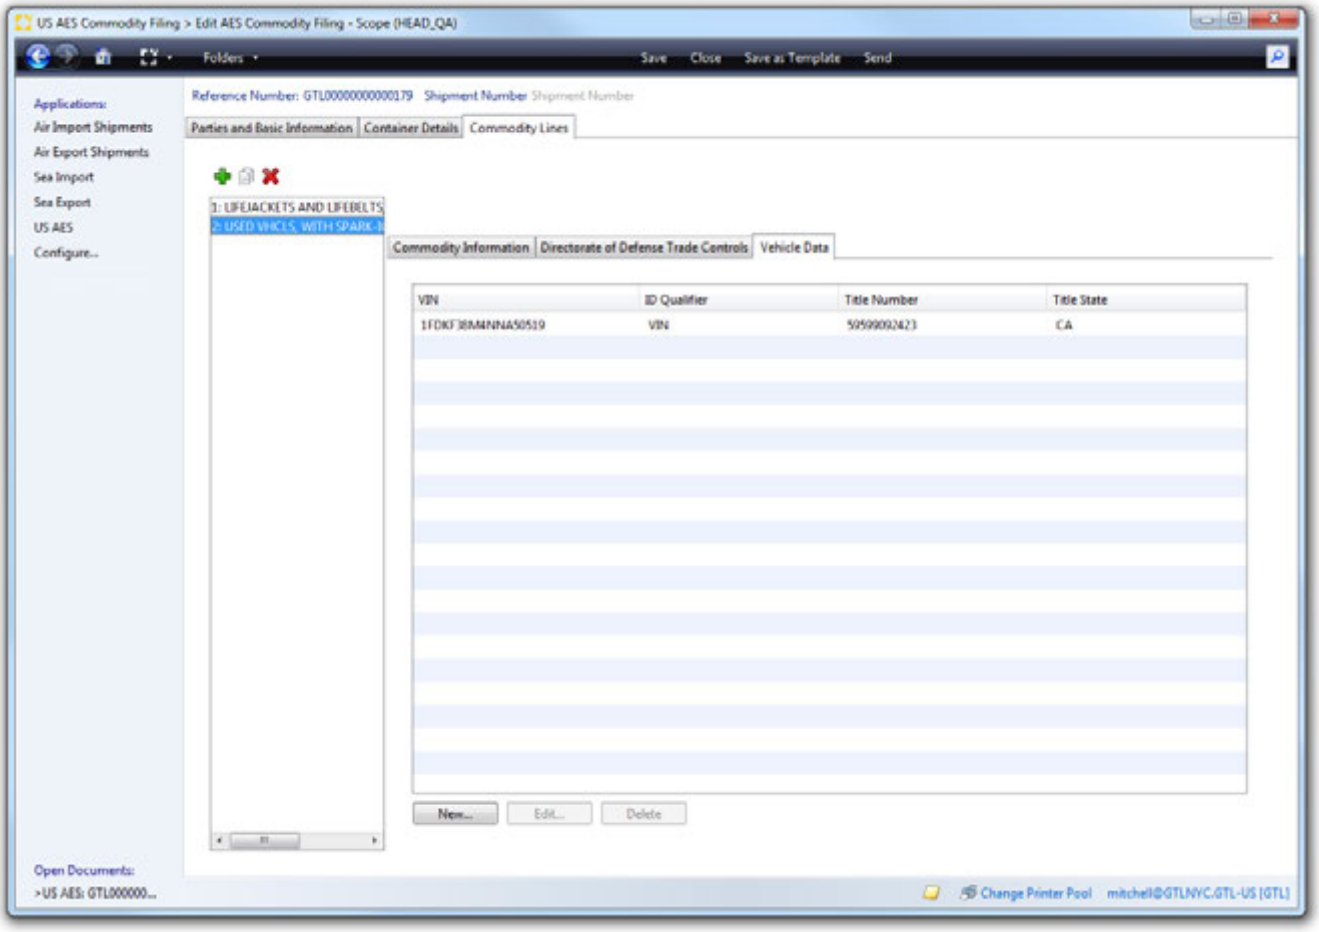
The total number of units being reported. These will be in the unit of measure used in the field Unit of Measure

Unit of Measure

The unit of measure for the article being shipped. The correct unit of measure will be provided on the export authorization. This is a search field and the code or name of the unit of measure or part thereof may be entered. The application will produce a list of matching results from which the correct unit of measure may be selected. To the right of the field is the option to show the complete list of possible unit of measure codes and these are from the Appendix W of the AESTIR.

Vehicle Data

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the commodity being exported is a *used* vehicle, all information in the *Vehicle Data* tab must be completed. A *vehicle* may be any of the following:

- Automobile
- Truck
- Tractor
- Bus
- Motorcycle
- Motor home
- Self-propelled agricultural machinery
- Self-propelled construction equipment
- Self-propelled special use equipment
- Any other self-propelled vehicle used or designed for running on land but not rail

If the export information code *HV* is used, then the *Vehicle Data* tab is mandatory, in addition, the HTS/Schedule B code used in the description field must be from the Census Schedule U.

The *Vehicle Data* tab appears in the form of a listing since multiple vehicles may be declared for each vehicle commodity line. All vehicles entered will be shown.

VIN

The Vehicle Identification Number or Product ID. If the used vehicle does not have a VIN number then the Product ID may be used instead.

ID Qualifier

This is used to indicate what kind of identifier is being used, if the VIN number is being used this will be a **V** and if the product ID is being used, it will be a **P**.

Title Number

Title number issued by the Motor Vehicle Administration. If a product ID had been reported and there is in title number, then re-enter as much of the product ID as will fit in the title number field. (ASKAES recommended work-around).

Title State Code

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The title state issued by Motor Vehicle Administration. If a product ID had been reported then the title state code may be left blank. If a VIN has been reported but a title state issued by the Motor Vehicle Administration is not available, then the state from which the vehicle is being exported may be reported.

New...

The *New* function button will launch the Vehicle Detail application where vehicle identification details may be entered.

Edit

The vehicle highlighted in the listing will be opened using the Vehicle Detail application in order to make changes.

Delete

The vehicle highlighted in the listing will be deleted from the entry.

Vehicle Detail Application

In order to add or change vehicle details the *New* or *Edit* fucntions are used in the vehicle data listing. This will launch the Vehicle Detail application.

Vehicle ID Number (VIN)

The Vehicle Identification Number or Product ID. If the used vehicle does not have a VIN number then the Product ID may be used instead.

Vehicle ID Qualifier

This field offers a drop down menu and this is used to indicate what kind of identifier is being used, if the VIN number is being used then **V** should be selected. If the product ID is being used, then **P** should be selected.

Title Number

Title number issued by the Motor Vehicle Administration. If a product ID had been reported then the title field may be left blank.

Title State Code

The title state issued by Motor Vehicle Administration. If a product ID had been reported then the title state code may be left blank. If a VIN has been reported but a title state issued by the Motor Vehicle Administration is not available, then the state from which the vehicle is being exported may be reported.

OK

Saves the vehicle data and return to the listing of vehicle information.

Cancel

Exit the Vehicle Detail application editor without saving any changes and return to the listing of vehicle information.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Container Details - US AES - Customs USA

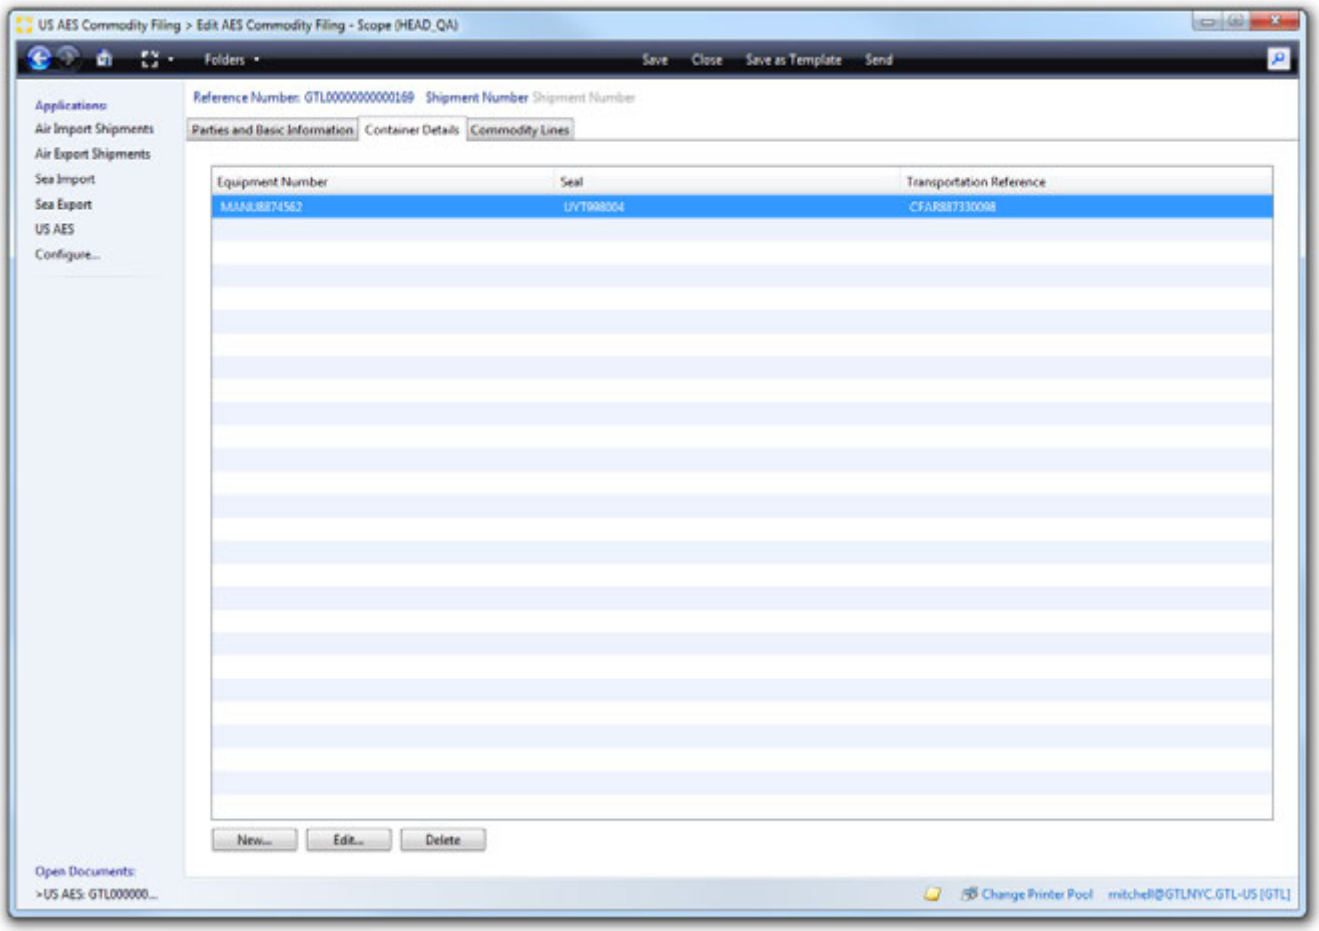
- Introduction
- Overview of container details
- Transportation Details Editor

Introduction

The container details tab allows multiple containers, their seal numbers and transportation references to be entered for sea export shipments (method of transport types 10, 11 and 12). At least one of these 3 elements must be included in the AES entry. These elements are not mandatory for other types of shipments and are generally left blank for these non-vessel shipments.

Overview of container details

Any containers, their seal numbers and transportation references entered in the sea export shipment will automatically appear in the overview.



Equipment Number

This is the container number or equipment that contains the cargo

Seal

Any seal numbers that have been issued for the equipment or containers that contain the cargo. If the seals have been affixed to the containers then they should be recorded on the same line as the container. If not yet affixed they should be reported on lines separate from the containers.

Transportation Reference

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

For vessel shipments, this must be the transportation reference issued by the carrier. Only a single transportation reference must be transmitted, this will generally be the ocean bill-of-lading or the carriers booking reference for the cargo. The AES entry for method of transport types 10 (Vessel), 11 (Vessel Containerized) and 12 (Barge) cannot be transmitted unless a valid single transportation reference has been entered.

New

The *New* function key will launch the Transportation Details Editor which is used to add additional Container Numbers, Seal Numbers or a Transportation Reference.

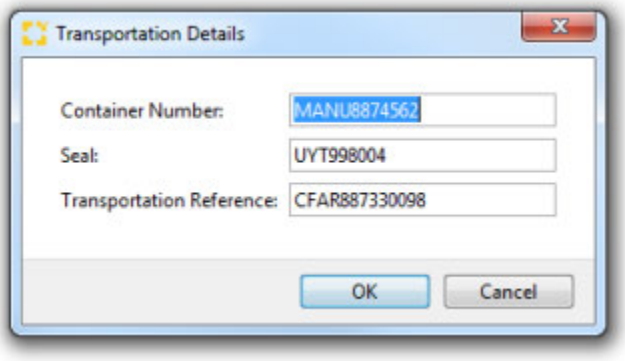
Edit

To change existing Container Numbers, Seal Numbers or a Transportation Reference, highlight the desired entry in the overview and select the *Edit* button to launch the Transportation Details Editor.

Delete

To delete existing Container Numbers, Seal Numbers or a Transportation Reference, highlight the desired entry in the overview and select the *Delete* button

Transportation Details Editor



Container Number

This is the container number or equipment that contains the cargo. The application will check the container number is valid and report any discrepancies in the check-digit.

Seal

If the seal is affixed to the container, it should be entered with the container number. If not affixed, it should be entered separately from the container number.

Transportation Reference.

The carriers Ocean Bill-of-Lading or booking reference for the cargo. Only a single transportation reference may be entered per AES entry. If a transportation reference already exists, it is not possible to add further transportation references.

OK

Saves the transportation details and exits back to the *Container Details* tab.

Cancel

Exits the transportation details without saving any information and returns to the *Container Details* tab.

Declaration Templates - US AES

- Introduction
- Overview
- New Template

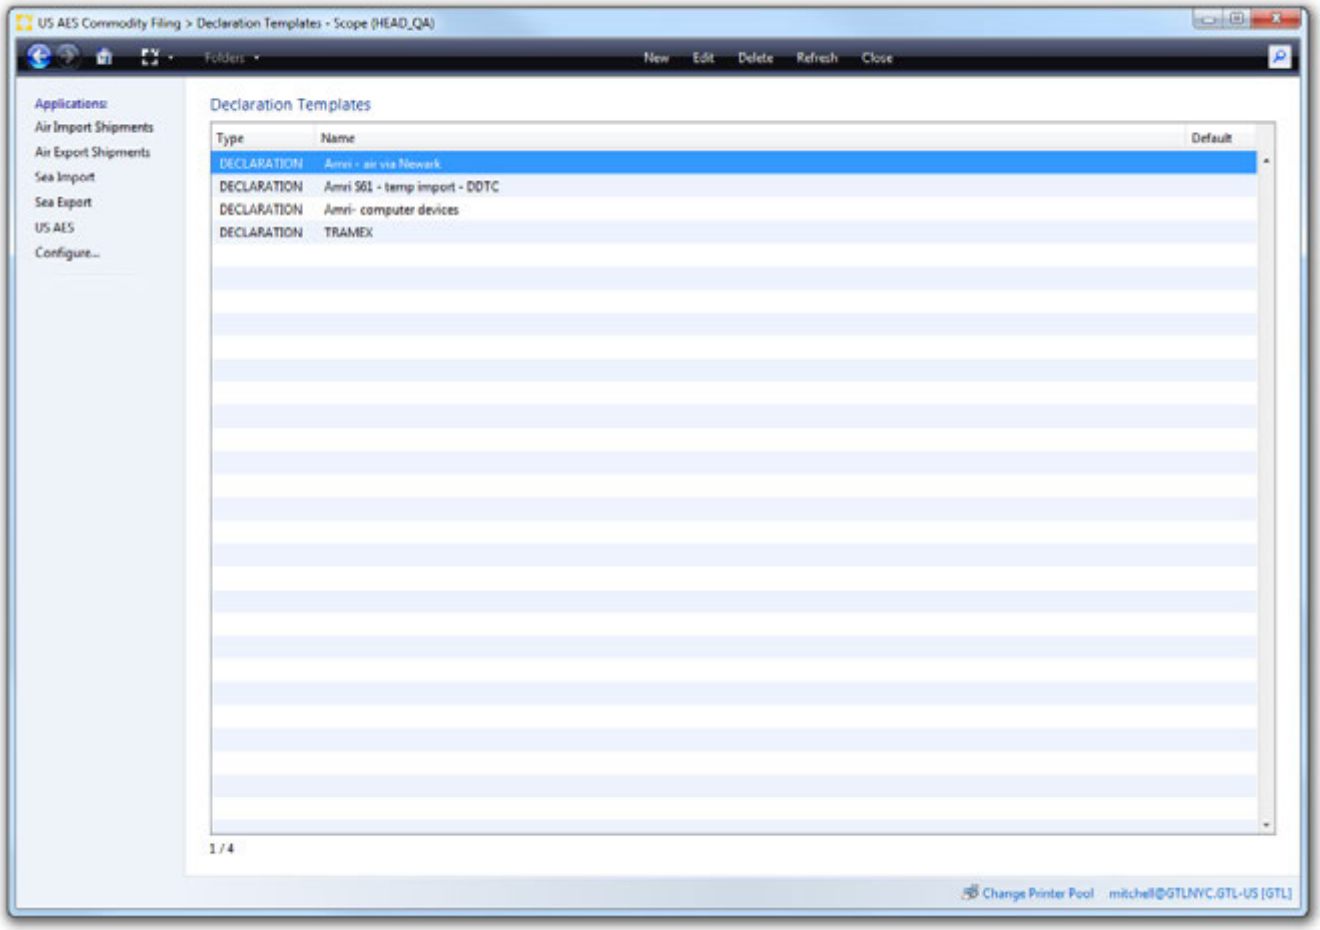
Introduction

Templates used to create EEI entries for shipments where much of the EEI information repeats on a regular basis and only transport or other minor changes occur. The **Declaration Templates** application is used to create, edit and manage templates for declarations.

The **Declaration Templates** application is opened from the US AES application by selecting the item **Templates** from the menu bar.

Overview

On opening the **Declaration Templates** application presents a complete listing of all existing templates, with options to edit, delete or add new templates.



New

When a template is to be created from scratch, the **New** option is selected. This will open the Parties and Basic Information screen of an EEI with further access to the Container Details and Commodity Lines. Apart from the Forwarder Name and inbond code, all fields will be blank and the user can fill in all fields with the data that should automatically appear when the template is used to create an EEI.

In most cases it is simpler to start with and existing EEI and use the Save as Template function as the basis for a new template.

Edit

The template highlighted in the overview will be opened, fields of the template can then be edited and saved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

The template highlighted in the overview will be deleted.

Refresh

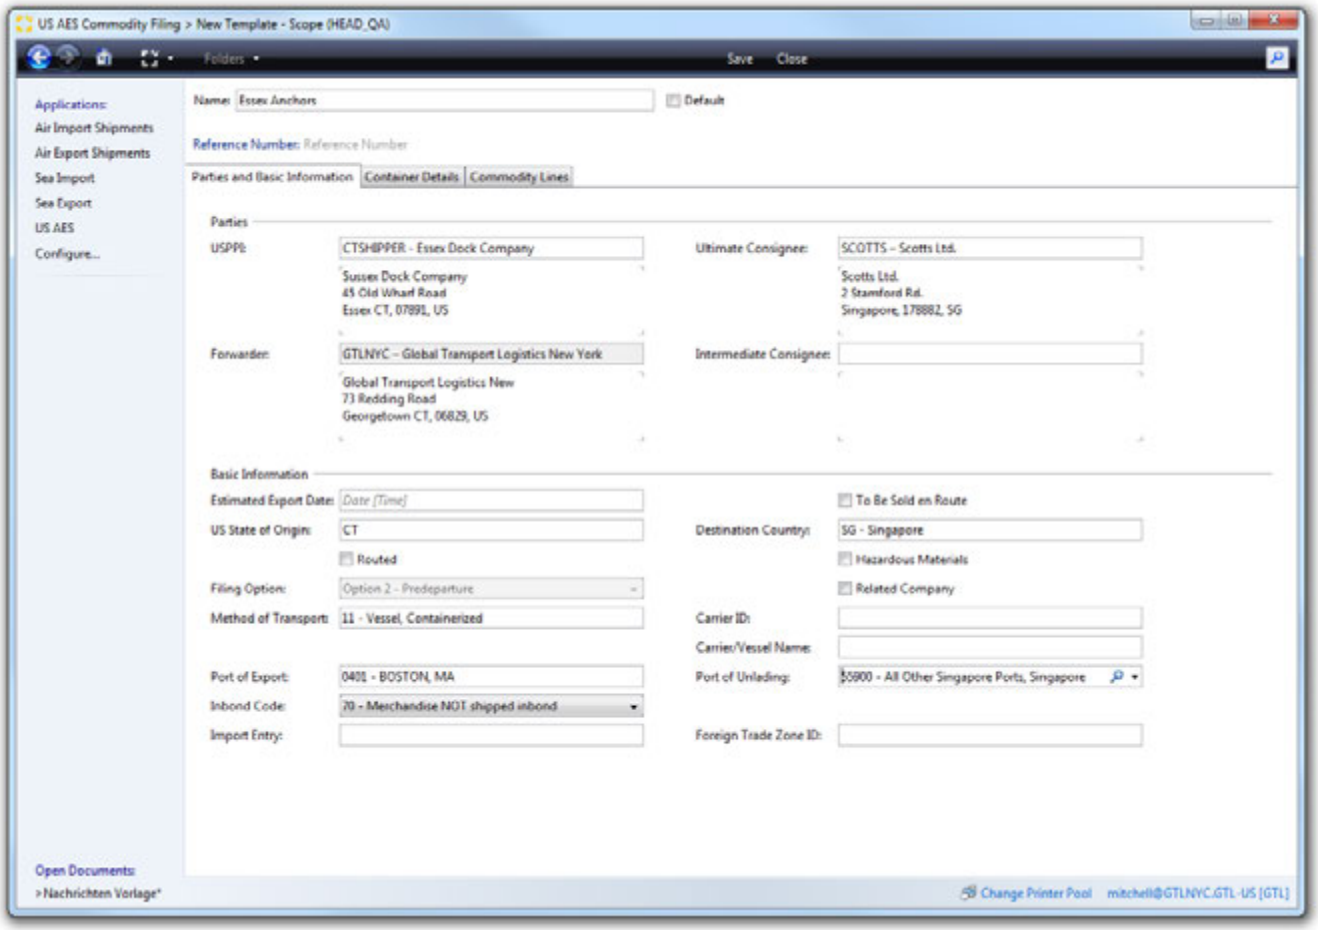
The list of existing templates with be refreshed to ensure all templates are visible.

Close

The **Declaration Templates** application will close and return to the US AES overview of EEI entries.

New Template

When the New option is selected from the overview of templates, the Parties and Basic Information screen of an EEI will open, with further access to the Container Details and Commodity Lines. Apart from the Forwarder Name and inbond code, all fields will be blank and the user can fill in all fields with the data that should automatically appear when the template is used to create an EEI.



Save

Once all details of a new template and been entered, use the **Save** option to save the template and return to the Declaration Template overview.

Close

To close a template, select **Close**. If there are changes to the template that have not been saved, a prompt will appear for confirmation if changes should be saved, discarded or if the **Close** action should be cancelled, this will return the user to the template.

Name

In order to be saved, a template must be given a name. Choose a name that is descriptive of when the template should be used, such as the name of the USPPI it was created for, or perhaps the kind of commodities it contains.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Default

When creating a new EEI a prompt will appear that asks if the EEI should be created using a template and a default template will be shown. This check-box can be used to indicate if a template is to be used as the default template for creating EEI's.

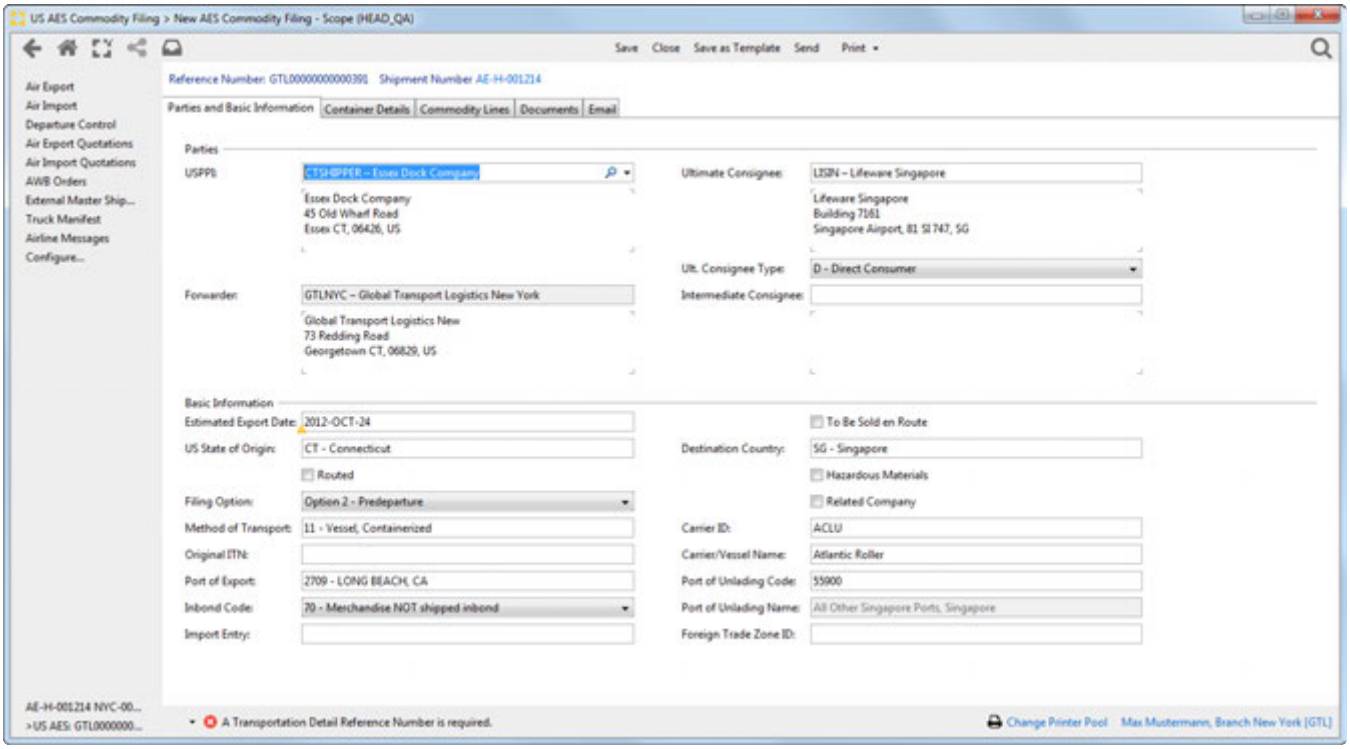
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Parties and Basic Information - US AES - Customs USA

- Introduction
- Parties
- Basic Information

Introduction

When an AES entry is created, the parties and basic information screen is where the essential and non-repeating information for the entry is created. On completion of this screen, greater transport details can then be added in the container details and commodity information can be inserted in the commodity lines



The menu bar of the application provides a set of actions:

Save

Any changes to the EEI will be saved and the application will return to the Overview of EEI entries. This action is only available if the EEI has not been sent to CBP, or if the the Update Declaration has been used to open an EEI.

Close

This action will close the EEI and return to the Overview of EEI entries. If changes have been ade to the EEI that have not been saved, a prompt will appear asking if changes should be saved, discarded or if the close action should be cancelled.

Save as Template

Any EEI entry can be used as the basis of a template. If this option is selected, the Declaration Template will launch to create a new template using all the fields from the EEI as the basis of the new template.

Send

If the EEI has not been sent to CBP or if changes have been made to an existing EEI, once all required fields are correct, the **Send** option will be available to transmit the EEI to CBP.

Parties

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The application lists the four possible parties whom must be declared to CBP when making an AES entry.

USPPI

The **USPPI** is the **United States Principle Party of Interest**. This is the party on behalf of whom the AES entry is being created and who takes responsibility for the cargo being transported.

Only Partners who have full complete US Partner Profile can be used as USPPI's.

Normally the USPPI is the shipper of the goods.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Ultimate Consignee

The party who will ultimately receive the goods. Normally this is the consignee and so the partner who is the consignee on the export shipment will default to this field. This address can be changed if required.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

When the goods are sold en route the ultimate consignee may not be known and the address may be entered as:

Ultimate Consignee Name: SOLD EN ROUTE
Address 1: SEA
City: City of First Port of Call
Country: Country of First Port of Call (ISO Code)

Forwarder

The Name and address of the forwarder who is submitting the AES entry to CBP. There is no access to this field and the address shown will normally be the Forwarders own name and address.

Intermediate Consignee

The party who acts as an agent for a principal party of interest in order to effect the delivery of the goods to the ultimate consignee.

This is a full text search field. Any part of a partner name or address may be entered in order to find the partner in the database of stored partners.

The Menu drop-down to the right of the field will provide further actions:

- Edit Partner
- Edit Address
- Refresh Address

Basic Information

Dates of export, and transport details are entered in the basic information section of the application.

Estimated Export Date

Estimated export date and time of the commodity.

To Be Sold en Route

If the ultimate consignee is unknown because the goods will be sold while in transit, then this box should be checked. In addition the ultimate consignee for the AES entry should be shown as:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Ultimate Consignee Name: SOLD EN ROUTE
Address 1: SEA
City: City of First Port of Call
Country: Country of First Port of Call (ISO Code)

US State of Origin

The 2 letter state code where the goods originated. This is a search field that will search all valid US states and presents a drop down list of matching states as the state codes or names or part-thereof are typed.

Destination Country

The declared 2 digit ISO country code of final destination for the commodity. This is a search field that will search all valid country codes and presents a drop down list of matching countires as the country codes or names or part-thereof are typed.

Routed

If the goods are controlled by an FPPI (Foreign principle party of interest) then the goods are deemded to be routed and this box should be checked to indicate this.

Hazardous Materials

Check this box when the goods are classed as hazardous goods.

Filing Option

An AES entry can either of the 2 options shown below:

Type	Description
Option2	Full details are to be submitted on export of the goods
Option 4	Post departure. Partial details are submitted on export of the goods. With full details to follow within 10 days of export. Only CBP approved parties can be option 4.

This field will automatically default the correct options according to the details stored in the role US Partner Profile that must be created for the USPPI's. If the USPPI's is may submitted both option 2 and option 4 entries, then both will be offered and the correct method should be selected.

Items on the USML cannot be declared as Post-Departure (option 4).
If any of the commodities being declared on the EEI are on the USML (United States Munitions List) and are therefore being exported using any of the following DDTC license type codes, SAG, SAU, SCA, SGB, S00, S05, S61, S73, S85, S94, then the EEI cannot be option 4 and must be option 2.

Related company

This box is to be checked to if either the USPPI's or the ultimate consignee own 10% or more of the other's voting securities.

Method of Transport

The type of transport on which the cargo will leave the last US port that it departs from. This is a 2 digit numeric code followed by the actual description of the method of transport. The application will default the most appropriate code according to the mode of the export shipment, an air export shipment for example will result in the code **40 - Air** defaulting to this field.

This is a search field in which either the code or a description of the type of transport can be entered. A corresponding matching list will automatically be shown from which the correct code can be selected. The complete list can be shown by pressing **F3** or selecting this option from the drop-down list on the right of the field. This will display the following transport types:

Code	Transport Type
10	Sea
11	Sea Containerized
12	Sea (Barge)
20	Rail
21	Rail Containerized

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

30	Truck
31	Truck, Containerized
32	Auto
33	Pedestrian
34	Road,Other
40	Air
41	Air containerized
50	Mail
60	Passenger,Hand-carried
70	Pipeline,Powerline

Carrier ID

For Air shipments which are method of transport type 40 and 41, the carrier ID will be the 3 digit ICAO code. For All other methods of transport, the 4 digit SCAC code should be entered. This is a search field that will search for results to any data entered by referring to the ICAO code database or the SCAC code database.

Unknown Carriers

The following codes can be used to identity unknown carriers

- UNMT — unknown Mexican trucker
- UNFA — unknown foreign air carrier
- UNUA — unknown U.S. air carrier
- UNCA — unknown Canadian air carrier
- UNKN — unknown carrier (Only for ocean, rail and truck shipments)
- 99O — Use this code if the aircraft is the item being exported. Indicate “Flyaway Aircraft” as the Conveyance Name.

Carrier/Vessel Name

If the shipment is an air export shipment and the transport type is 40 or 41, the carrier name will automatically be shown in this field according to the IATA ICAO code that has been selected as the carrier ID and there is no option to change this.

For sea export shipments where the transport type is 10, 11 or 12 this field should be the name of the vessel Transporting the goods.

Truck and rail shipments with are transport types 20, 21, 30 and 31, this field will be filled with the carrier name according to the SCAC code selected, and there is no option to change this unless the transport type is changed.

Unknown Carriers

When any of the unknown carrier codes are used, the actual name of the carrier should be entered. The carrier name cannot include the word UNKNOWN

Port of export

The last port of exit in the USA. This is a full text search field that will search the Schedule D database for port codes or names that match the user input. A port can only be used if it is valid for the method of transport.

Port of Unlading

The port of unlading is only required for sea export shipments where the mode of transport is 10 or 11. It is also required for air export shipments where the Destination Country is Puerto Rico. This is a full text search field that will search the Schedule K database for port codes or names that match the user input.

Inbond Code

The Ibond field can be used to indicate if the export goods are bonded goods. This field defaults to 70 which indicates the the goods are not bonded since this is the most common condition and CBP do not use AES entries to close out in bond shipments.

This field offers a drop down menu from which a bond type can be selected:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Code	Description
36	Warehouse Withdrawal for IE
37	Warehouse Withdrawal for T&E
67	IE from a (FTZ) Foreign Trade Zone
68	T&E from a (FTZ) Foreign Trade Zone.
70	Not In Bond

If the in bond codes 36, 37, 67 or 68 are used, then it will be mandatory to also complete the Import Entry field. Additionally the code 67 and 68 will require the Foreign Trade Zone ID to be entered.

Import Entry

If the export goods being transported under bond, then this should be indicated in the Inbond Code field using the appropriate in bond code. It is also necessary to enter the import entry number in the import entry number field. For in bond codes 67 and 68 which indicate the goods are held in a Foreign Trade Zone, the import entry number will be the entry admission number of the e214 on which the cargo was admitted to the Foreign Trade Zone.

Foreign Trade Zone ID

Goods being exported from a Foreign Trade Zone will have the Inbond Code 67 or 68. For these types of cargo the ID of the Foreign Trade Zone must be entered in the Foreign Trade Zone field. The foreign trade zone ID should be 5 digits, the first 3 digits of the ID should be numeric and the last 2 should be alphanumeric.

Return of Events from Scope Customs to Partner applications

As part of an interface integration Scope is able to send events back which occur during the declaration process.These events are being triggered by a customs response message.

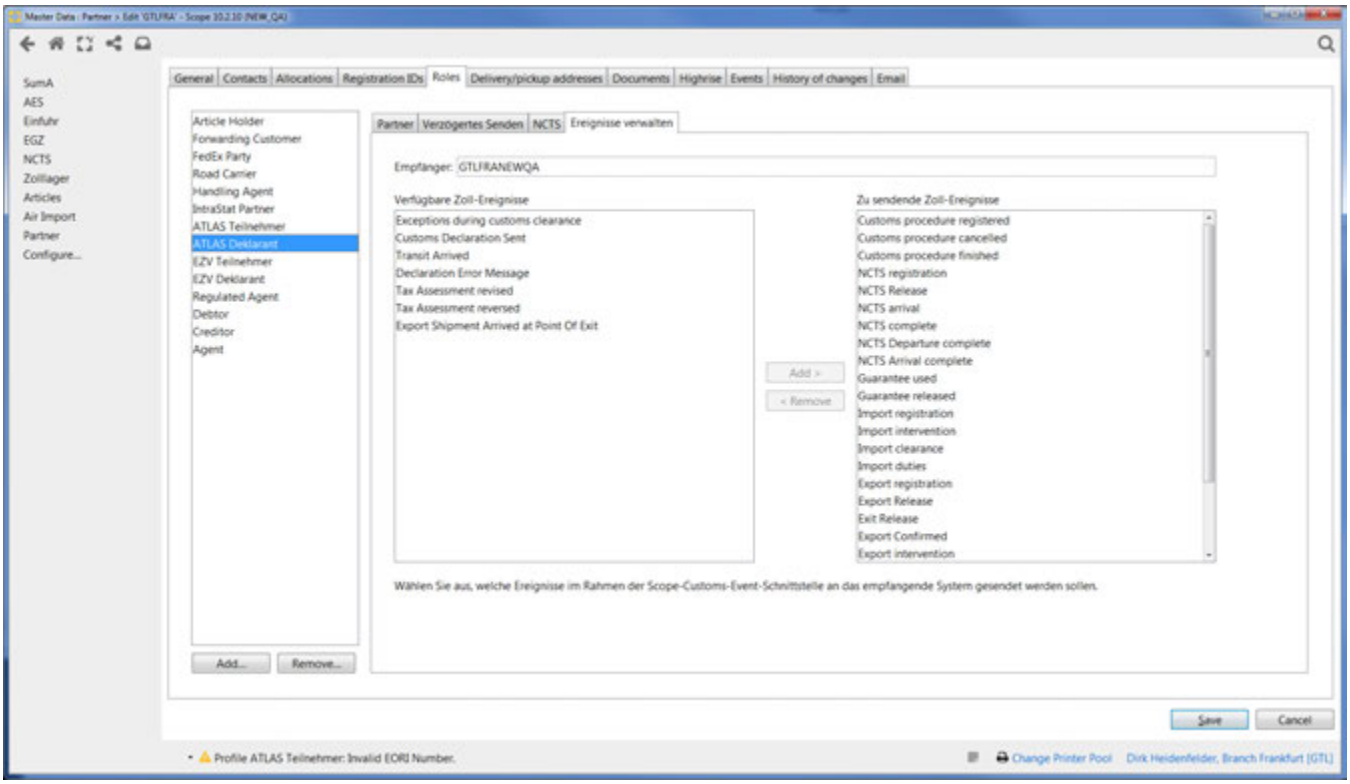
These message will alway be returned real-time directly after the event occured.

The format of the messages is the same like the already known "Scope Event" interface in Forwarding. Für customs purposes there are only additional codes, and some addition reference information.

Active and Configure in Scope

The return of the desired events can be defined in the Scope partner profile:

- for Customs-DE in the role "ATLAS-Declarant"
- for Customs-NL in the role "Netherlands Customs Partner"
- for Customs-CH in the role "EZV Declarant.



In this screen you can choose, Which Events shall be returned to your system; assiging / de-assigning is done by selecting an event then click "Add", or "Remove" respesctively. Multi-seletion via CTRL-Click is possible.

The receiving system needs to be entered as receiver in the top field. It must be the same like the one which send in the interface messages; if not, Scope does not have a valid remote links to this system.

Available Events / Codes

Scope can return the following events. Boxes in YELLOW are the same in all customs procedures, and hence universally valid. BLUE events are by nature only available in dertain processes. Which processes is mentioned in the rightmost column.

Code	Short Description	Relates To	Long Description	Only in

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

CDS	Customs Declaration Sent	Declaration	A customs declaration has been sent to customs. This signals that Scope will not accept updates or cancellations to the related shipment any longer.	
CAP	Customs Declaration Accepted	Acceptance	This event is sent when a customs declaration has been accepted by customs.	
COK	Customs Declaration Registered	Registration	This event is sent when a customs declaration has been successfully transmitted to customs and has thus gained a customs entry number. This event can occur multiple times if the customs entry number changes.	
CLD	Customs cleared	Release	The declaration is cleared and OK.	
CGL	Guarantee loaded	Guarantee load	My guarantee has been charged after a release of a Transit	Transit
CRR	Declaration Error Message	Error	The declaration received a customs error message. Usually means that it must be reset.	
CPR	Exceptions during customs clearance	Exception	This event is sent if exceptions have occured during the clearance process. In particular rejections or document / goods inspections.	
CTX	Tax Assessment received	Tax assessment	Tax assessment has been issued initially.	Import, incl, Bonded Warehouse
CRV	Tax Assessment reversed	Tax assessment	The tax assessment has been cancelled by customs. However, the declaration is not necessarily rejected. This event may contain a new customs entry number.	
CDR	Customs Duties Re-assessed	Tax assessment	New / Corrected Tax assessment submitted (SRATAX)	
CCE	Customs Examination	Inspection	Customs has ordered an examination of the goods	
CCL	Customs Declaration Cancelled	Cancellation	This event is sent when a customs declaration has been cancelled.	
CTA	Transit Arrived Export Shipment Arrived at Point Of Exit	Presentation	An NCTS declaration has received an Unload Permission after sending the Arrival Notification An Export Shipment has received an Allowance for Exit after Presentation	Transirt, Export
CFN	Customs Procedure Finished	Finishing	This event is sent when a customs procedure has been completed.	Transit, Export, SumA
CGL	Guarantee released after finishing	Guarantee load	My guarantee has been cleared after a finishing of a Transit	Transit

Information Content in the Event message

The following Reference Informationen is returned:

Field	contains
scopeCode	Event code
description	Event description
location/name	Scope-Partner's Branchcode
customsReferenceNumber	Declaration reference number
customsRegistrationNumber	Declaration registration number
customsItemNumber	Number of the goods item line, if required
customsGRN	Guarantee number (for Transit procedures)

In addition, further information is returned in the event, provided it is available:

Field	contains
shipper	Consignor
consignee	Consignee

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

shipmentNumber	Shipment Number
shipmentReference	Shipment Identification
houseDocumentNumber	House-BL / HAWB
transportDocumentNumber	Nr. of the Transport Document
mutuallyAgreed	Agreed Reference
invoiceNumbers	invoice number(s)

Accounting

- Accounting Interface
- Consistency Scope - Accounting

Accounting Interface

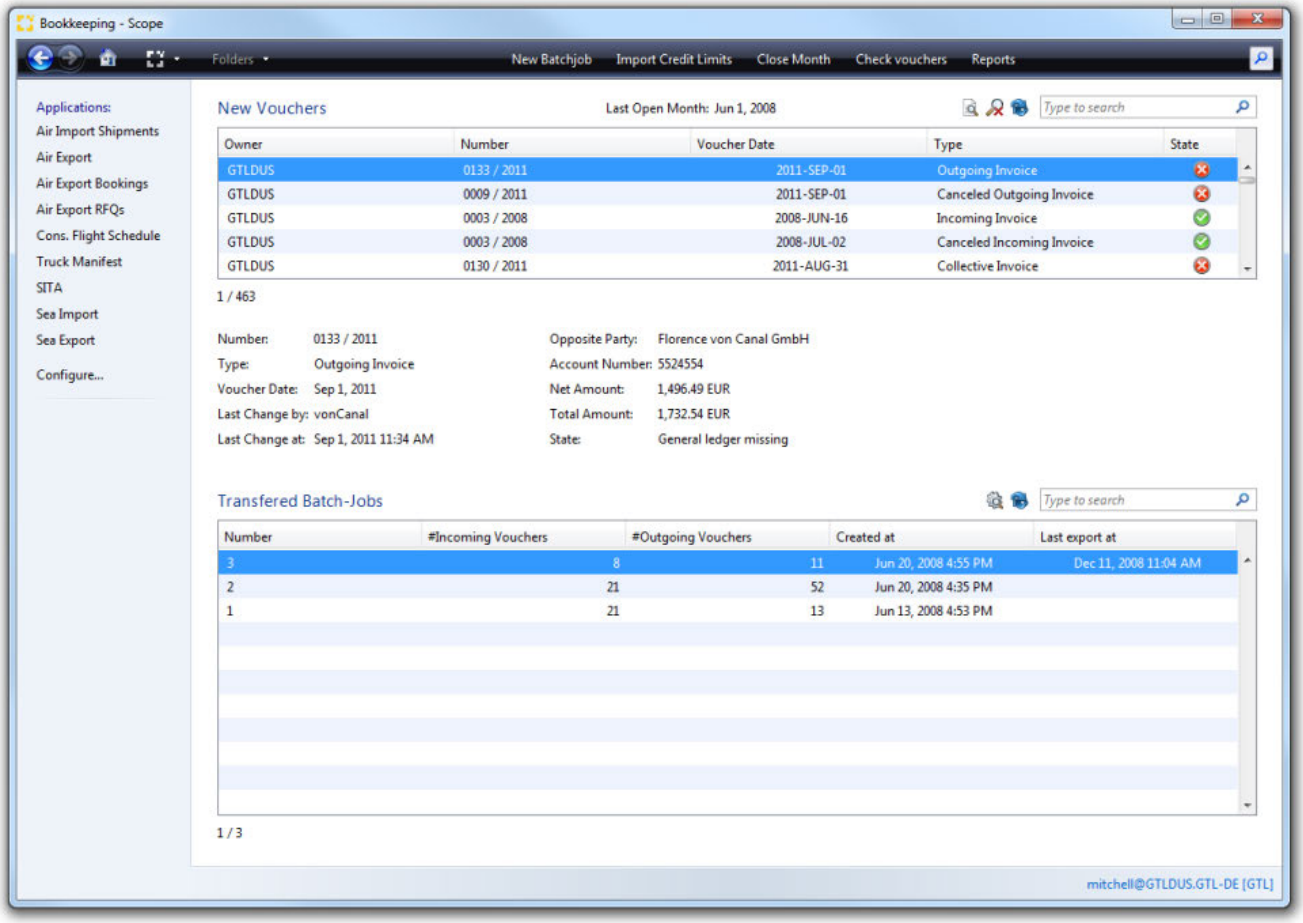
Introduction

This application is used to transfer accounting data per legal entity (=country) from the Scope system to an accounting system. In addition, the latest credit limits may be imported from the accounting application into the Scope system. We have interfaces to the following accounting systems:

- Abacus
- AccPac
- AccountMate
- Account View
- Afas
- Contpaqi
- Control 2000
- Datev (CSV + XML)
- eGecko
- Exact (Globe + Online)
- Fmuta (6 + Afas)
- PEBE Finance
- Proffix
- Quickbooks (Desktop + Online)
- SQl Accounting
- Scope Standard CSV
- Simba
- Twinfield FMUTA
- Varial (World Edition ASCII + XML)
- YonYou U8
- Zensoft

Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



New Batchjob

This action will initial the transfer of vouchers from Scope to the accounting system. The summary table will display all completed vouchers, but only those with the status *Ready to transfer* will be included in the batch.

Import Credit Limit

Opens a file browser to locate the CSV file with the latest credit limits. This may then be selected and imported into Scope for automatic update of business partners' credit limits

Close Month

If you work with monthly bookings for the estimates, this function performs the month end close of accounting. See Monthly Settlement.

If you work with the "fixated estimates" method, closing the period will prevent outgoing invoices, estimates and purchase invoices to be booked into an old period.
The procedure then is:

- Close month in Scope in [Finance|Accounting] in the top bar: Month - Close month
- Run accounting interface batch in [Finance|Accounting]
- Import in the accounting package
- Close same period in the accounting package (at least for the journals used by Scope)

Check vouchers

All vouchers will be rechecked to determine which are ready for transfer to the accounting system. Voucher that have all details required by the accounting system are accordingly marked with the  icon.

Reports

The reports function will launch a booking reports application where booking specific reports can be generated.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

New Vouchers

An summary table of all vouchers not yet transferred to the accounting system. The summary table shows the following details of each voucher:

Summary Table Details

- **Owner** - The branch where the voucher was created.
- **Number** - The voucher number and the year it was created.
- **Voucher Date** - The date the voucher was created
- **Type** - The voucher type
- **Status** - An icon indicating if the voucher is ready to transfer. = ready and = indicates the voucher will not transfer due to a problem. Highlight the voucher to see a full description of the problem in the voucher details section below the voucher.
- **Count** - As each voucher is highlighted, it's current order in the total number of non-transferred vouchers is shown at the base of the summary table.

Last Open Month

Above the summary of vouchers the date of the last open accounting month is displayed.

View vouchers

As vouchers are highlighted in the summary table, the icon can be used to view the full voucher.

Jump to error source

Vouchers in the summary table that have the *not ready* icon can be highlighted, then click the icon to jump to the application where the error causing the problem can be fixed. For example of the charge code is missing a general ledger, the system will jump to the charge code maintenance application simultaneously loading in that application the charge code that needs attention.

Refresh voucher

When changes have been made that may impact a voucher, the icon can be used to refresh the voucher to ensure the latest status of the voucher is present.

Type to search

Enter keywords in the search field to filter the list of vouchers.

Voucher Details area

As each voucher is highlighted in the summary table, greater details of the voucher are shown below the summary table:

- **Number** - The voucher number and the year it was created.
- **Type** - The voucher type .
- **Voucher Date** - The date the voucher was created.
- **Last Change by** - The last user to make any changes to the voucher.
- **Last Change at** - The last date any changes were made to the voucher.
- **Opposite Party** - The recipient of the voucher
- **Account number** - The recipient of the voucher's account number.
- **Net Amount** - The total voucher amount less any taxes.
- **Gross Amount** - The total voucher amount including any taxes.
- **State** - The status of the voucher.
  Voucher that are **ready** will be notes as *Ready to transfer*.
  When **not ready** to transfer, a fuller description of the reason is provided.

Transferred Batch-Jobs

This section of the application shows batch jobs that have already been created and transferred. The table displays:

- **Number** - This is the number applied to the batch job for identification purposes.
- **#Incoming Vouchers** - the number of incoming vouchers that were in the batch.
- **#Outgoing Vouchers** - the number of outgoing vouchers that were in the batch.
- **Created at** - the date the batch was created.
- **Last export at** - The last time output of the batch was created.

Open Batch

Transferred batches may be opened by highlighting them in the summary table and then clicking the icon. The View Batchjob application will then open.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Refresh transferred batch jobs

Click the  icon to ensure the latest list of transferred batch jobs is shown in the table of transferred batch jobs.

Type to search

Enter keywords in the search field to filter the list of transferred batch jobs.

Consistency Scope - Accounting

Ascertain completeness Scope - Financial Interface and Accounting Package

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Ascertain completeness Scope - Financial Interface and Accounting Package

As financial transactions are transferred from Scope to the external accounting package there is a procedure to check the completeness of the interfaced transactions in Scope and in the accounting package.

Warning
We strongly advise you to make NO changes on any bookings, created through the interface, in the accounting package directly. Do not change period, ledgers or amounts at all.
We strongly advise not to create any additional bookings in the accounting package directly on ledgers used by Scope.
If you choose to do so, please be aware that this has a big impact on the procedures followed to ascertain the completeness of the interfaced transactions. It will work against you later when identifying and looking for differences between the two systems.
All corrections should be done by crediting and debiting from Scope by booking additional sales or purchase invoices.

NOTE: Before checking the completeness of the Scope and the accounting package interface, make sure all batches that have been created in Scope are successfully imported in the accounting package.

Please note that if you are making use of Exact Online the Period-date check (a setting which can be found in the Exact Online settings) should be set to no, else Exact Online will overrule the booking date (period) coming from Scope and you cannot do any booking date (period) comparisons.

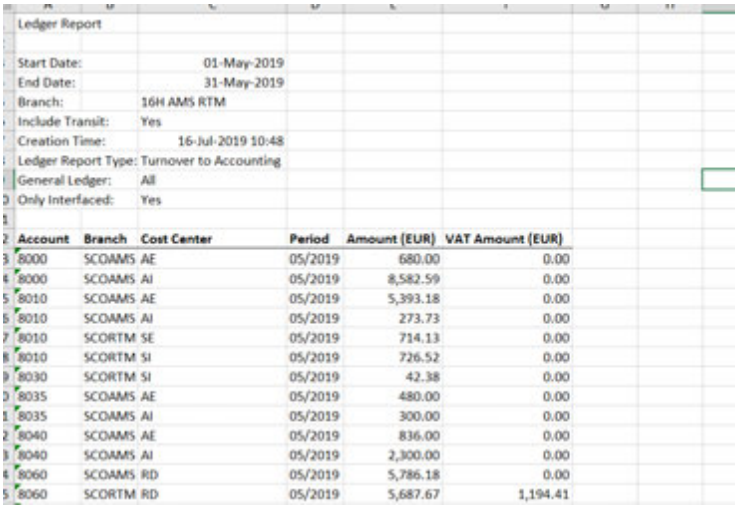
Scope Ledger Reports

[FinanceReporting] - Ledger reports

The ledger reports should match with the ledgers in the accounting package.
The ledger report can be run for a time span on Booking date (that equals the financial period in the accounting package). Check boxes for 'Include Transit' and 'Interfaced only' should be checked both.

The ledger report types you can choose are:

Turnover – Gives the total per ledger per cost center per financial period. The figures per ledger should match the figures on the same ledger in the accounting package (turnover ledgers of the P&L). At the bottom of the report a total per ledger (for all cost centers) is given;



Ledger Report

Start Date:	01-May-2019
End Date:	31-May-2019
Branch:	16H AMS RTM
Include Transit:	Yes
Creation Time:	16-Jul-2019 10:48
Ledger Report Type:	Turnover to Accounting
General Ledger:	All
Only Interfaced:	Yes

Account	Branch	Cost Center	Period	Amount (EUR)	VAT Amount (EUR)
8000	SCOAMS	AE	05/2019	680.00	0.00
8000	SCOAMS	AI	05/2019	8,582.59	0.00
8010	SCOAMS	AE	05/2019	5,393.18	0.00
8010	SCOAMS	AI	05/2019	273.73	0.00
8010	SCORTM	SE	05/2019	714.13	0.00
8010	SCORTM	SI	05/2019	726.52	0.00
8030	SCORTM	SI	05/2019	42.38	0.00
8035	SCOAMS	AE	05/2019	480.00	0.00
8035	SCOAMS	AI	05/2019	300.00	0.00
8040	SCOAMS	AE	05/2019	836.00	0.00
8040	SCOAMS	AI	05/2019	2,300.00	0.00
8060	SCOAMS	RD	05/2019	5,786.18	0.00
8060	SCORTM	RD	05/2019	5,687.67	1,194.41

You can compare this with the turnover ledgers on the P&L in the accounting package for the same period. The values should match exactly.
In case there is a difference on a ledger, you can go one deeper step in detail by running this report in Scope;

Turnover details – Gives all transactions per turnover ledger. Optionally you can specify an account number to just run it for one specific ledger;

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

[FinanceReporting] - Estimates report

The estimates report shows the individual bookings made on all/the given accrual ledgers for the selected booking(=financial) period.
If you want to check the balance on the accrual ledger on a certain date (f.e. 31-DEC-2018), you should run this report from 01-JAN-1900 till 31-DEC-2018. This will give all the bookings in that period, made on that accrual ledger.The total of these bookings should match with the balance on the accrual ledger in the accounting package on 31-DEC-2018.

Start Date:	01-May-2019
End Date:	31-May-2019
Branch:	AMS

[FinanceReporting] - Financial Period Report

In [Finance->Reporting] you can run the Financial Period Report

A shipment in Scope has ONE **Economic Date**. By default this is the arrival date for import shipments and the departure date for export shipments. Financial bookings (turnover and estimated costs) on the shipments are booked in the **Booking Date**. The booking date is taken from the economic date of the related shipment. When that period is already closed, the booking date is adjusted to the first available date Scope can book in.

So this can lead to a shipment with financial bookings in different booking periods.

The reports from the Shipment Overview use the economic date of the shipment. So that might include amounts of financial bookings in different periods.

Just one example - create and print an additional invoice for 100€ in JUN for a shipment of MAY. If the MAY period has been closed in Scope, Scope is not allowed to book the additional invoice in MAY and it will be booked in JUN.
In operational reports the profit of the MAY shipment goes up with the 100€ even though this has been booked in the accounting package in JUN. The 100 € will not show in ledger reports ran over MAY but will show in the ledger reports ran over JUN. This, as explained above, to determine the correctness of the interface between Scope and the accounting package.
This is the reason that, apart from the [Finance->Reports] you cannot compare operational reports with figures in the external accounting package.

The Financial Period Report, however, does give you info on turnover or costs booked in periods where the booking period differs from the economic date of the shipment that invoice belongs to.
With the above example in mind, run the Financial Period Report like this:

Booking date: 2019-JUN-01 to 2019-JUN-30, [v] Include Transit, Economic date: ‘ Earlier’, Based on: ‘Order’.

This will show you the invoices booked in JUN for shipments with an economic date of MAY (or even earlier);

A	B	C	D	E
Financial Period Booking Report				
Start Booking Date	01-Jun-2019			
End Booking Date	30-Jun-2019			
Branch	AMS			
Include Transit	Yes			
Creation Time	16-Jul-2019 11:27			
Economic Date	earlier			
Based on	Orders			
Branch	**Shipment Number**	**Cost Center**	**Economic Date**	**Booking Period**
SCOAMS	AI-004635	AI	26-May-2019	6/2019
SCOAMS	Fwd-000581	RD	23-May-2019	6/2019

The option Invoice / Order determines whether Scope will only check Outgoing and Incoming Invoices(option: Invoice) or whether it will check estimate bookings as well (option: Orders).

Credit Limits - Accounting- Finance

- Introduction
- Description

Introduction

Credit limit information can be imported into Scope to update the the credit limits available to debtors . As new outgoing vouchers are created for these debtors, their credit limit and current credit balance is checked. When a debtor exceeds their credit limit the user will be informed accordingly during the creation of the outgoing voucher.

Description

Structure of the credit limit file

Files must be CSV file with six columns:

1	Debit account number	The debit account number of the business as stored in the debtor role of the business partner
2	Name	ignored
3	Name 2	ignored
4	Credit Limit	New credit limit for the accounting group
5 *	Internal Credit Limit	New credit limit for the accounting group
6	Balance	The balance available to the accounting group

On import, the first line of the file (header) is always ignored.

Monetary amounts in columns 4.5 and 6 are given without a currency since the currency will always be the currency used by the debtor when setting accounts.
Monetary amounts should not have a "thousands" separator:

2.000,- EUR will be shown in the file as '`2000`'.
350,50 EUR will be shown in the file as '`350,50`'.

> Column 5 is only output by Buha accounting software

Performing the import

Credit limit files are imported by opening the Accounting Application and selecting the *Import Credit Limits* option. A file browser will appear and is used to locate the credit limit files on the local computer or network.

- Any number of files may be chosen for import
- The contents of the files may be mixed
  If a file contains the line:
  `14485;000649;;20000;;200`
  and another line contains:
  `14485;000649;;20000;;5000`
  The credit limit for accounting group "14485" will be 20,000 EUR and the balance will be 5.200 EUR.

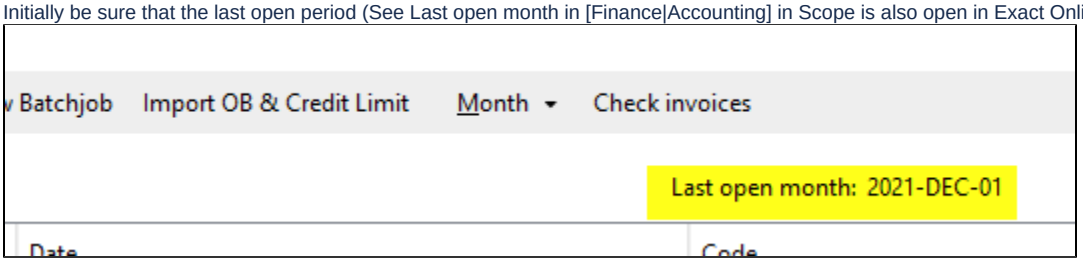
Exact online interface user manual - Interface procedure

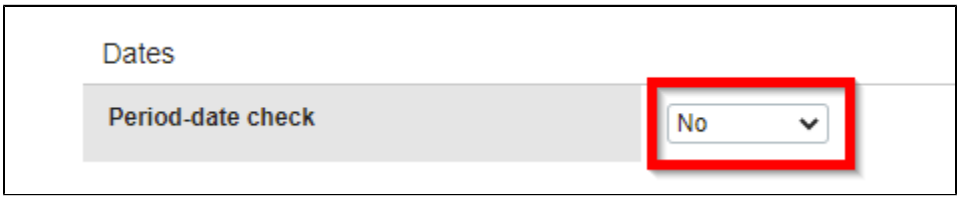
- Period closing in Scope and Exact
- Procedure Scope to Exact
  - Export Relations and Transactions from Scope
  - Import Relations and Transactions in Exact
    - Import Relations
    - Import Transactions
- Procedure from Exact to Scope
  - Export debtor balances from Exact
  - Import into Scope

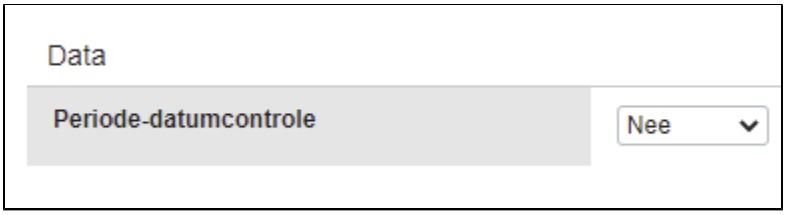
Period closing in Scope and Exact

Initially be sure that the last open period (See Last open month in [Finance|Accounting] in Scope is also open in Exact Online.



Please note that the Administration | Settings of Exact Online the "Period-date check"in the Exact Online settings MUST be set to No.





If you want to close a period so that Scope no longer books in that period in Exact, please use this sequence. It will prevent outgoing invoices, estimates and purchase invoices to be booked into an old period.

- Close month in Scope in [Finance|Accounting] in the top bar: Month - Close month]
- Run accounting interface batch in [Finance|Accounting]
- Import in the accounting package
- Close same period in the accounting package (at least for the journals used by Scope)

Procedure Scope to Exact

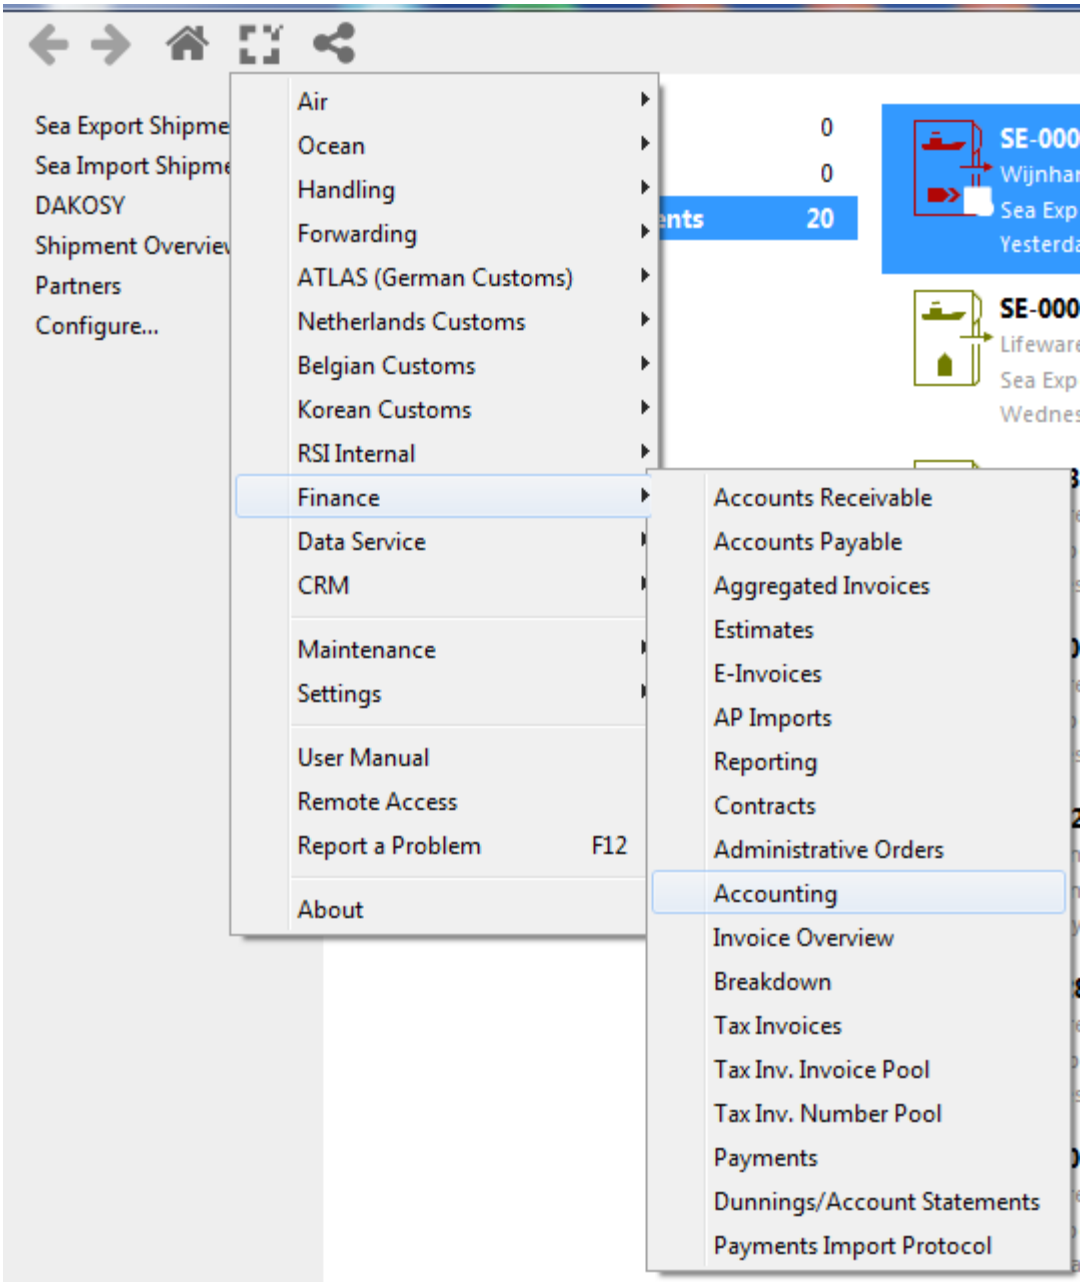
This procedure covers 2 types of data:

- Changes in Debtors/Creditors (=Relations in Exact Online)
- Outgoing Invoice, Incoming Invoices and Cost Estimates (=Transactions in Exact Online)

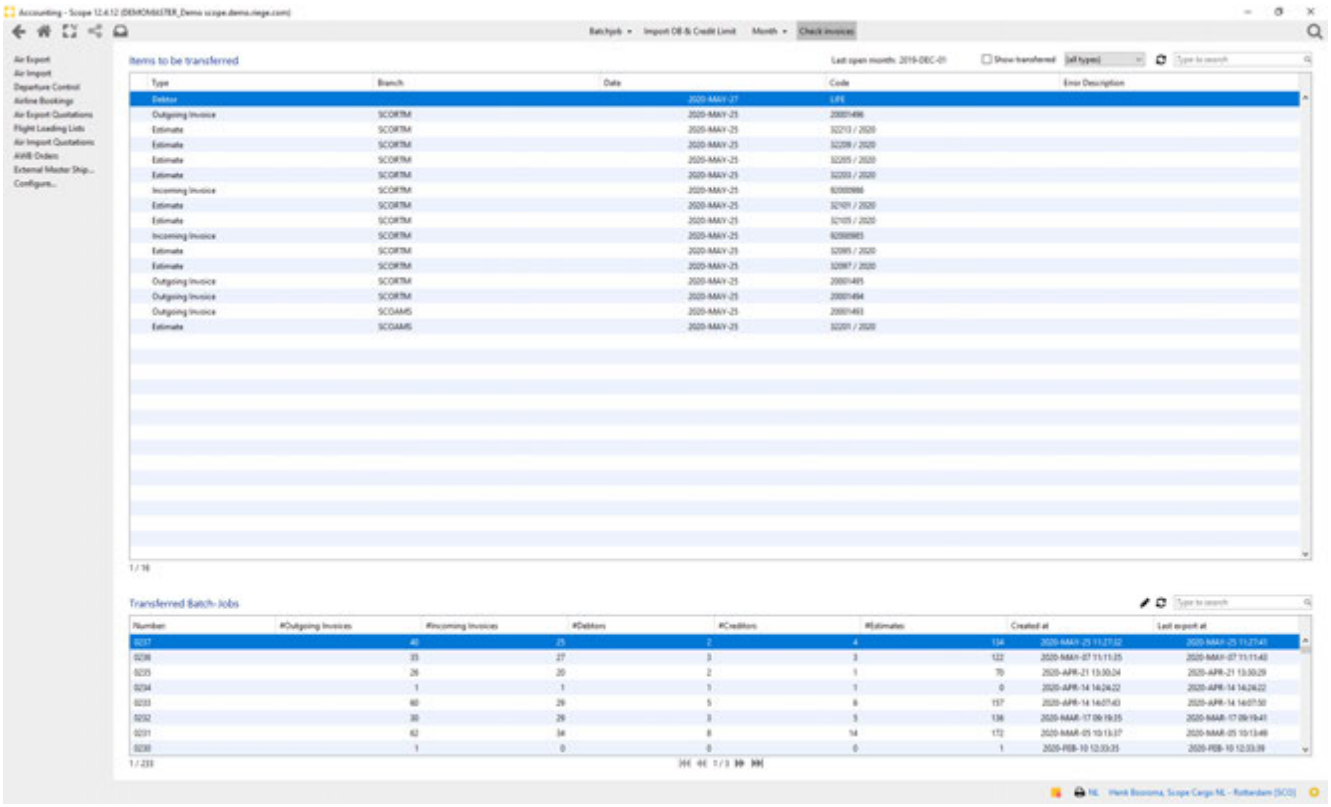
Export Relations and Transactions from Scope

Start Finance-Accounting

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

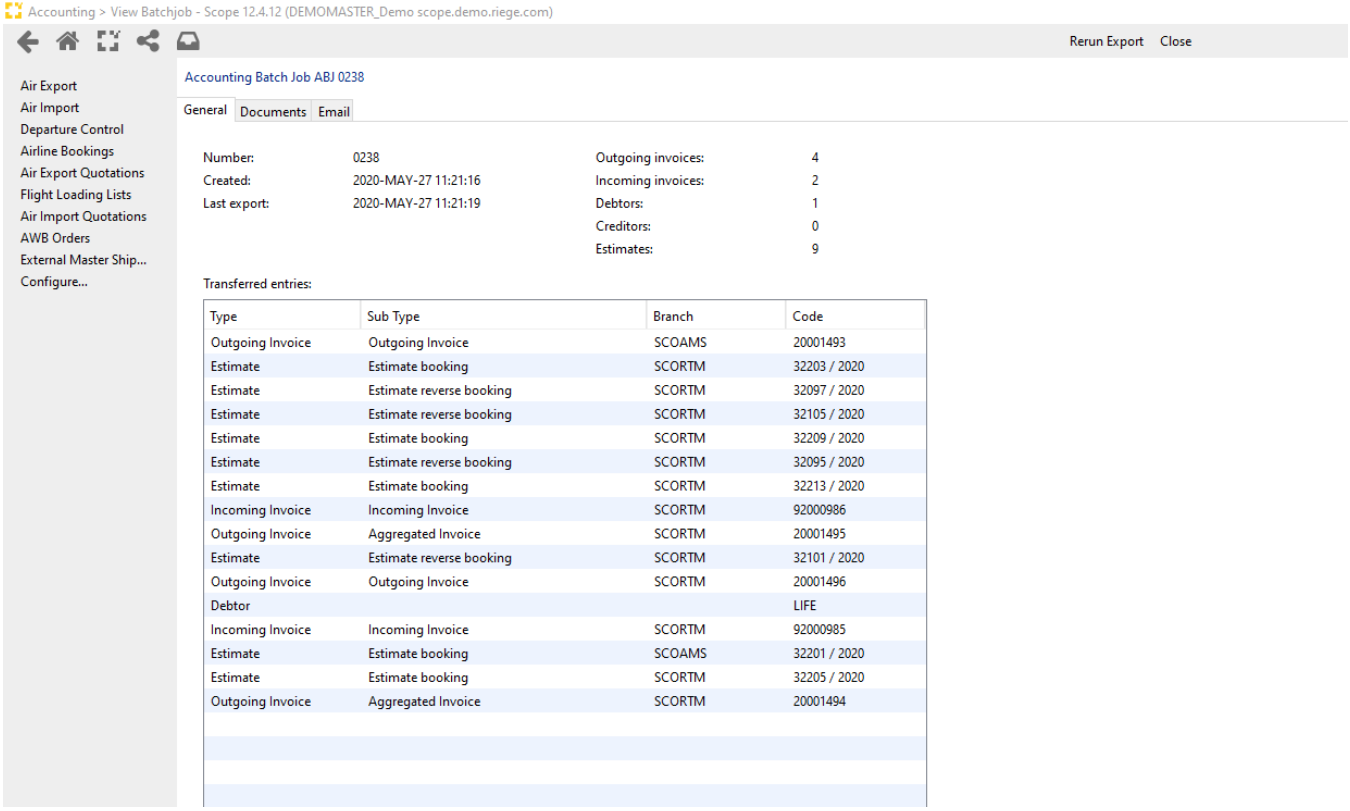


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



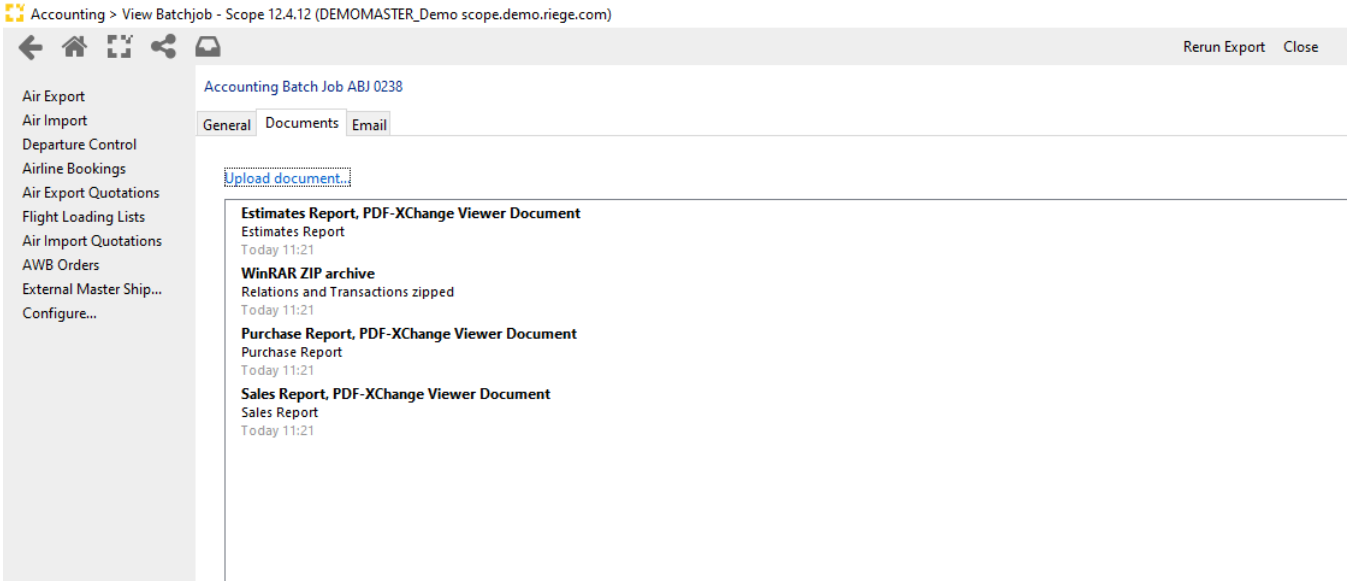
Press Batchjob > New Batchjob
All new or modified debtors and creditors will be placed into a file.
All new vouchers (sales and purchase) shown will be placed into a new interface batchfile. General bookings (cost estimates) are transferred as well.
After the batch is created, the New Vouchers section is empty and a new Batch job is shown at the lower part of the screen.
The new batchjob containing the relations and transactions is opened automatically.

The General TAB shows the details of transactions that are in the batch.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Go to the Documents TAB to save the batch files to your local machine.



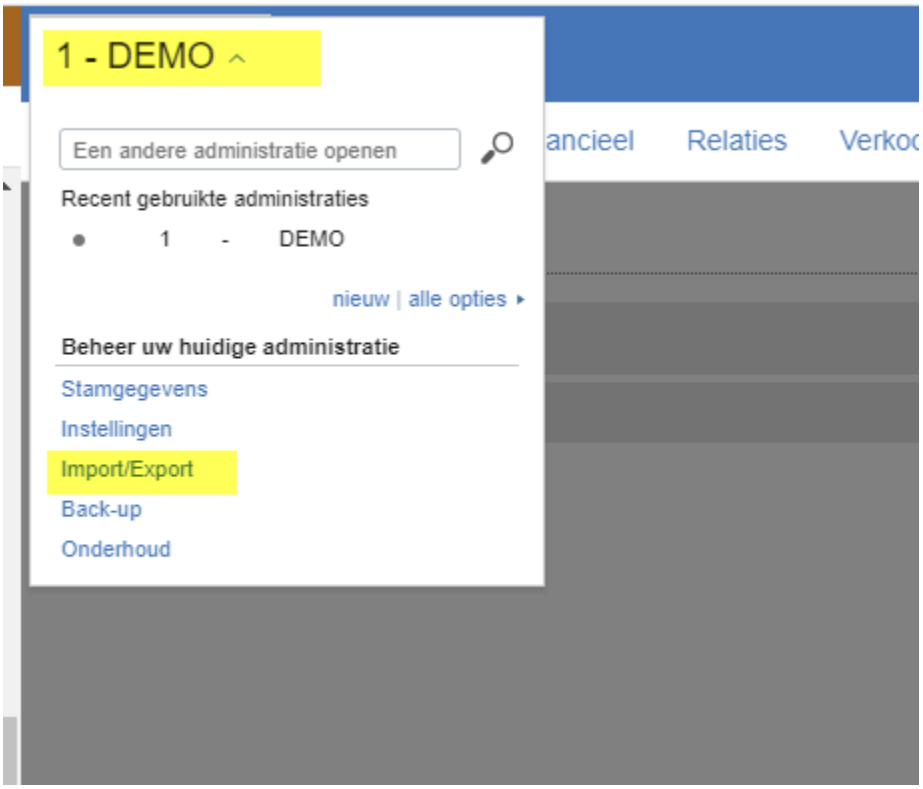
The relations and transaction files are zipped into one archive file. The 3 report files are pdf's showing the exported sales, accruals and purchase bookings. They can simply be opened by double clicking them.

Double click the ZIP archive to open it and then save all the files inside to a directory on your local machine.

Now you are all set to start importing in Exact.

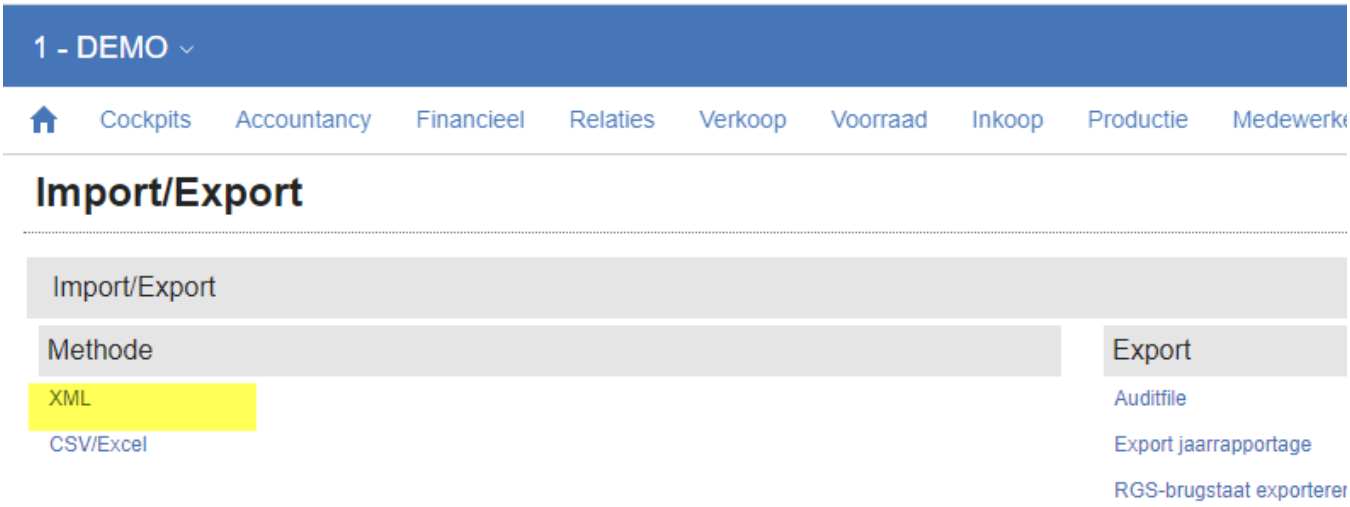
Import Relations and Transactions in Exact

Login to Exact Online.
In the top left, click on the administration number.
Choose Import/Export

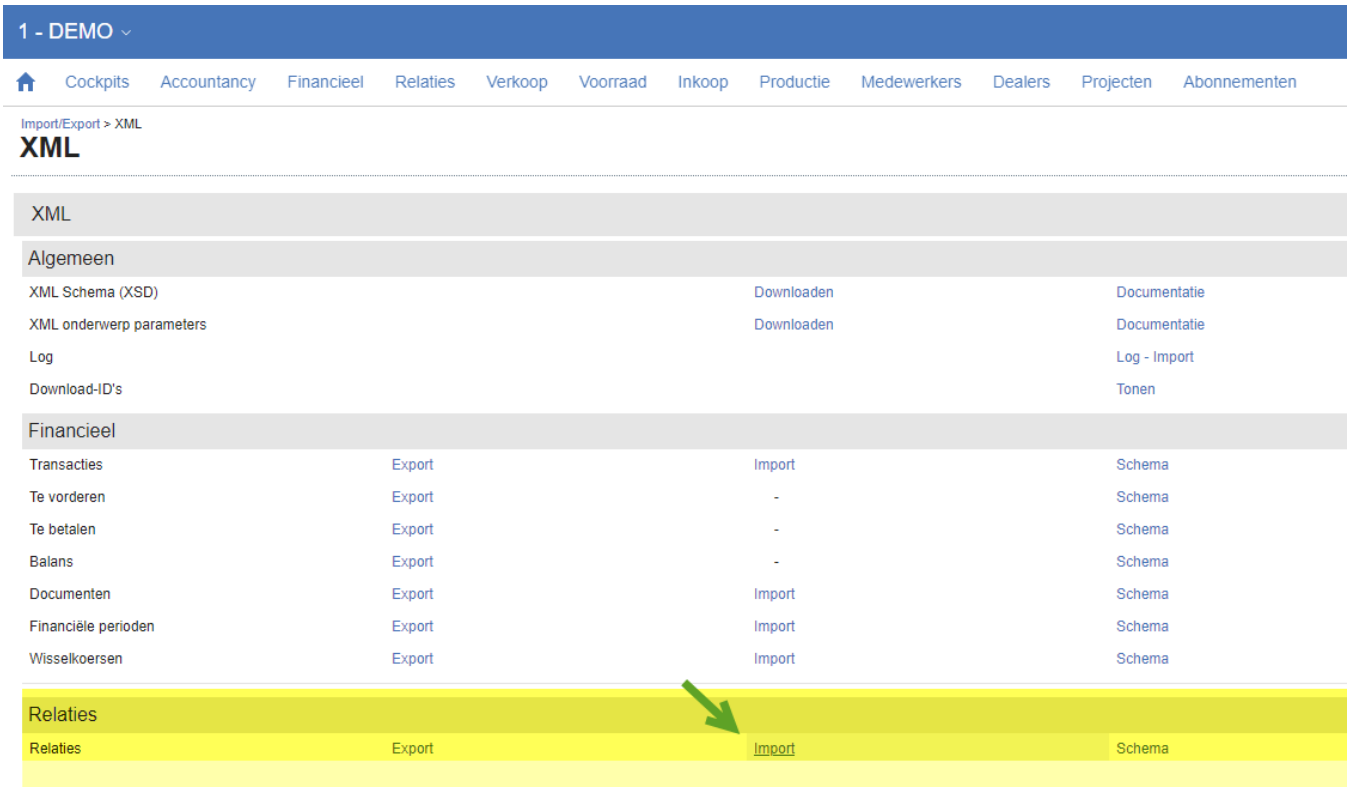


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the next screen select XML;

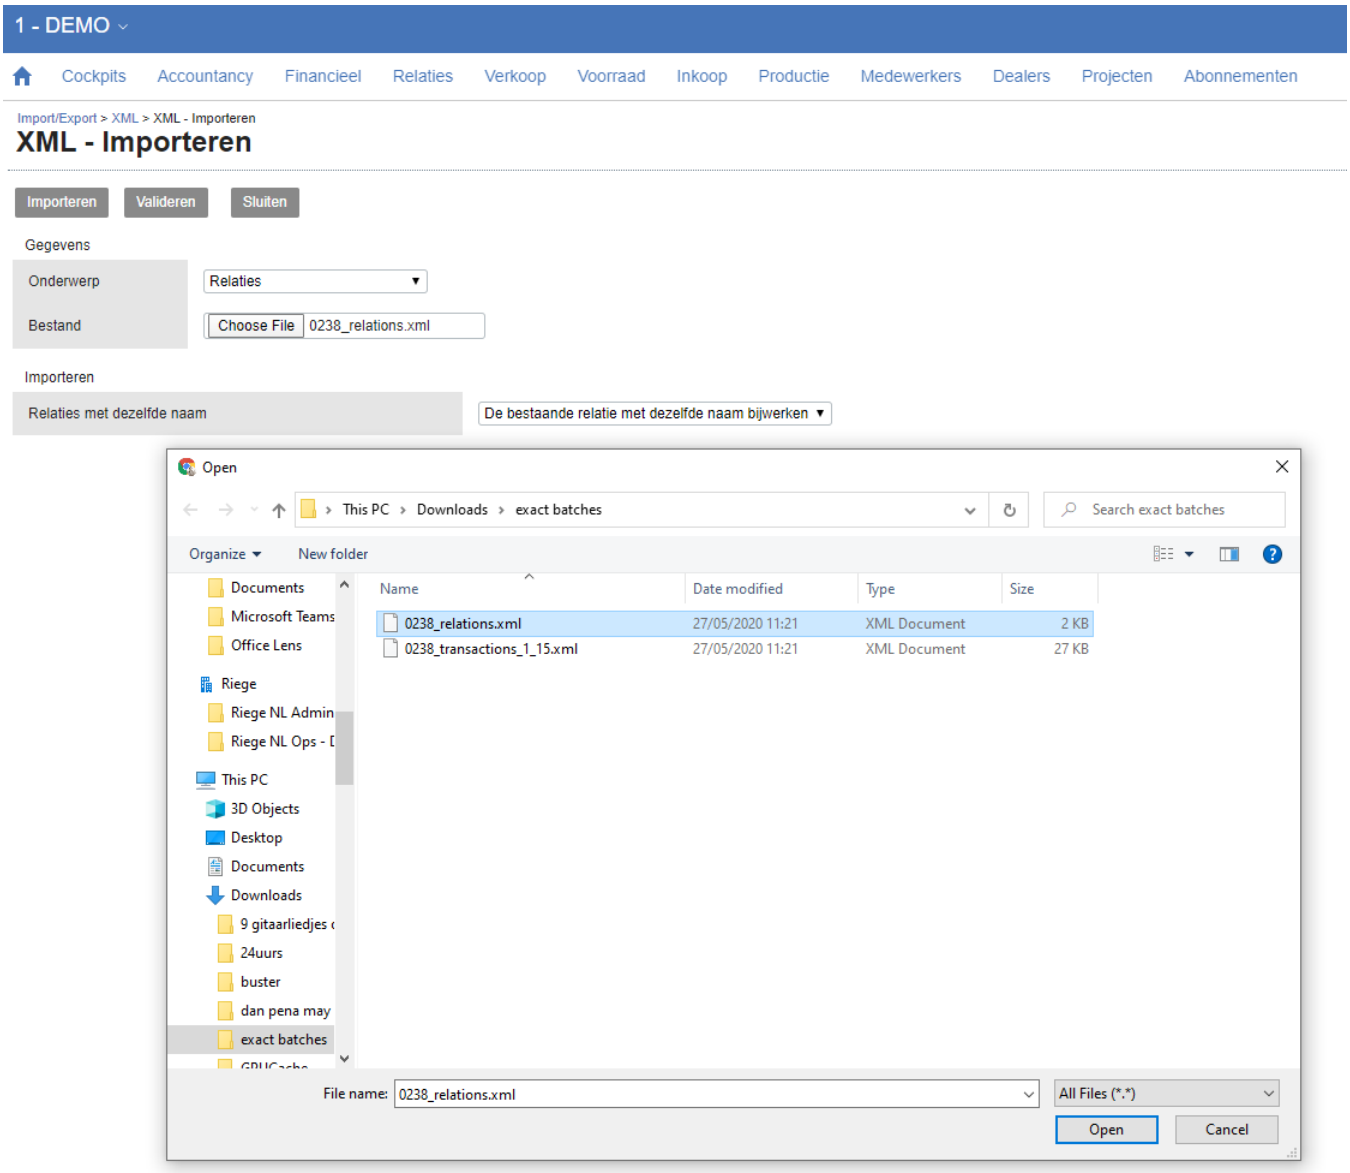


First import Relations before(!) importing the Transactions.



Import Relations

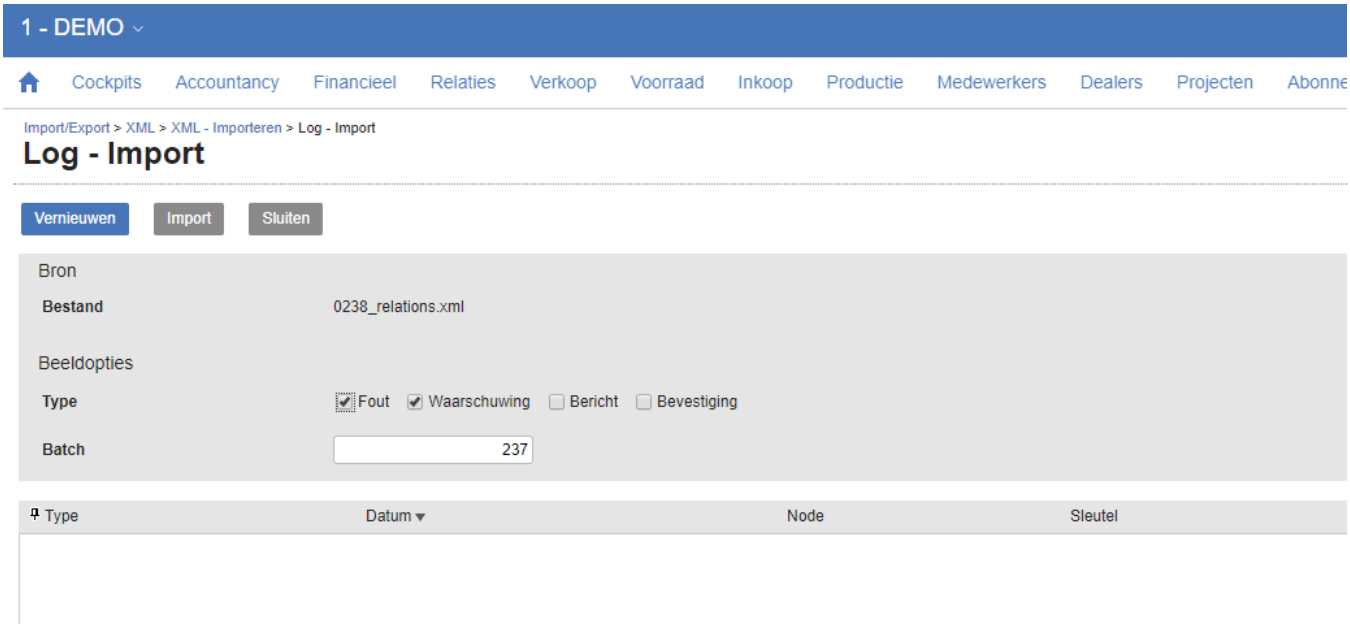
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Select the path to the relations.xml file created by and saved from Scope.
Press Import to start the import process.

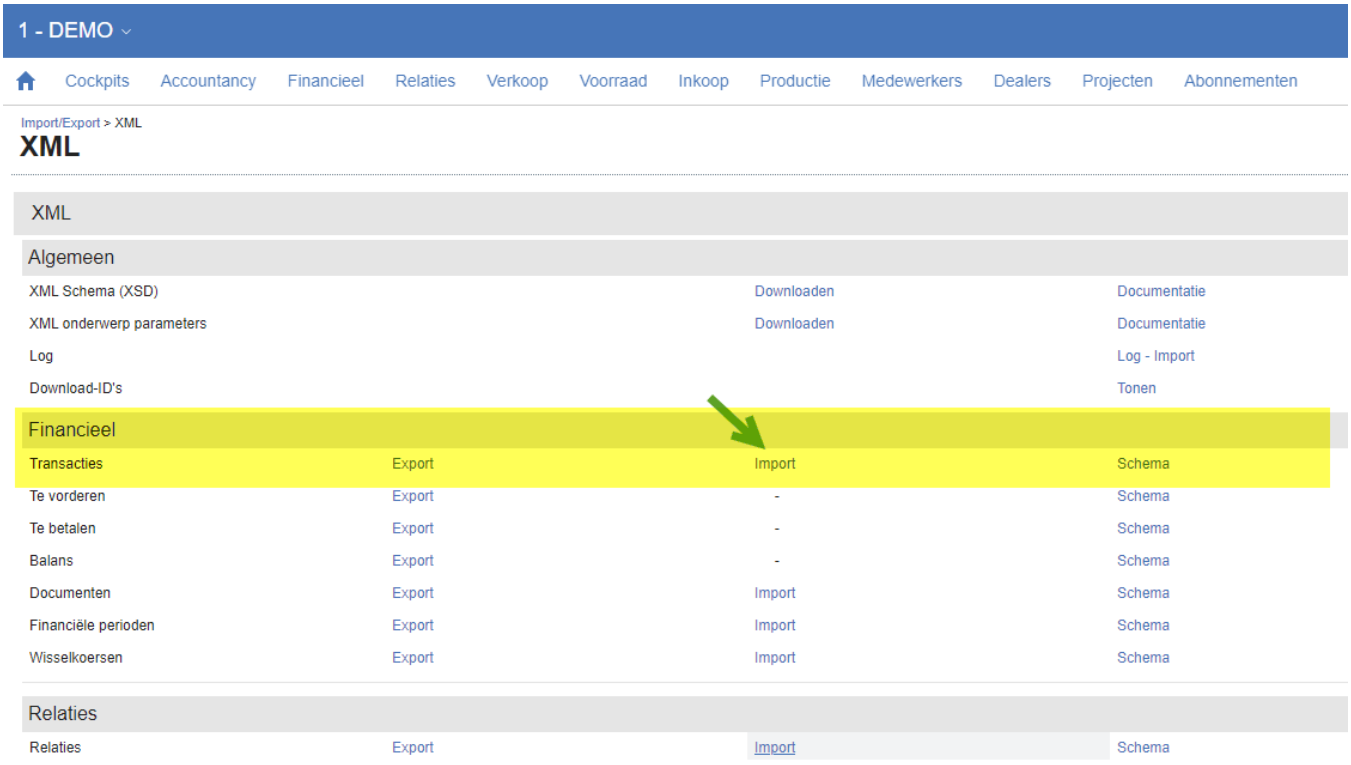
After that, please check for errors and warnings by selecting Error/Fout and Warning/Waarschuwing and then press Refresh/Vernieuwen.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



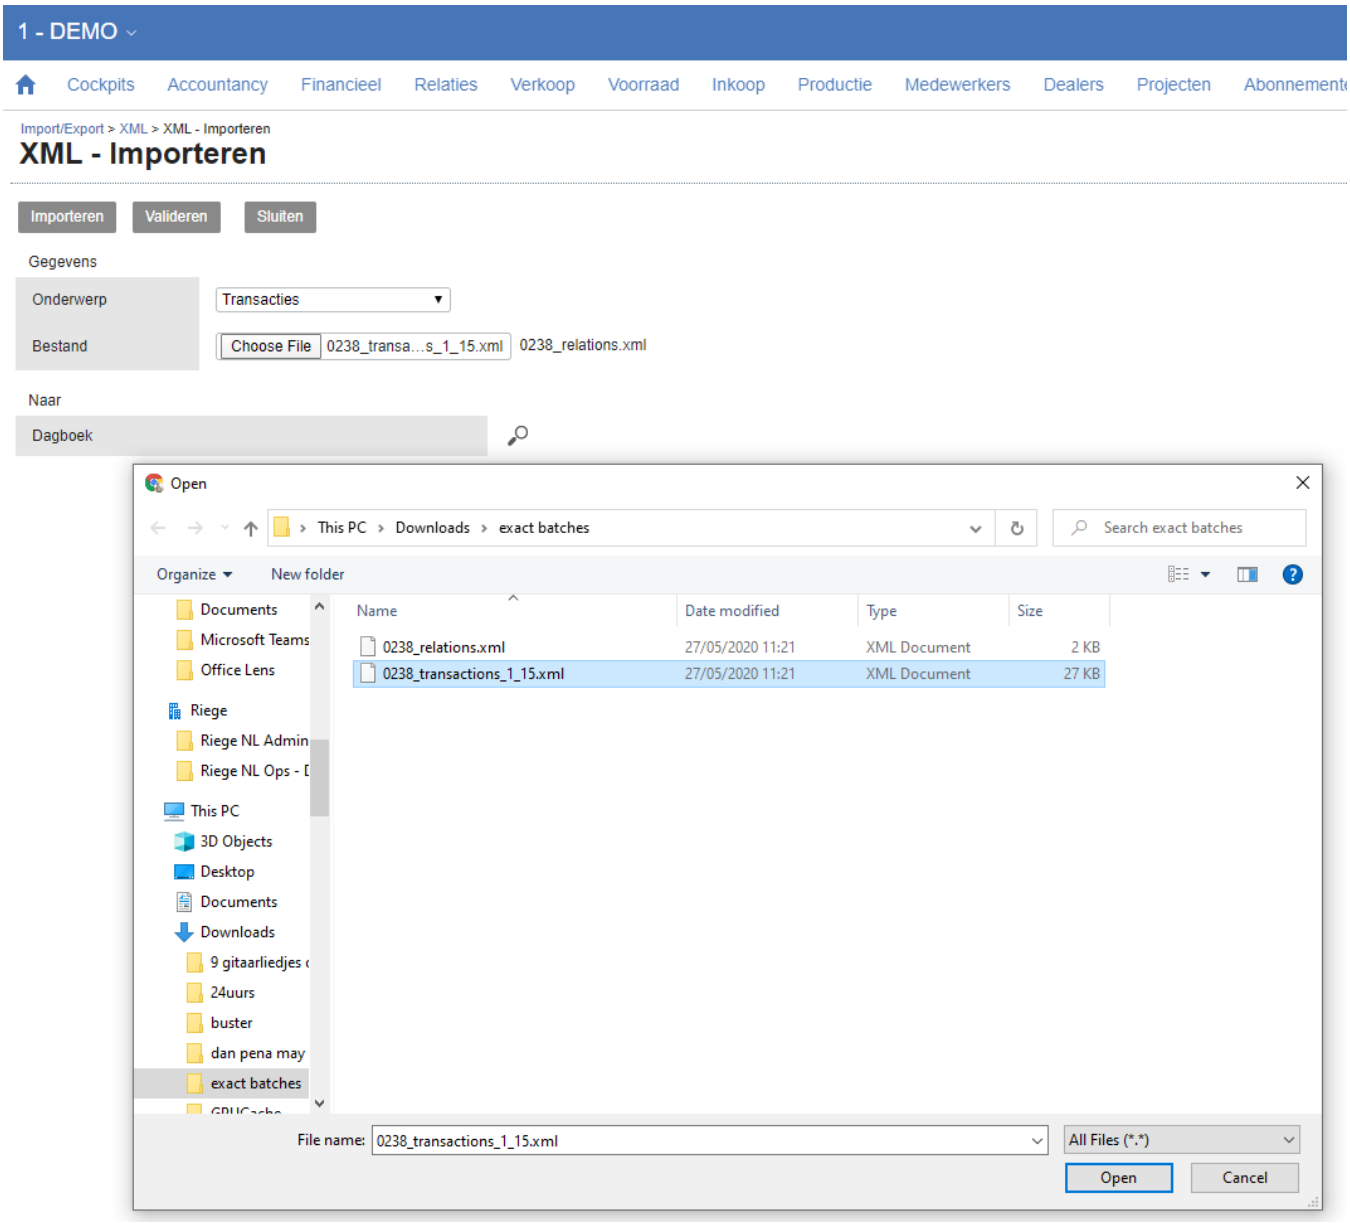
If any errors or warnings are shown on the screen, please contact Riege support so we can help you with the error or warning and see how it can be corrected & avoided in a next batch.

Import Transactions



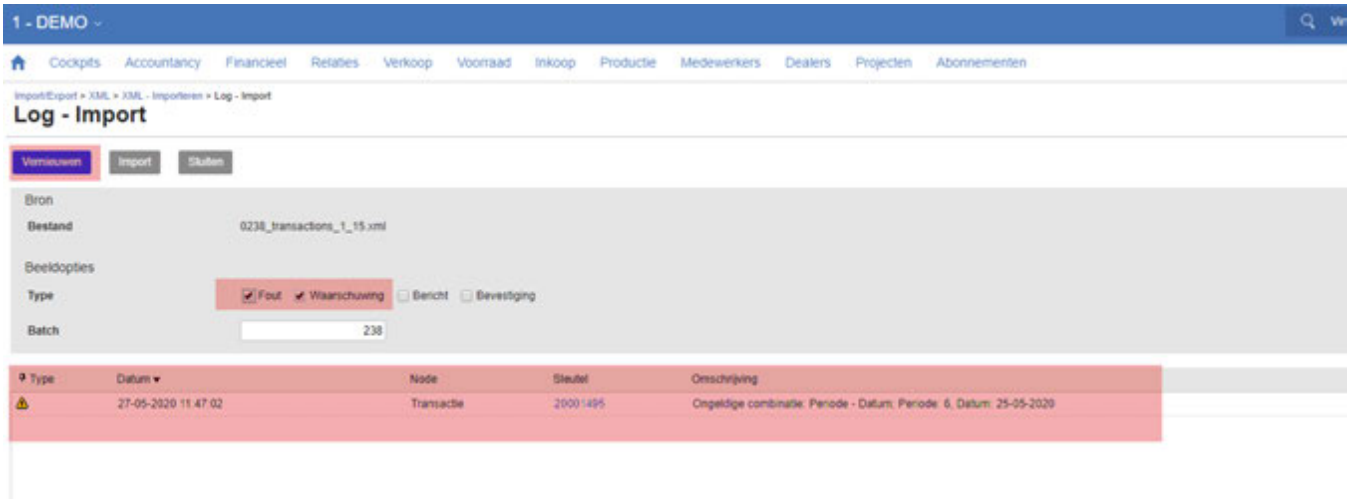
Select the path to the transactions.xml file created by and saved from Scope.
Press Import to start the import process.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Press Import to start the import process.

After that, please check for errors and warnings by selecting Error/Fout and Warning/Waarschuwing and then press Refresh/Vernieuwen.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If any errors or warnings are shown on the screen, please contact Riege support so we can help you with the error or warning and see how it can be corrected & avoided in a next batch.

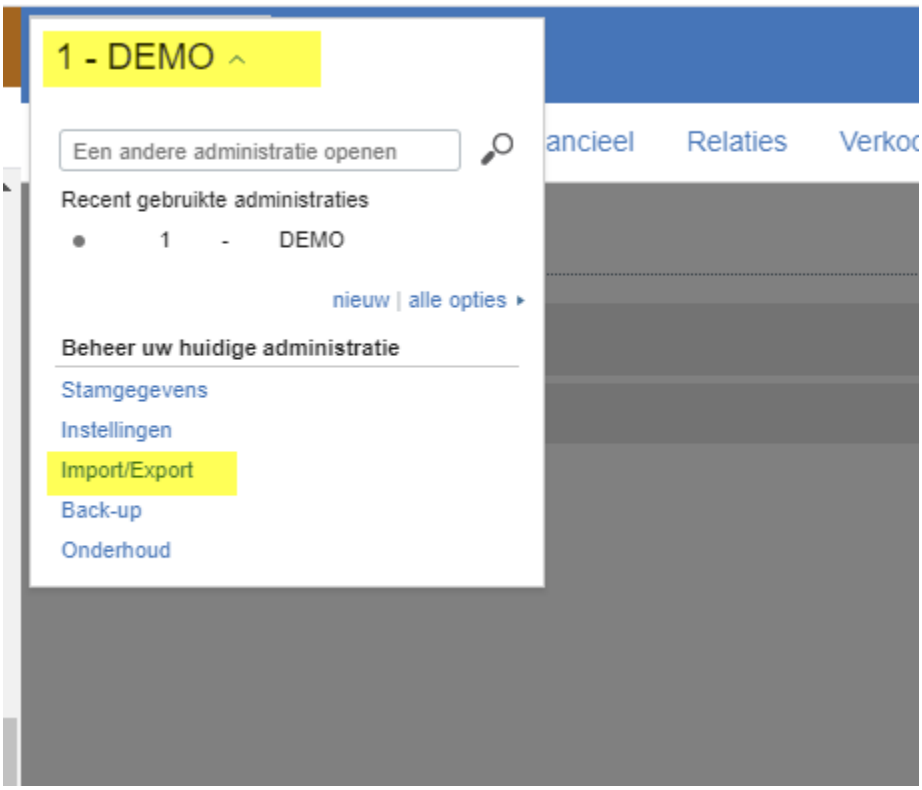
If Scope generated more than one transaction file, make sure you repeat this step for every transaction file.

Procedure from Exact to Scope

This procedure describes the steps for updating the outstanding debtor balance in Scope using the outstanding invoices from Exact.

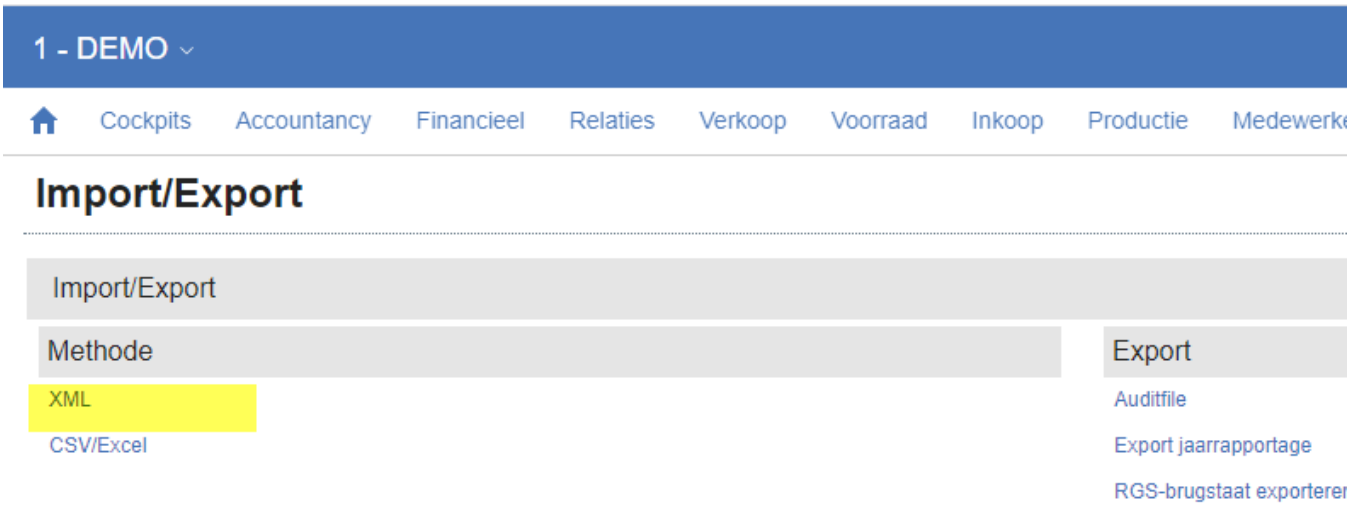
Export debtor balances from Exact

In the top left, click on the administration number.
Choose Import/Export

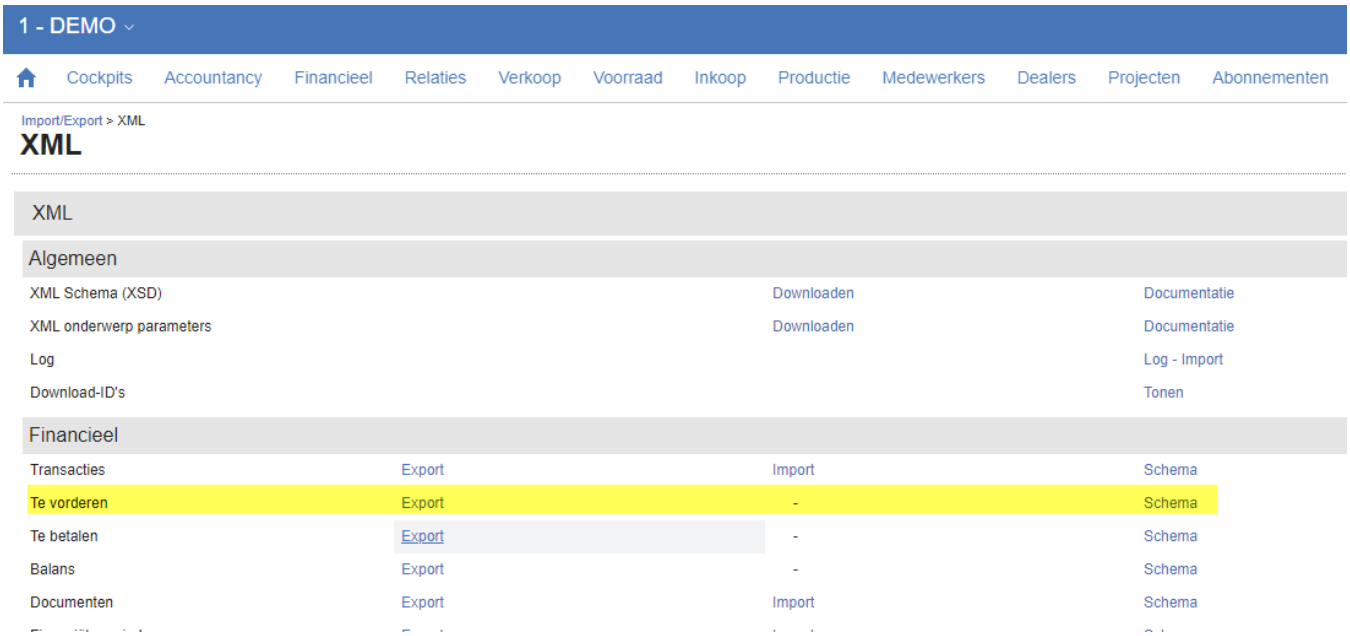


In the next screen select XML;

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Select the Export option under Financial/Te vorderen:



Choose the option "Export(eren)", in the next screen, select Export(eren) again, in the next pop-up choose Volgende and then remember where the export AR xml file is saved on your system.

You can repeat the same steps for the creditor balances by exporting de "Te betalen" option from the same Import/Export XML screen in Exact. This will create an AP xml file.

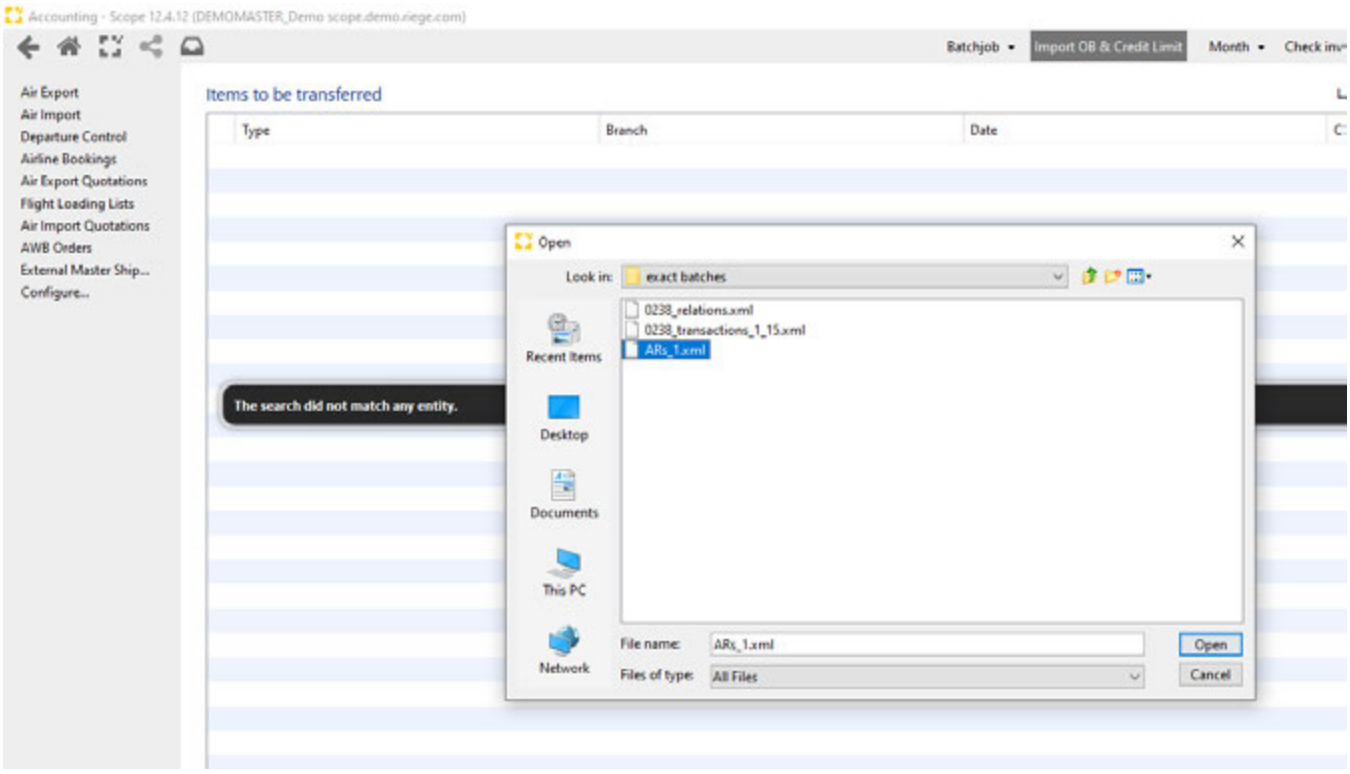
Import into Scope

If you have the Dunning module in Scope, open balances are calculated by keeping track open invoices instead of open balances. If that is the case, The AR and AP files must be imported in the function 'FinancePayments (Invoices)'. In this case, don't read further here.

If you don't have the Scope Dunning module, Scope can keep track of Open balances. These can be updated from Exact using the following procedure.

In Scope go to: Financial / Accounting:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Select the option: Import OB & Credit limit

Select the file, just exported/downloaded from Exact.(Debtors: ARs_1.XML)

After the file has been selected and processed by Scope, the Debtor open balances are updated. You can check that in: Maintenance / Partners / Role: Debtor:

- Open Balance (import)
  This is the amount last imported from Exact
- Open Balance (invoices)
  This is the amount of invoices not interfaced to Exact yet
- Open Balance (total)
  Sum of the 2 above.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

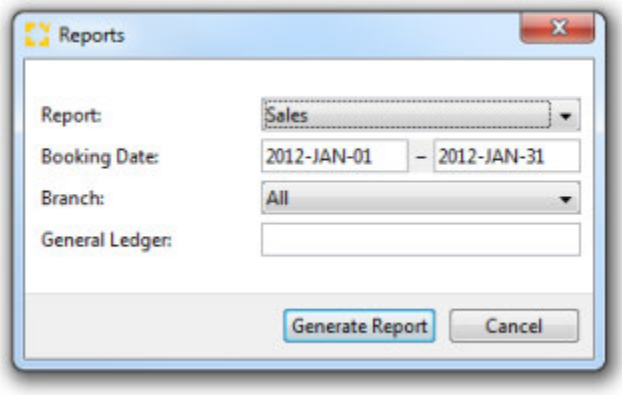
Reports - Bookkeeping - Finance

- Introduction
- Description

Introduction

From the menu bar of the bookkeeping application the **Reports** option can be selected. This is an application to produce accounting specific reports.

Description



Report

From the drop-down menu, the following report types are available:

- **Sales**
- **Sales Details**
- **Sales VAT**
- **Purchase**
- **Purchase Details**
- **Purchase VAT**
- **Financial Period Booking**

Examples of each report a shown at the end of this section.

Booking Date(s)

The Dates within which the voucher was generated.

Branch

The branch for which the report should be generated. This field will default to *All* meaning all available branches, however the drop down menu can be used to restrict the report to any of the listed branches.

General Ledger

The report may be further restricted to a particular general ledger . If left bank, *all* general ledgers will be included.

Generate Report

The report will be generated according to the criteria selected. The report will open in the default spreadsheet application of the local computer.

Cancel

Exits the application without report generation.

Report examples

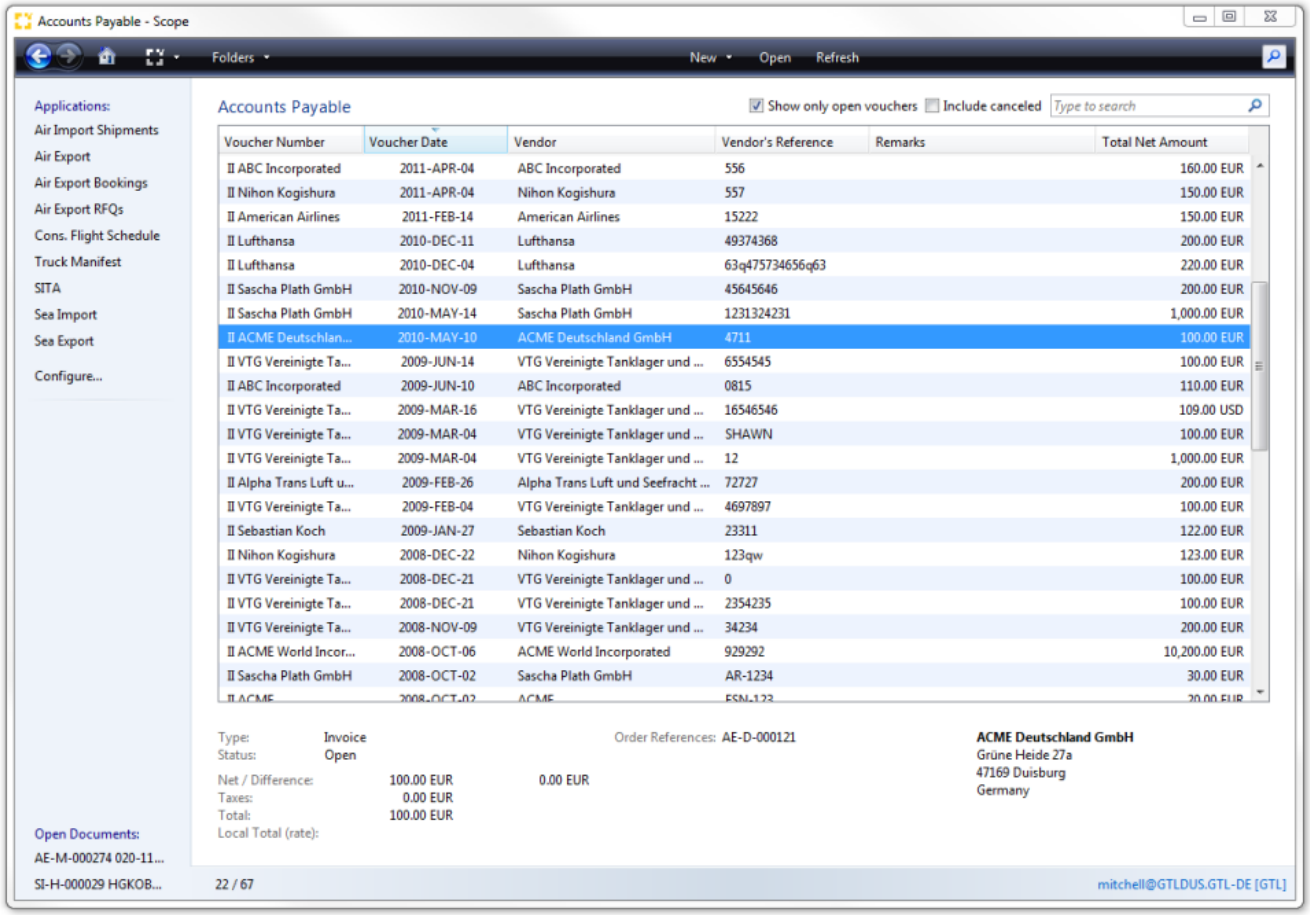
Accounts Payable

- Introduction
- Description

Introduction

This accounts payable application is used to record incoming invoices or credit notes and apply them to the shipments that incurred these incoming costs. This application should be used when recording incoming vouchers that apply to multiple different types of shipments. For incoming documents that apply to a single shipment, it is preferable to use the fast incoming invoice/credit note entry programs found in the voucher tab of all shipments.

Description



New

The *New* action is a drop-down menu that offer the choice of making a new incoming invoice a new incoming credit note or a new customs invoice

Open

This action will open the incoming invoice/credit note highlighted in the summary table.

Refresh

Updates the index to ensure the last incoming vouchers are visible.

Accounts Payable

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The summary table displays all incoming vouchers according to the search options used. As each voucher is highlighted in the table, further detail about the voucher are visible below the summary table.

Show only open vouchers

This box is checked by default so that when the application is started, the summary table shows only incoming vouchers that have the status *Open*. Uncheck the box to see all vouchers.

Include canceled

Check this box to include in the summary incoming vouchers that may have been canceled.

Type to search

This is a full text search field. An part of the voucher number, vendor, vendors reference or remarks may be entered to search for the desired vouchers.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

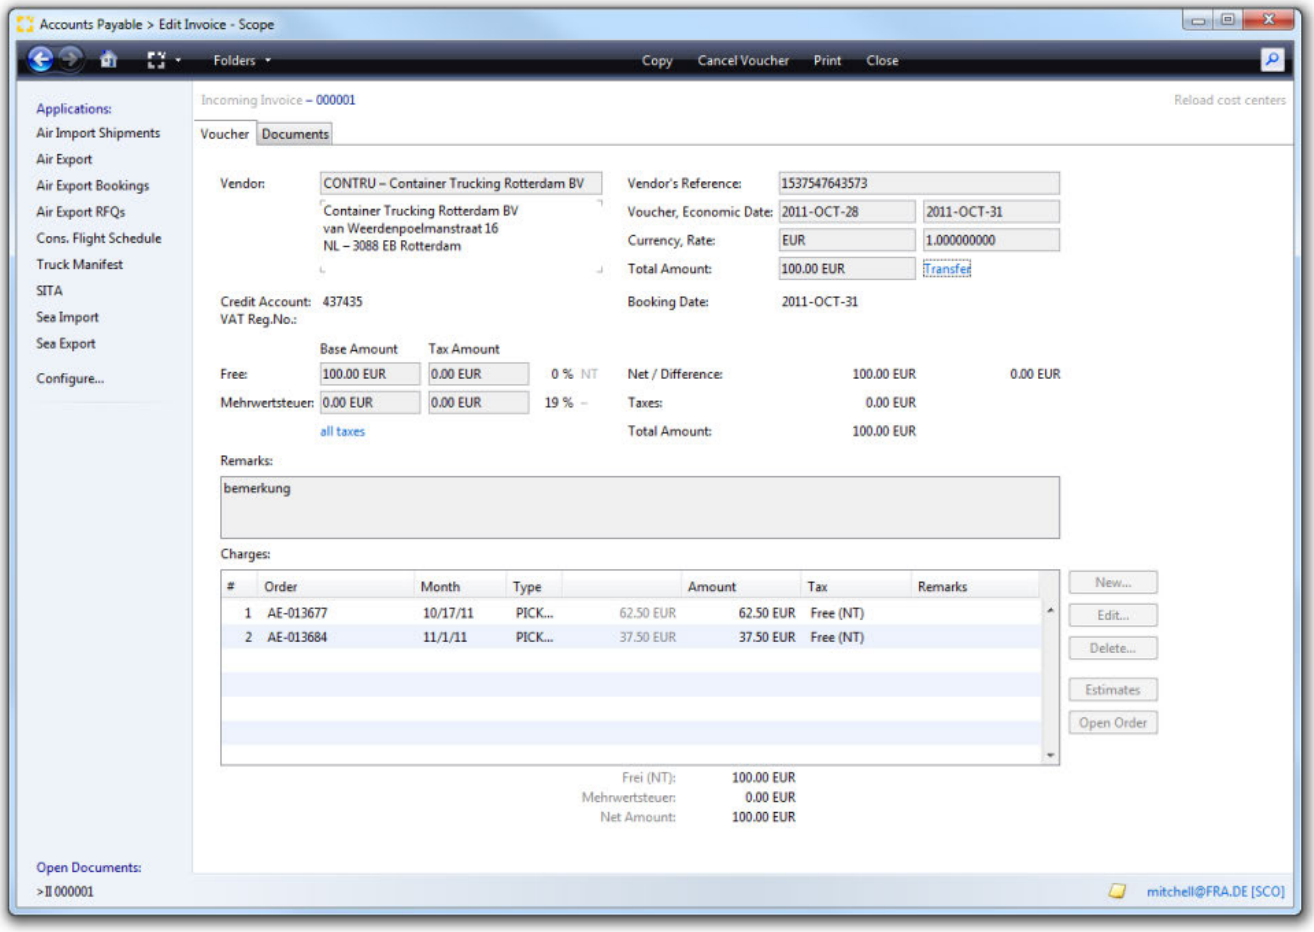
Completed Incoming Vouchers - Accounts Payable - Finance

- Introduction
- Description

Introduction

On completing an incoming voucher, the status of the voucher is set to *Finished*. The voucher is given a voucher number and transferred to the accounting system, in addition the cost figures are posted to the jobcosting of the shipments and orders to which the voucher relates. These finished documents cannot be modified and may only be cancelled and re-issued.

Description



The following actions are available for a finished voucher:

Copy

Uses the current voucher as the basis of a new voucher which is the available for processing. When the copy function is activated, a dialogue will appear for confirmation that charge lines from the original voucher should be included in the copy. If the charge lines are excluded, then only the header of the voucher is copied to the new voucher.

Cancel Voucher

Creates a cancellation receipt for the current voucher. A dialogue appears to confirm a replacement for the voucher should be issued. If this is selected, then in addition to the cancellation receipt a copy of the voucher is opened as a new voucher and can be processed accordingly.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Print

Prints a copy of the voucher.

Close

Closes the voucher and returns to the accounts payable overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

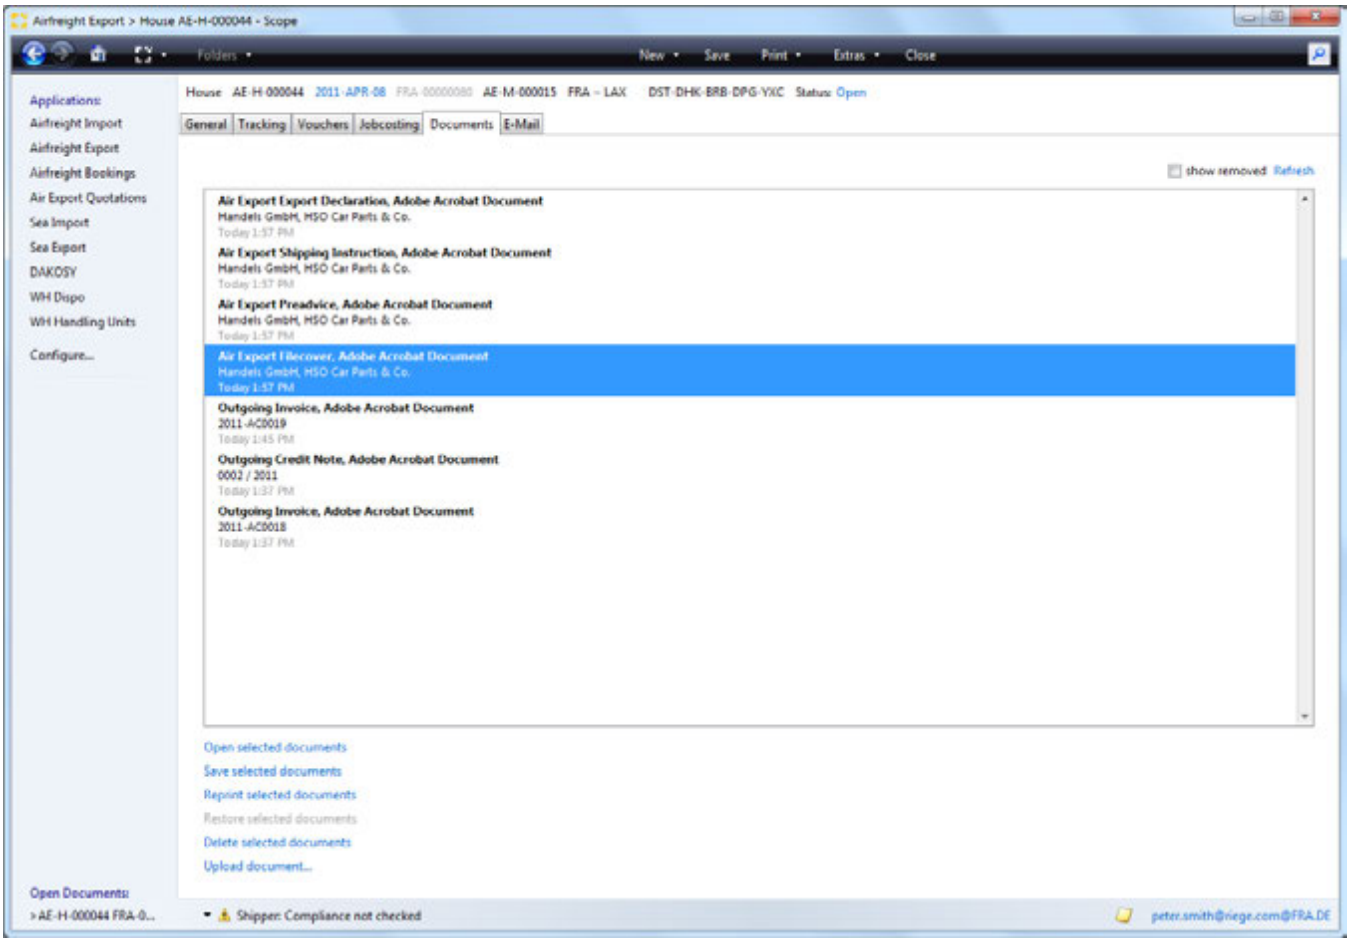
Documents - Accounts Receivable - Finance

- Introduction
- Description

Introduction

The documents tab shows all documents that have been created and printed for the current shipment. These documents can be opened, downloaded, reprinted, deleted and some documents may be uploaded to web-tracking. Uploaded documents are also displayed.

Description



Document Overview

This area displays all documents that are associated with this shipment or order. The name of the document together with the type of document and creation date are shown. The current version of a document is always displayed. By selecting the show deleted check box, all previous or deleted versions of a document will be shown. These are displayed in ~~strike-through~~ text.

Show removed

Documents that have been previously deleted will be displayed.

Refresh

Updates the current list of documents.

Open selected documents

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

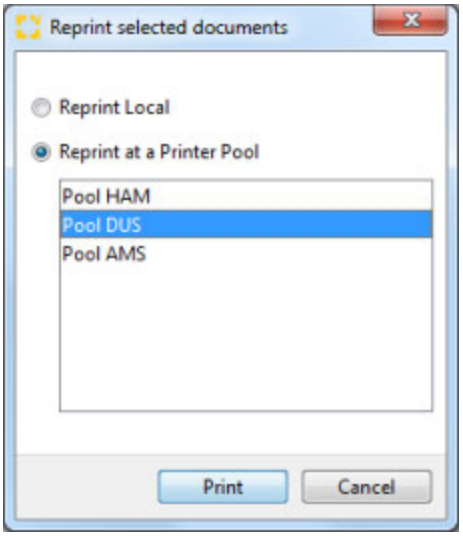
Opens any document currently highlighted in the list. Documents will open according to the file type associations of the local pc. For example Adobe Acrobat Reader will be used to open PDFs if that is the program associated with PDFs on the local pc.

Save selected document

Save the selected document to a drive on the local PC. A folder navigator will appear to allow navigation to the correct folder.

Reprint selected documents.

Opens a print application that allows the document to be printed to the local printer, or to a printer in an available print pool. It is possible to setup the print pools of remote offices to be accessible for printing to these remote offices.



Local printer

Print the document on the predefined default printer.

Print to printer pool

Allows selection of a printer pool from the list displayed.

Printer-Pools (List)

The desired printer pool can be selected from the list. Documents can be set to print to particular printers automatically.

Print

Print the document to the selected printer.

Cancel

Cancel the operation without further action.

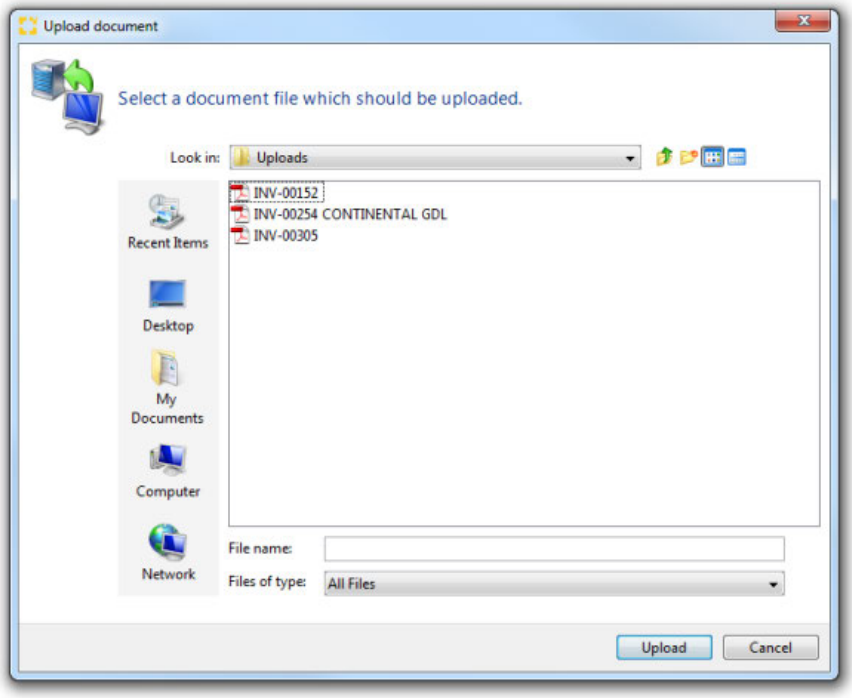
Delete/Restore selected document

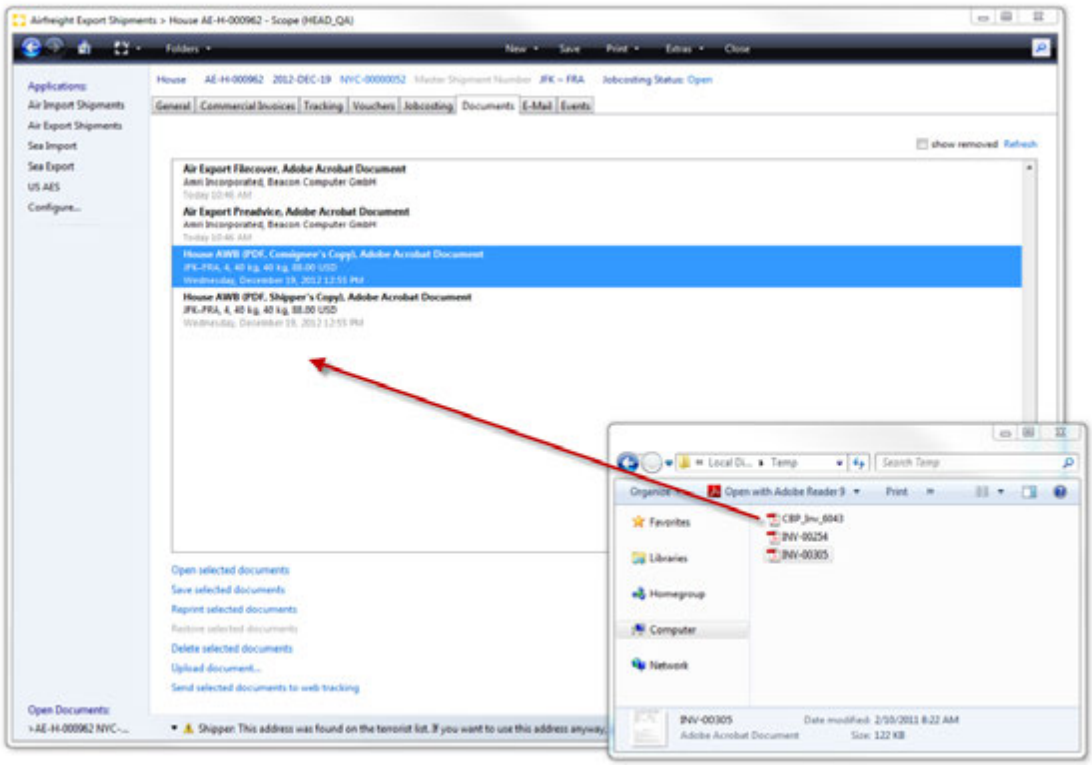
The document highlighted in the list will be deleted from view. Documents are not physically deleted but marked as inactive and therefore not visible. To view all documents including inactive documents, check the show removed box to the right above the document listing. If a document has been deleted, it can be restored by using the show removed check box, highlighting the inactive document and then selecting the *Restore selected documents* action.

Upload document...

Opens a file dialogue window which can be used to upload an external file to the current shipment. Alternately, navigate to the document on the desktop and drag and drop the document into the documents tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

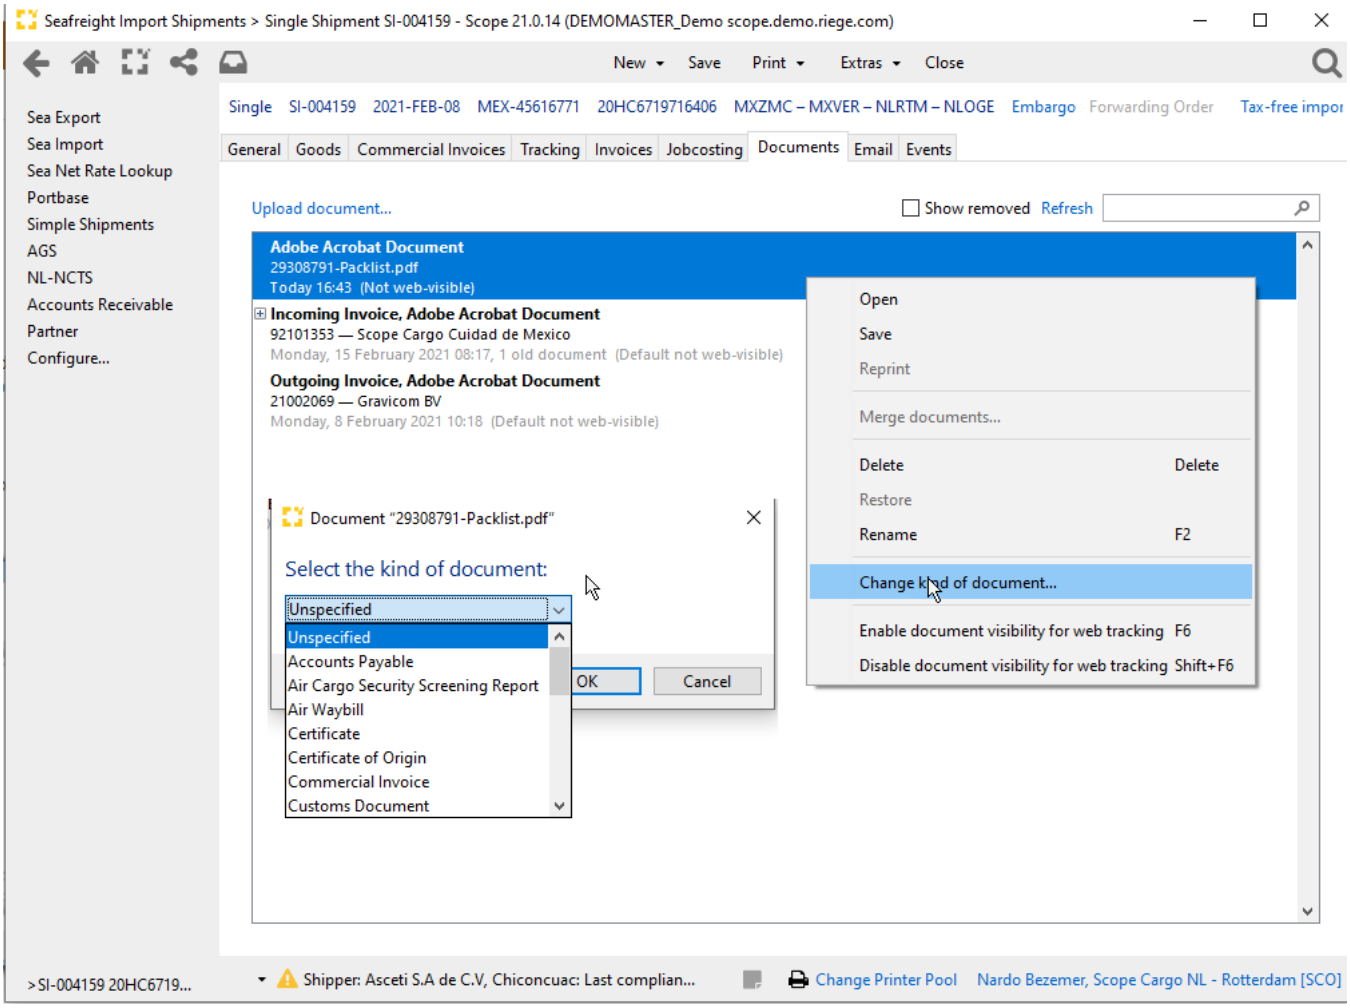




Assign Kind of Document type

During upload or via a right mouse click ,it is possible to set a document kind to the uploaded documents
when a uploaded document has a proper kind set, it will be available to automated email processes (invoices, prealerts)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Available kinds are :

- Accounts Payable (incoming invoice)
- Air Cargo Security screening report
- Air Waybill
- Certificate
- Certificate of Origin
- Commercial Invoice
- Customs document
- Dangerous Goods Declaration
- Forwarding instructions
- Goods receipt
- House Bill of lading
- Image
- Insurance Certificate
- Master Air Waybill
- Master B/L (Draft)
- Master B/L
- Packing List
- Proof of delivery
- Shipping documents
- Shipping Instructions
- Waybill

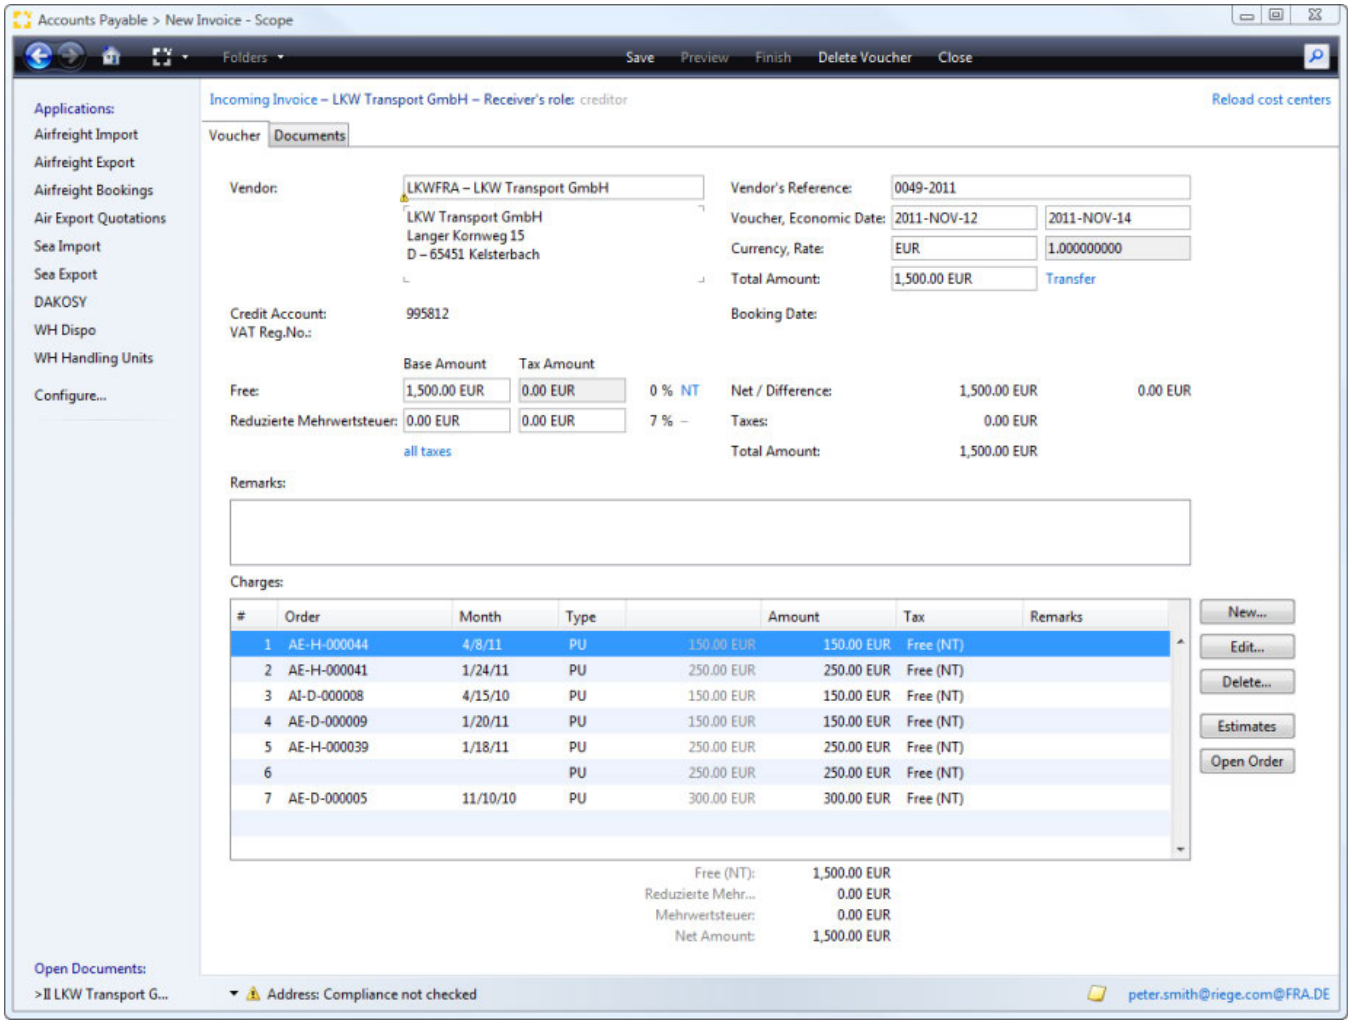
New Incoming Vouchers - Accounts Payable - Finance

- Introduction
- Description

Introduction

The new incoming voucher application registers incoming invoices and credit notes. Amounts on the incoming invoices or credit notes are allocated to shipments and orders and any cost estimates for the incoming charges are resolved. At this stage the voucher has the status *open* which indicates the voucher has been created but is incomplete.

Description



Save

Saves the current voucher

Preview

Opens the voucher as a PDF on the local computer.

Finish

Completes the voucher. If data has not yet been saved, it is automatically saved when the voucher is finished.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If there are cost estimates that have not been resolved when the voucher is finished, the estimates editor is launched to resolve these outstanding figures.

Delete Voucher

Deletes the current voucher (Only available for open vouchers)

Close

Closes the voucher and exits back to the voucher summary table. If changes have been made to the voucher, a dialogue appear to confirm if these changes should be saved.

Title Bar

The title bar displays the following information about the current voucher:

- The type of voucher - this can be an incoming invoice or and incoming credit note
- The Vendor who issued the incoming voucher.

Vendor

The vendor who issued the incoming voucher (invoice or credit note). This is a full text search field and any part of the vendor's name or address can be entered to locate the correct partner from the database of maintained partners. The context menu is also available to create a new vendor or access other partner details functions.

Vendor's Reference

This is the reference for the incoming voucher provided by the vendor. This is normally the invoice or credit note number on the incoming document.

Voucher Date

The date the incoming voucher was issued by the vendor. This is a date field

Economic Date

The date to be used as the date when the incoming voucher was received. This will default to the current date. This is a date field

Currency

The currency of the incoming voucher. This is a currency field

Rate

The rate for the currency used on the incoming voucher. If the local currency is used then the rate is 1.0000000. When a foreign currency is used, the rate will be determined from the master currency data . This rate may be over-written if necessary.

Total Amount

The total amount to be paid on the incoming voucher including any taxes. The amounts entered in the *tax free*, *taxable* and actual tax amounts must add up to the *total amount* figure in this field.

Transfer

This field indicates how payment of the voucher will be made. Normally most vendors are paid via bank transfer and so the field defaults to *Transfer*, however this is an action link and when clicked the change payment type dialogue will appear and allow the payment type to be changed to a *check* or *cash* transaction.

Credit Account

This is the credit account of the selected vendor. This information comes from the creditor of the master business partner data.

Tax ID

The tax ID number used by the vendor. This information comes from the accounting tab of the master business partner data.

Booking Date

This is the date the incoming voucher is registered and will be applied automatically as soon as the current document is finished.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Base Amount

The base amount can include amounts that are tax free and taxable. Therefore beneath the *Base amounts are 2 fields to capture these figures:

Free (Tax free)

The total amount on the incoming voucher that is free of taxes

Taxable

The total amount on the incoming voucher that is taxable

Tax Amount

Associated with the base *tax free* and base *taxable* amounts are fields where the actual tax amounts for these figures are stored.

Tax Amount (Free) and reason code.

The taxes on the *tax free* amount will of course be 0.00, however to the right of this figure is the reason code which indicates why there are zero taxes to pay on this amount. This reason code will default to *NT* meaning "no taxes". However if a different reason can be determined for a charge being free of taxes then the reason code will automatically display that alternate reason code. For example, if the incoming voucher is being created in the EU but the vendor is locates in the USA, then the reason code zero taxes will automatically change to *3C* meaning "third country". The reason code can be changed by clicking the code. A dialogue will appear and offer the following list of reason codes:

Reason Code	Description
EX	Export
IM	Import
NT	Not Taxable
3T	Third Country Transport
DT	Duties
3C	Third Country
OS	Offshore
IN	Internal
BG	Bonded Goods

Tax Amount and tax type

The figure on the incoming invoice that is deemed to be taxable is entered in the *Taxable* field, the application then tries to determine the actual taxes that should be paid on this figure using the tax regimes stored in the country master data. To the right of the tax amount the tax percentage figure will appear.

all taxes

If the voucher contains more than two different tax rates, this action link can be used to launch an *edit tax amounts* application in which all tax methods, rates, figures and reason codes can be adjusted.

Net/Difference

The *Net* amount is the total of the tax and taxable amounts on the incoming document (exclusive of tax). The difference is the net amount less the charges currently booked on the voucher in the charges table . These figures are automatically calculated.

Taxes

The amount of tax on the incoming voucher.

Total Amount

The sum of the *net* amount and the *taxes* on the incoming voucher which should also equal the total amount of the voucher.

Remarks

This is a free text area where any additional information about the incoming voucher may be recorded.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Charges

The charges table show details of all the charges that have been booked on the voucher using the charges Editor.

Charge table line details

The following information about each charge is shown

- # - The number where the charge falls in the sequence of all charges.
- *Order - The shipment or order number to which the charge is allocated.
- **Month** - The month the shipment or order was created. (if several charge lines refer to the same shipment or order, then only the month only appears on the 1st line with the shipment or order)
- **Type** - The charge code of the charge line
- **Amount** - The amount of the charge in both the local and document currency.
- **Tax** - The tax code and tax reason code for the charge.
- **Remarks** - Any additional remarks made on the charge line.

Charge Table Totals

At the base of the charge table, all the charges are summed:

- **Free(NT)** - The total of the tax free charges
- **Taxable** - The total of the taxable charges
- **Net Amount** - The total of the taxable and tax free charge lines.

New

Once all required elements of the voucher header have been entered the **New** button becomes active and is used to start the charge line editor in order to search for shipments or orders and apply incoming charges to them.

Edit

When existing charges are highlighted in the charges table, the **Edit** button becomes active and is used to start the charge line editor in order to edit existing charge lines.

Delete

This function button will delete the charge line highlighted in the charges table.

Estimates

Opens the estimates editor

The functions *New, Edit, Delete* and *Estimates* are only available when the document is first saved.

Open Order

Opens the shipment or order on which the charged is allocated.

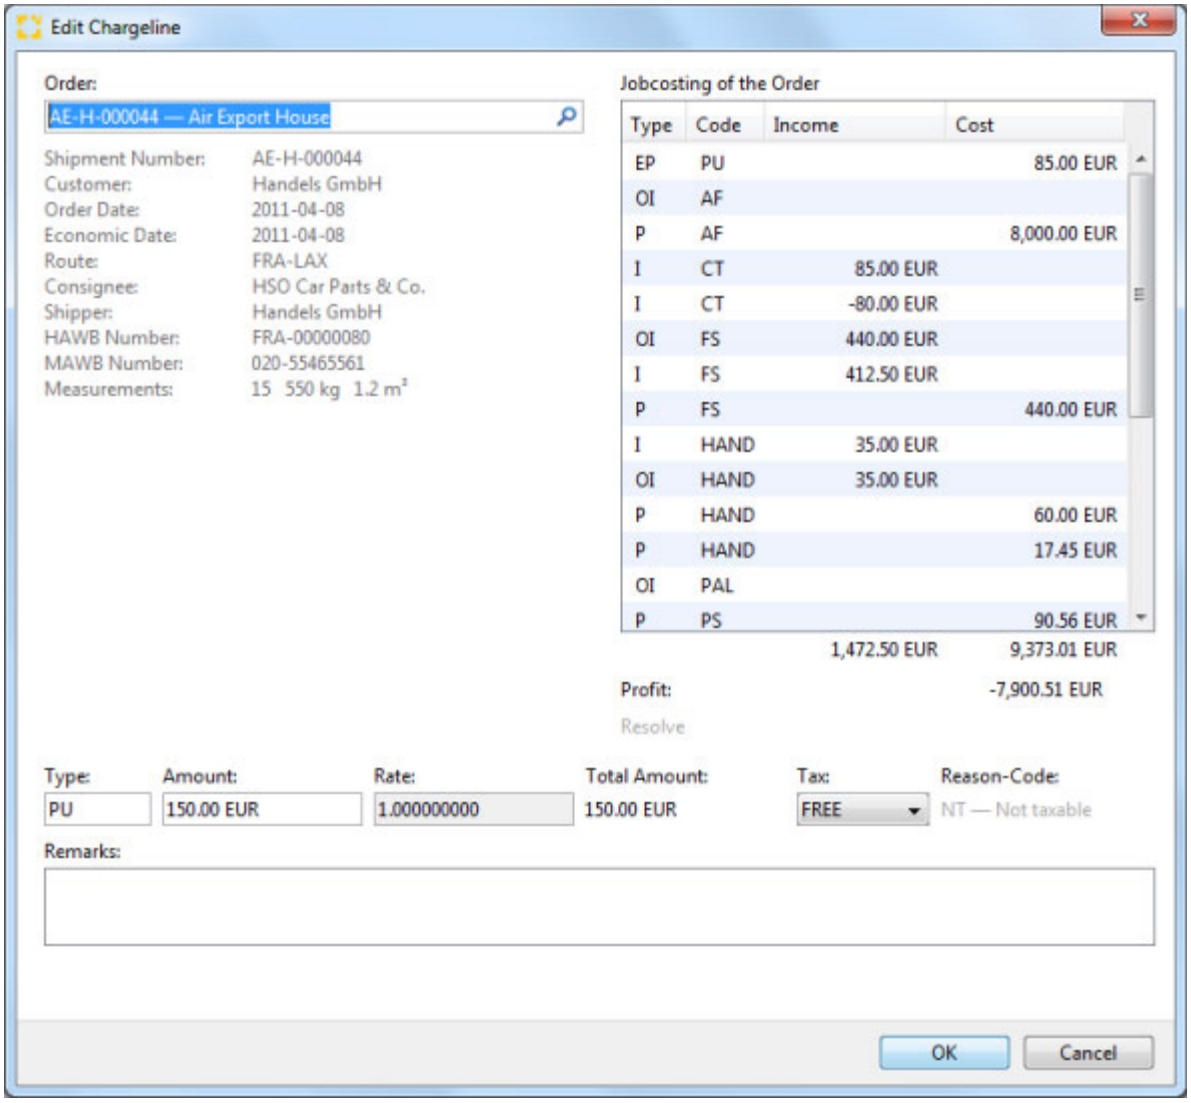
Tip

Use the key combination **Ctrl + I** to display the following information about the charge line highlighted in the charges table:

- The name of the user who created the shipment or order
- The date the shipment or order was created.

Charge Line Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Order

The shipment or order to which the charge should be applied. This is a full text search field. Enter details specific to the shipment in order to find the shipment or order. This can be the shipment number, bills of lading, the references of the shipper or consignee. The customer name, shipper or consignee names may also be used.

Once the shipment or order has been selected, a selection of shipment or order details are shown beneath the order field.

Jobcosting of the Order

This is a table showing the jobcosting of the shipment or order selected, the table shows:

- **Type** - The voucher type on which the charge line occurs.
- **Code** - The charge code of the charge.
- **Income** - If the charge is income, the amount will appear in the *income* column.
- **Cost** - If the charge is a cost, the amount will appear in the *cost* column.

At the base of the table the totals are shown for the *income* and *cost* columns

Profit

The profit field shows the difference between the *income* and *cost* columns of the jobcosting table.

Resolve

By highlighting a a cost estimate (EP) in the costs column of the jobcosting table and then clicking the *Resolve* action, the amount of the cost estimate will be booked as the cost for this charge line. This resolves this estimate.

Type

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The charge code for the amount being entered. This is a search field that tries to match input data with the available charge codes . Therefore the charge code or name or part thereof may be entered to locate the correct charge type.

Amount

the amount and currency of the charge line. This may be complete by clicking the *resolve* action described above.

Rate

If the currency of the charge line is a foreign currency then the **rate** field will refer to the maintained exchange rates to determine the correct rate for the currency. This may be over-written. If the local currency is used then the rate defaults to 1.0000000.

Total Amount

The total amount of the cost in the local currency.

Tax

The tax type for the charge. This is a drop down field that can be used to select the tax types available in the country where the charge is being processed.

Reason Code

The reason for the tax type.

Remarks

This is a free text field where any remarks about the charge line may be recorded.

OK

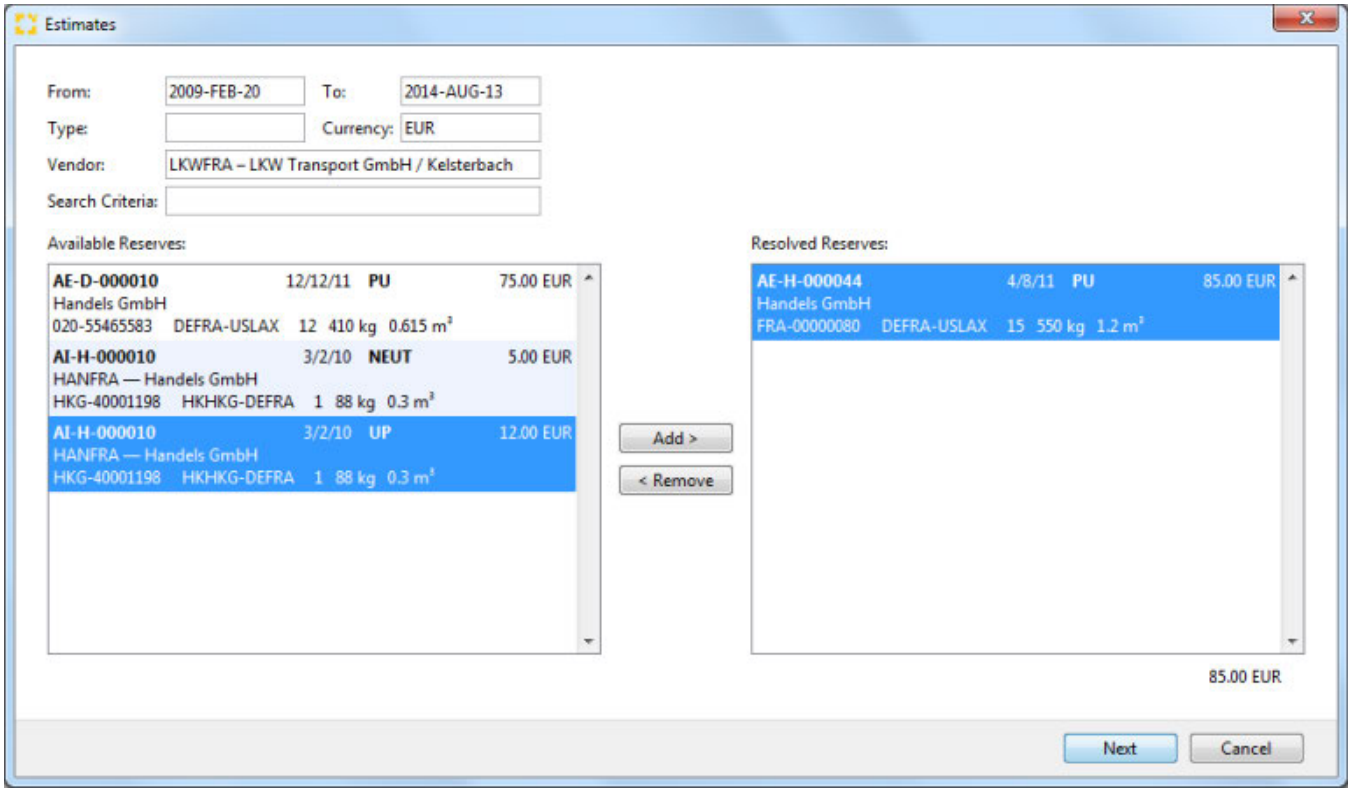
Save the charge line information and returns to the incoming voucher editor.

Cancel

Closes the **Charge Line Editor** without saving any changes made.

Estimate Editor (Part 1.)

Estimates can be resolved on a charge line basis, but it is also possible to use the **Estimate Editor** to process estimates. The **Estimate Editor** is generally used in situations where it is preferable to identify outstanding estimates based on values such as a date range, a charge type, a vendor name or some other search criteria. This approach can be preferable to processing estimates using the shipment or order option available in the charge line editor.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The *Estimates editor provides a set of search fields to help defined exactly which cost estimates are to be located:

From

The date from which to search for estimated payments.

To

The date to which to search for estimated payments.

Type

The charge type of the estimated payments

Currency

The currency of the cost estimate.

Vendor

The name of the vendor against whom the cost estimated has been booked. The vendor used in the voucher will be used by default.

Search Criteria

Additional search criteria can be entered in this field such as the departure, destination, customer etc.

Available reserves

Once the search details have been completed, the application will list all matching cost estimates in the **Available reserves** table which will display:

- **Shipment number**
- **Shipment creation date**
- **Charge Code** - (for the estimate cost)
- **Charge amount & currency** - (for the estimate cost)
- **Customer**
- **Bill of Lading**
- **Departure - Destination**
- **Pieces**
- **Weight**
- **Volume**

Add

The cost estimate highlighted in the *Available Reserves* table will be moved to the *Resolved Reserves* table when the **Add** button is clicked.

Remove

The cost estimate highlighted in the *Resolved Reserves* table will be moved to the *Available Reserves* table when the **Remove** button is clicked.

Resolved Reserves

Cost estimates that have been *added* from the *Available Reserves* table. At the base of the **Resolved Reserves** table, the total of the records in the **Resolved Reserves** table is shown.

Next

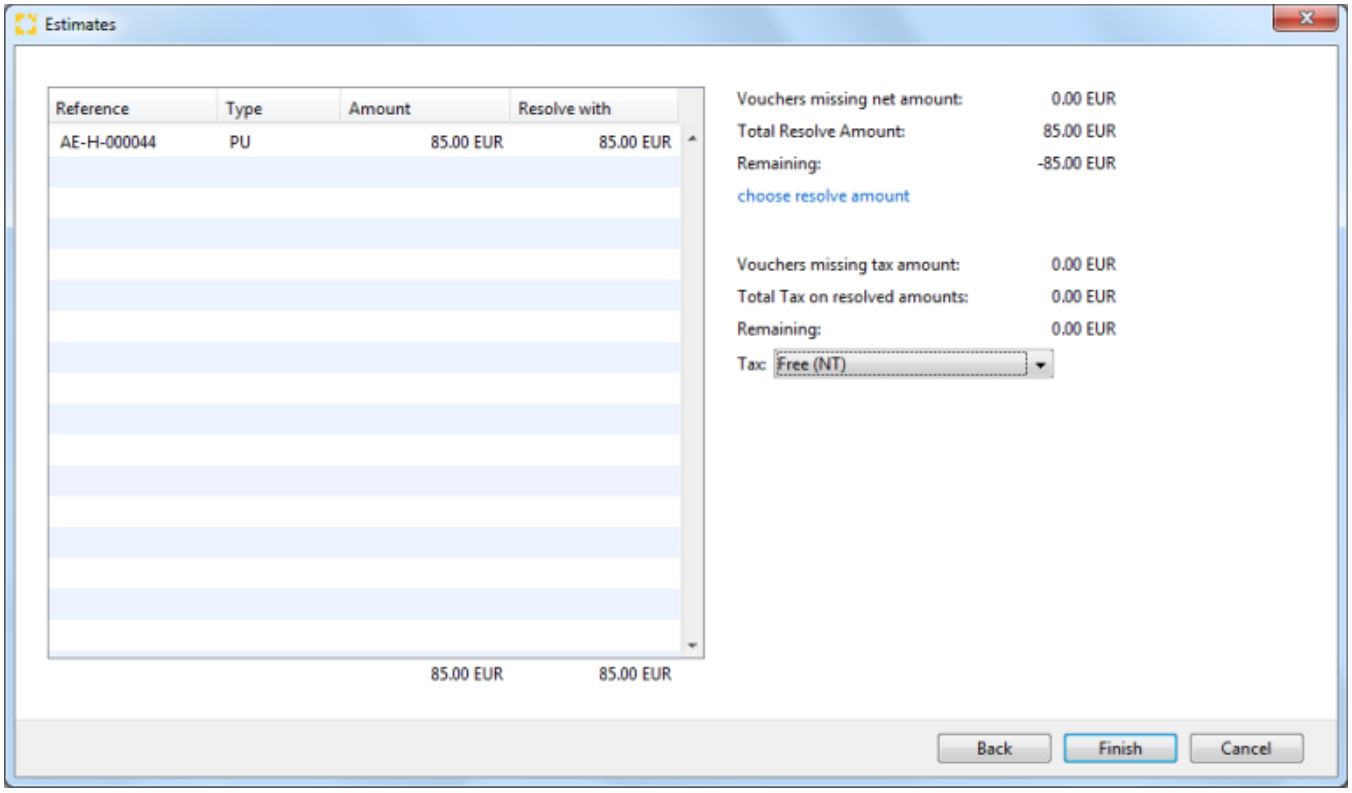
Continues on to the 2nd part of the estimate resolution process in which estimates may be further processed or distributed.

Cancel

Closes the estimates editor without further action.

Estimate Editor (Part 2.)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Resolution Table

The resolution table displays the following:

- * Reference* - The reference number of the order or shipment
- **Type** - The charge code of the amount
- **Amount** - The amount of the estimate
- **Resolve with** - The amount allocated to resolve the estimate.

Vouchers missing net amount

The amount on the incoming voucher that still needs to be allocated.

Total resolve amount

The shows the total of cost estimates currently assigned to resolve amounts

Remaining

The difference between the cost estimates currently assigned and the total amount of the incoming voucher.

choose resolve amount

The action link launches a pop-up where the amounts may be resolved. If multiple estimates are to be resolved with a single figure, then there is the option to select how the charges will be distributed.

The following distribution methods can be used:

- Equally
- By chargeable weight
- By gross weight
- By volume
- By quantity
- By profit share

Tax

The tax code is displayed. If no tax code could be determined, it may be set manually.

Back

returns to the first part of the estimate editor process.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Finish

Save the voucher and replaces cost estimates with the figures from the incoming voucher.

Cancel

Closes the editor without further action

Additional Estimates Editor

On finishing an incoming voucher, if cost estimates in orders and shipments have not been fully accounted for by the incoming voucher, the **additional estimates editor** appears and displays the shipments or orders where these partial estimates still occur in order for new cost estimates to be created if necessary.

Select All

all the charges list will be marked for change automatically. Alternately charges can be selected on an individual basis by checking the box next to each line.

New Cost Estimate

The difference between the allocated payable amount and the original cost estimate is shown. If the line is checked, this figure will be used to create a new cost estimate. The figure may be manually adjusted.

Ok

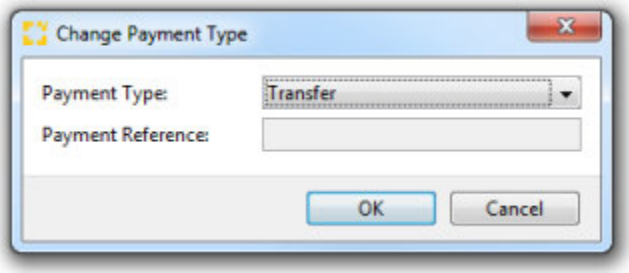
Creates the new cost estimates and exits the application

Cancel

Exits the application without creating new cost estimates.

Change Payment Type

This application is used to indicate how the vendor will be paid for the invoice



Payment type

This is a drop down menu with the options:

Type	Description	Payment Reference
Transfer	Bank transfer of funds	Not required
Cash	Cash amount	Optional
Check	Bank Check	Optional

Payment Reference

In the case of cash or check payments a payment reference may be recorded. For checks this will normally be the check number.

OK

Stores the payment type details and returns to the incoming voucher details.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Cancel

Exits without change to the payment type.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

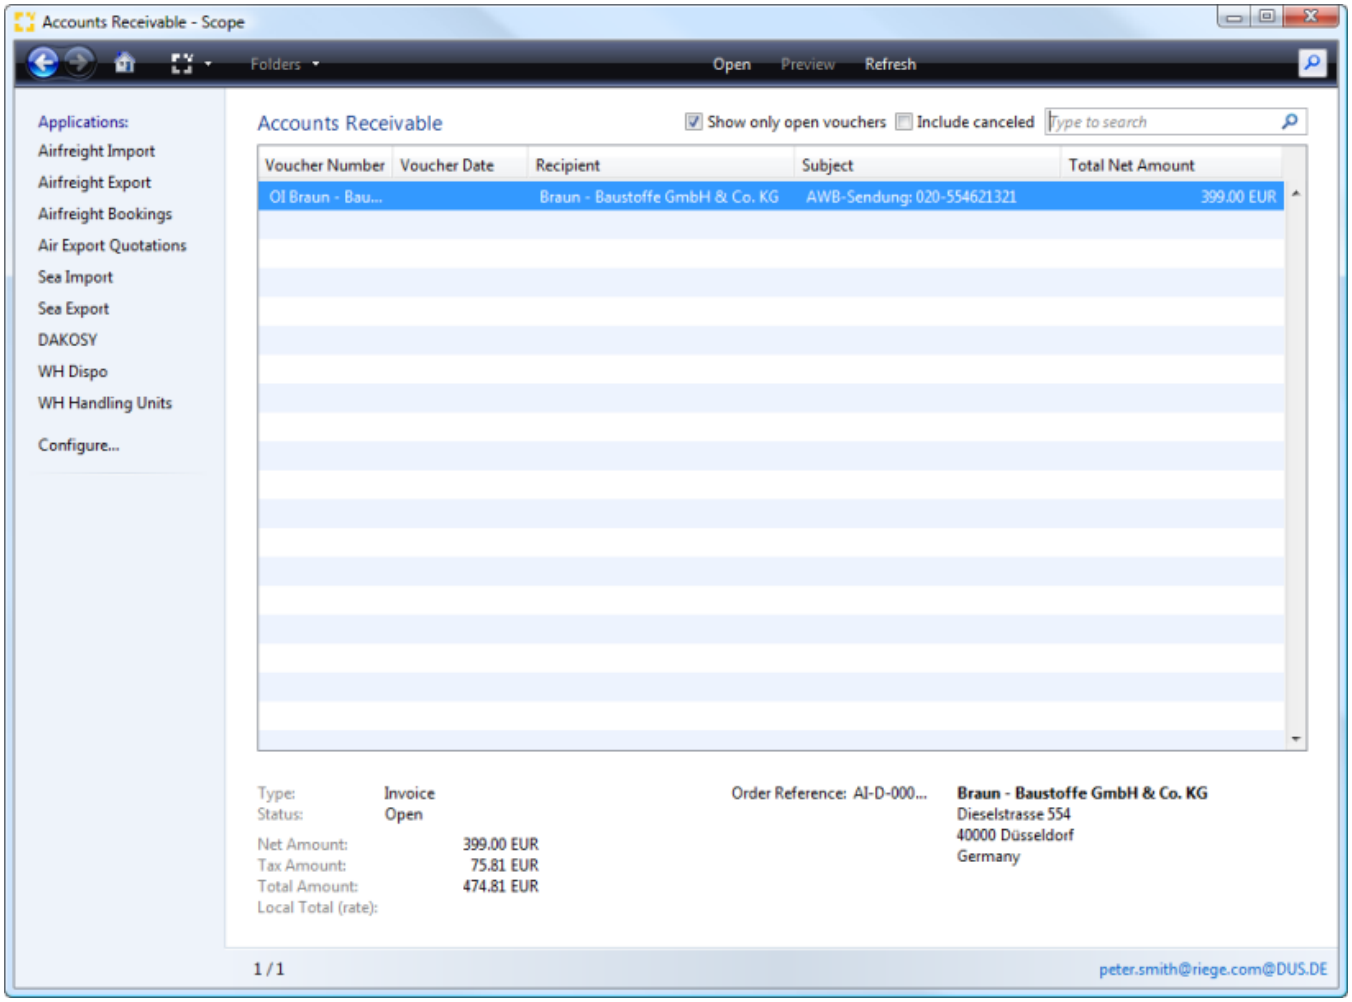
Accounts Receivable

- Introduction
- Description

Introduction

This application will display all outgoing vouchers, these can be invoices, credit notes or invoice cost estimates. These documents may then be invidually viewed, cancelled, corrected or printed.

Description



It is not possible to create new vouchers in this application. This can only be done in the various job applications.

Open

This option will open the voucher highlighted in the overview using the invoice editor . Alternately the voucher can be double-clicked to open it.

Preview

This option will generate a PDF version of the document. A PDF can be generated even when no invoice number exists.

Refresh

Updates the index to ensure the latest vouchers are visible.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Show on open vouchers

This box is checked by default and therefore only unfinished vouchers will appear in the overview. By unchecking this box, all vouchers will appear, regardless of status.

Include cancelled

To include vouchers that have been cancelled, check this box.

Type to search

This is a full text search field. An part of a recipient or subject may be entered to find the desired vouchers.

Accounts Receivable - Summary Table

The summary table displays the following information about each voucher:

Voucher number

If the voucher is finished then this column will display the voucher number. If the voucher is still open then this column will display the kind of voucher, such as OI (Outgoing invoice) and the recipients name. If no recipient is present, then only the kind of voucher is shown.

Voucher date

The date the voucher was printed.

Recipient

The recipient of the voucher.

Subject

The subject of the voucher (if any).

Total Net Amount

The total amount of the voucher including any taxes.

Details

As vouchers in the overview are highlighted, their details are shown in the lower part of the application:

Type

The document type, invoice or credit note.

Status

Displays the current status of the document

Status	Description
Open	The document is still open and can be edited
Finished	The document has been print and is therefore finalized
Canceled	The document has been cancelled

Net Amount

Total amount without any taxes

Tax Amount

Total of any taxes

Total Amount

Total voucher amount including any taxes

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Local Total (rate)

If the invoice has been raised in a foreign currency, this total amount including any taxes is displayed in the local currency.

Order Reference

The shipment number or order reference to which this voucher belongs.

Recipient address

To the right is the full recipient address.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Edit Invoice - Accounts Receivable - Finance

- Introduction
- Description

Introduction

This application enables existing outgoing invoices or credit notes to be edited, printed or cancelled. Depending on system settings, costs and revenues may be automatically calculated in order to simplify calculation of amounts.

Description

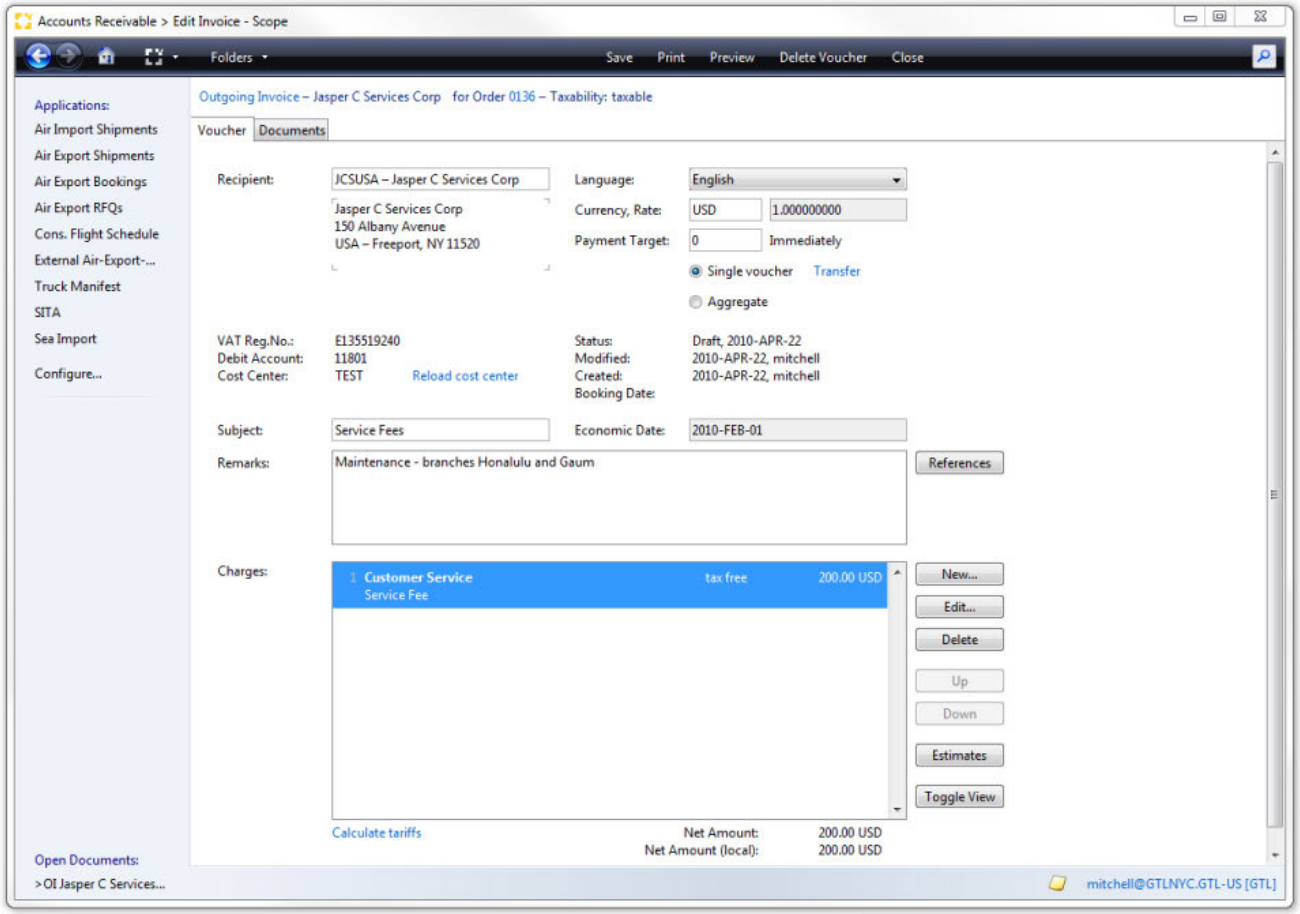
documents in the voucher overview screen may be in either of 2 states:

- **New/Open documents**
  These documents have not yet been printed and are therefore not complete. New documents may be created and edited and existing open documents may be edited. New documents may be saved but are not considered closed until they are printed.
- **Completed documents**

Once printed, the status of a voucher is set from *open* to *closed*. On printing vouchers are given a valid document number (Invoice number) and the financial data they contain is transferred to the accounting department. Printed documents therefore cannot be modified, they can only be cancelled /credited and replacements created.

New /Open documents

the following functions and fields are available when a voucher has the *open* status.



Save

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

the document will be saved but an invoice number is not assigned.

Print

The action will print and complete the document, setting the status to completed. It is only possible to print a voucher if no red error/validation messages are present. If only yellow warnings are present, then the document may be printed.

Preview

this action is only possible if there are no red error/validation messages present. The preview will generate a pdf version of the document that has no document number. This provides a view of the current state of the document.

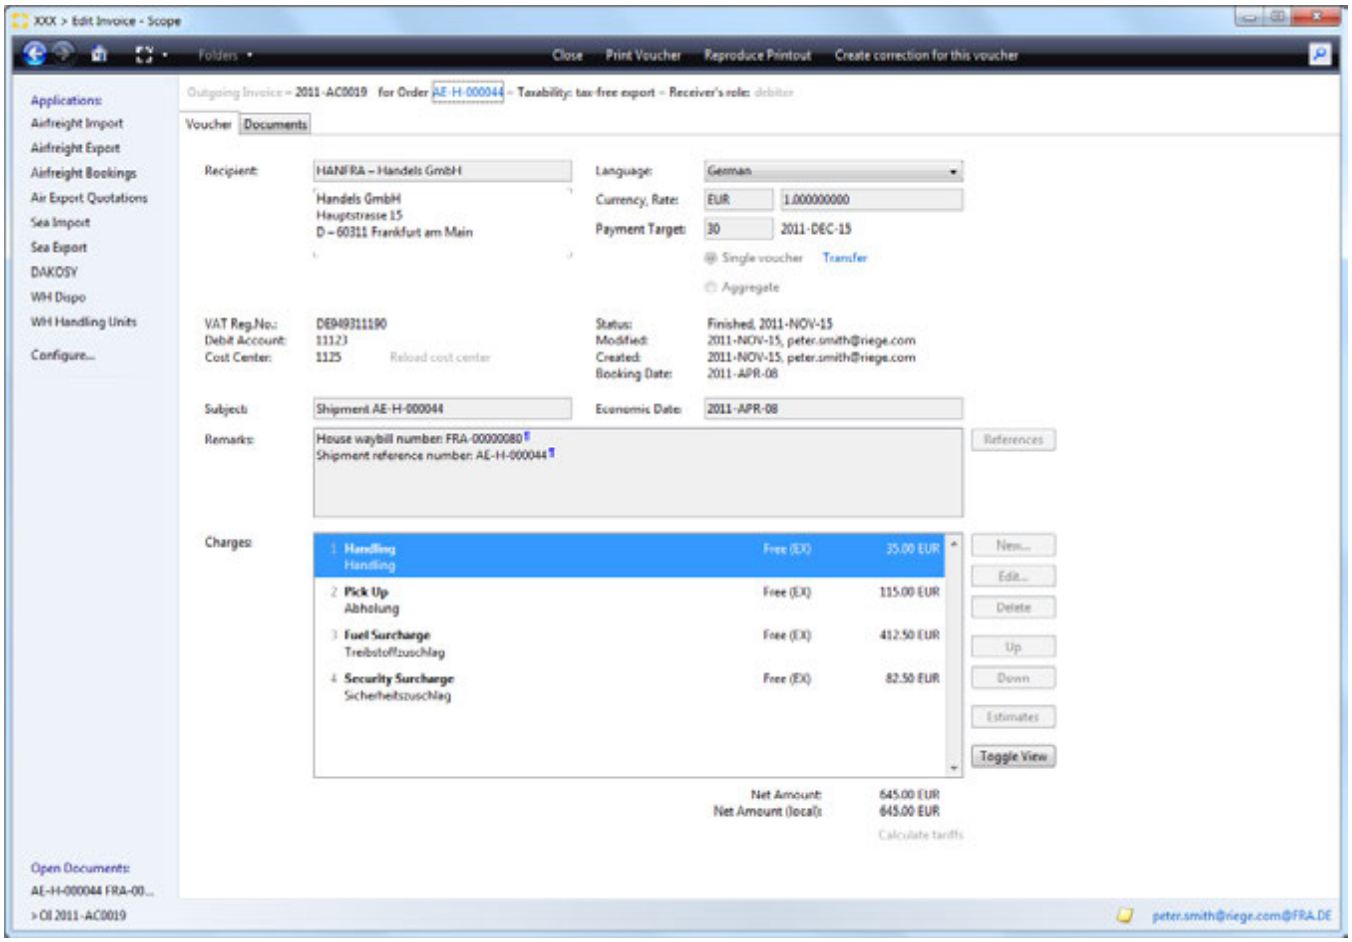
Delete Voucher

This action will completely remove the document. Only open documents may be deleted. Completed (printed) documents must be cancelled (see completed documents).

Close

Close the document. If changes have been made, the system will ask if any changes are to be stored or ignored.

Finished documents



If a voucher is finished, then when it is opened in the invoice editor, the following menu bar options are available

Print Voucher

Prints a new copy of the voucher.

Reproduce printout

Create corrections for this voucher

Cancels the voucher but uses the cancelled voucher as a basis for a new voucher.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Cancel Voucher

Cancels the voucher.

Close

Closes the voucher and returns to the overview.

Title Bar

The following information and available actions are displayed on the title bar.

- Document type
  By clicking this link a document may be reversed from invoice to credit and vice versa). On clicking the link a security prompt will appear to confirm the action and offer the additional option to "additionally negate charge line amounts". This option will invert the charge line amounts from positive to negative figures (and vice versa). The action is only available for new / open documents.
- Voucher recipient
  Displays the voucher recipient's name.
- Order
  The shipment to which this document is assigned. Clicking this link will open the shipment.
- Taxability

Displays the tax status of the document.

Receiver

The recipient of the document. By default the customer specified in the shipment will be used. The search box can be used to locate a different address for the recipient. The context menu or the corresponding function keyscan be used to further processes the recipient address.

Language

Indicates the language being used on the document. Clicking the language button will produce a list of languages available on the system. By changing the language, the printed output of the document will change accordingly. The exception to this is the charge lines; Once the charge lines have been inserted in the document and the document has been saved, the language of the charge lines will not change if a new language is selected. To match the charge line language to the rest of the document, any existing charge lines must be deleted and re-inserted to reflect the correct language choice. It is also important to note that a translation to the desired language must exist in the Charge Types maintenance.

The default language is maintained in the master business partner data

Currency

Displays the currency of the invoice. A default currency can be stored for the customer using the master partner maintenance program . If no currency is stored then the local currency is used. The field offers a search function to locate alternative currencies for the document.
The currency shown here will determine the currency shown on the invoice for total amounts.

Exchange Rate

The rate at which local currency amounts are converted to foreign currency amounts and vice versa. The exchange rate will transfer from the master exchange rate data, but it may be changed manually. The exchange rate is always required since the entries in costs and revenues of job costing must always be shown in the local currency. If the local currency is used as the invoice currency then the exchange rate will show as 1.0000000 and cannot be modified.

Payment Target

The date the invoice should be paid by. Enter the number of days from the current date, the actual payment date will be shown automatically to the right.

Single Voucher

If selected, this check box indicates that upon completion/printing a single document number (invoice number) is to be issued and applied to the document. The document is then ready for the accounting department.

Aggregate

If selected, the single voucher is automatically unchecked. Upon completion/printing, no document number (Invoice number)is issued. The document is to be grouped with other documents that will become an aggregated invoice.

Transfer

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This action link will open a pop-up window where the payment method can be indicated. The payment method can be bank transfer, cash or check. A payment reference for the latter 2 options may be entered.

Tax ID

The tax identification number of the recipient of the document. This data will appear according to the master data. of the recipient.

Debit Account

The accounts receivable account number of the document recipient as stored in the partner's master data .

Cost Center

Every order is assigned to a cost center. If this changes in the course of document creation, it can be reloaded by clicking the **reload cost center** action link.

Status / Modified / Created

The status of the document is shown and the date that this status was set. In addition the date the document was last changed appears in the **Modified** field and the data the document was created appears in the **Created** field.

Subject

The subject of the document that is to be printed on the document.

Economic Date

The service date of the document used to determine the economic month of the document.

Remarks

Additional information to be printed on the document. By clicking the **References** button, any shipment references such as shipper's references or P.O. numbers will automatically appear in the remarks field.

Charges

Displays charges to be billed to the recipient. At least 1 charge must be present if the document is to be printed. If tariffs and rates have been stored for the customer, then the charges window may be automatically filled with system calculated charges. These may be doubled clicked or opened with the edit function if further adjustments are required.

New

Creates a new line item.

Edit

Opens the highlighted item for further editing.

Delete

The highlighted item will be removed.

Up

The selected item will be moved one position up in the list of charges.

Down

The selected item will be moved one position down in the list of charges.

Estimates

Estimate income that exist for the shipment can be seen and selected from a pop-up window. This action converts an estimate into a final charge.

Toggle View

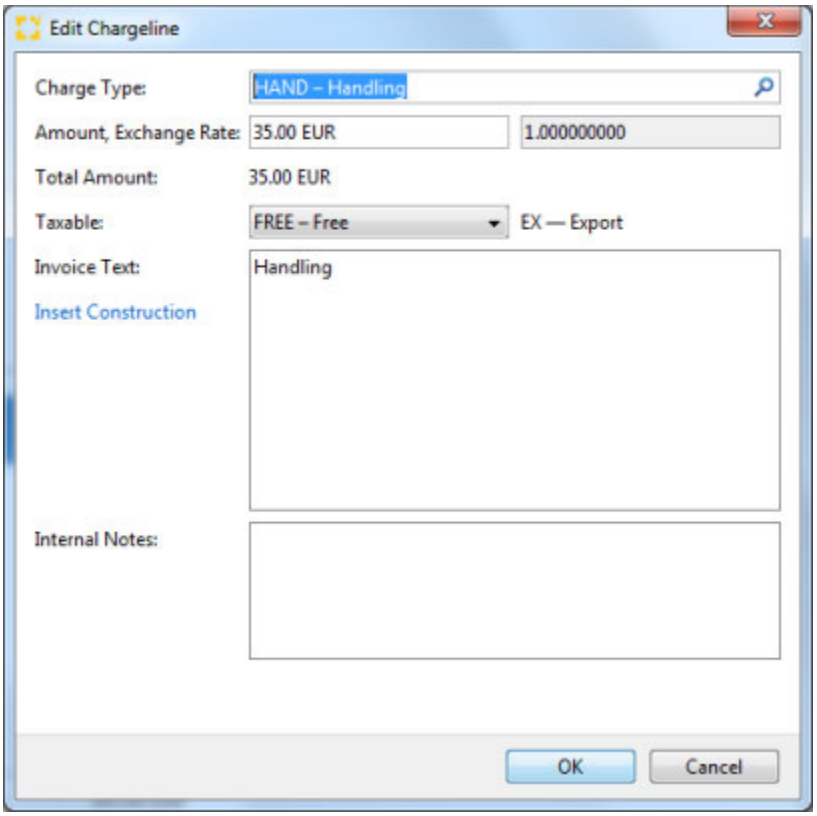
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Change the way the charge line information is displayed from 1 line entries to 2 line entries and vice versa. This action has no impact on the final printed document.

Calculate tariffs

If tariffs have been created for the items in the charge lines, this action link will reprocess all charge lines again against all tariffs to show charges as per the current tariffs.

Charge Code Editor



Charge Type

The charge code and description of the service being billed. Charge codes can be located by entering the code or charge description or part thereof. Only charges defined in the master data are available.

Amount / Exchange rate

Amount and currency code for this line item.

> The field *value* can also be adjusted using the drop-down menu which present the calculator option (or use the function keys F3) or the tariff re-calculation (function key F5) this will automatically recalculate any available tariffs.

Exchange Rate

Exchange rate for the item line. If the local currency has been used as actual currency, the exchange field is not modified because the exchange rate in this case is 1.0000000.

Tax

Depending nature of the consignment and the tax rates for the voucher recipient country, the appropriate tax rate is proposed.

Invoice Text

A full description of the line item. The description may be edited as desired and multiple line can be used. Right click to get the context menu which will offer access to Text blocks or press Ctrl + T to access this function.

Remarks

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Optional details about the charge which are not printed and not sent to accounting.

Close

Closes the document and returns to the overview of vouchers.

Print

Print the document which will now appear in the Documents tab.

Preview

Produces a pdf version of the document that can be checked for correctness prior to finalizing the voucher.

Cancel

a cancellation of the voucher is generated (invoice or credit note). A replacement voucher is issued that may be re-edited.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Scope EU VAT defaulting rules

Introduction

This page describes the VAT defaulting rules as implemented in Scope for a legal entity located in the EU.

Description

The matrix outlines how Scope looks at a shipment and determines the applicable tax status, FREE or VAT, and the corresponding reason code.

Origin	Destination	Customer	Valid Vat Number	VAT or FREE	Reason Code	VAT Percentage	Exception Rules
EU	EU	Local	-	VAT	-	Registered Country VAT percentage	1, 2
EU	EU	EU	✓	VAT	RC	0,00%	1, 2
EU	EU	non-EU	-	FREE	3C	-	
EU	non-EU	Local	-	FREE	EX	-	
EU	non-EU	EU	-	FREE	EX	-	
EU	Non-EU	non-EU	-	FREE	3C	-	
Non-EU	EU	Local	-	VAT	-	Registered Country VAT percentage	3 **(NL&BE)**,4
Non-EU	EU	EU	✓	VAT	RC	0.00 %	3 **(NL&BE)**,4
Non-EU	EU	non-EU	-	FREE	3C	-	
non-EU	non-EU	local	-	FREE	3T	-	
non-EU	non-EU	EU	-	FREE	3T	-	
non-EU	non-EU	non-EU	-	FREE	3T	-	

Exception Rules	Description
1	If on Air Import, simple shipments taxability is not set to automatic or taxable then the tax will be set to FREE.
2	If on Air Exports the SCI code begins with "T" then tax will be set to FREE.
3	If the legal entity issuing the invoice is located in the Netherlands or Belgium then for non-EU imports the tax will always be set to FREE.
4	If the charge type has the flag "Tax-free in imports/export" set to active then the tax will be set to FREE.
VAT-Group	When the receiver of the invoice is part of a VAT group for the country of the legal entity where the invoice is issued then VAT status will be overruled taking into account that both parties belong to the same financial holding.
Embassy	When the receiver of the invoice has the business type set to "embassy" then the VAT status will be overruled and always considered FREE.
Private Person	When the receiver of the invoice has the business type set to "private person" then the above matrix will be treated as a local partner, regardless of the country of the private person.
DT, ET , VT	When the charge type is of the type DT, VT or ET, then the tax status will always be free with the reason code DT.

Administrative Order

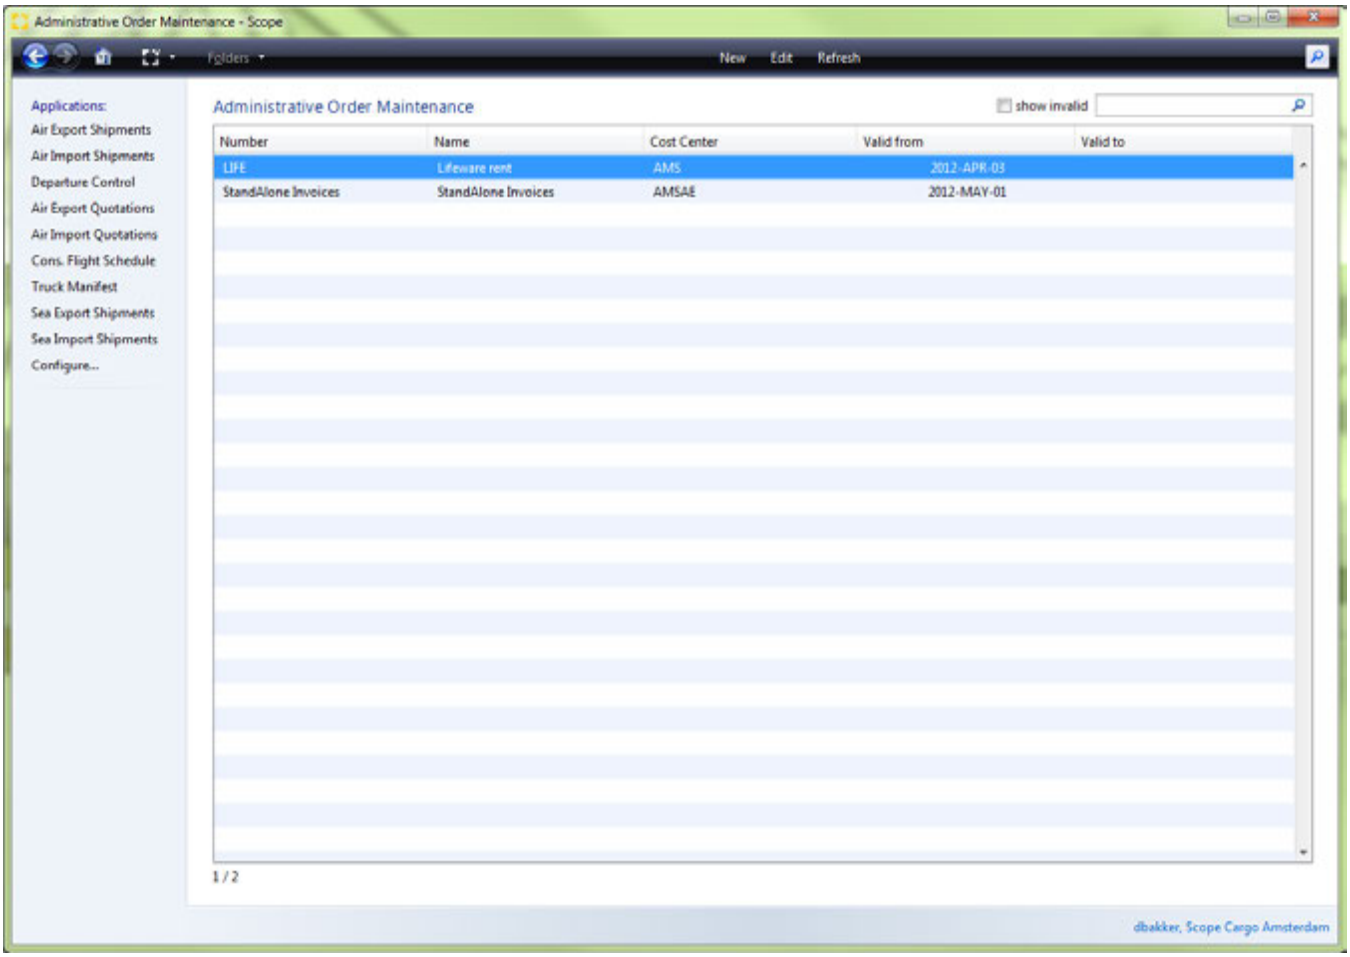
- Introduction
- Description

Introduction

In this function it is possible to maintain Administrative Orders. Administrative Order are orders that are created for administrative purposes. Typical use for Administrative Orders is:

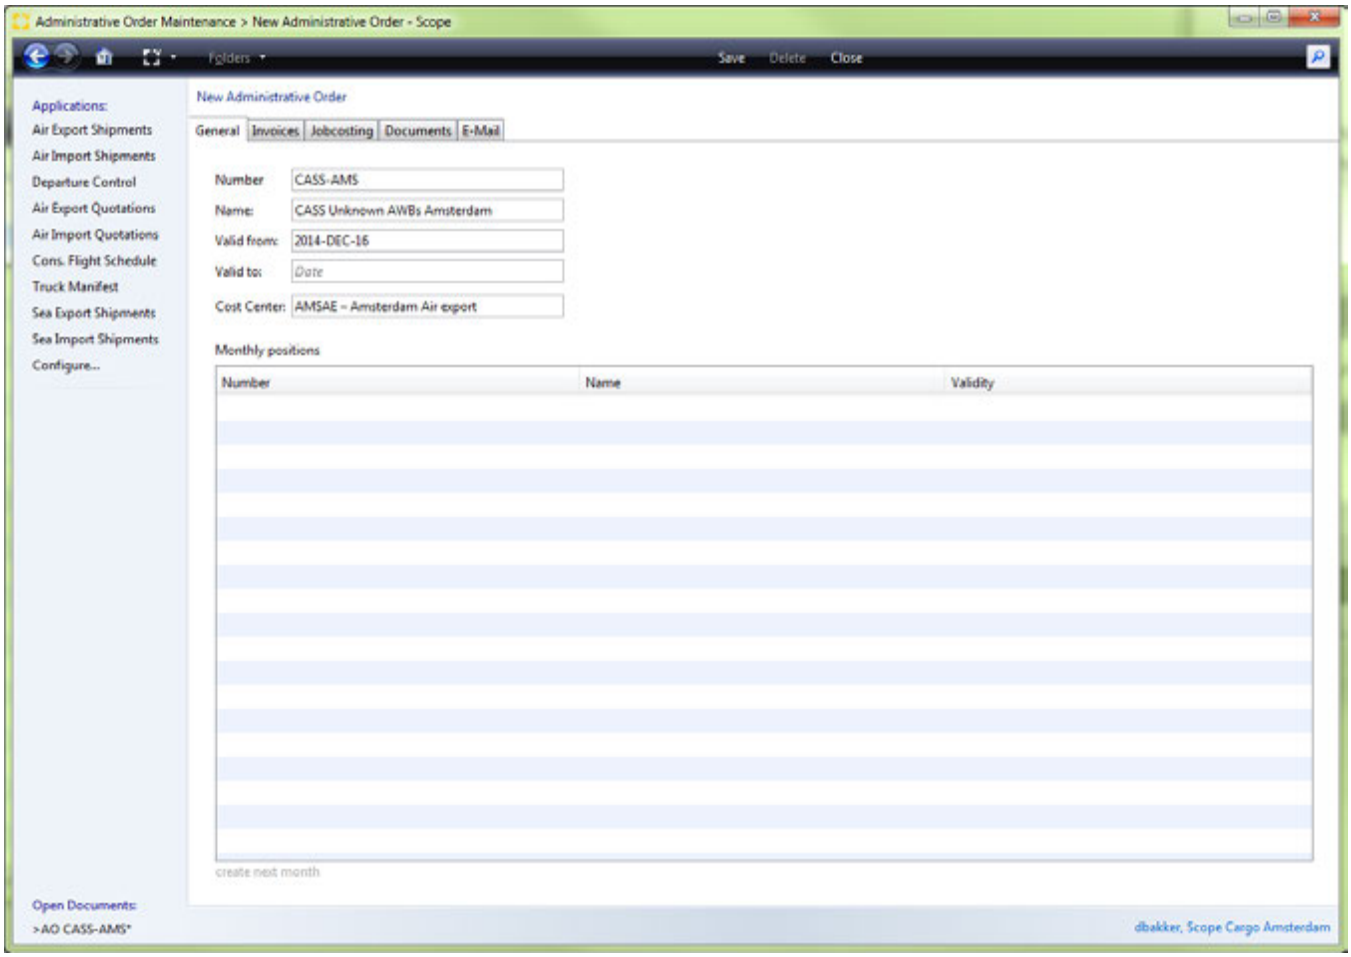
- an Administrative Order is needed for the processing of the CASS invoice. All costs that cannot be matched to a shipment(order), will be booked on this administrative order.
- an Administrative Order can be used to produce a monthly invoice to customer that rents a part of your warehouse, or any other non-shipment related invoicing.

Description



New Administrative Order

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In this screen, you define the header details for the Administrative Order. Once the header details are defined, a monthly position/occurrence of will be used to book the charges on.

NOTE: The contents of the 2nd, 3rd,... tab is based upon the selection of the monthly position, made in the first (General) tab.

Tab (General)

Number

This number will be the basename for all underlying positions/occurrences of this Administrative Order as for each month a new position/order will be created.

Name

A short descriptive name for the Administrative Orders. It normally describes the purpose of this Administrative Order.

Valid from/to

This field defines for which period the monthly positions can be generated. The valid-to is optional.

Cost Center

This defines the Cost Center to be used for the monthly positions. Scope always uses a Cost Center for each Order. Select one of the Cost Centers defined under Maintenance/Finance/Cost Center.

Monthly Positions

Each monthly order appears here in the list. The number it gets, will be constructed from the number (in top) of the Administrative Order, combined with YYYY/MM. For Example: CASS-AMS-2014/02.

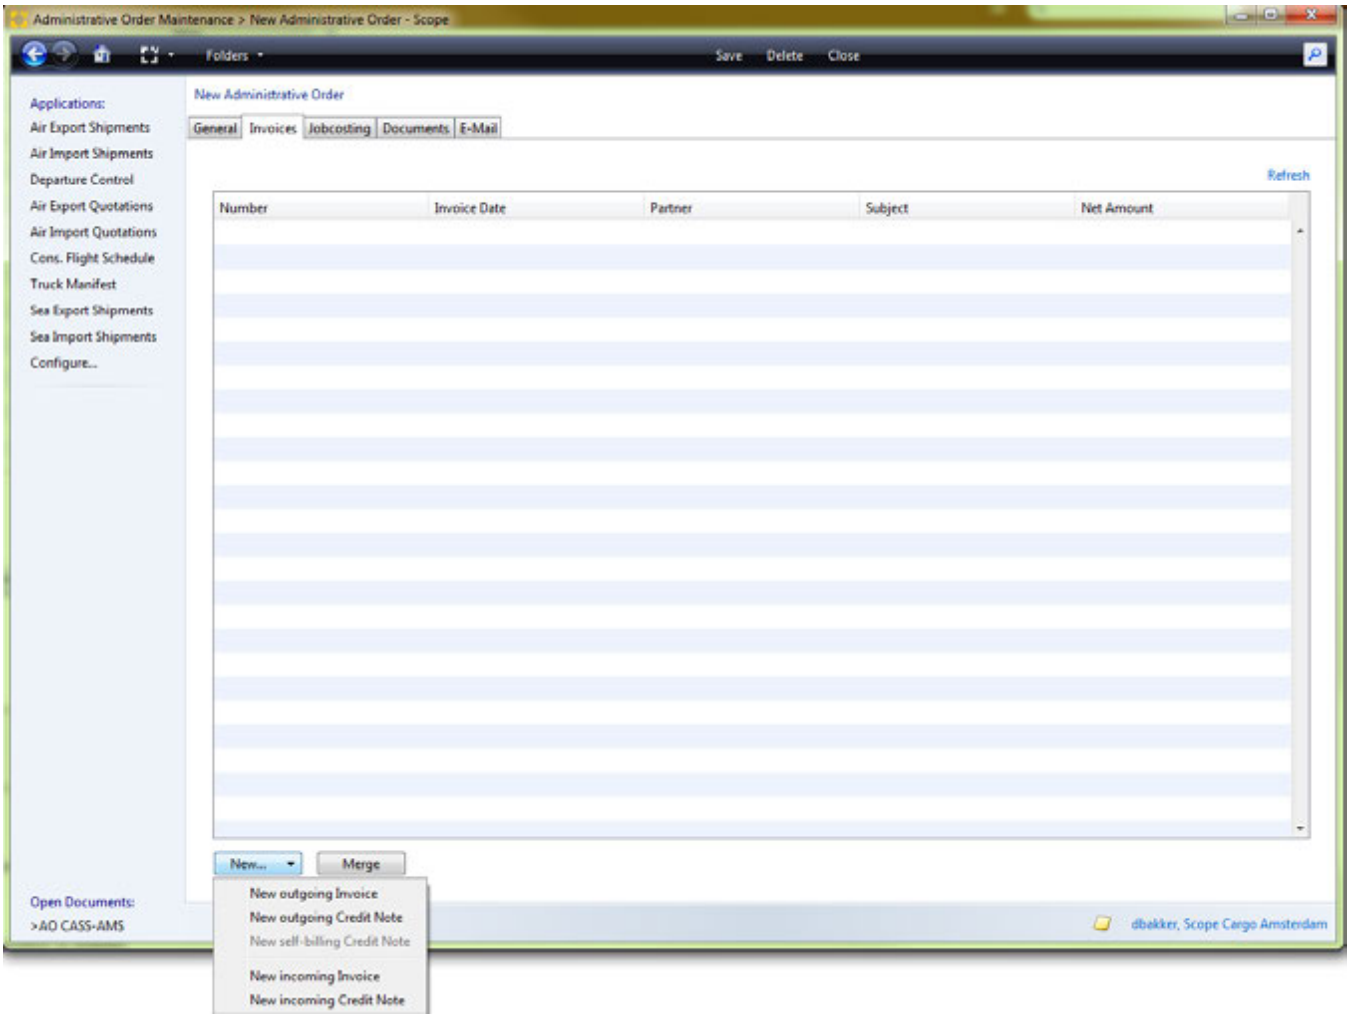
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Action link: create next month

This link will create a new position/occurrence of the Administrative Order for the next month.

Tab (Invoices)

This shows the invoices made for the monthly position, selected in the first tab.



Action: New...

In this dropdown box, you can choose what invoice or credit note you want to create for this Administrative Order/position. This could be a Outgoing Invoice (Sales Invoice or Credit Note) or an Incoming Invoice (Purchase Invoice or Credit Note).

The creation of the Outgoing Invoice is done in same screen as in Finance/Accounts Receiveable.
The creation of the Incoming Invoice is done in same screen as in Finance/Accounts Payable.

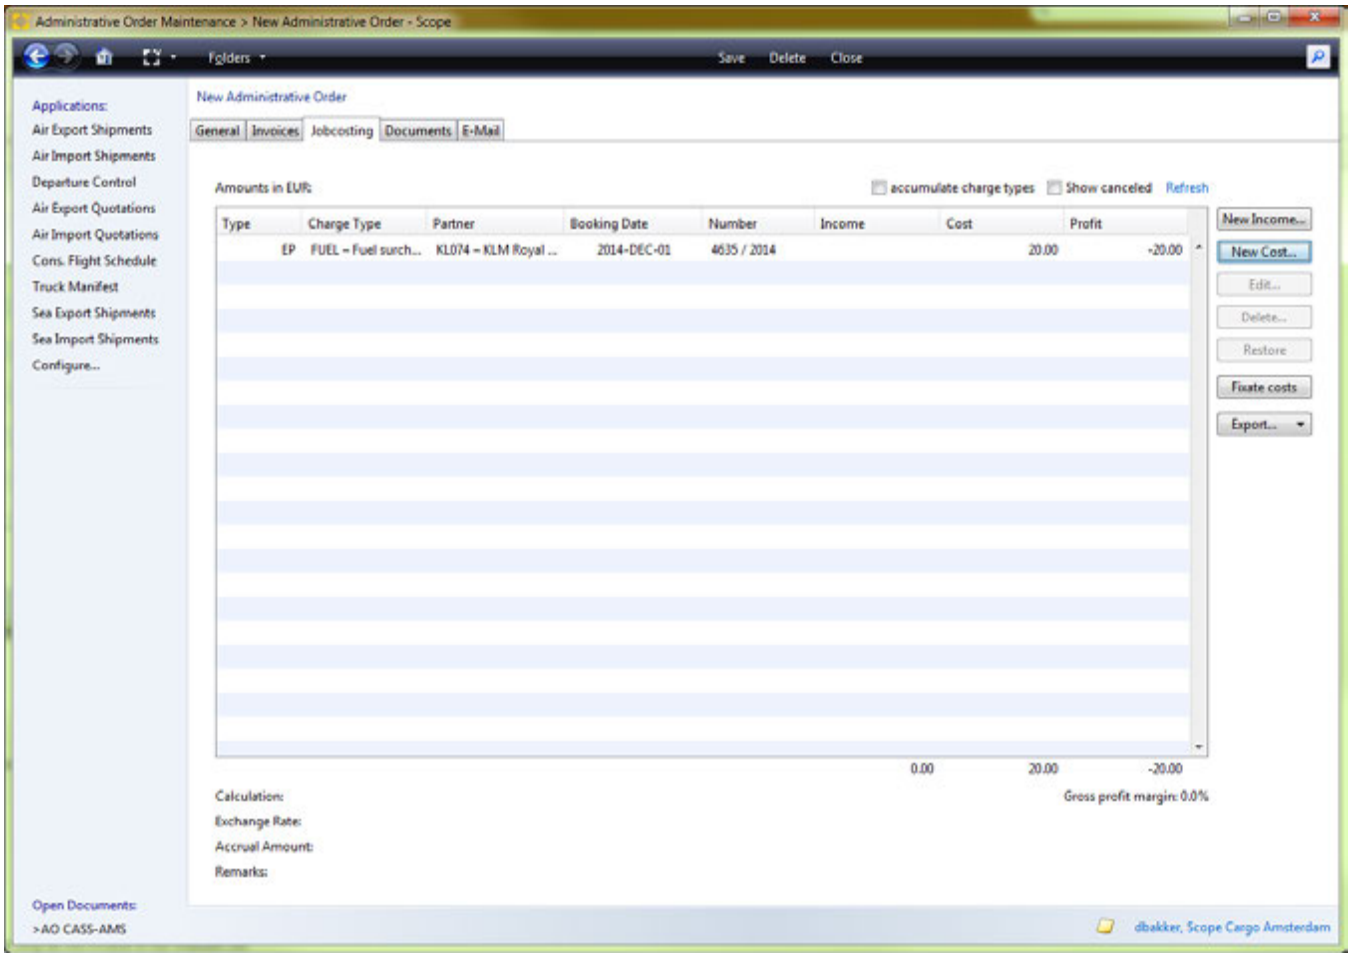
Action: Merge

This action allows the user to select 2 or more invoices and merge them into 1 invoice. This is only possible as long as the invoice is not finalized yet.

Tab: Jobcosting

This screen gives an overview of all Income and Costs entered for the selected Administrative Order/position. As with Jobcosting screens in all entries, here you can also enter new Estimated Income and Estimated Costs.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



See: Jobcosting - Functions - General

Tab: Documents

This tab shows the documents linked to the selected Administrative Order. See: Documents - Functions - General

Tab: E-mail

This tab shows the emails sent for the selected Administrative Order. See: E-Mail - Functions - General

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

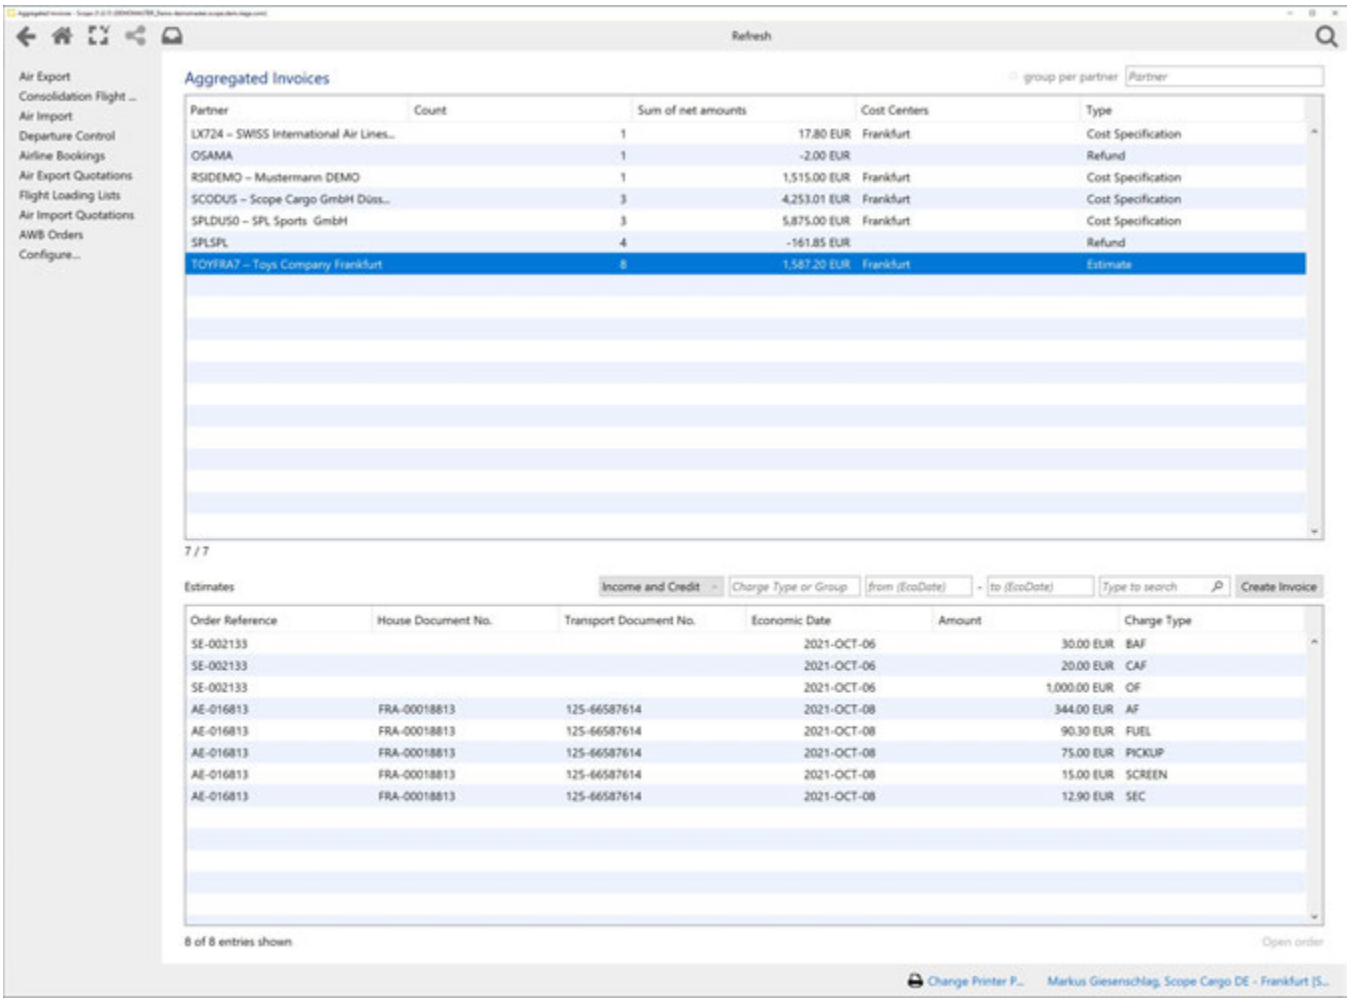
Aggregated Invoices

Scope allows for two different ways of creating aggregated invoices

- Aggregated Invoice by Estimate
- Aggregated Invoice per Cost Specification

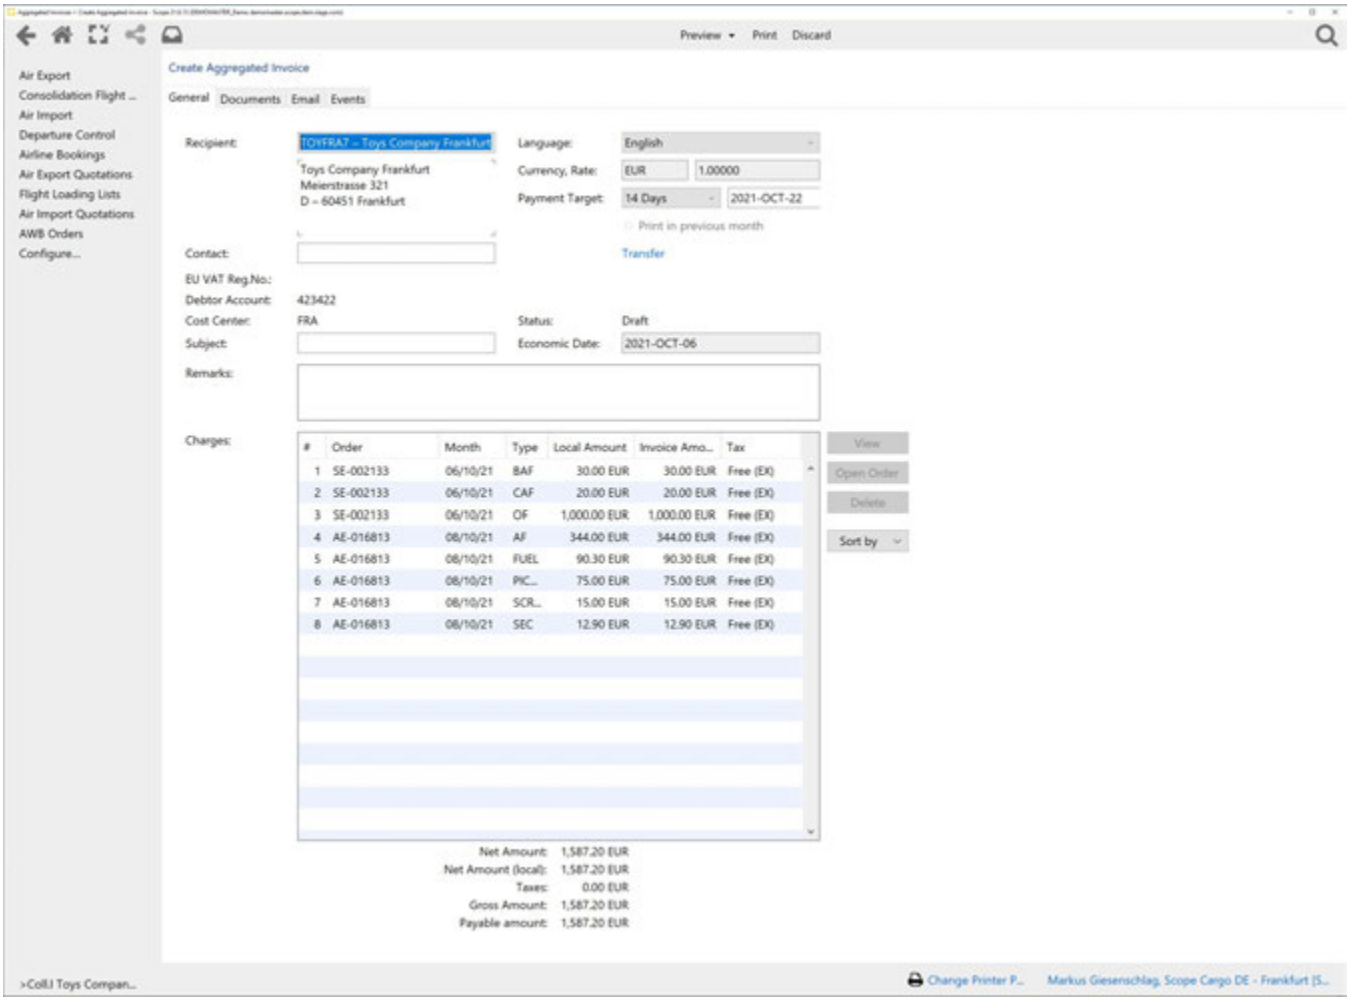
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Aggregated Invoice by Estimate



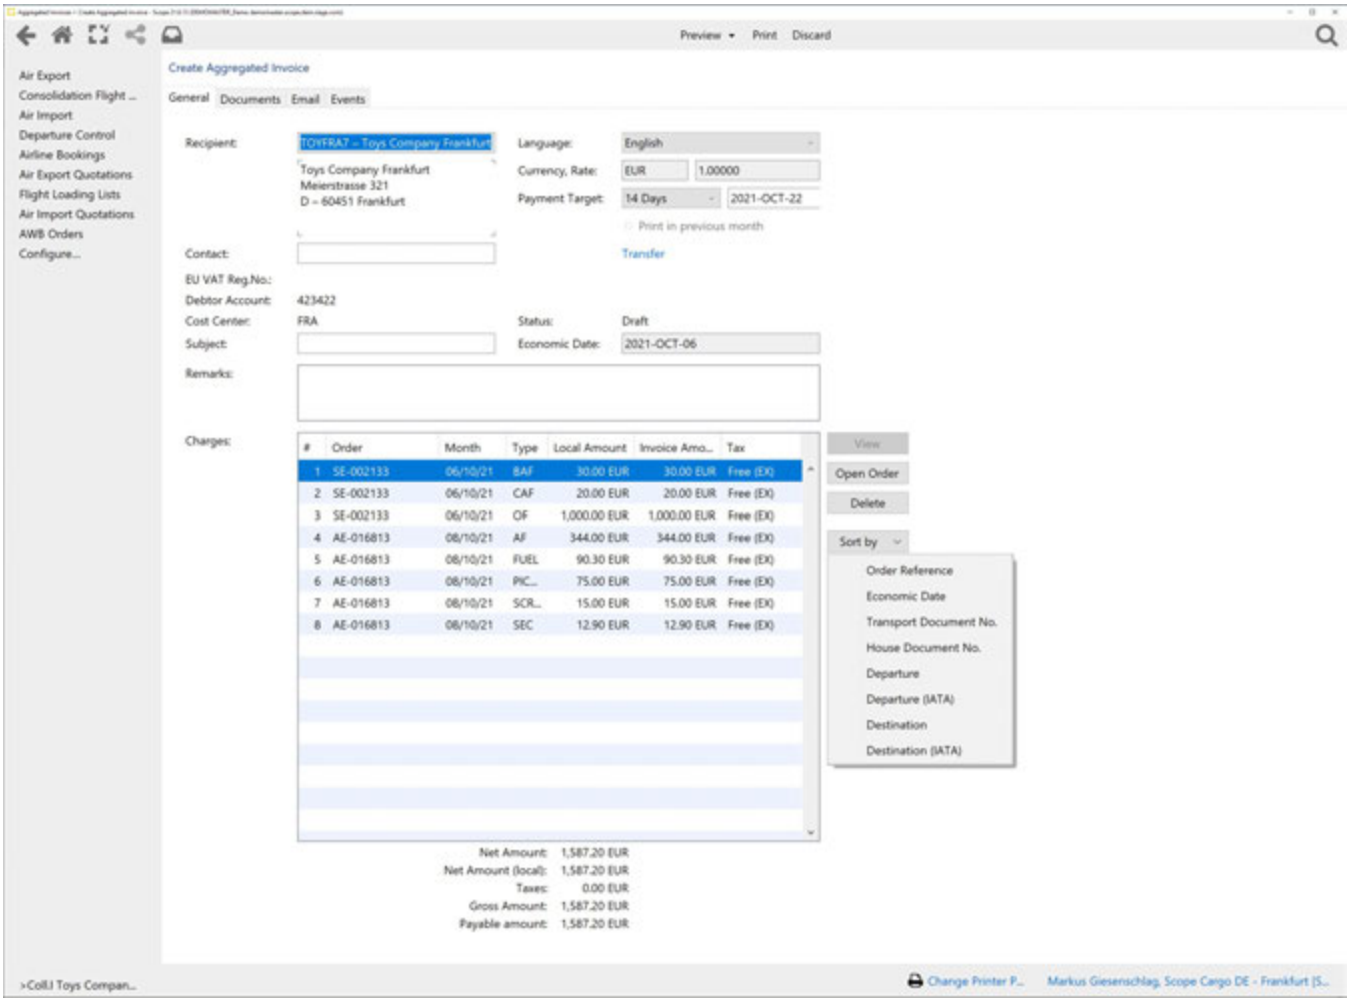
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When selecting a line with Type "Estimate", clicking on "Create Invoice" will take the user to the invoice editor for aggregated invoices by estimate.



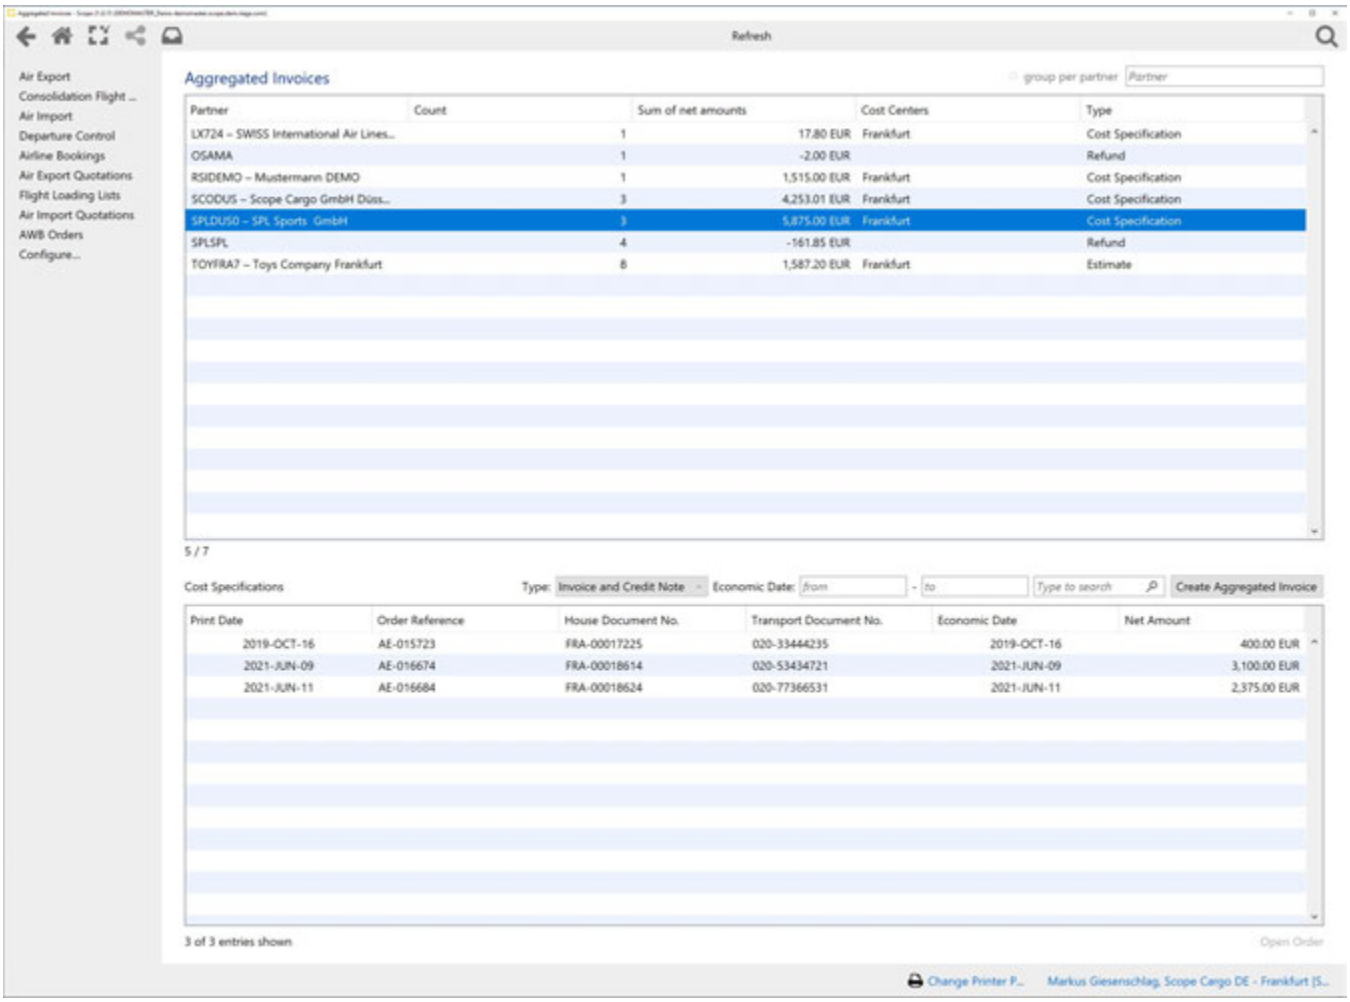
The button "Sort by" allows the user to change the order of the charge lines on the invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



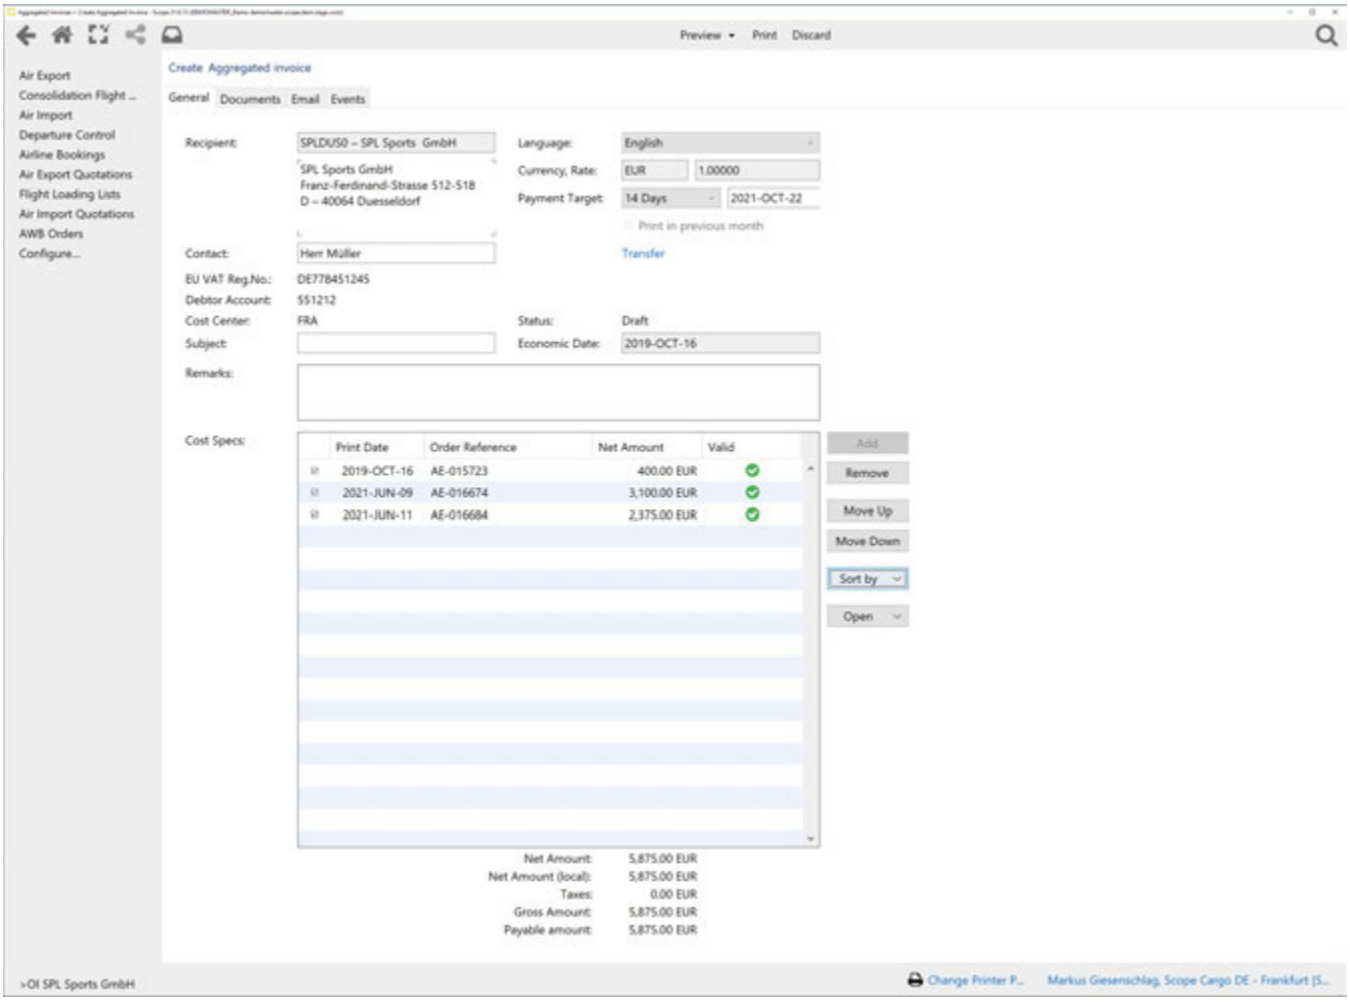
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Aggregated Invoice per Cost Specification



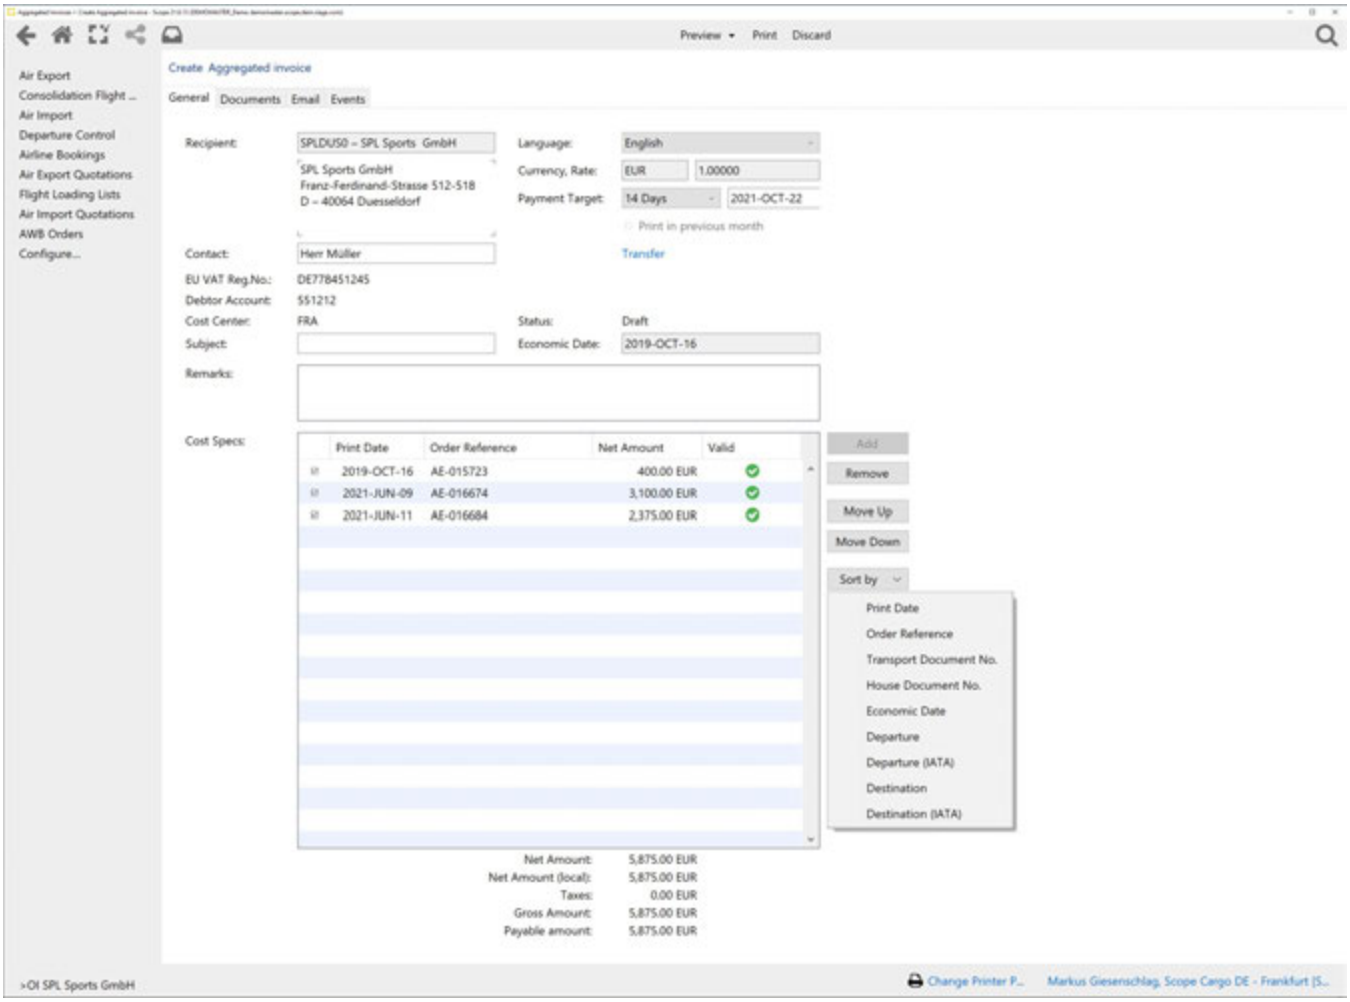
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When selecting a line of Type "Cost Specification" clicking on "Create Aggregated Invoice" will take the user to the invoice editor for aggregated invoices by cost specification.



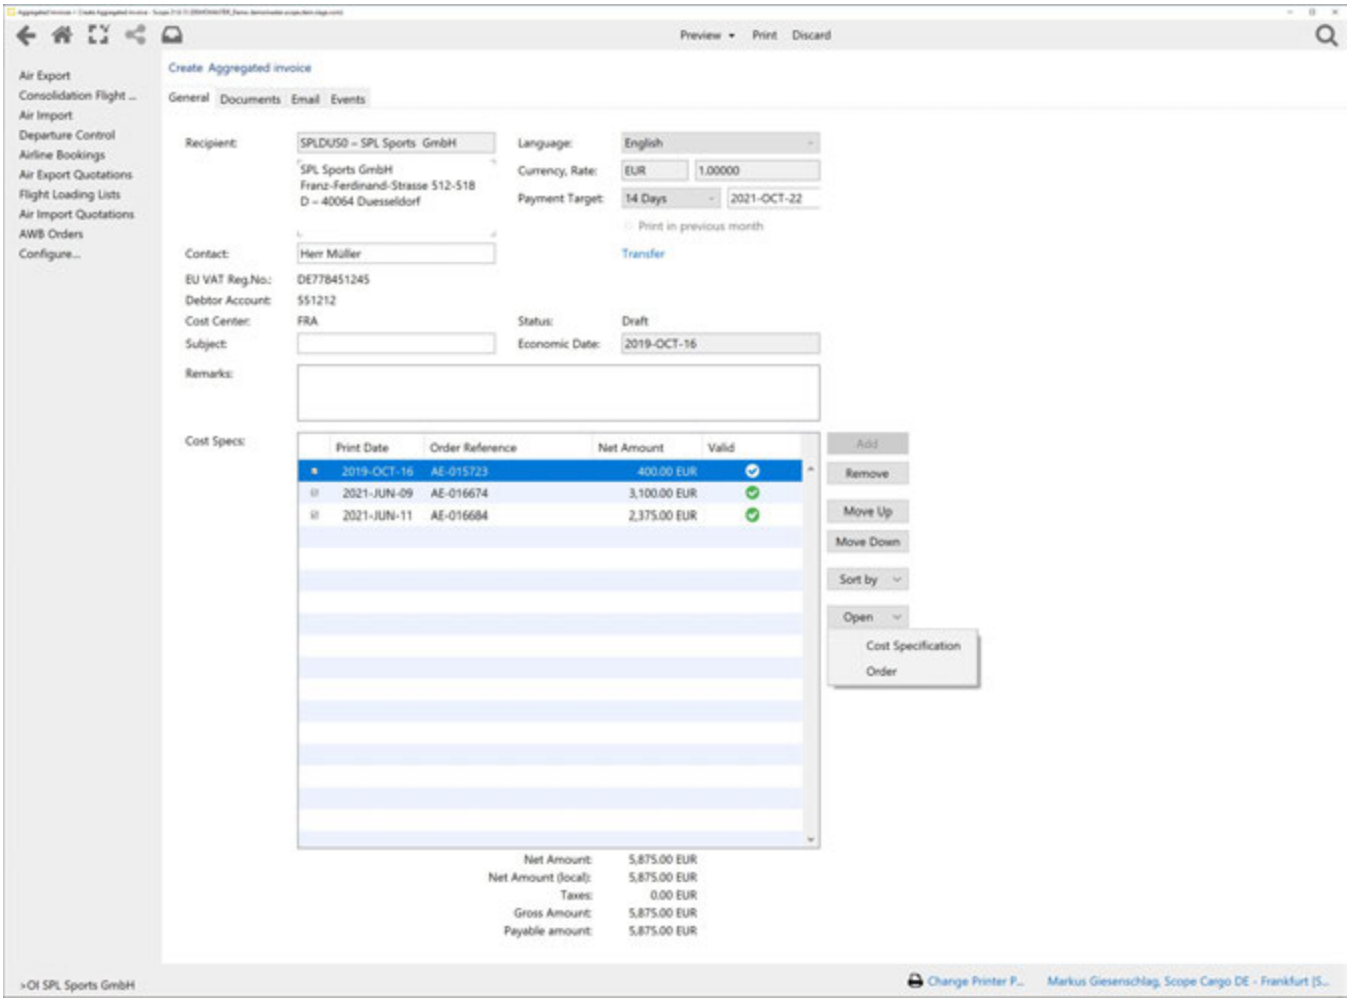
The button "Sort by" allows the user to change the order of the charge lines on the invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The button "Open" allows the user to add orders or cost specifications to the invoice that had not been selected before.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



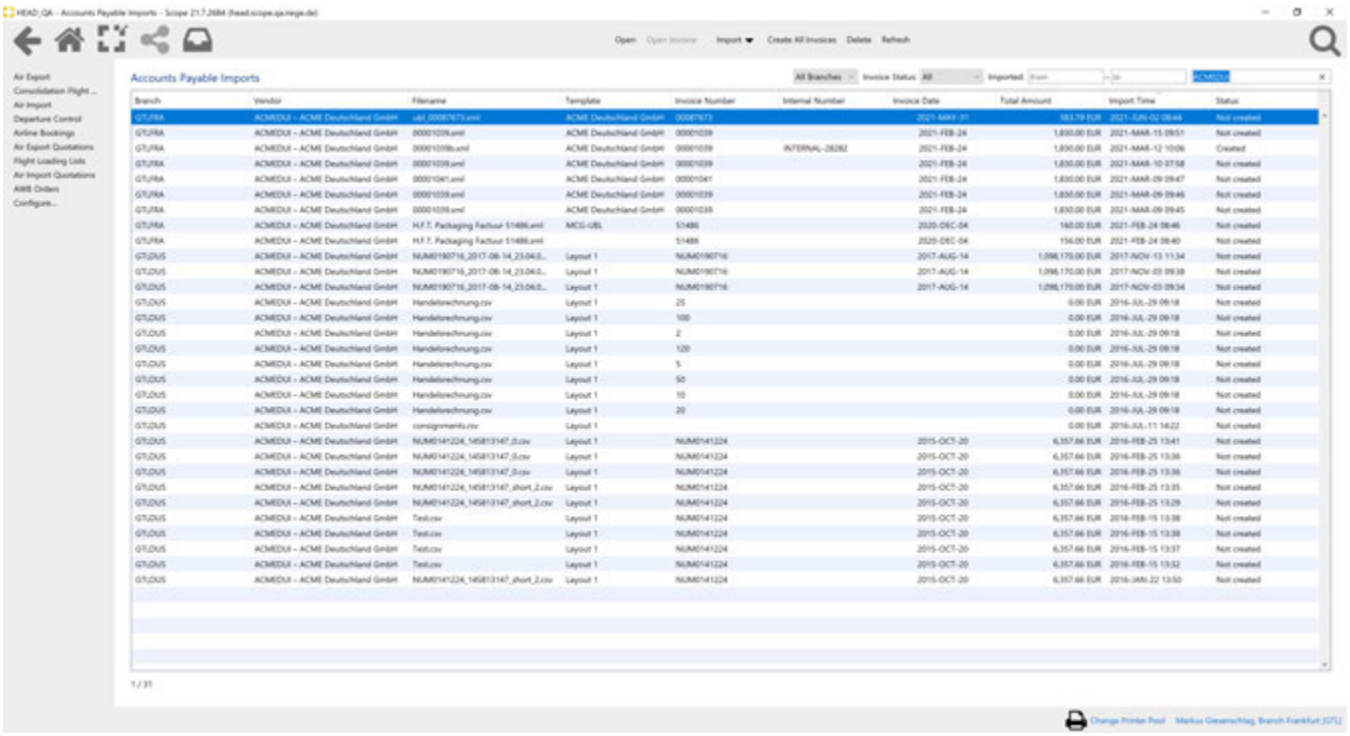
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AP Imports

- Introduction
- Description
  - CSV/Excel
    - File
    - Template
  - UBL XML
    - File
    - Template

Introduction

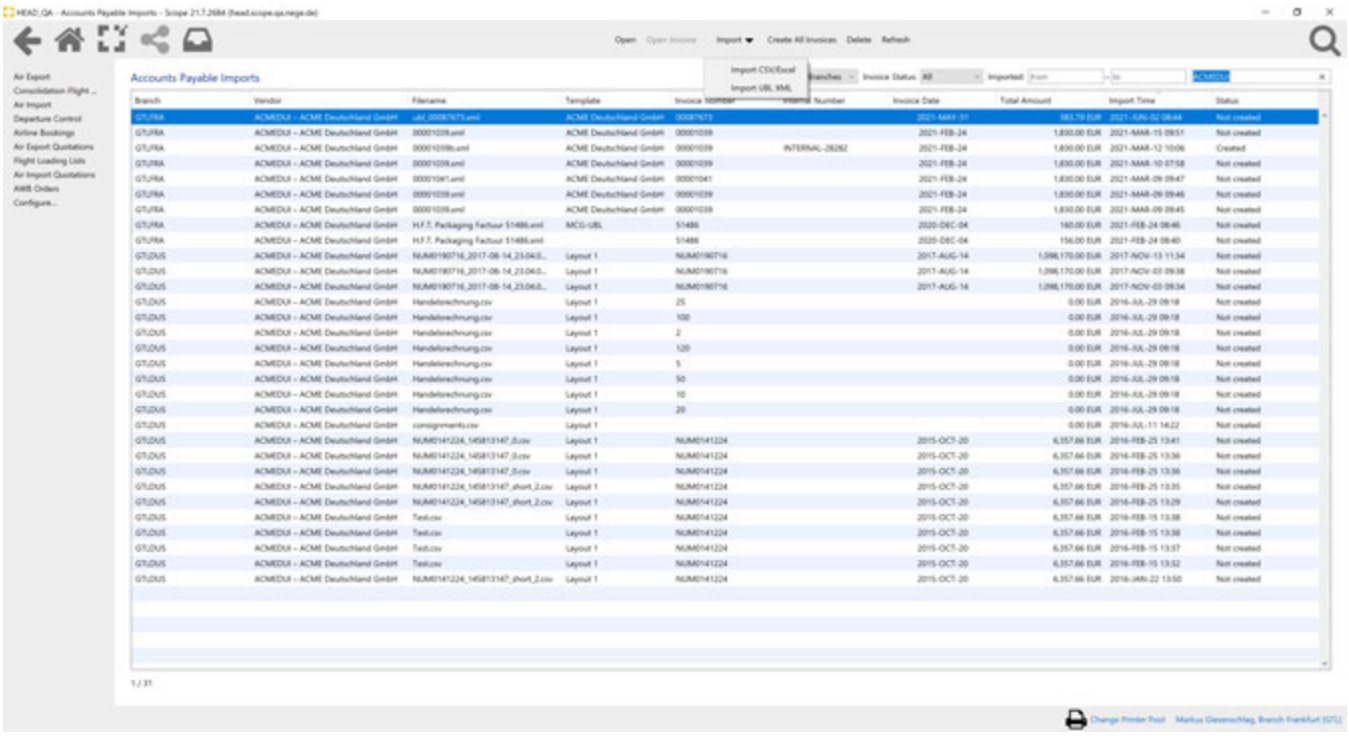
The AP Imports appliance allows to import electronically provided payable information into Scope and create the resulting incoming invoices and credit notes.



Description

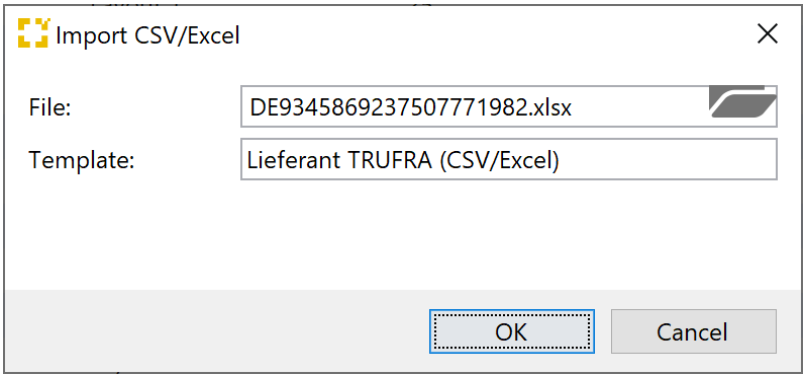
To import a given file, the user selects "Import" from the menu bar.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Two technically different formats are supported: CSV/Excel and UBL XML.

CSV/Excel



File

The user selects the respective CSV/XLS file containing the electronically provided payable information from his computer.

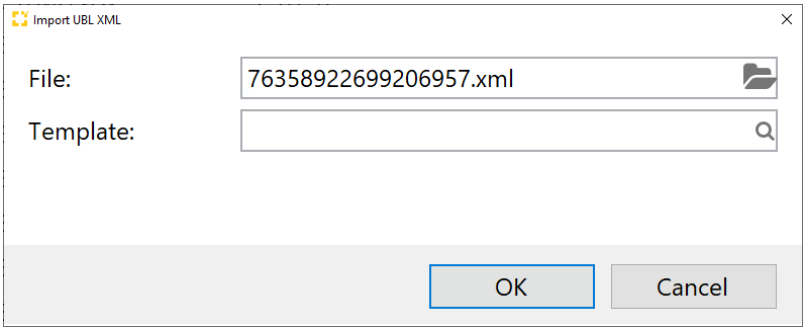
Template

For CSV/Excel-format selecting an AP Import Template is mandatory.

When Scope has completed processing the file the user will be taken to the AP Imports Editor.

UBL XML

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



File

The user selects the respective XML file containing the electronically provided payable information from his computer.

Template

Due to the structure provided in the UBL-format selecting an AP Import Template can be left blank.

When Scope has completed processing the file the user will be taken to the AP Imports Editor.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

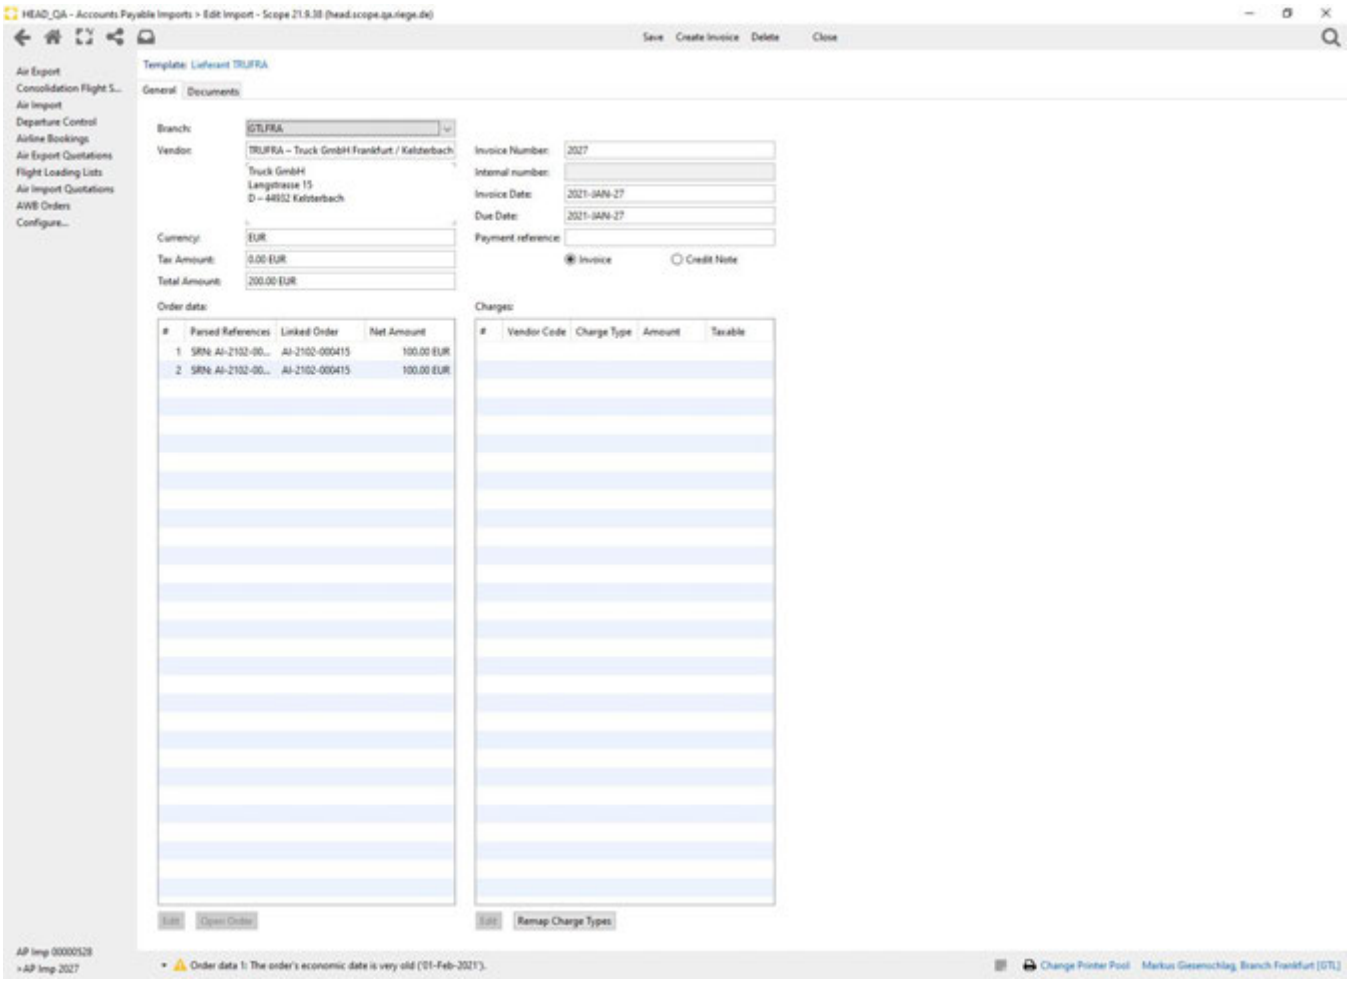
AP Imports Editor (CSV/Excel)

The editor shows all details taken from the imported file and their respective matches with Scope's own details.

In contrast to the UBL-Import the assigned template cannot be changed.

Matching the vendor

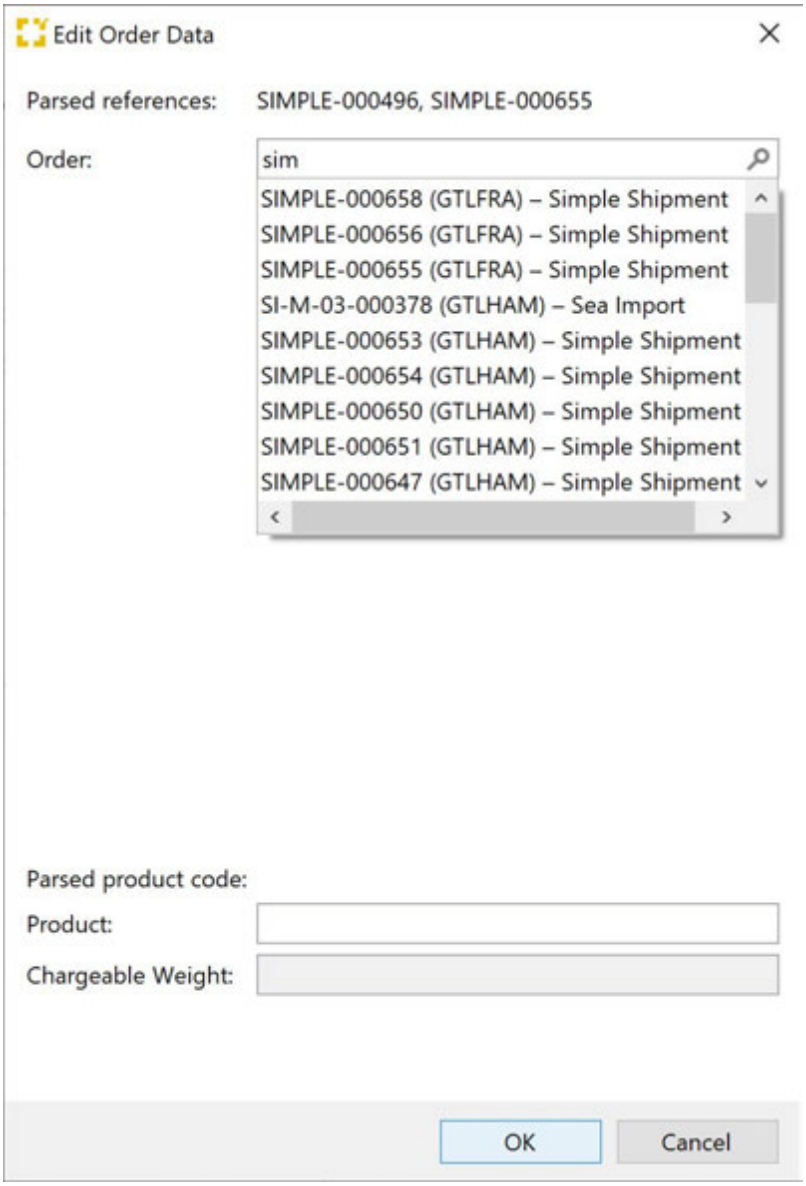
The vendor is matched by the definition in the template.



Matching the orders

Scope tries to find the order matching the references given in the UBL-file. In case Scope can't find a match the user has to select the correct order manually.

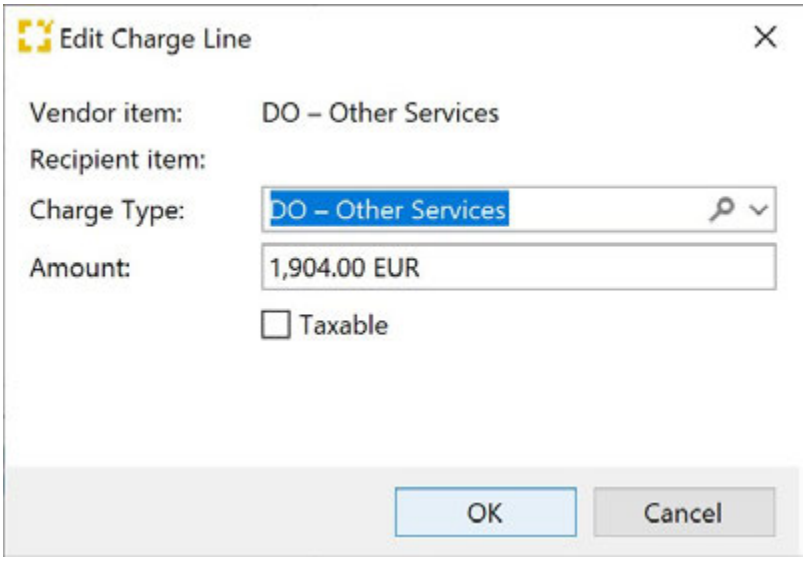
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Matching the charges

Scope tries to match the charge codes given in the file with Scope's own charge codes. In case Scope can't find a match the user has to select the correct charge code manually.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

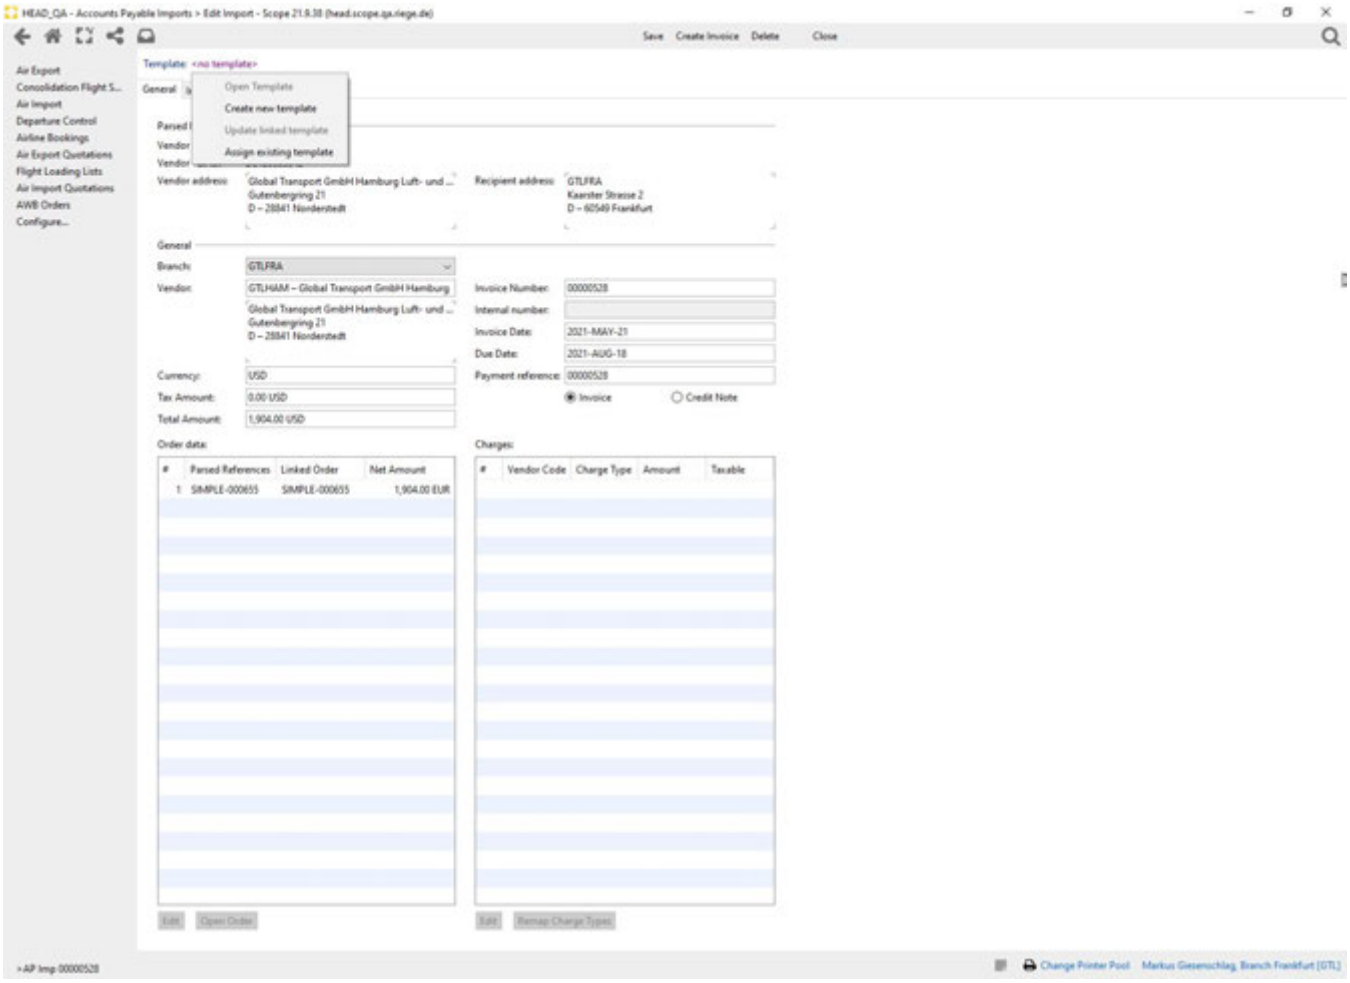


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AP Imports Editor (UBL)

The editor shows all details taken from the imported file and their respective matches with Scope's own details.

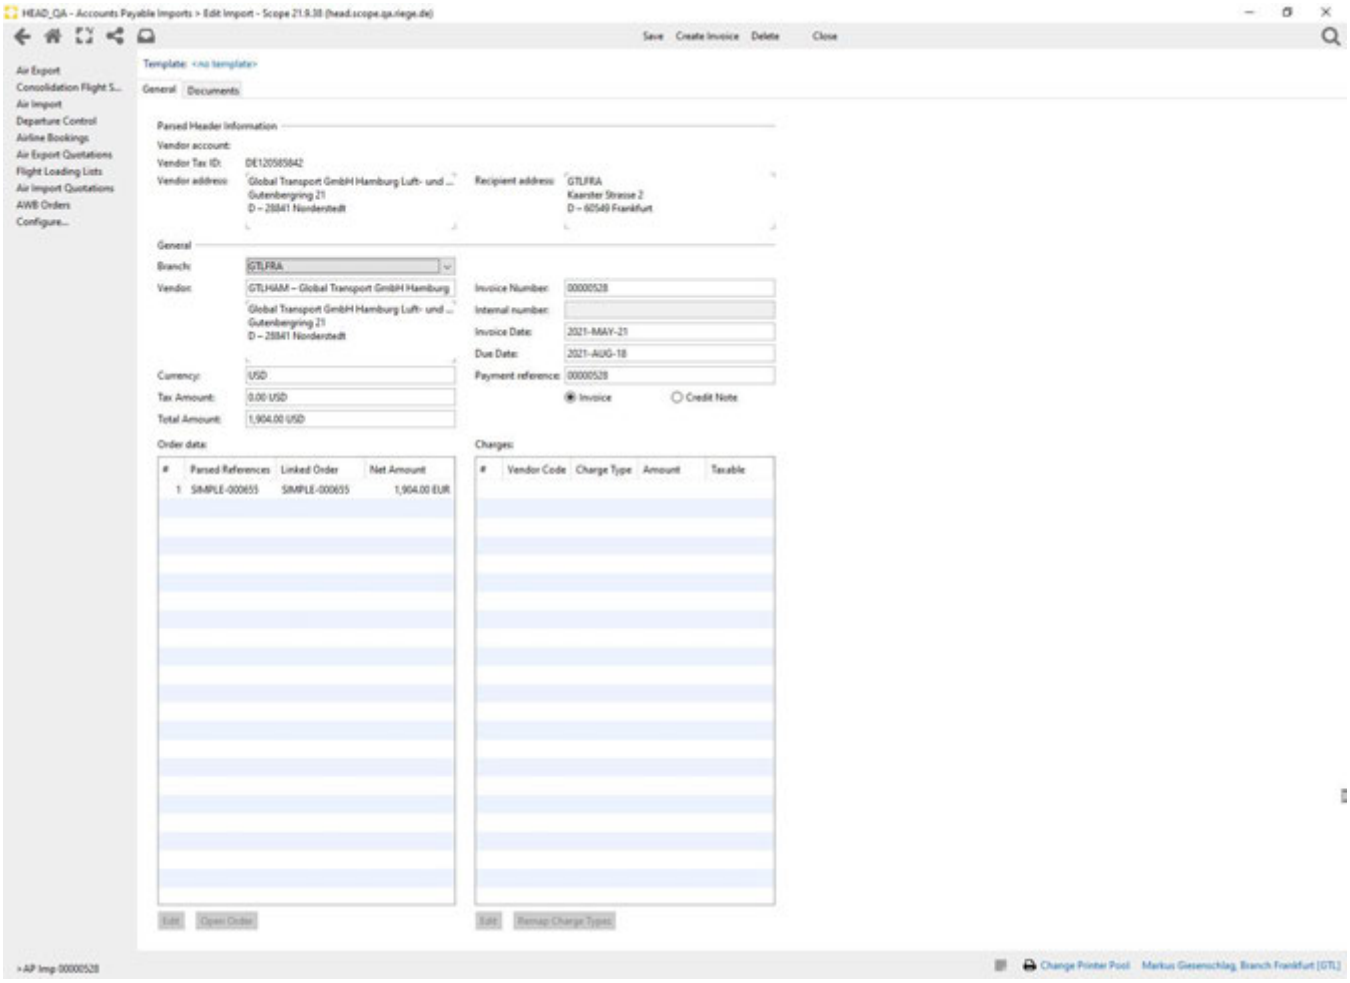
The user can assign an existing template or create a template from the current import.



Matching the vendor

The vendor is matched by creditor account number or if the creditor account number is not contained in the UBL-file by tax-id and address.

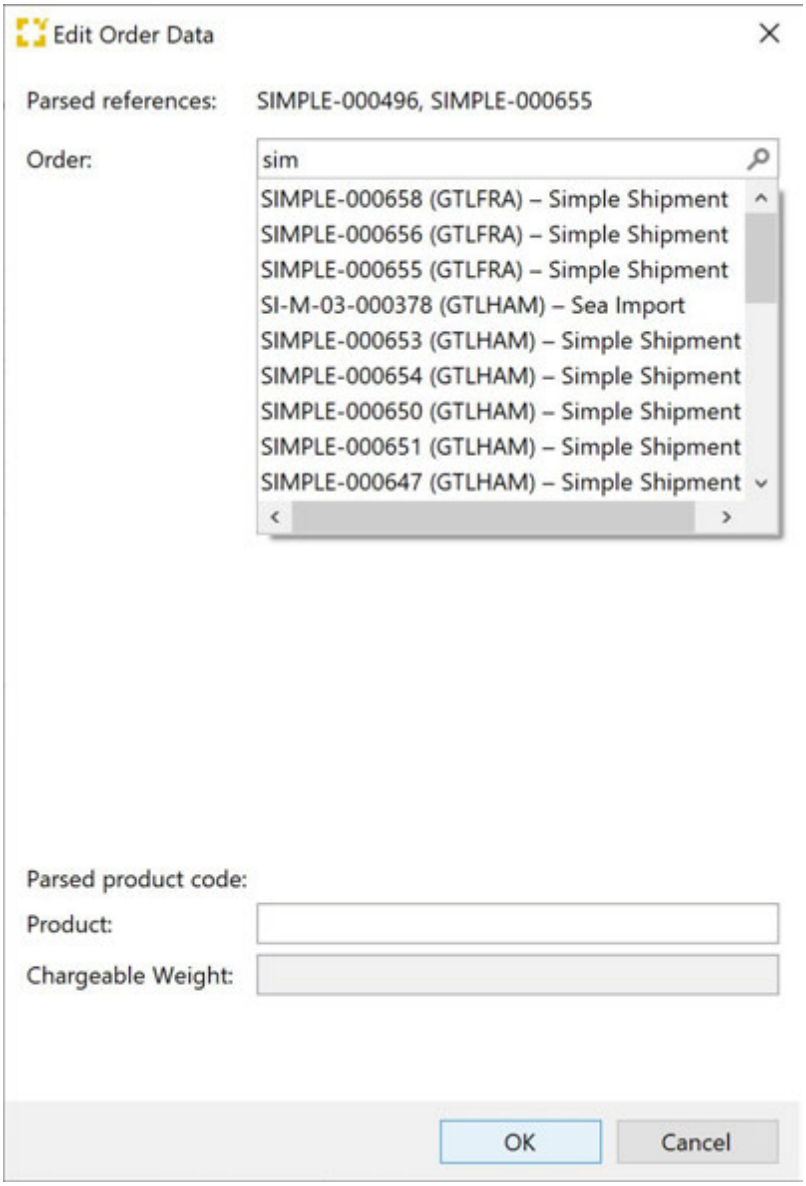
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Matching the orders

Scope tries to find the order matching the references given in the UBL-file. In case Scope can't find a match the user has to select the correct order manually.

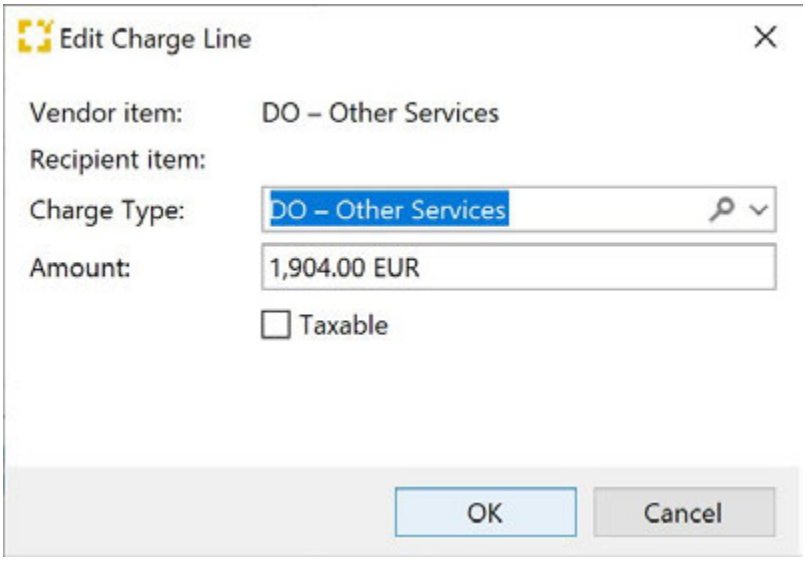
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Matching the charges

Scope tries to match the charge codes given in the file with Scope's own charge codes. In case Scope can't find a match the user has to select the correct charge code manually.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Breakdown

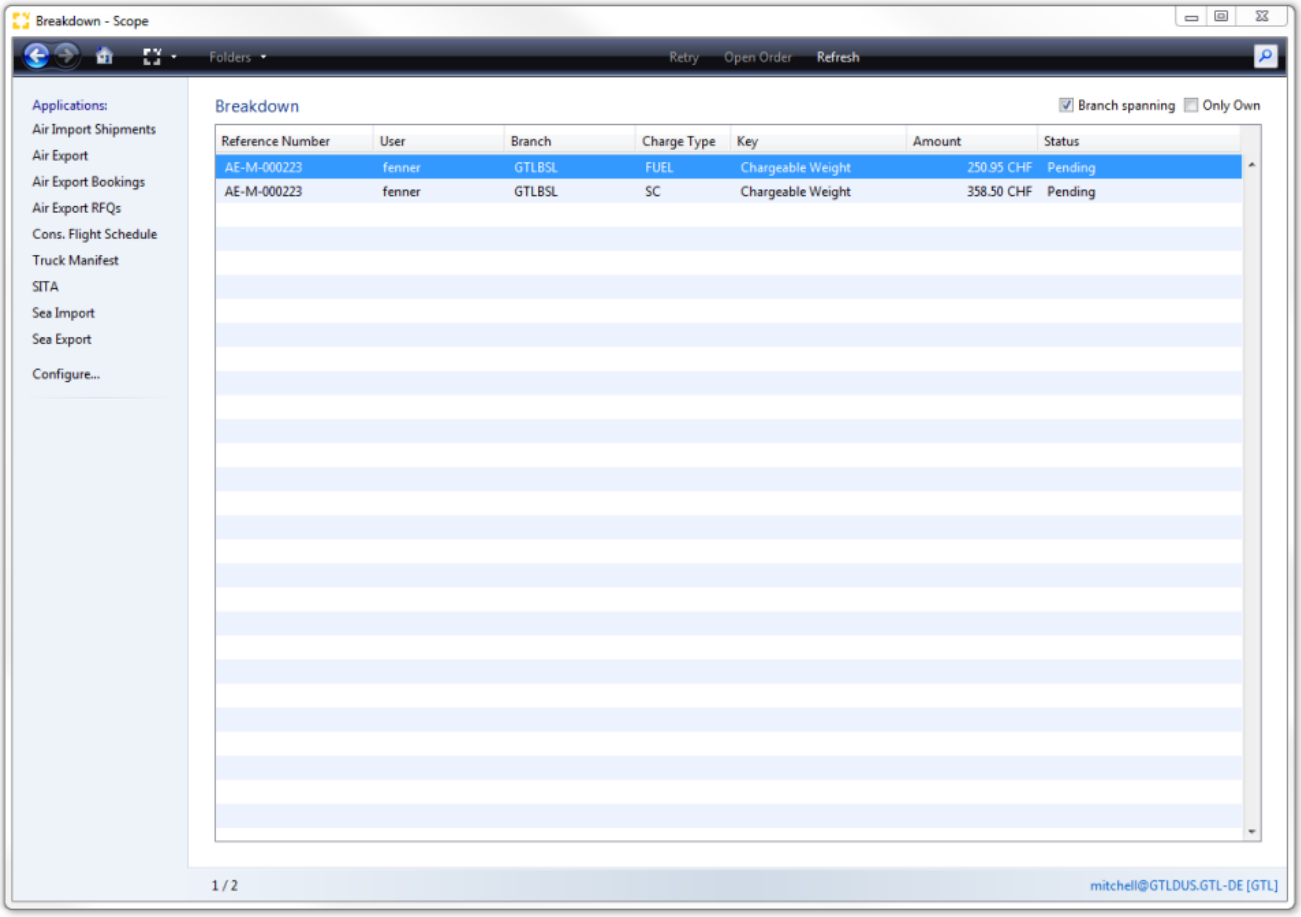
- Introduction
- Description

Introduction

Breakdown refers to the breakdown of charges on master shipments to all the house shipments on the master. Depending on how the charge code is defined, the figure may be broken down equally across all the houses, or it may use any of the other possible breakdown methods such as by chargeable weight, by gross weight, by volume, by number of pieces or by profit share. When viewing figures in jobcosting , the *Type* column will indicate any transferred charges as *charge type* "TEP" or "TEI". For jobcosting purposes it is always assumed that profit is not viewed at master level, but at house level and therefore master charges will always be transferred to house shipments to ensure master shipment show zero profit.

The purpose of the **Breakdown** finance application is to show jobs that have not broken down correctly with the option to retry the breakdown.

Description



Retry

This action will restart the transfer process for the shipment highlighted in the overview.

Open Order

The order highlighted in the overview is opened to show the full jobcosting entries.

Refresh

The index is updated to ensure all orders with transfer errors will be displayed.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Branch spanning

Check this box to view all orders in all branch offices that have transfer errors.

Only own

This box is checked by default and therefore when the application starts, only the orders that have transfers initiated by the current user will be displayed. Uncheck the box to see error transfers for all users.

Breakdown (Summary table)

The breakdown summary table displays the following information

Reference Number

The reference number for the transfer which will normally be the shipment number.

User

The user who created the transfer job.

Branch

The branch office where the transfer was created.

Charge Type

The charge code, for the charge that failed to transfer.

Key

The method by which the charge is to be broken across the house shipments.

Amount

The amount of the charge that is to be broken across the house shipments.

Status

The status of the transfer job.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

CASS

- Introduction
- Description

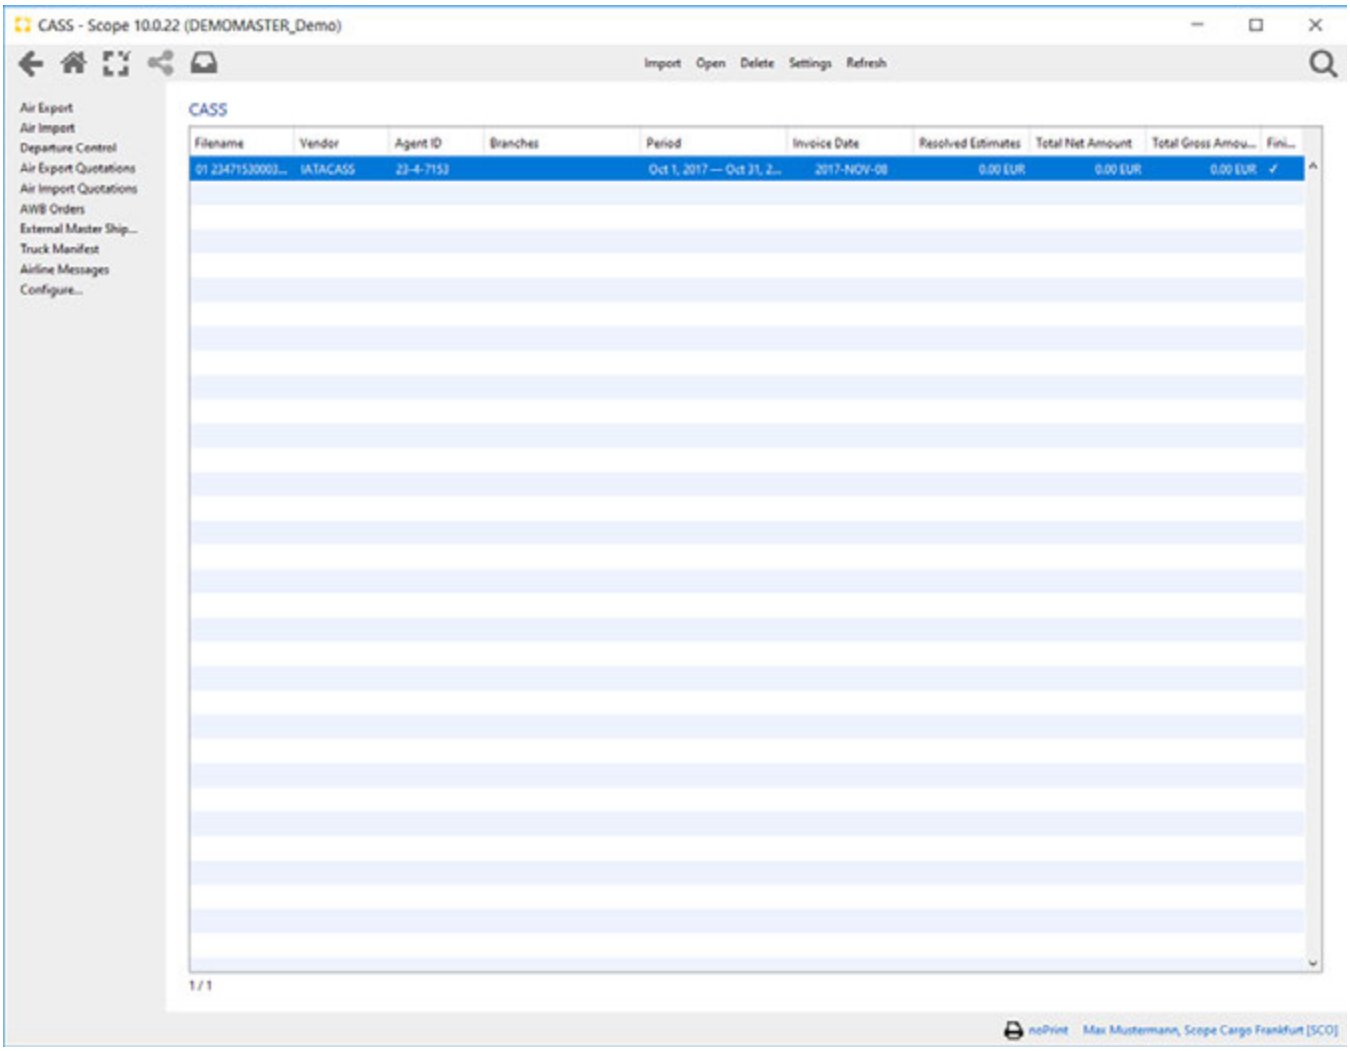
Introduction

Cargo Account Settlement Systems (CASS) is a system for billing and settling of accounts between airlines and freight forwarders. CASS files are generated monthy bei IATA and are available as hardcopy or electronic file (Excel-file or HOT-file). Through using CASS application it is not necessary to check the hardcopy manually. Instead Scope will check the CASS automatically and issue a voucher for accounts payable.

Description

CASS files (HOT-file) containing financial information from the airline can be imported into the Scope system using the CASS application (*Finance - CASS*). Estimated due-Carrier (like Airfreight, Fuel-/Security-Fee) will be resolved by a voucher (accounts payable)

Please note, it is necessary to request HOT-file at your IATA office.



Import

This action opens a file browser in order to select the files on the local computer or local network that is to be imported into Scope

Open

Opens the CASS file highlighted in the overview

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

Delete the CASS file highlighted in the overview

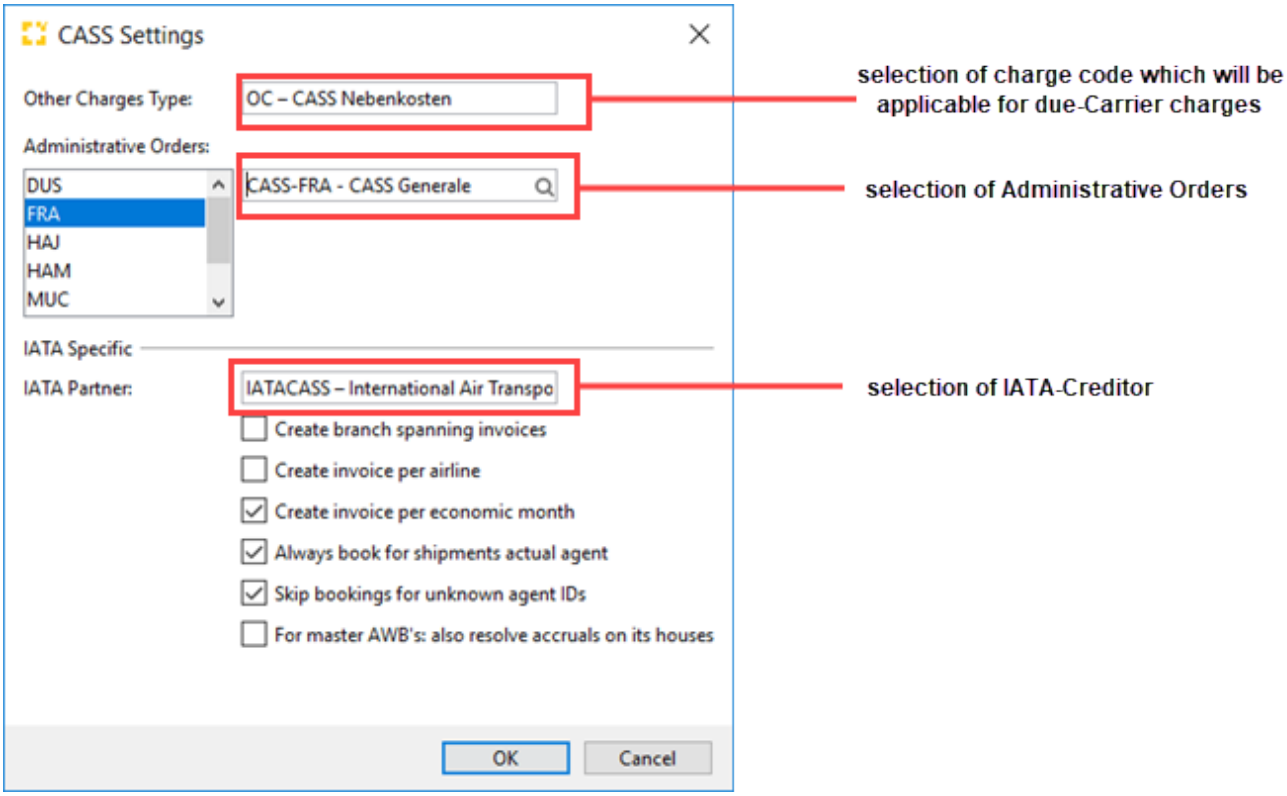
Settings

Opens the CASS parameters setup.

Refesh

Updates the index to ensure the latest CASS details are visible in the overview.

Configure parameters application



IATA partner

The name of the IATA partner. This is the vendor to whom CASS payments are made. This partner should be created in advance of entering the CASS settings. Partner needs the role vendor.

Create branch spanning invoices

When selected, a single voucher to the vendor will be created. When not selected, the vouchers to the vendor will be on a per branch basis.

Voucher per airline

This check box is used to indicate if there is one voucher per airline.

Create invoice per economic month

Vouchers will utilize the economic month of the shipments. In the instance where the CASS vendor sends an additional charge or credit months after the shipment, the charge will be booked to the current economic month. If not checked, then the charge will be booked to the economic month of the shipment.

Always book for shipments actual agent

The shipment will be booked against the agent (branch) who originally registered the MAWB. Thus if a MAWB registered by LAX is used by NYC, the shipment will be booked against LAX.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Skip bookings for unkown agent IDs

If the CASS hot file contains bookings for unknown agent IDs, these bookings will be skipped.

For master AWB's; also resolve accruals on its houses

This can be left unchecked since accruals are always resolved to the house level when processing CASS charges.

Cass Other Charges Type

The charge code for the CASS other charges.

Since the CASS file does not contain individual other charges such as Fuel and Security, but only a total of such charges, this CASS other charge code should be used to represent these charges. Typically "OC" is used.

Branches

All of the branches of the organization should be visible. For each branch, administrative orders should be created.

Administrative orders

From the "Finance" menu option of each branch, Administrative Orders should be selected. Within this application, for each branch, a CASS administrative order should be defined. The can be chosen freely and the appropriate cost center applied. A set of monthly positions for each order should be created so that monthly CASS figures can be applied to the appropriate administrative order. This should be done in advance of applying CASS settings, so that there is a valid administrative order to select when finalizing settings. The purpose of administrative orders is so that unknown CASS charges can be stored in these orders and subsequently resolved by the user who will manually apply them to the correct shipments.

CASS Charge Type

CASS consist of two amounts: AF (Airfreight) + sum of Due-Carrier Other Charges. AF will be dissolved by the same charge type, all other charge type (e. g. Fuel, Security, DGR, X-ray) will be dissolved by the Due-Carrier Other Charges.

Pay attention while importing CASS

- Import is only allowed with HOT-file
- Settings must be set up correctly
- Administrative order must be generated for each month

Pay attention after importing CASS

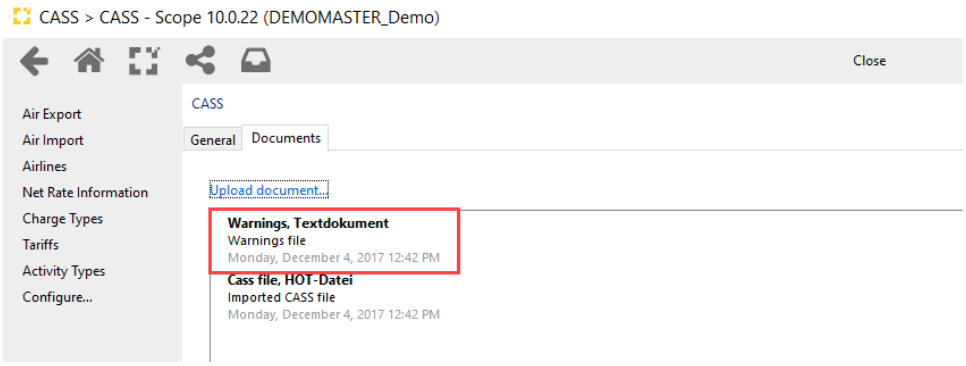
- **Check Warnings**

  While importing CASS Warnings will be created if an error occured:

Warning	Meaning
Unknown IATA code% 1 $ s% 2 $ s at AWB Booked on% 3 $ s from% 4 $ s	The line item could be assigned to any branch (% 1 $ s is then the IATA code for which no suitable treasury agent was found). These amounts are recorded anyway, on the administrative order of the branch that carries out the CASS-Import .
AWB Unknown% 1 $ s Booked on% 2 $ s% 3 $ s	No shipment could be found for the AWB-number. It is therefore posted to the administrative order of the corresponding branch (IATA code could be assigned in the case of a branch.)
Wrong AWB% 1 $ sf \ u00fcr% 2 $ s Program go \ u00f6rt% 3 $ s Booked on% 4 $ s% 2 $ s	The IATA code was assigned to a branch, and the shipment of specified AWB was also found, but the shipment is not one of the assigned branch. It is then posted to the administrative order of the identified settlement
Number of scanned records% s (% s) does not match the number specified in the footer (s%) agreed	The checksum at the end of the file has not agreed. This warning has no effect.
An AWB% s,% s, gives way to the specified tax amount (% s) from the expected (% s)	The calculation of the VAT amounts are not in accordance with, or oppose the sum.
An AWB% s has been found to be a cancellation (DCO / CCO), no edition (DCR / CCR). At AWB +% s has been found for a Revised (DCR / CCR) No cancellation (DCO / CCO).	These warnings are usually created together: The previous CASS run had incorrect amounts (eg, total 100, - USD, instead of 80, - USD, it would be). The current CASS run corrects the amounts with a DCO with 100, - USD and a DCR of 80, - USD. If either the DCO or lacking the DCR is still recorded, with DCO - normal, DCR ' .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In addition, a report is created as a CSV, which can be seen and checked in the documents tab of the CASS.
The report will be generated if the sum of reserves is consistent with the amount of the CASS per shipment.



The CSV has the following columns and is produced per branch:

1. AWB-number
2. Shipment Number
3. charge code (AF or CASS-charge-code)
4. Expected (total accruals amount)
5. In fact (amount CASS)
6. difference
7. %
8. Tax (VAT or FREE)
9. Weight (CASS) (weight of the shipment in the CASS-file)
10. Weight (self) (weight of the shipment in scope)

The third document number is generated as follows:
CASS <branch-code><zeitraum-start><zeitraum-ende>
The data is in the format 'dd / mm / yyyy'
So, for example, 'CASS-RSIDUS-01/03/2018-31/03/2018' . This number can be modified in the accounts payable program.

- **Balance list**

  Besides Warning list a second list will be created, called Balance list. You can use this list to check which accrual was not issued or issued incorrectly. This such case you have two possibilites: Acknowledgement of this amount or claim at CASS **afterwards**. Please note, CASS must be booked as received. It is possible to change the amounts after importing, but not advised.
- **Estimates / Accruals**

  in Estimates application you can generate a report with all resolved accruals, so you can reconstruct how accruals (Airfreight and due-Carrier-charges) were resolved
- **Account payable**

  CASS-voucher can be opened at accounts payable application and exported to xls-file to check the administrative orders

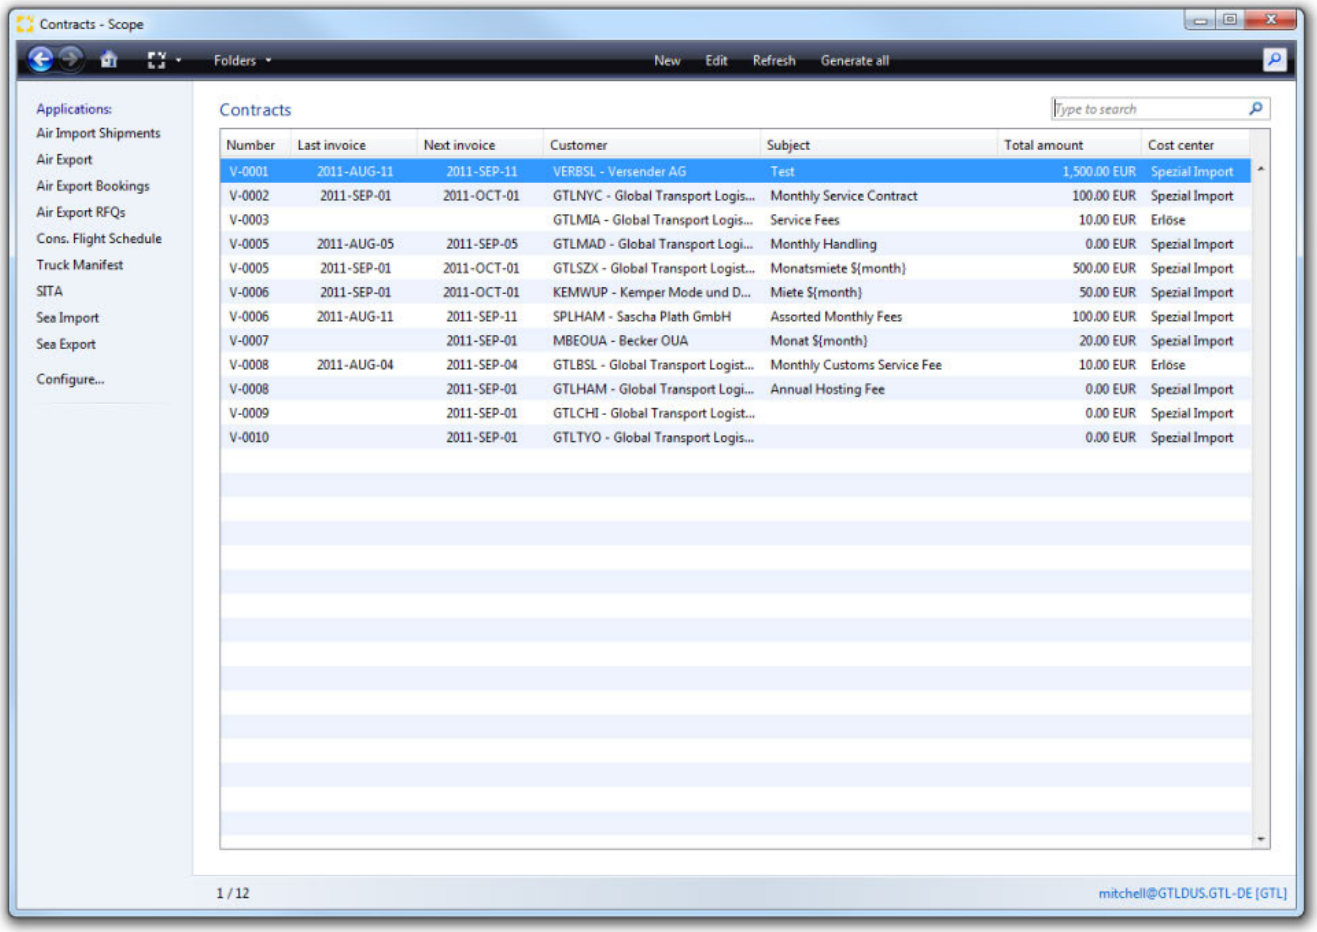
Contracts

- Introduction
- Description

Introduction

The Contacts application is used for legal agreements that require invoices to be issued on a recurring basis at regular intervals. Each contract therefore contains the items that are to be automatically charged and invoices are automatically generated at the required intervals with these items.

Description



The overview will show all contract created, these may be active or terminated contracts.

The following functions are available:

New

Opens the contract editor to create new contracts

Open

The contract highlighted in the overview will be opened using the contract editor. Changes may then be made to the contract.

Refresh

Updates the index to ensure the latest contracts are present.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Generate All

This function will automatically generate all due vouchers for all the active contracts listed in the overview. As the vouchers are generated, the *last invoice* and *next invoice* date columns will be automatically updated.
The new vouchers will also be present in the accounts receivable application.

Contracts (summary table)

The following information is available about each contract in the summary table. Contracts information can be sorted by clicking the title of the table columns:

Column	Description
Number	A unique reference for the contract, generated automatically when the contract is first saved.
Last Invoice	The last date on which an invoice was issued for the contract
Next invoice	The next date on which an invoice is due to be issued for the contract
Customer	The Name of the partner to whom the invoice will be issued.
Subject	A summary description of the contract
Total Amount	The total amount that is billed on each invoice for the contract
Cost center	The cost center to which the contract charges will be applied

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

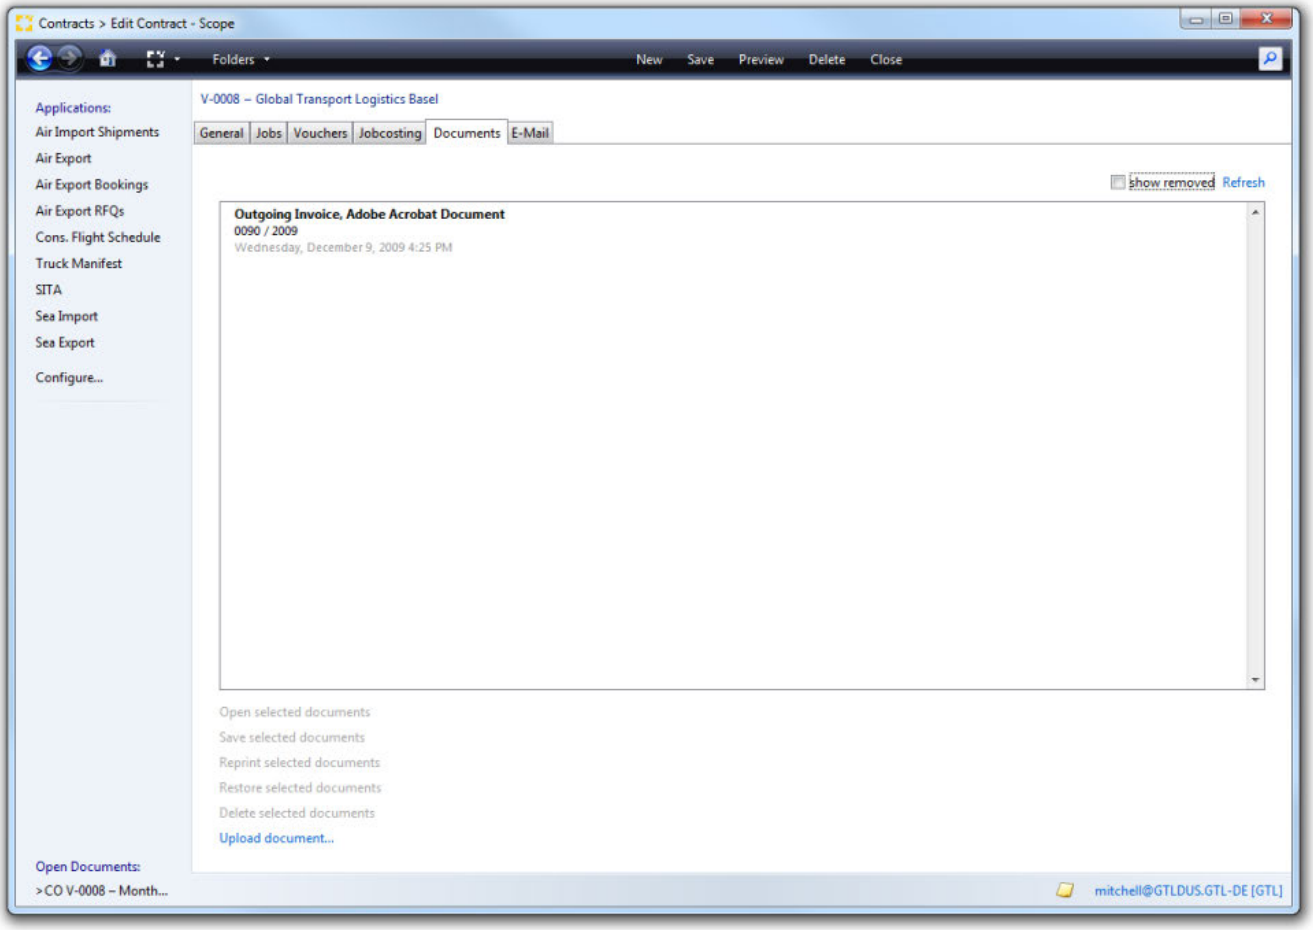
Documents - Contracts - Finance

- Introduction
- Description

Introduction

The documents tab shows all documents that have been created for the job selected in the jobs tab. If no job is selected, then documents generated for all jobs are shown.

Description



The following functions are available in the menuu bar:

New

Creates a new contract.

Save

Saves the currently open contract.

Preview

Opens an example of the invoice in PDF format on the local computer. This is a sample document and no financial changes occur.

Delete

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This action is only available if a new contract has not been saved. Once a contract is saved, it is not possible to delete it, however a contract can be terminated by setting the *Ends on* date to a date in the past.

Close

Closes the current contract without saving any changes.

Show removed

Displays any document that may have been removed from the listing of available documents.

Refresh

Updates the index to ensure the latest documents are visible.

Open selected documents

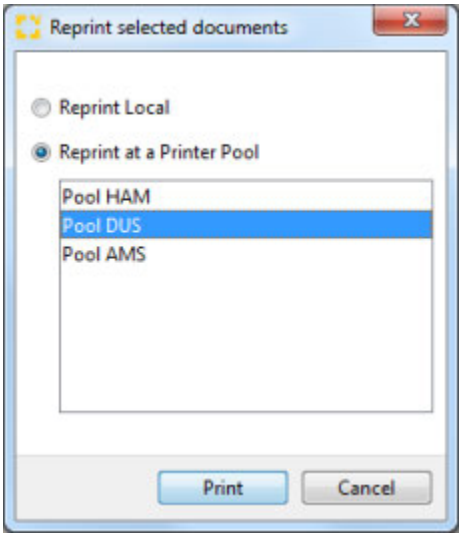
Opens any document currently highlighted in the list. Documents will open according to the file type associations of the local pc. For example Adobe Acrobat Reader will be used to open PDFs if that is the program associated with PDFs on the local pc.

Save selected document

Save the selected document to a drive on the local PC. A folder navigator will appear to allow navigation to the correct folder.

Reprint selected documents.

Opens a print application that allows the document to be printed to the local printer, or to a printer in an available print pool. It is possible to setup the print pools of remote offices to be accessible for printing to these remote offices.



Local printer

Print the document on the predefined default printer.

Print to printer pool

Allows selection of a printer pool from the list displayed.

Printer-Pools (List)

The desired printer pool can be selected from the list. Documents can be set to print to particular printers automatically.

Print

Print the document to the selected printer.

Cancel

Cancel the operation without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Restore selected documents

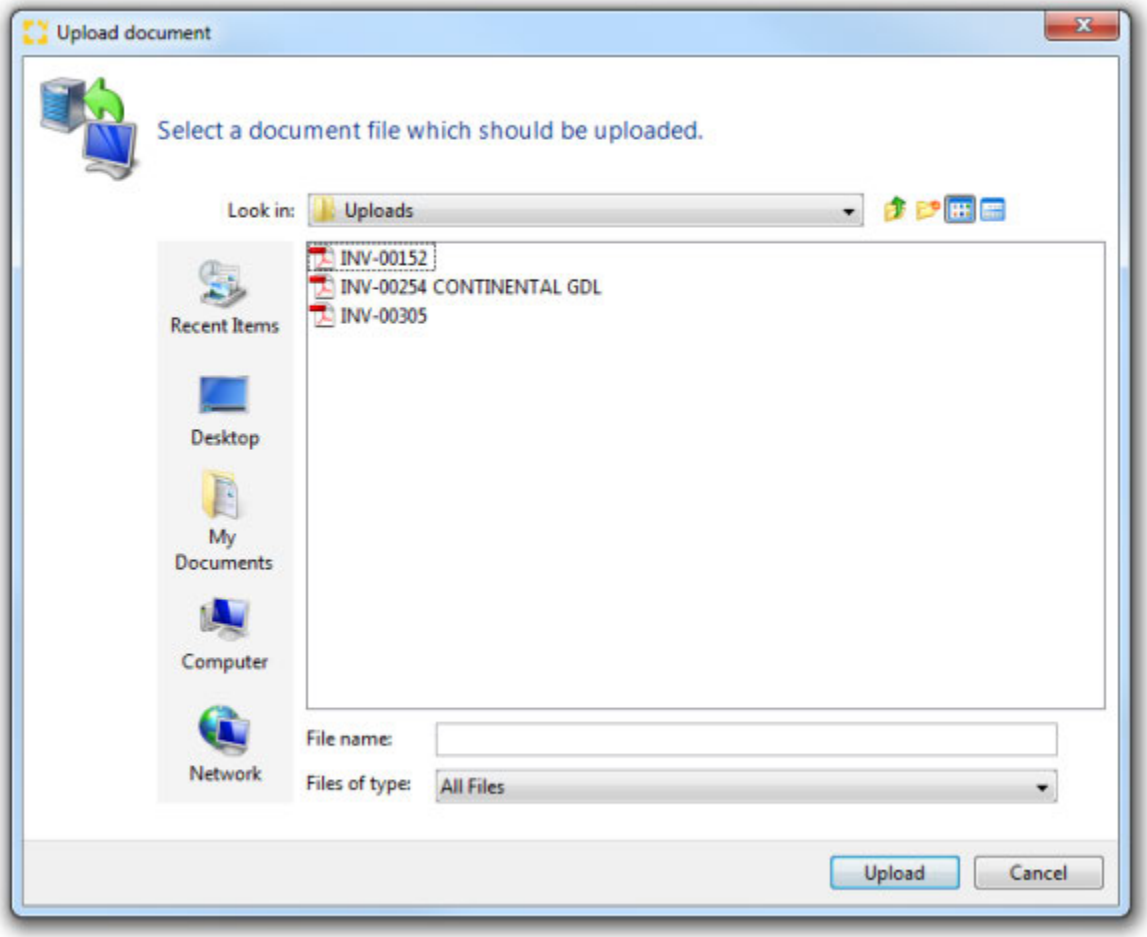
Previously deleted documents can be seen by checking the *show removed* box. This will then be shown in ~~strike thru~~ text. They may be restored by highlighting them and choosing this **restore selected documents** option.

Delete selected documents

Documents highlighted in the listing will be deleted.

Upload document...

Opens a file dialogue window which can be used to upload an external file to the current shipment.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

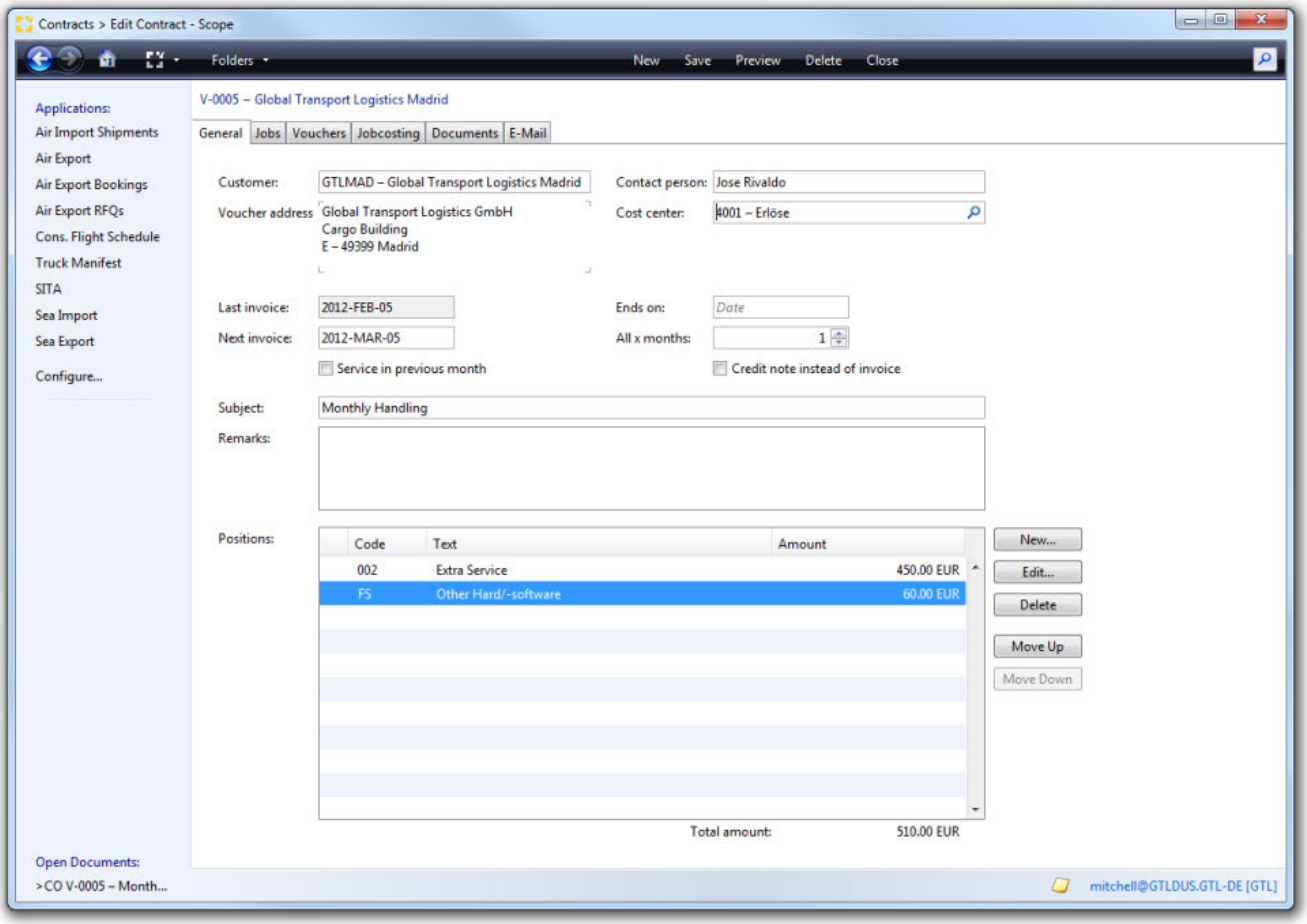
General - Contracts - Finance

- Introduction
- Description

Introduction

When a new contract is created or an existing contracted is opened, the contract editor open at the **General** tab of the contract. This tab is used to define all the billing related information required to issue regularly repeating invoices.

Description



New

Creates a new contract.

Save

Saves the currently open contract.

Preview

Opens an example of the invoice in PDF format on the local computer. This is a sample document and no financial changes occur.

Delete

This action is only available if a new contract has not been saved. Once a contract is saved, it is not possible to delete it, however a contract can be terminated by setting the *Ends on* date to a date in the past.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Close

Closes the current contract without saving any changes.

Customer

The party with who the contract is agreed and to whom the invoices will be issued. This is search field that will search for stored partners

Contact person

The name of the person at the contrating party who should be contacted in relation to this contract. Any contacts currently stored for the business partner will be available in this search field.

Cost center

The cost center to which charges should be applied by the accounting department for this contract.

Last invoice

The date on which the last invoice for this contract was generated.

Ends On

The date on which this contract will end. After this date, no further invoices will be issued.

Next invoice

The date on which the next invoice is due to be issued.

All x months

The monthly interval on which the next invoice is to be issued.

Service in previous month

This indicates that the service performed is done in the previous month and the invoice issue date is adjusted accordingly.

Credit note instead of invoice

This check box is used to indicate that a credit note should be issued instead of an invoice.

Subject

The subject of the contract.

Remarks

Additional information about the contract be printed on the document.

Charges

Displays charges to be billed to the recipient. At least 1 charge must be present if the document is to be printed. These may be doubled clicked or opened with the edit function if further adjustments are required.

New

Creates a new line item.

Edit

Opens the highlighted item for further editing.

Delete

The highlighted item will be removed.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Up

The selected item will be moved one position up in the list of charges.

Down

The selected item will be moved one position down in the list of charges.

Monthly Settlement

- Introduction
- Description

Introduction

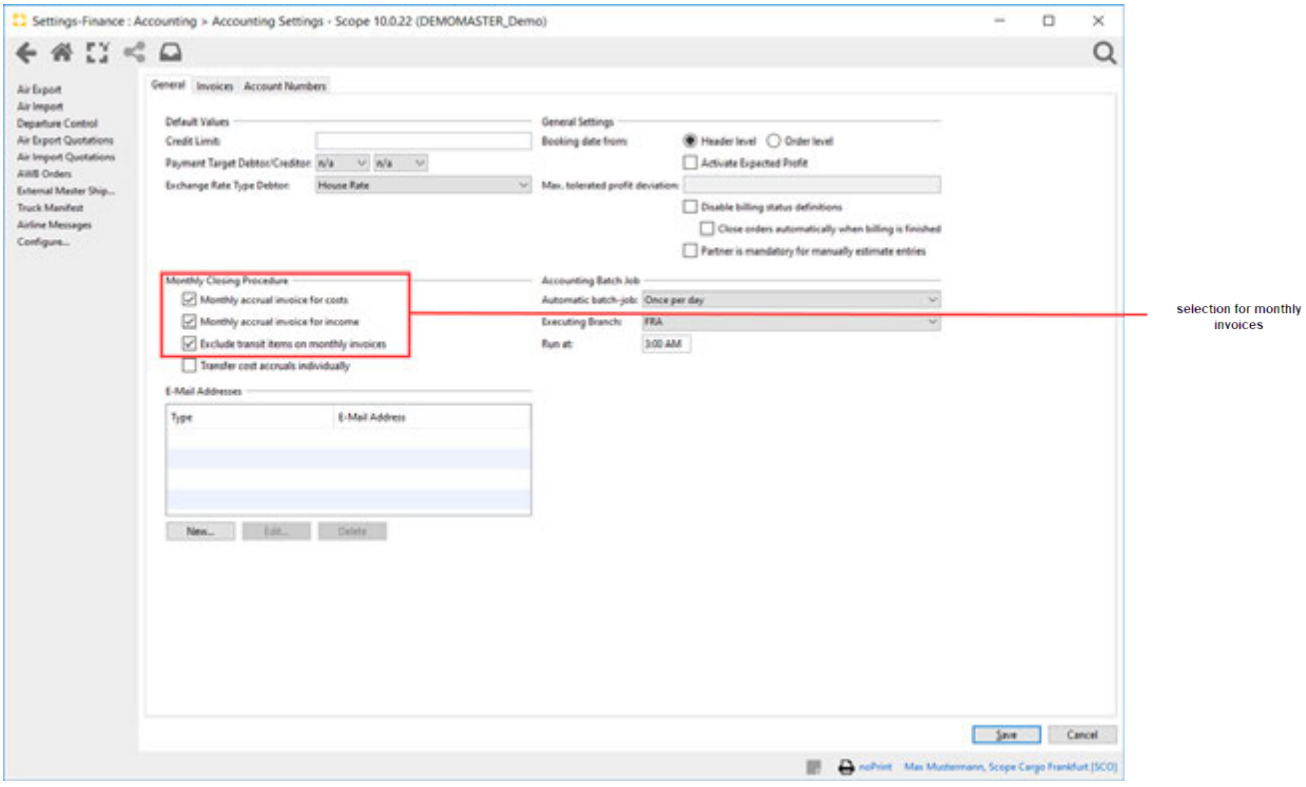
The Monthly Settlement application will allow you to close a month from the accounting side. This is done by choosing the date for the last booking on the month you would like to close. Once the date is set any new accounts receivables will be booked to the actual month. Monthly Settlement can be used to generate reports, which are "fixed" and will not changed after a month is closed. Any new items created are added to the actual report for all open months, leaving the closed month unchanged.

Please note that Monthly Settlement is only valid for the whole entity, it is not possible to create a monthly settlement per branch on different times.

example of setting the close date: The last possible day of booking for the Month of February is set to 16.03.2018. Then assume that you are working on a February shipment and you create an accounts receivable on 16.03.2018. From the accounting point of view this will be added to the month of February. However, if you create an accounts receivable on the same shipment but after the close date, for example on 19.03.2018, this amount will be booked on the month March because February is closed and nothing can be added to it.

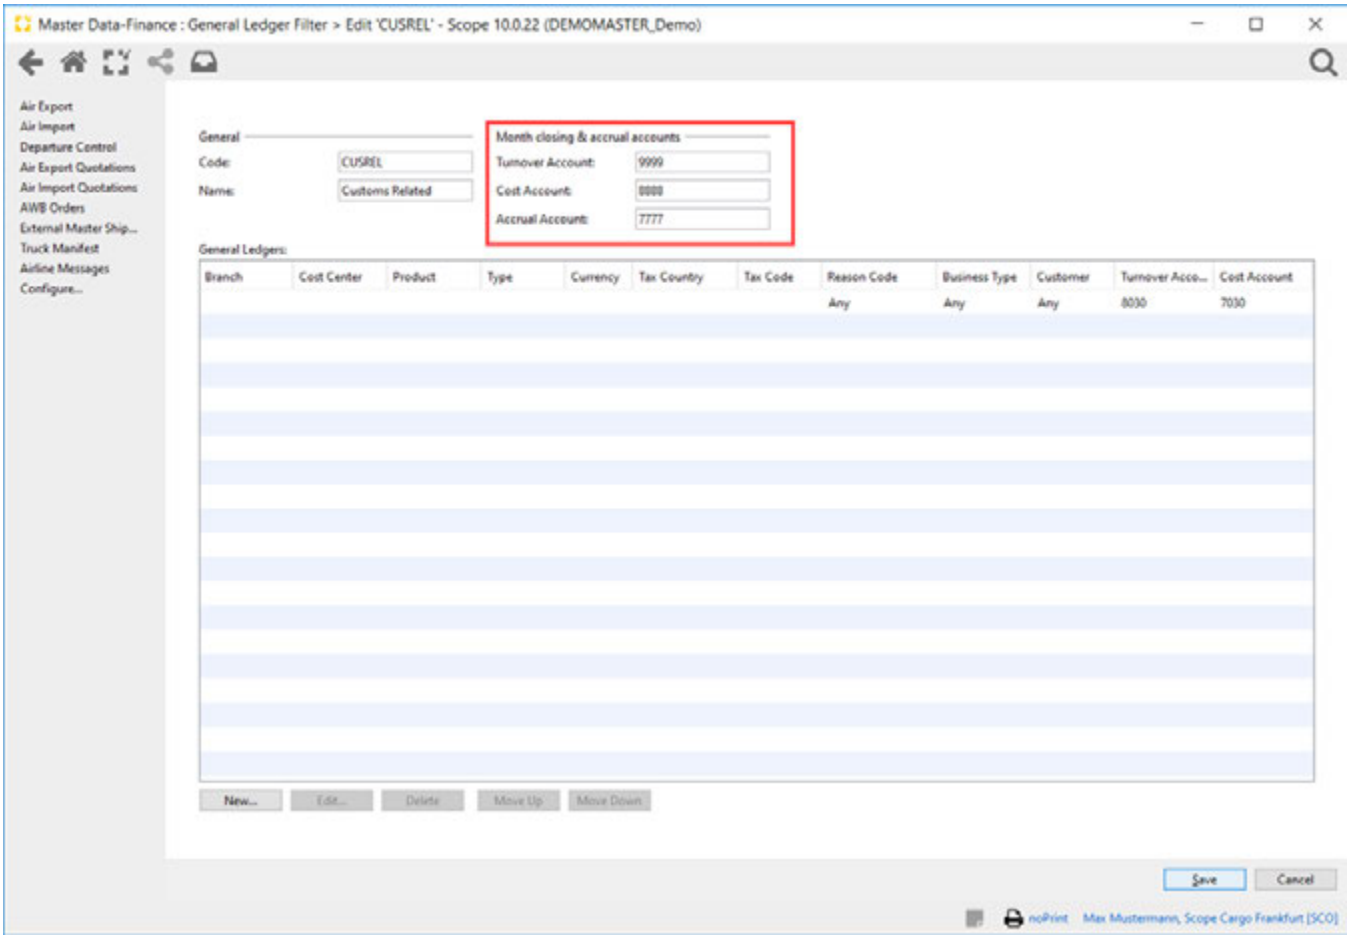
Description

Before starting the Monthly Settlement application it is necessary to setup the Accounting settings (*Settings - Finance - Accounting - Edit Accounting Settings*). On the below image you can see the settings need to be set so Scope will issue a monthly accrual for income and costs. Additionally, you can choose "*exclude transit items on monthly invoices*", so no transit items (like duty + taxes) will be considered for monthly accruals.



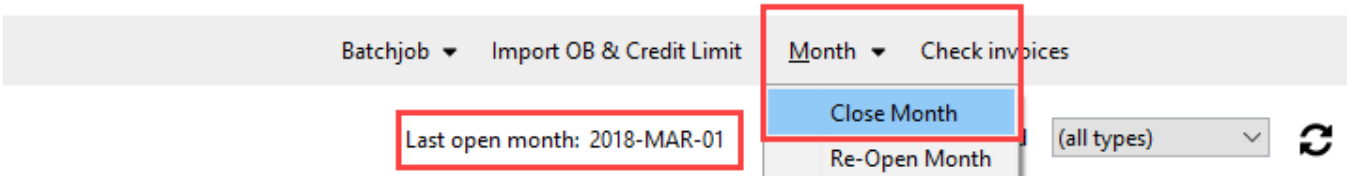
The next step is to adjust the General Ledge Filter for Month closing and accruals accounts (*Master Data - Finance - General Ledge Filter - Month closing and accruals accounts*)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Month closing (Monthly Settlement)

To close the actual month you have to go to application *Finance - Accounting*. There you can see the last open month and you can start monthly settlement by choosing "Close Month".



Close Month

Close last open month

Re-Open Month

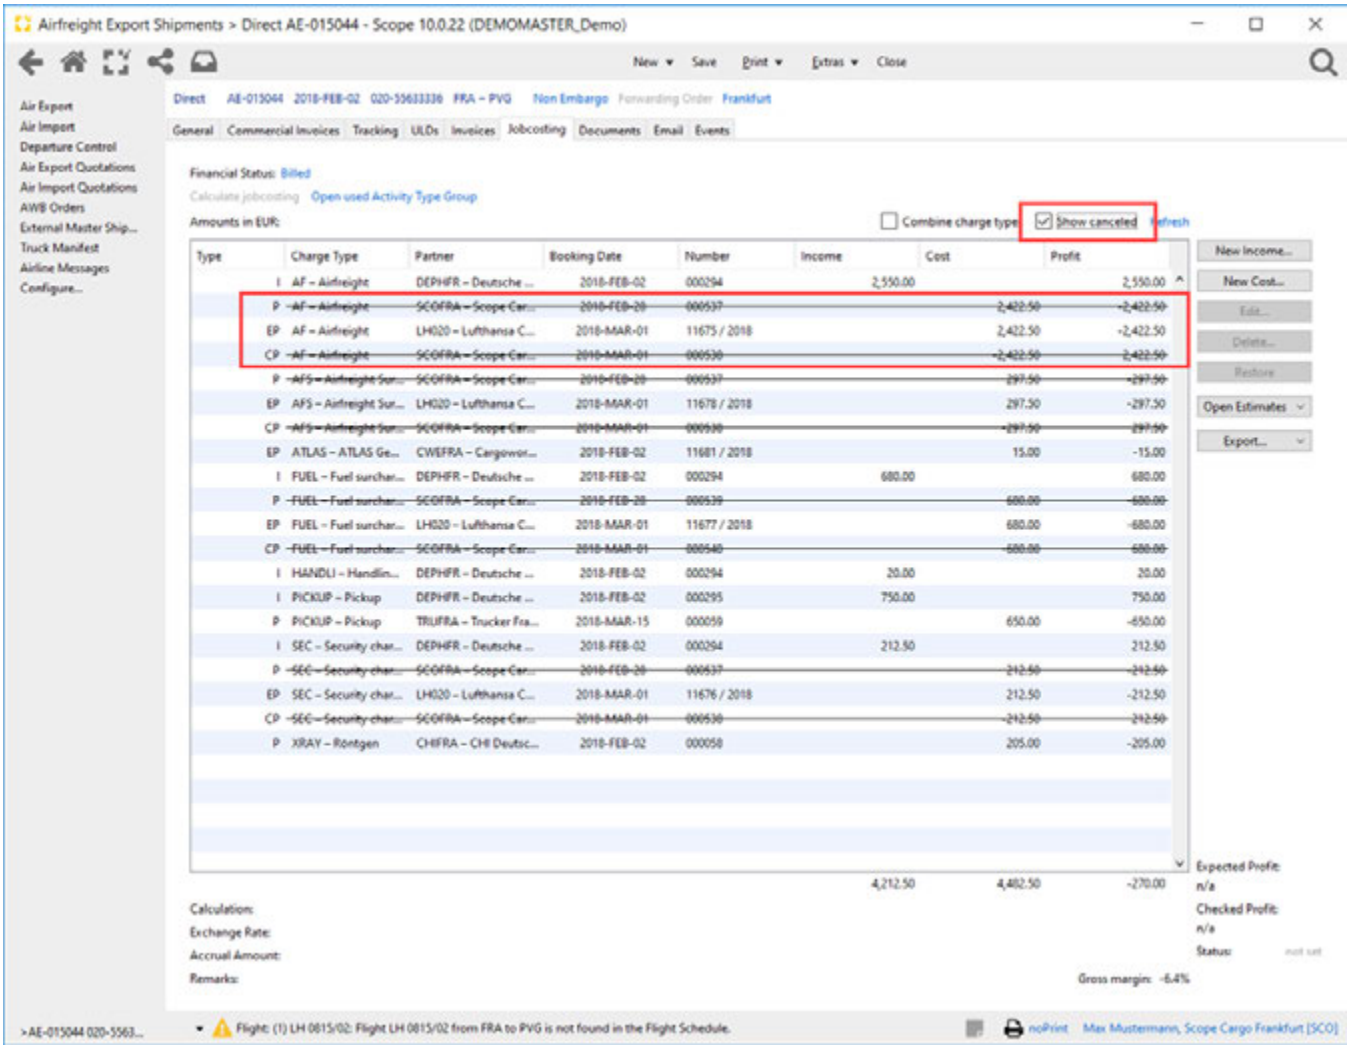
Re-Open the last closed month. Keep in mind that any reporting issued before re-opening of the month may now be invalid from any changes and you may have to re-create them.

Monthly Accruals Invoice

If you have closed a month, Scope then creates a monthly accruals invoice for any new items created after the close date. The number of accruals added to this monthly invoice is limited to 250 items per default, but this limit can be raised up (as needed). Scope will create one invoice with all these accruals, but in some cases, if more than one invoice is need this will be created.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

All accruals of the closed month will be terminated in the closed month and transferred to the next open month. To review this workflow in a shipment you have to go to Jobcosting tab and choose "*Show canceled*". Monthly accruals invoice can be selected at Accounts Payable Application.



example charge type AF:

In the above mentioned example you can see the accrual Airfreight (AF), mentioned as EP - Estimated Payment. Through monthly settlement the accruals must terminated in the month of February and transferred to the month of March. Scope dissolved EP AF with an invoice, called P AF (Payment) - now the accrual is terminated in February. But for accounting, the accrual must be transferred to March, so Scope will cancel payment by CP - Cancellation Payment and issue EP AF for month March.,

If you receive the accounts payable from your supplier for charge type AF in March, accrual EP AF will be terminated. If you receive no bill in March, this accrual we be transferred to month April.

Estimates

For an overview of all open and dissolve accruals go to the application "Estimates" (*Finance - Estimates*)

Payments

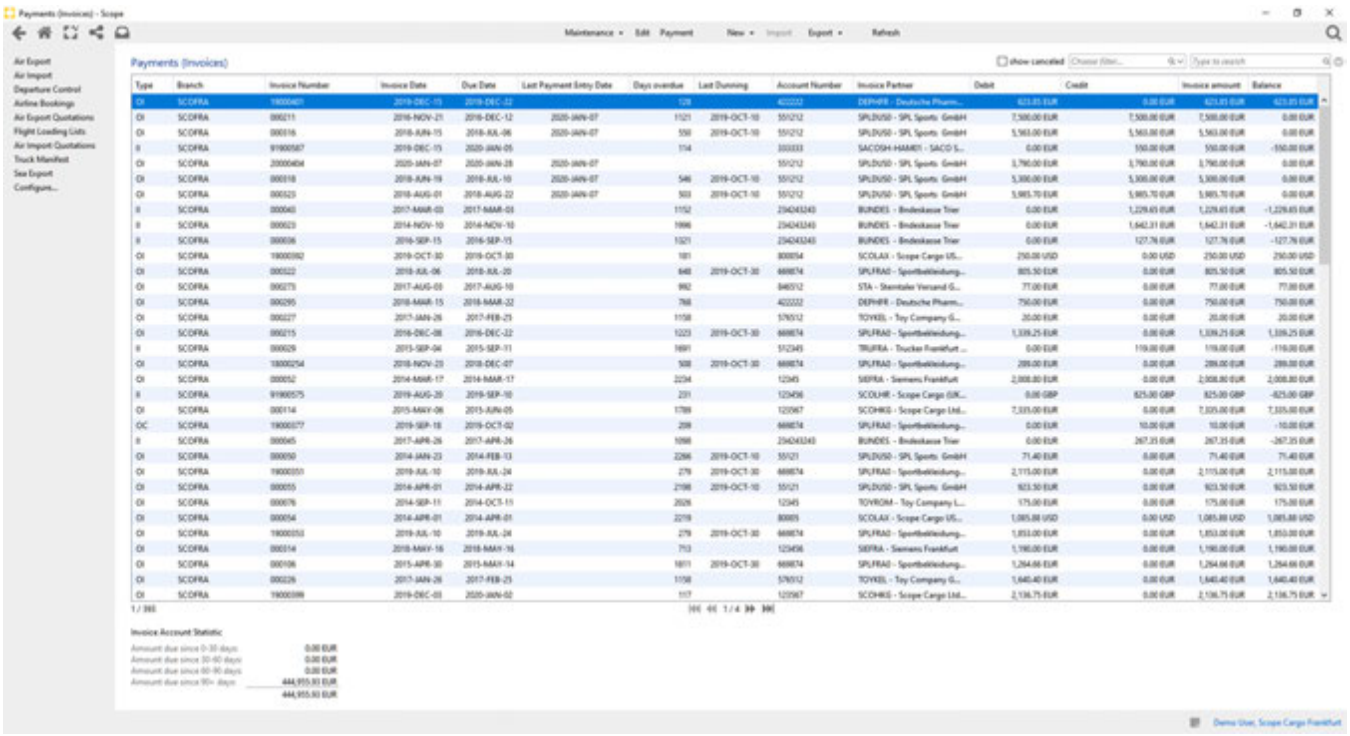
- Introduction
- Description

Introduction

In the payments application, which is a separate module named Payments(Invoices), an overview is given over open (unpaid) outgoing / incoming invoices. When activated every printed accounts receivable and every finished accounts payable appears in the payments application.

This function allows the registration of payments, either manual or via an import and generate account statements or dunning for debtors which can be send directly via email to the predefined contacts of the applicable debtor.

Description



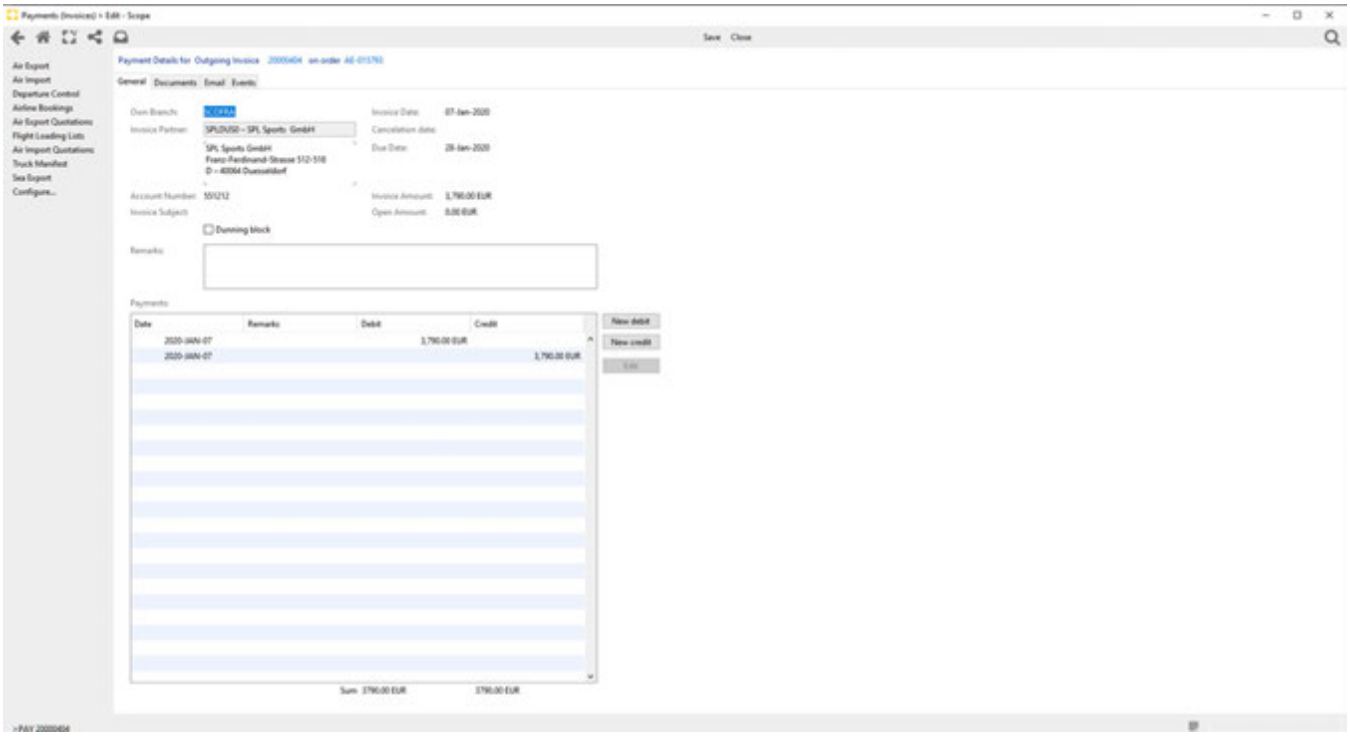
Settings

Under settings the payment module is activated and set-up, details of the settings can be found on the linked page, but will be maintained by RSI Support Staff.

Edit

Under edit a selected invoice can be opened and the payment details can be reviewed, if the actual payments are not imported by interface but maintained manually, payments can be entered here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Invoice Partner

Address details as printed on the actual invoice

Invoice Amount

The original full invoice amount in the currency of the invoice

Open Amount

The open amount of the invoice

Dunning block

If this option is set to active, this invoice will not be listed in the statements

Remarks

Any remarks regarding the payment of this invoice can registered.

Entries

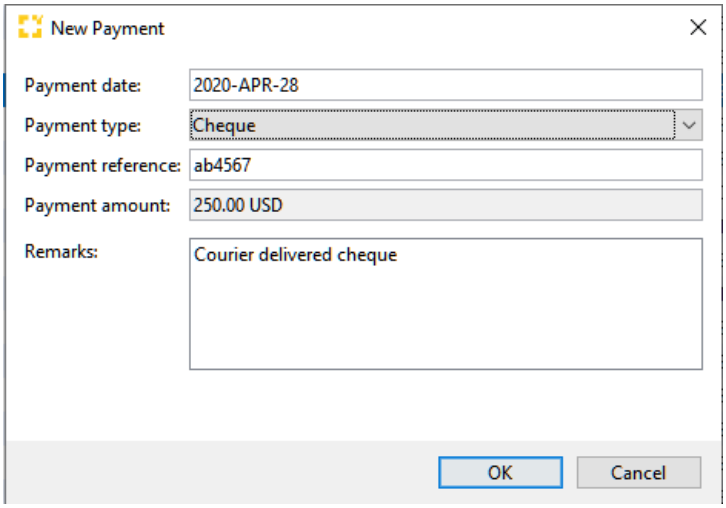
Under entries, previously registered payments are displayed

Column	Description
Date	Date Payment was registered
Remarks	Any remarks entered, in case payment created via Import , It will contain date/time and user doing the import
Amount	Amount Paid
Payment Type	Selected payment type, will remain as unknown when payments are imported.

Payment

Payment details on an invoice can be registered here. Either via the button 'Payment' on the overview screen (for the full amount only) or - when in edit-mode - with the buttons 'New debit' or 'New Credit'.
This is only available when the setup is for manual payments.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Payment type

Method of how the payment is done

- Transfer
- Cash
- Cheque
- Direct debit
- Credit card
- Debit Card
- Unknown
- Correction

Payment date

Date of the payment

Remarks

Any remarks regarding the payment.

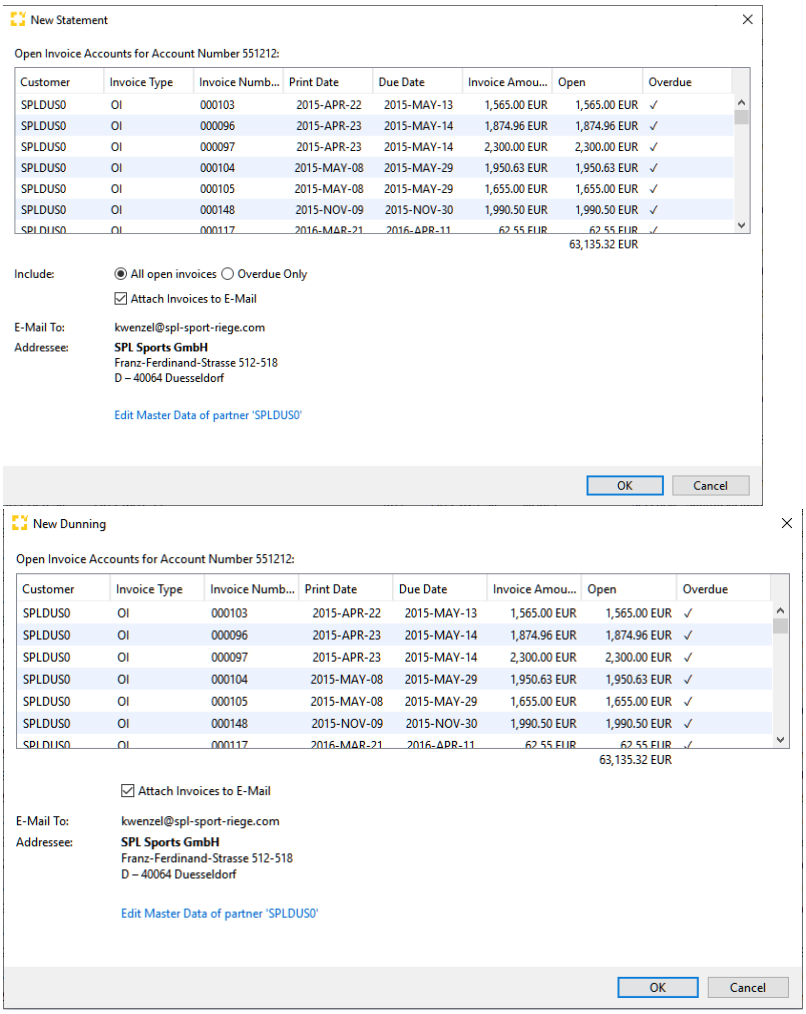
Payment Amount

The amount which is being paid on the invoice, if less than the full amount, the balance will reflect a corrected amount.

New Statement

Under New, a statement or dunning can be generated for the debtor of a selected outgoing invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the New Statement dialog all applicable invoices, which will be shown on the statement are displayed and the details as set-up in the master data Debtor .

Voucher type

Type of invoice displayed

Type	description
OI	Outgoing invoice
OC	Outgoing Credit note
Coll.I	Collective invoice
II	Incoming invoice
IC	Incoming credit note

Invoice number

The assigned invoice number of the reminded invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Print date

The print date of the reminded invoice.

Due date

The due date of the reminded invoice, calculated on basis of the selected payment terms.

Invoice Amount

The total invoice amount in the actual invoice currency of the reminded invoice.

Open Amount

The total unpaid invoice amount in the actual invoice currency of the reminded invoice.

Overdue

Indication whether the reminded (outgoing!) invoice (not credit note!) is already past the due date or not.

Include

Radio setting whether the statement should include **ALL** invoices or only the invoices which are **OVERDUE.** Via this setting the statement type is determined:

- if all open invoices are included, the statement type is STATEMENT
- if only overdues are included, the statemen type is DUNNING

Incoming Invoice included

Indication whether any incoming invoice should be included in the statement.

E-mail to

The to-addressee of the account statement e-mail, as set-up in the master data.

E-mail cc

The cc-addressee of the account statement e-mail, as set-up in the master data.

Edit master data

This action link will directly open the master data partner to add or edit the master data details.

Statement e-mail sample

Export

With the export option it is possible to create 2 different reports:

1. Detailed report - an excel report of all outstanding invoices of the current active filter, allowing grouping, sorting and further excel modifications
2. Aging report - an excel report specifying amounts not overdue and amounts overdue per: 1-30 days/31-60 days/61-90 days/91+ days period

Import

In the import function the payment details are imported from an interface file, The import functions will be activated when the accounting software can deliver a predefined format.
The status and result of an import run, can be seen in the function "Import payments protocol".

For details of our standard CSV/XLS Import format please check here: Payments - Standard Import file

Refresh

Rebuilds the screen to the latest information.

Show Closed

Include paid invoices where the balance is 0/zero and which are no longer outstanding.

Show canceled

Include canceled invoices in the overview. They are displayed striked through in the overview. In the invoice number column you see the cancellation number and the original invoice number in brackets.

Filter

The Filter option in payments allow the set-up of filters with the following criteria

Criteria	options	description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

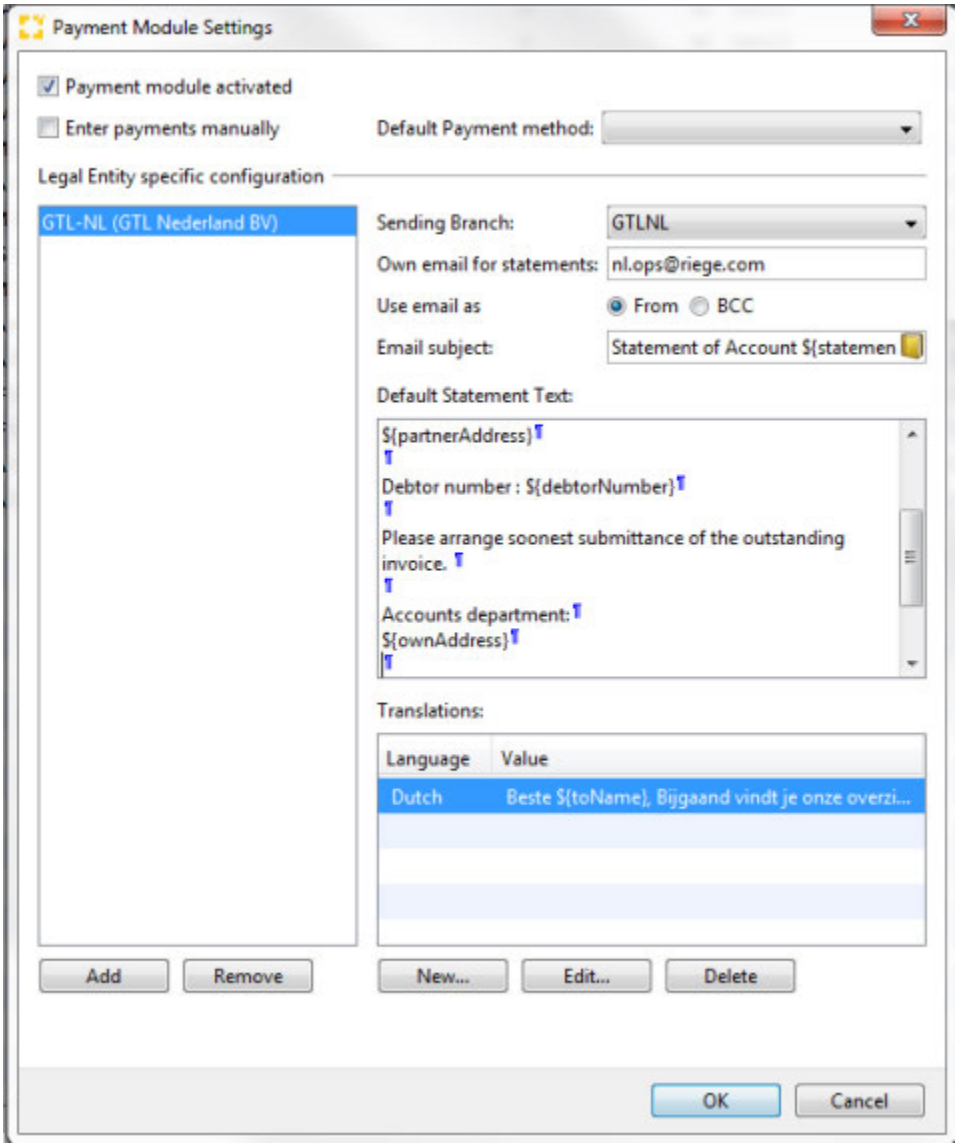
Payments - Settings

- Introduction
- Description

Introduction

In the option payment settings the activation and set-up of the payments module is done. This set-up will be done by RSI staff and will be charged.

Description



Payment module activated

When active the payments module has been activated and all printed incoming and outgoing invoices are registered in this module to track their payment status.

Enter Payments manually

When active the payments will be registered manually, if not active the payments can only be registered via predefined import interface files.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Default Payments method

When the payments are being registered manually a default method of payment can be registered here.

Legal Entity Set-up

For each legal entity available in the organisation the statement details are to be defined

Sending Branch

The branch which will be used as sending branch of the statement.

Own e-mail address for statements (From / BCC)

Additional e-mail address used by the outgoing statement, depending on the setting From / BCC.
Emails will be using the email address according to following schedule

setting	Sending email address	Bcc emailaddress
From	will be the entered email address will be used as from email address	will be the email address from the user sending the statement of account
BCC	will be the email address from the user sending the statement of account	will be the entered email address will be used as from email address

Subject

The subject of the email containing the statement of account can be set up here, place holders (as per below overview) can be used here.

Statement Text

The text to be defined for the outgoing email, the Text allows for the following placeholders(variables).

Placeholder	Description
${statementDate}	The date the statement is generated
${partnerAddress}	The full address of the receiver of the statement
${partnerCode}	The partner code of the receiver of the statement
${totalsPerCurrency}	Total amount on the statement per currency
${ownAddress}	Address details of the sending branch
${debtorNumber}	The assigned debtor number of the statement addressee
${toName}	Name of the contact(s) setup as to email address
${ccName}	Name of the contact(s) setup as cc email address

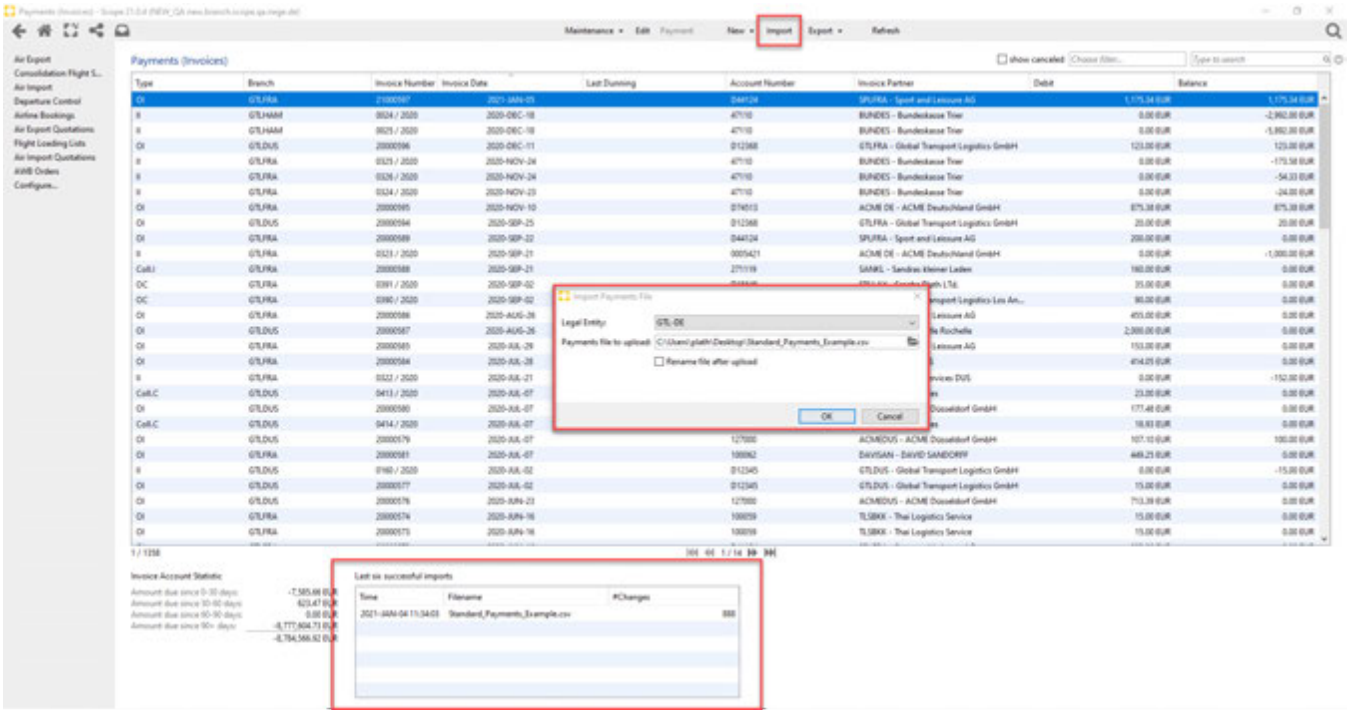
Statement Text translations

The translated statement text to be used when the available translation language equals the partner language.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Payments - Standard Import file

Introduction



This interface allows to synchronize open balances per invoice between the accounting system and Scope. Based on the current open balances in Scope and the reported balances in the import file payments are identified. Invoices not contained on the open balance list will be regarded as fully paid.

> ⚠ The Usage of this module might be chargeable. Therefore please contact our Scope Helpdesk via support@riege.com for activation.

File Format

Supported file types

- CSV with separator ';'
- Excel (xls and xlsx)

Column headers are mandatory as they describe the content of the file and determine the import mode in Scope.

Different import modes exist for

- Account receivables AND account payables
- Account receivables only
- Account payables only

The import mode is determined by the naming of the column holding the debtor or creditor account number:

- Header name *Account Number* import mode "Account payables & receivables"
- Header name *Customer* import mode "Account receivables"
- Header name *Vendor* import mode "Account payables"

When importing open balances a complete list of all applicable invoices with an open balance different to zero is required. Applicable Invoices not contained in that list will be treated as paid. Applicability of invoices is determined by the import mode.

Import Modes

Account Receivables & Payables

Use one of the following formats:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Signed amounts
  Account Number;Voucher Number;Voucher Date;Open Balance;Currency;
  Example: Accounts receivables & payables with sign.csv
- Unsigned amounts with D/C identifier
  Account Number; Voucher Number;Voucher Date;Open Balance;Type;Currency;
  Example: Accounts receivables & payables with DC.csv

Account Receivables only

Open account payables will not be marked as paid when using this import mode.

Use one of the following formats:

- Signed amounts
  Customer;Voucher Number;Voucher Date;Open Balance;Currency;
  Example: Accounts receivables only with sign.csv
- Unsigned amounts with D/C indicator
  Customer; Voucher Number;Voucher Date;Open Balance;Type;Currency;
  Example: Accounts receivables only with DC.csv

Account Payables only

Open account receivables will not be marked as paid when using this import mode.

Use one of the following formats:

- Signed amounts
  Vendor;Voucher Number;Voucher Date;Open Balance;Currency;
  Example: Accounts payables only with sign.csv
- Unsigned amounts with D/C indicator
  Vendor; Voucher Number;Voucher Date;Open Balance;Type;Currency;
  Example: Accounts payables only with DC.csv

Open Balance Currencies

The open balance may either be reported in invoice currency or in local currency of the Scope legal entity.

In case the open balance is reported in legal entity currency the exchange rate on invoice header level is used to converted the open balance into invoice currency. This option is only recommended to be used, if the accounting interface transfers all invoices to the accounting system in legal entity currency.

Debit Indicator

The default debit indicator to be used with column *Type* is "D".

Alternative Column Names

To simplify the integration of this interface with different accounting systems alternative column names and debit indicators may be used.

Default Column Name	Alternative Column Names
Account Number	• Konto • Kontonummer
Customer	• Debtor • Debitor
Vendor	• Creditor • Kreditor
Voucher Number	• Rechnungsnummer • Rechnungs-Nr. • Rechnungs-Nr
Voucher Date	• Rechnungsdatum • Datum

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Open Balance	• Saldo • Betrag
Type	• Credit Debit Indicator • Credit/Debit Indicator • Soll-Haben-Kennzeichen • Soll-/Haben-Kennzeichen • S/H Betrag
Currency	• Währung • WKZ (Eingabebetrag)

Alternative debit indicators to the default "D":

- S

Reporting

Name	Purpose	Example
Ledger Report	Evaluate the turnover per general ledger to evaluate profitable and less profitable parts of the company.	
Estimates Report	List of open estimates, i.e. items that are calculated based on stored buying or selling rates or manual entry by a user but that are not part of a finalized invoice. They are not current financial figures with regards to accounting but need to be evaluated to get a clear picture of the brnach'sa financial situation.	
Financial Period Report	Evaluate actual financial figures (i.e. finalized invoices) per shipment. It delivers a breakdown of the financial figures in the given period.	
Month Closing Report	Overview financial figures both actuals (finalized invoices) and estimates (open invoices). Apart from the general finacial figures for the given month, it shows open receivables that will be billed in the coming month but relate to transactions performed in the given month. It will show furthermore all cost estimate where no actual payable has been received yet, hence costs that will occur in the following month but relate to transactions performed in the given month.	
NBB Report	List of payables and receivables per invoicing partner ad their respective turnover. This will allow to evaluate the turnover of certain partners and to identify increase/ decrease in business with given partners.	
SNB Report	List of invoicing partners (both payables and receivables) per shipment and their respective turnover. This will allow to evaluate the turnover of certain partners and to identify increase/ decrease in business with given partners.	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

		
CBS Report	List of all shipments by transport mode with income and cost. Needed in some countries to report these figures per transport mode to the government (for statistical purposes).	
Profit-Loss Report	List of profit or loss per shipment. Filter criteria allow easily to identify shipments where the company made a loss and by analysing the respective shipments to identify possible patterns for non-profitabel transactions.	
Chargetype Report	List of turnover per chargetype and invoicing partner (both payables and receivables). This allows to identify services where the company earns or losses money on and therefore gives an indication where adjustemnts to selling rates might be advisable.	
Economic Month Report	List of turnover per economic month and branch. This will allow to evalute each branch's financial status in particular in comparision to previous months.	
Invoice Report	List of all finalized invoices	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

		
Customer Invoice Report	List of invoices to a certain partner including paymnet details related to the particular invoice. It allows an evaltuation of the given partner with regards to his turnover and in particular his payment morale. Hence allow possible danger to the finacial situation e.g. regarding partners with high turnover but low payment morale	
Work in Progress Report	List of all payables and receivables (actuals and estimates) on open shipments. It delivers an finacial overview of all transactions that are still being worked on by operations.

  - Additional manual invoices
- Project billing
  - Creating a new project
  - Creating an invoice for a project
- Payments
  - Overview Riege Entities usage Accounting

Introduction

This documentation is about the RSI billing process as every RSI branch is creating outgoing vouchers to their clients using this Scope system.

There are two types of billing:

Type	Description	Example	Scope module
Recurring Fees	Monthly SaaS and transactional fees	Monthly SaaS, transactional fees, eg. airline messages	Contracts
One-Time Fees	Project-, Service- and Implementation costs	Project work, Implementation, Trainings, Form adjustment	Projects

Depending on the type of billing you need to create a new entry in contracts or projects. This documentation will describe both type processes.

Contract billing

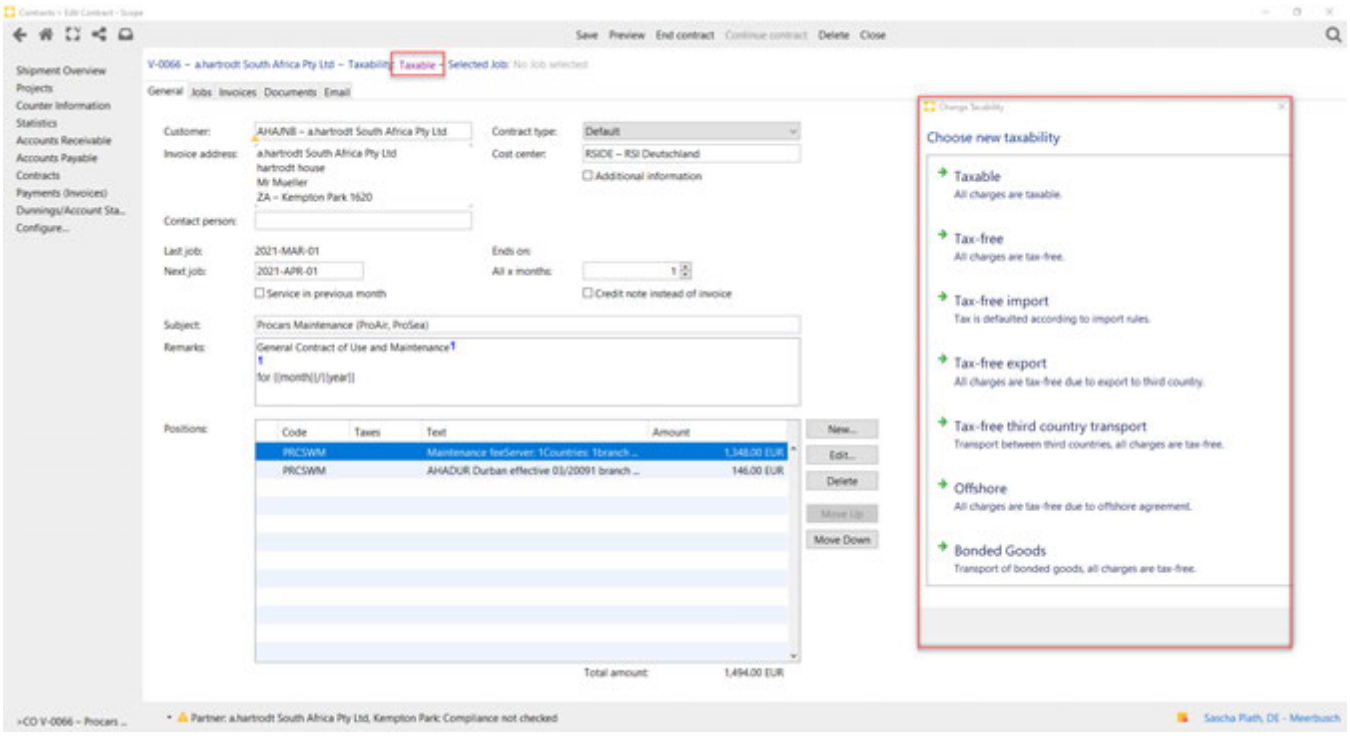
As stated before, contract billing is a reoccurring process: fees and costs, which have been agreed on being charged monthly, will be automatically put on a monthly system invoice to the customer. The contract module is also used by our customers to bill their customers for warehouse rent and other service in the same way as we bill our customers. Therefore a general documentation is published here.

Since there are no shipments, the repeating invoices will be linked to the corresponding "job", which will be shown in tab "Jobs": every month a new job will created automatically while creating the next invoice and linked to the corresponding contract. The job will also determine the economic date of the invoice!

Creating a new contract

Once the customers signed the quotation for Scope, you can maintain it as a new contract in Scope. Tab "General" is used to define all the billing related information required to issue regularly repeating invoices:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Taxability

Choose the type of taxability, the future invoices will have to use for billing.

Customer

The party, who the contract is agreed and to whom the invoices will be issued. This is a search field that will search for stored partners.

Cost center

The cost center to which charges should be applied by. For RSI-DE we use the corresponding branch, who is billing the customer. In other branches you might just have one general cost center or just cost centers to determine, whether it is a "project" or a "software as a service" income.

Last invoice

The date on which the last invoice for this contract was generated.

Ends On

The date on which this contract will end. After this date, no further invoices will be issued. You have to use the action "End Contract" in order to fill this field and also add a reason/description for the termination.

Next invoice

The date on which the next invoice is due to be issued. If the date is set in the past and you press "Create all" in the homeview, a new invoice will be created and the field "last invoice" will be updated.

All x months

The monthly interval on which the next invoice is to be issued.

Service in previous month

This flag determines the economic date of the invoices: it indicates that the performed service is done in the previous month and the invoice issue date is adjusted accordingly. It will determine, which "jobs" will be created for this contract.

Example: transactional fees are usually billed for the previous month (as you have to collect the number of transactions for the month first), user accounts might be billed for the current/upcoming month. Therefore you might need to create 2 contracts for the same customer: one for the fees of the previous month and another contract for the fees of the current month, so the customer will receive 2 invoices each month as you also have 2 different economic months to bill for.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Credit note instead of invoice

This check box is used to indicate that a credit note should be issued instead of an invoice.

Subject

The subject of the contract. You might want to use parameters, such as {{month}} or {{year}} to allocate specific information on every invoice.

Remarks

Additional information about the contract be printed on the document.

Charges

Displays charges to be billed to the recipient. At least one charge must be present if the document is to be printed. These may be doubled clicked or opened with the edit function if further adjustments are required.

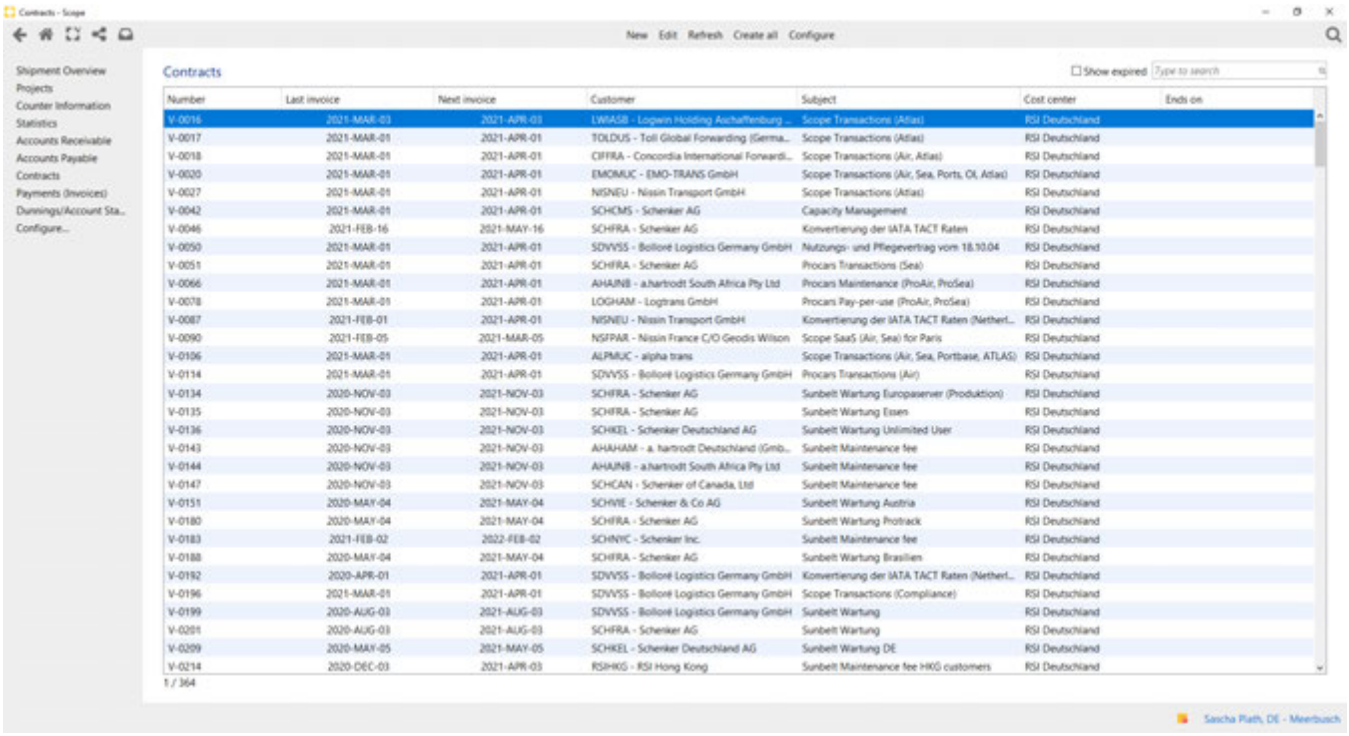
The available RSI charge codes are listed here. The amount doesn't have to be set as it might be calculated by a tariff while creating the invoice.

Notes

Similar to our Scope shipment entry, you can also add a note to the contract to inform users and give details additionally to the Remarks field.

Creating invoices for a contract

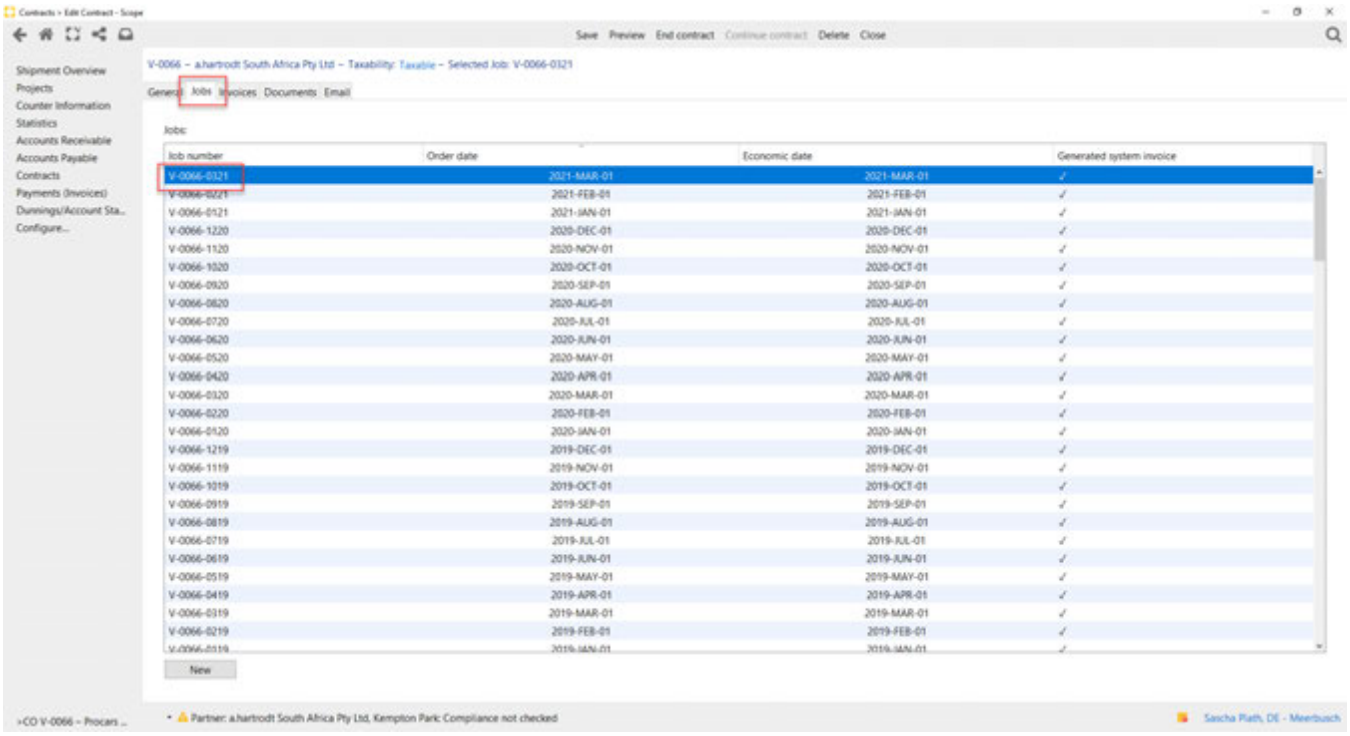
Once the contract is saved and a contract number is generated, you can find the new entry in the homeview:



The column "Next Invoice" will indicate, which invoices are due. By selecting "Create all" the system will generate the corresponding due invoice for each contract. Those new invoices can be reviewed and printed/finished eventually.

If the new invoice is created for a new economic month, the system will automatically create a new "job" for the invoice, which is an administrative order. You can look up the corresponding jobs linked to the contracts in tab "Jobs":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



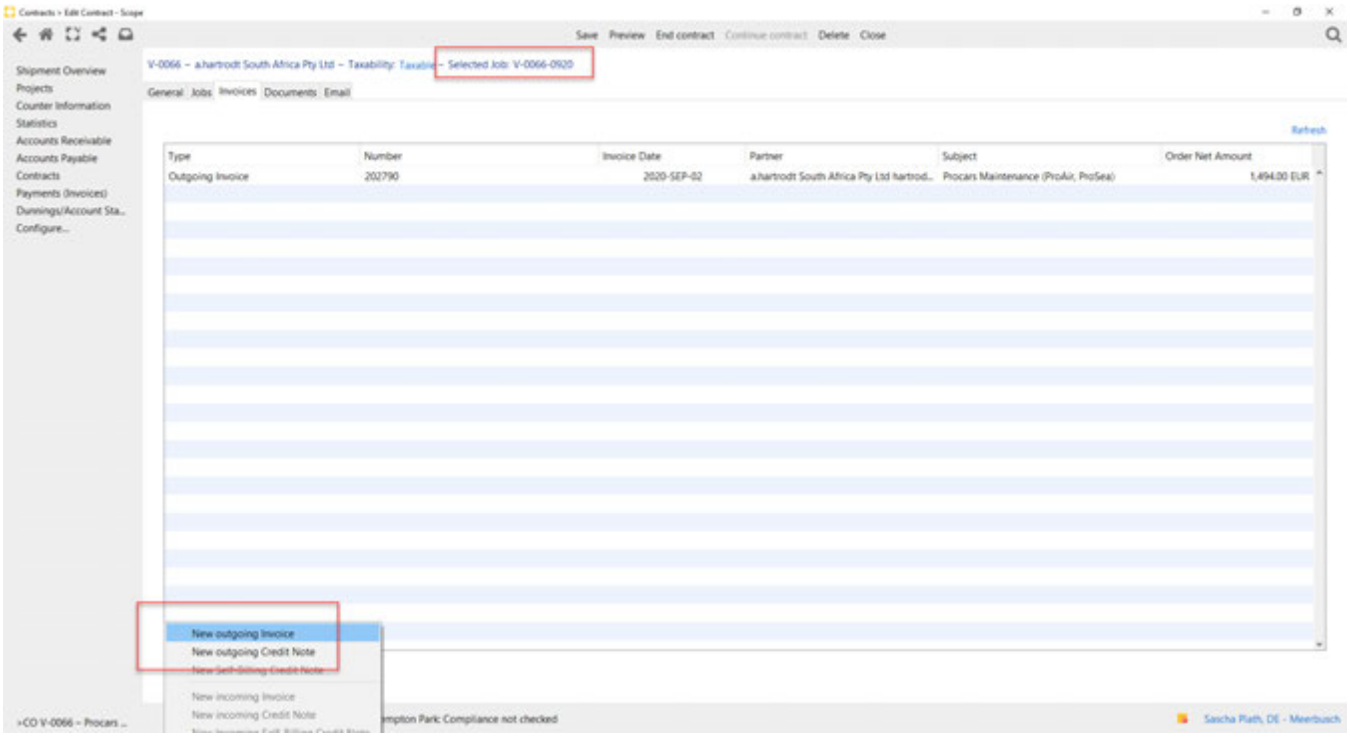
The job number is the contract number + economic month MM + economic year YY.

Additionally to the automatically created jobs by generating the system invoices via "Create all", you can also add new jobs manually, with order date of today and economic date of the next available month.

The tab "Invoices", "Documents" and "Email" will only showcase the entries, which are linked to the selected job. So if you want to have an overview of ALL created invoices for this contract, you **must not** mark any job or mark all jobs in tab "Jobs".

Additional manual invoices

As described above you have to open the corresponding contract, select the job with its economic date you like to create the additional invoice for and then select in tab "Invoices" the corresponding voucher type:

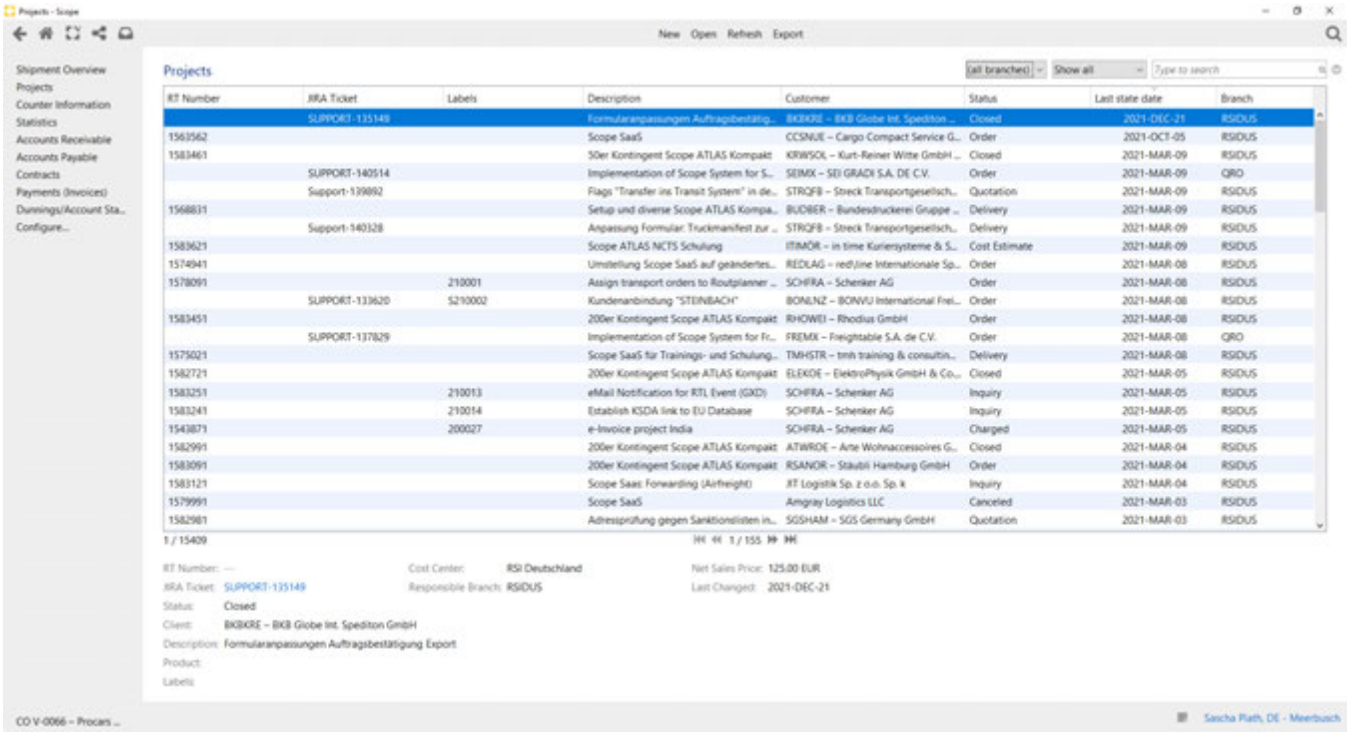


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The creation of the outgoing invoice is described here.

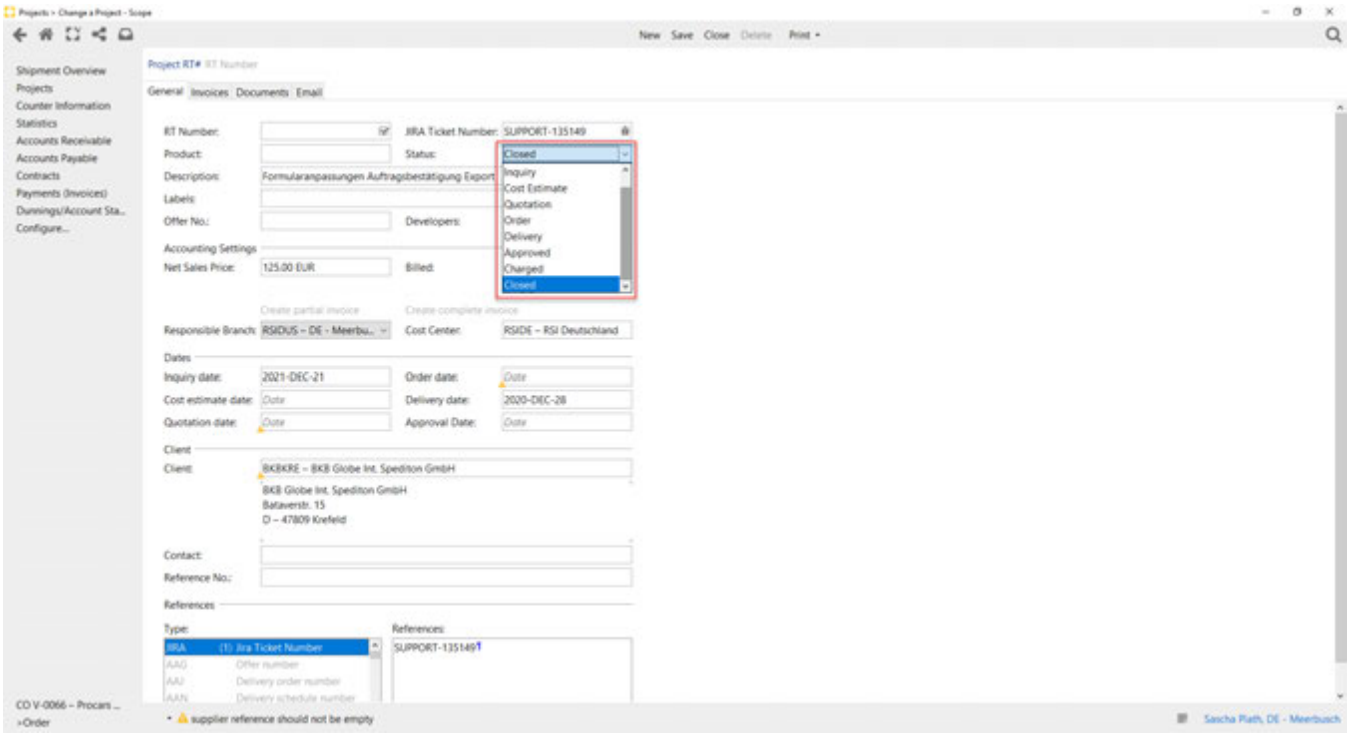
Project billing

Project billing is a one-time process to charge customers individually for a project or service. There is no re-occurrence once the project or service is finished. Therefore you need to create an administrative order (similar to a "job" in contracts) and just create the outgoing voucher. The administrative order can be generated in different modules, however the official RSI-internal module is "Projects" creating project orders:



Creating a new project

While pressing "New" in the Homeview of Projects you can create a new project order:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

RT number

Ticket number out of https://rt.riege.com/

JIRA ticket number

Ticket number out of https://jira.riege.com

Please not that you either have to have a RT number or a JIRA number in order to save a project.

Product

Product code - can be ignored internationally

Status

The following status can be selected:

- Canceled
- Inquiry
- Cost Estimate
- Quotation
- Order
- Delivery
- Approved
- Charged
- Closed

Important

Make sure to have entered the corresponding dates in the project before changing the status to "Delivery", "Charged" or "Closed"!

Description

Detailed subject of the project or service, which will lead to an invoice

Labels

additional references and keywords, which can be used to search for this project

Offer No

Quotation number

Developer

Developer or service lead, who will execute the project

Net Sales Price

Net Quotation amount

Billed

Total amount of invoices, which have been already created for this project

Paid

Mark as paid, if the amount as been already paid the customer before issuing the last invoice for this project

Responsible branch

The RSI branch, who is going to create the invoice

Cost Center

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The cost center to which charges should be applied by. For RSI-DE we use the corresponding branch, who is billing the customer. In other branches you might just have one general cost center or just cost centers to determine, whether it is a "project" or a "software as a service" income.

Dates

The following date fields are available:

- Inquiry date
- Cost estimate date
- Quotation date
- Order date
- Delivery date
- Approval date

> **Important**
>
> Make sure to enter at least the **order date** and **delivery date**. Scope will determine by those dates the **economic date**, which is important for the invoice process!

Client

The party with who the project is agreed and to whom the invoices will be issued. This is a search field that will search for stored partners.

Contact

Contact person of the client, who ordered this project or service

References

Additionally references (e.g. customer's reference)

Creating an invoice for a project

Create partial invoice

Once the project has been entered and saved, you can create a partial invoice. For some projects it is agreed to bill the customer in 3 parts: first invoice is to be billed when the quotation is signed, the second when the project has been delivered and the third part is to be billed when the project is closed.

Create complete invoice

Once the project has been entered and saved, you can create an invoice. If you bill services and to not charge partially, you should use this function.

The creation of the outgoing invoice is described here.

The available RSI charge codes are listed here.

Payments

Billed invoices can be marked with payments, which have been made by the invoice receiver. For more details of this function, please look here.

Overview Riege Entities usage Accounting

The following table gives an overview of the accounting functions used per Riege entity.

Entity	Accounts Receivable	Accounts Payable	Accounting Interface	Payment Module manual (m) / automatic (a)

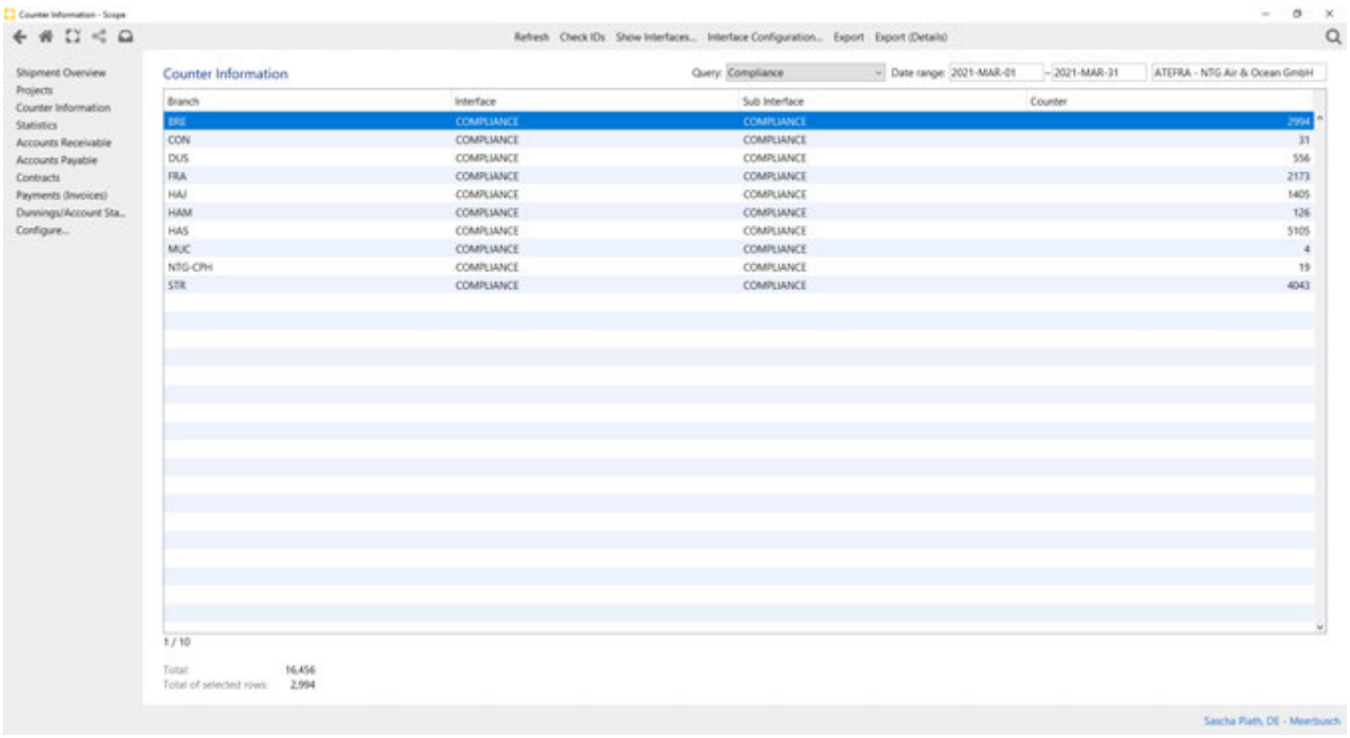
Counter Information - RSI Billing

- Introduction
  - Description
    - Homeview
      - Query
      - Date range
      - Selection key field
    - Refresh
    - Check ID's
    - Interface Configuration
    - Show Interfaces
    - Export
    - Export Details

Introduction

This module gives you an overview of the messages/counts of the corresponding interfaces and is currently used to create centrally, monthly reports for each branch of all customers and their transactions. The sheet will be sent to each branch, so the transactions can be billed by inserting the corresponding figures in the Scope invoices via Contracts. However this module becomes also handy for checking current transactions of a customer individually for a specific daterange.



Description

Homeview

Query

Query is a saved counter query, which can be maintained via action "Interface Configuration...". For more details please look further down.

Date range

Time selection for the handled transactions of that time period

Selection key field

Corresponding partner of transactions to be counted. Only partners with role "Billing Partner" can be selected here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Refresh

To update the entries of your selection and the screen

Check ID's

to create a sheet showcasing all IDs including "wrong" entities, which couldn't be found in the counting to allocate the corresponding partner. Those wrong entities belong to "wrong" mapped values as "External ID" in role "Billing Partner".

The monthly check will be done by RSI-DE, which include a check by receiving ALL IDs from all transactions used for ALL interfaces for the corresponding date-range (month) and comparing all values with the entries of the "External IDs" from all partners in our database. The once, that are only found in the transactions/counters, but not in any partner, will be listed and need to be maintained for the corresponding customer eventually.

Interface Configuration

Not everybody is allowed to create new queries as you have to have a deep understanding of the corresponding interface and its counters. Therefore do not simply create a new query, but consult with Christoph Knolle and management before.

Currently the following filters/queries have be maintained and therefore can be selected in the overview:

Query	Interface	Description
AHP Merkle	EXTERNAL_TRACKING	Customer specific (STR) sending certain "Cargo IMP" Events as IFTSTA status message from Scope to customer via Edibooking CC
AIRLINE-BOOKING	AIRLINE-BOOKING	All messages from Sub-Interface "AIRLINE-BOOKING" collecting the FFR and FFA messages
ATLAS Komplett	ATLAS	German-customs
ATLAS Komplett (Exit Kunden)	ATLAS	German-customs
Airline Messaging C3XCCS	C3XCCS	ACE (Air Carrier EDI) from CHAMP, Descartes and SITA, more details here: Air Carrier EDI (ACE)
Airline Messaging CATS	CATS	Old query
BHT	BHT	Ocean port messaging for Bremen (DEBRE) including all messages via Sub-Interface "ALPO"
C3XCCS FHL	C3XCCS	Air Carrier EDI (ACE) : only House-Data messages sent to airlines
C3XCCS FNA	C3XCCS	Air Carrier EDI (ACE) : only Rejection messages from airlines
C3XCCS FSU	C3XCCS	Air Carrier EDI (ACE) : only Status update messages from airlines
C3XCCS FWB	C3XCCS	Air Carrier EDI (ACE) : only Master-Data messages sent to airlines
CH	EZV	Swiss-customs
CH Customs	CH_CUSTOMS	Swiss-customs
CH Customs (ohne S+T)	CH_CUSTOMS	Swiss-customs
Cargo2K	CATS	Cargo 2000 quality report counting airline messages
Chain.IO	PURCHASE_ORDER	US specific EDI Booking - connection with Chain.IO (for customer Green)
Champ	CATS	ACE (Air Carrier EDI) connection via CHAMP
Compliance	COMPLIA	Denied party screening messages

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

	NCE	
DLH AWB	CARGOX ML2SCI	Customs-specific
Dakosy	DAKOSY	Ocean port messaging of Hamburg (DEHAM) - more details here: Dakosy
EDI Booking Complete	BOOKING	All EDI-Bookings
EMO USA (XML 1_2)	EXTERNAL_TRACKING	customer specific EDI (EMO) for generic XML event messages
KHD-BASF-EInvoice	Finance	Customer specific (KHD)
KHD-BASF-IFCSUM	BOOKING	Customer specific (KHD)
KHD-DAIMLER	BOOKING	Customer specific (KHD)
KHD-DAILMER-DVV	BOOKING	Customer specific (KHD)
KHD-Kundenanbindungen	BOOKING	Customer specific (KHD)
KHD-SIEMENS-IFCSUM	BOOKING	Customer specific (KHD)
KHD-UNIFY	BOOKING	Customer specific (KHD)
MSE-TOCS	MSE-TOCS	Customer specific (MSE Europe) counting received shipment data: for each TOCS shipment this data will be passed once to Scope and will result in a house shipment and HAWB document using the provided information. More details: MSE TOCS - Scope Interface
MTU/Diesel	EXTERNAL_TRUCKING	Customer specific (STR) to keep track of consignments as seen from the MTU / Tognum P.O. Management System in place at Streck - more details: Streck Axit MTU
NL	NL_CUSTOMS	Dutch-customs
NL-AWB-FHL	CATS	Airline messaging counting for AMS: only House-Data messages sent to airlines
NL-AWB-FMA	CATS	Airline messaging counting for AMS: only Airline confirmation messages received from airlines
NL-AWB-FNA	CATS	Airline messaging counting for AMS: only Airline rejection messages received from the airlines
NL-AWB-FWB	CATS	Airline messaging counting for AMS: only Master-Data sent to airlines
Oceaninsight	SCE	Ocean carrier messaging: to count Ocean Insights events flowing in additionally to the events received from INTTRA / GT-Nexus and Cargosmart as they will be charged independent of the default SCE counting. More details: OCE Counting
PORTBASE	PORTBASE	counting EDI messages to the harbour system of Rotterdam (NLRTM) (Portbase).
Penrod	EXTERNAL_TRACKING	US Customer specific (GWS for Penrod): Generig event messaging, more details: Scope Event Outbound
Ryder	Finance	customer specific (STR) counting outgoing invoice transactions, more details: Scope Interface - Ryder
SCI Interface	SCI	Customs interface to provide a universal customs declaration interface into all customs procedures in all countries we offer. More details: SCI - Scope Customs Integration
SITA	HANDLING_SITA	Airline messaging: counting FWB messages for later retrieval of shipment, warehouse entry data in the warehouse - onhand module. More Details
SUMADRITTER	ATLAS	German-customs
Scope Exit	Scope exit	German-customs for EXIT AES messages (AES (Automated Export System). More details: https://wiki.riege.de/display

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

		/EXIT
Seafreight EDI	SCE	All ocean carrier messages including INTTRA, CARGOSMART, GTNEXUS and INTTRA-VGM
US Customs (AES)	US_CUSTOMS	American-customs
VGM	SCE	Ocean carrier: counting only Vermas messages (VGM)
W3Coach	WINK	customer specific (STR) for warehouse interface counting shipments
WINK	WINK	All Transport messages

Export

This is an old version of Export and not really used anymore.

Export Details

To create a sheet with numbers of all specified counters with all transactions from all customers.

> **Specific counters**
>
> Only the counters, which have been linked to the customer via Master data - RSI Billing role "Billing partner" - tab "Interface filter". If not maintained, the export function will not support the counter for the customer.

This might take a while before the sheet is created, also there is no time-out if the process takes more than 30 minutes. Once finished the numbers of the corresponding daterange/month will be exported to a local directory chosen by the user divided with sub-directories for each customer/organization code.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Master data - RSI Billing

- Introduction
- Partners
  - Contacts
  - Role "Debtor"
  - Role "Creditor"
  - Role "Billing Partner"

Introduction

In order to simplify the billing process as well as set up the counters for customers' transactions, master data is essential.

Partners

Contacts

Please add the contacts with their email addresses and assign role "Invoice recipient" to them, if the customer requires receiving invoices automatically emailed to them while printing the voucher. However please make sure, that the email template (System Email Settings Templates) is set up and you also need to maintain the corresponding fields in tab "Email Sending options" in role "Debtor" for this partner after inserting the contacts. You can see more details in Role "Debtor".

Role "Debtor"

Customers to be billed need to have role "Debtor". If not set, you will not be able to print the voucher.

Role "Creditor"

Vendors need to have role "Creditor" to finish an accounts payable.

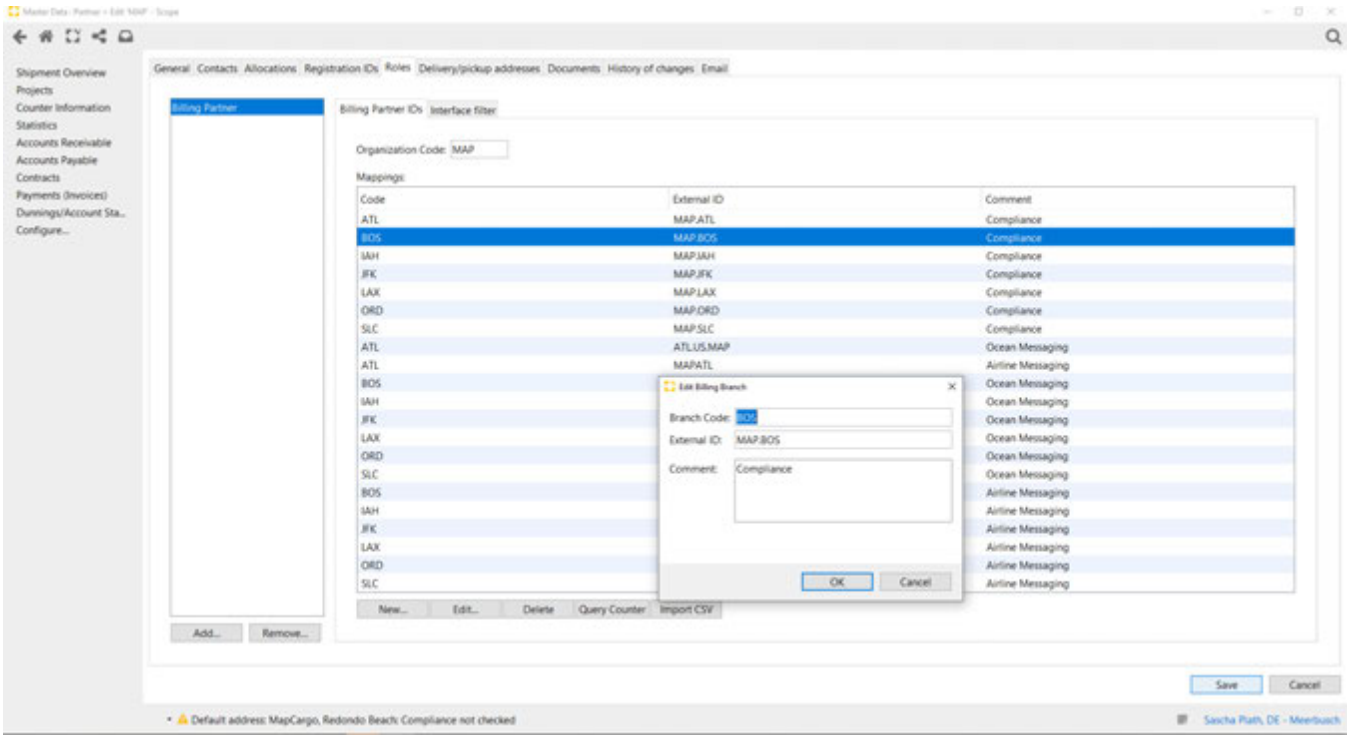
Role "Billing Partner"

This role is exclusively designed for the internal RSI billing process and needs to be maintained for every customer regardless, wether he will be charged by counters or not. This role is divided in two tabs:

Billing Partner IDs

This will define the global organization code of the (new) customer and the corresponding mappings of the customer's IDs for the counters.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Organization Code

Insert the corresponding 3-letter-code of the organization used in Organizational Structure and will automatically be published on Customer 3-Letter Organisation Code List. Since you can bill different branches of the same organization, the code doesn't have to be unique. However please make sure to insert the correct 3-letters.

If your customer does not have any counters or interfaces to be billed, you can just enter the Organization Code and save the role. However the code is mandatory to be filled!

Mappings

Insert the corresponding mappings to setup the counters and identify the customer's transactions:

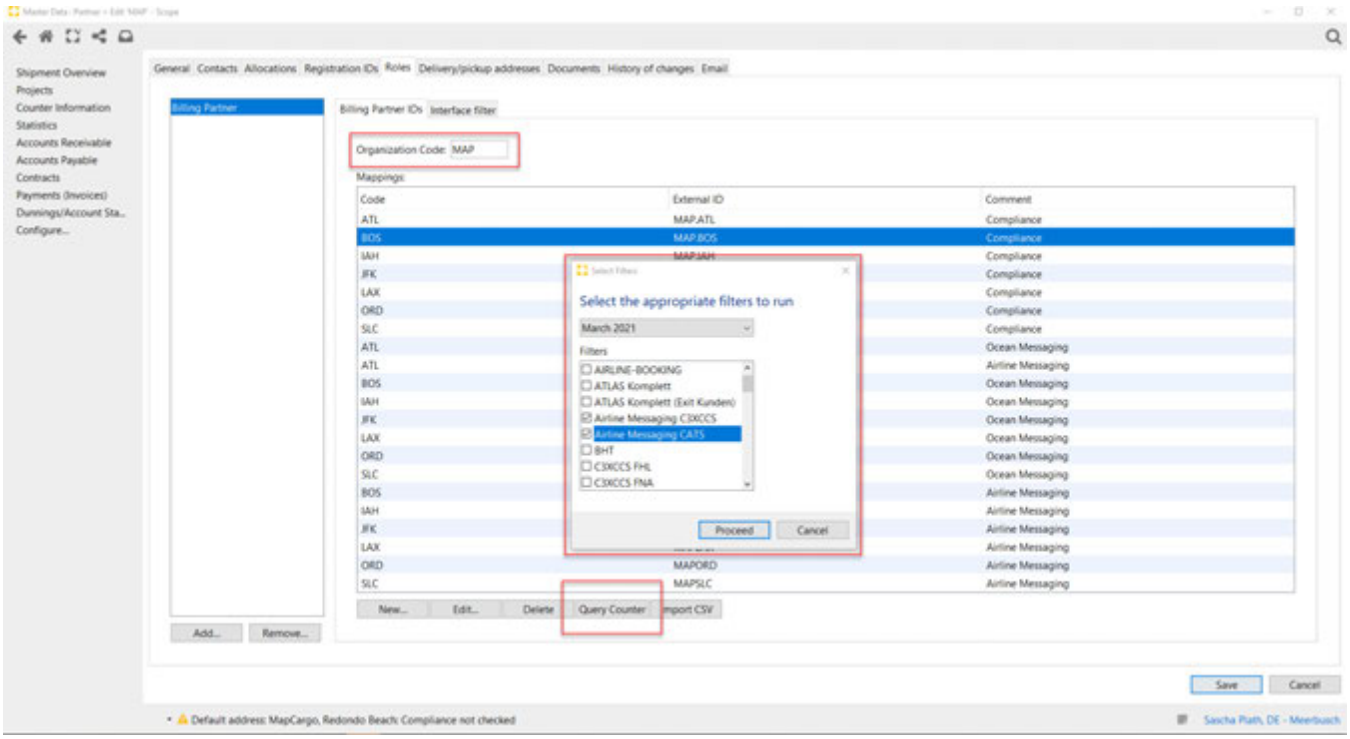
Field	Description
Code	Branch or Legal entity code as maintained in organizational structure. Depending on the interface, it might vary between branch or the legal entity-code.
External ID	Corresponding ID, which will be used in the corresponding CC to identify the message-receiver. When creating the reports of the counters every month, the not-identifyable IDs of transactions will be listed via this function and need to corrected eventually.
Comment	Description to give details of the mapping

With function New, Edit and Delete you can modify the entries accordingly.

Import CSV allows you to import the mappings via a csv/txt-sheet.

Query counter

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

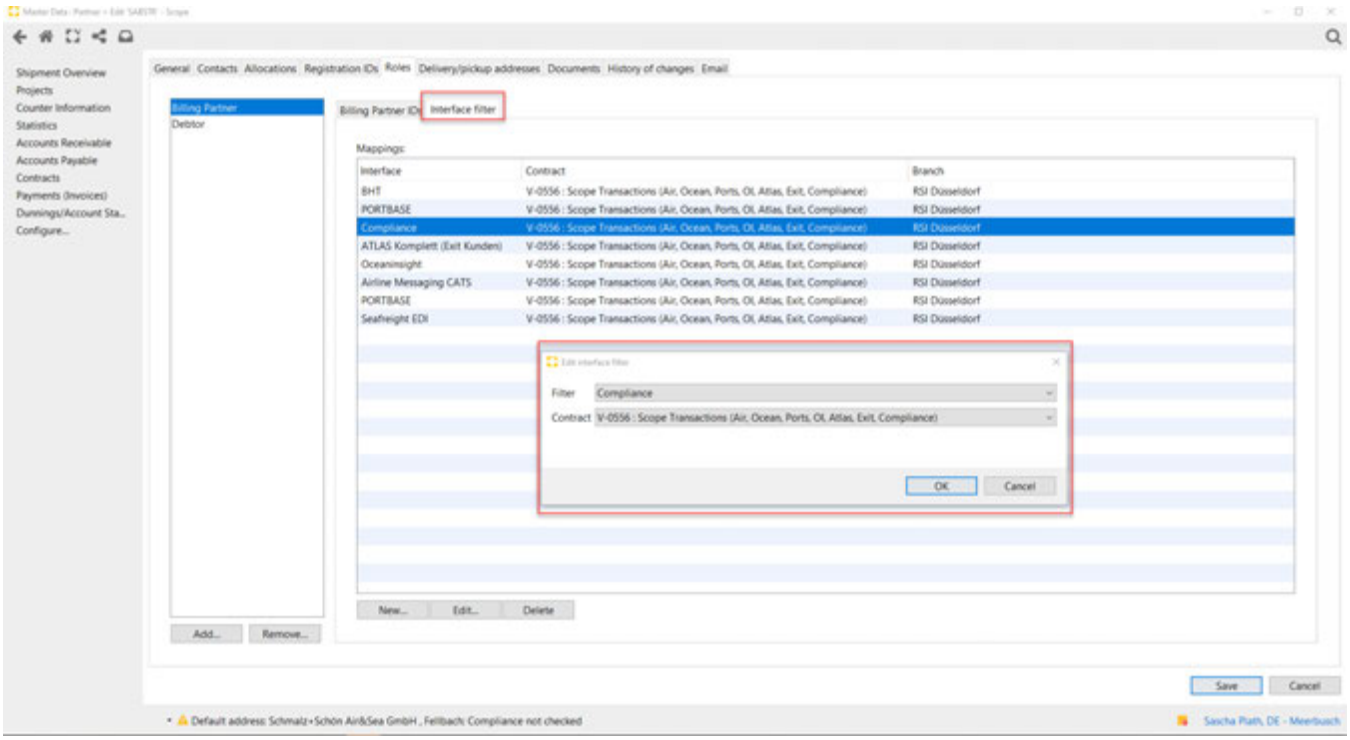


You can select the corresponding month as well as the corresponding filters, you like to create the reporting for.

You can find a detailed overview of the filters here: Counter Information - RSI Billing

Interface filter

This tab is implemented to link a counter to a contract for counting the transactions respectively:



In order to export the transactions via Counter Information - RSI Billing you need to maintain the corresponding interface mappings. Otherwise the counters will not be used for the export.

Also this feature is not completed yet, so the calculations of the amount by transactions needs to be done manually. You can use tariffs to calculate the amounts by the figures. However since there is no direct link to the counters, you needs to insert the numbers of transactions manually in your customer invoices.

Voucher Types

- Introduction
- Description

Introduction

Financial documents can be grouped according to types and for each type of financial document a code is used and will be present when viewing the document to assist in identifying it and to ensure it is processed correctly during accounting operations.

Description

List of voucher types:

Type	Description in English	Description in German
EI	Estimate Income	Reserve für einen Ausgangsbeleg
OI	Open Income	offener Ausgangsbeleg
I	Income	Ausgangsbeleg
EP	Estimate payable	Reserve für einen Eingangsbeleg
OP	Open payable	offener Eingangsbeleg
P	Payable	Eingangsbeleg
TEP	Transfer Estimate Payable	Transfer Aufwands-Rückstellungen
TEI	Transfer Estimate Income	Transfer Erlös-Rückstellungen

CRM

Introduction

Application CRM (Customer relationship management) is used to create Sales Activities, Quotations and Rate Sheet Templates

- Quotations
- Rate Sheet Template
- Rate Text Blocks
- Sales Activities
- Customers and Prospects

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Quotations

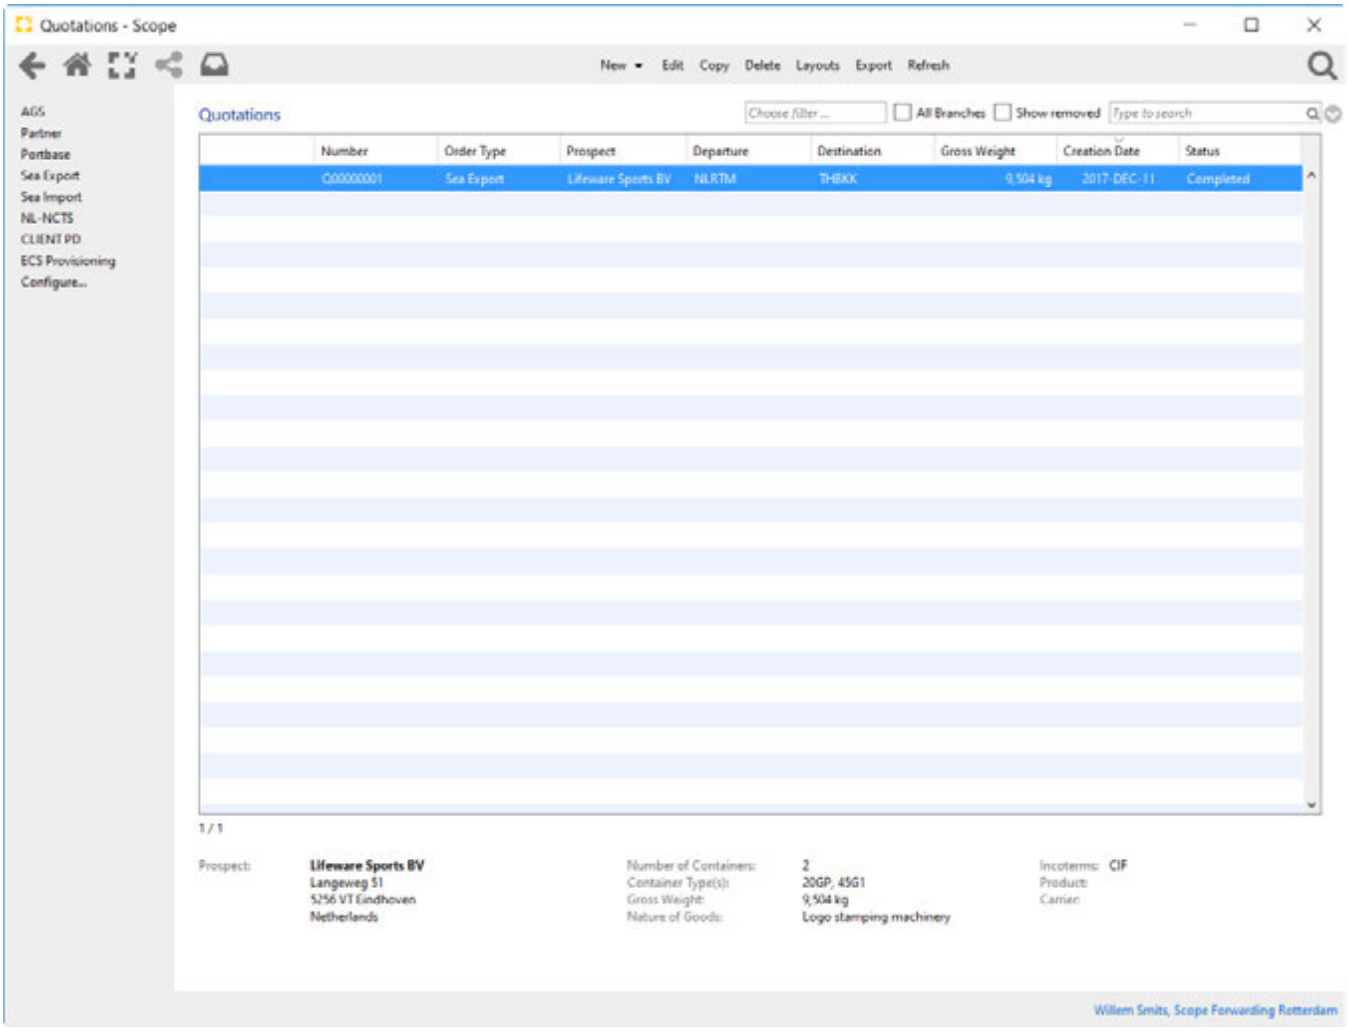
Introduction

In the function Quotations it is possible to create and monitor sales quotations for one-off shipments. For continuing shipments to multiple destinations, the tariffs can be registered in the corresponding function and
overviews can be provided to customers using the rate sheet template application. The quotation function supports all modules including simple shipments, overviews can be produced via the export functions allowing review in Excel.
A shipment can be created based on the created quotation using the entered tariffs and rates.

Description

- Introduction
- Description
- General tab
- Calculations
- Charge Type Line Dialog
- Layout Tab
- Generic Tabs

Homeview



Titlebar

In the title the main functions of the quotation application can be found.

New

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the drop-down of the New button a selection can be made for the type of declaration to be made:

- Air Export
- Sea Export
- Air Import
- Sea Import
- Simple shipment

Edit

The Edit function will open the quotation.

Copy

As a quotation may only be used once, a copy function is available if a comparable quotation is to be used.

Delete

With the Delete option a quotation can be set to invalid. It will not be removed but hidden from the default view.

Layouts

Shortcut option to start the Layout application where the users can define Excel sheet layouts by selecting available columns.

Export

Exports the information of the active qoutations to an Excel sheet, using optionally a predefined layout.

Refesh

Reload the page with the last statuses.

Search Bar

In the search bar search criteria can be defined or a filter can be activated for finding a specific quotation or a group of quotations to be exported.

Sorted Filters

In the stored filters predefined filters can be stored, system delivered filters are :

- Expired quotations: quotations having the status completed and quotations having an expiry date before Today
- Quotations to be processed: quotations having the status New or Reopened that require action (coming from an external source).

All Branches

With the proper permissions it is possible to see quotations of all branches within an organisation.

Show Removed

Show all quotations that were previously removed.

Quick Search Box

Search a qoutation based on text data within a quotation.

Qualified Search Box

In the qualified search the following criteria are present.

Criterion	Operators	Description
Clerk	is / is not	User creating the quotation
Creation date	is / is greater / is less / is between in the last / in the current month / in the last month	Actual date search creation of the quotation Relative date search creation of the quotation
Departure	is / is not / located in / not located in / part of region	Main carriage departure of the quotation
Destination	is / is not / located in / not located in / part of region	Main carriage destination of the quotation
Last status change	is / is greater / is less / is between in the last / in the current month / in the last month	Actual date search last status change of the quotation Relative date search last status change of the quotation
Latest shipping date	is / is greater / is less / is between	Actual date search last shipping date of the quotation

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

	in the last / in the current month / in the last month	Relative date search last shipping date of the quotation
Module	is / is not	Module for which the quotation was made
Place of delivery	is / is not / located in / not located in / part of region	Place of delivery in the quotation
Place of receipt	is / is not / located in / not located in / part of region	Place of receipt in the quotation
Product	is / is not	Sales product of the quotation
Prospect	is / is not / is part of group	Search for the partner
Rejections reason	is / is not	the reason code entered for rejecting the quotation
Sales person	is / is not	The sales person registered on the quotation
Send out before	is / is greater / is less / is between in the last /in the next / in the current month / in the last month	Actual date search due date of the quotation Relative date search due date of the quotation
Shipment type	Is / is not	LCL or FCL only applicable for sea quotations
Status	is / is not	The status of the quotation

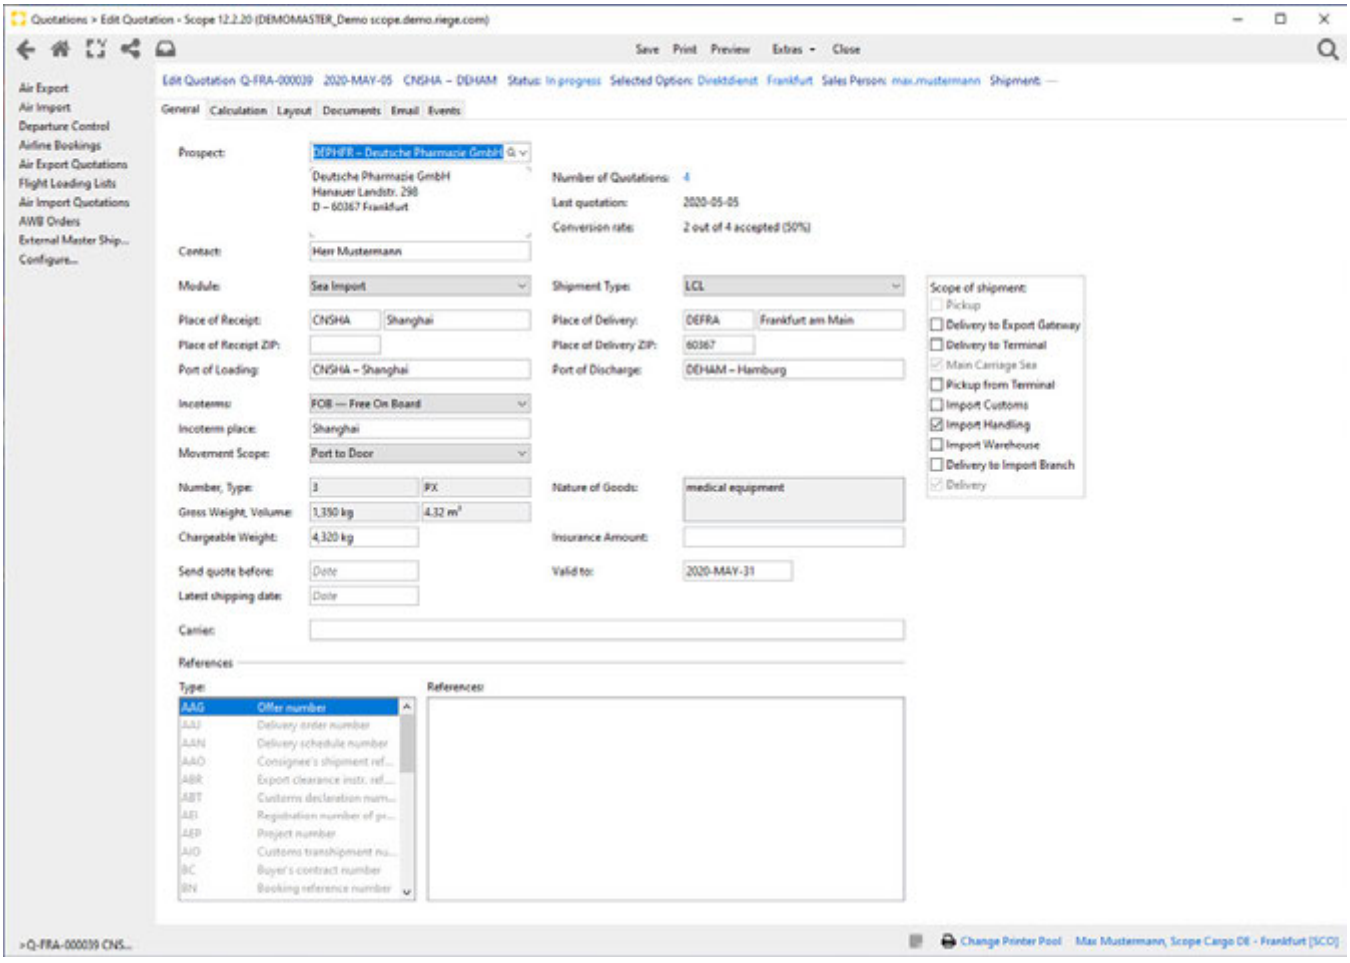
Grid

In the grid all records which meet the criteria of the filter will be shown, most fields of the quotation are available as columns, which can be activated /deactivated with a right mouse-click.

Preview

In the preview most relevant details of a quotation can be reviewed in the preview without actually opening the quotation.

General tab



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Menu Bar

Save

Option to save the quotation

Print

The option to finally print the quotation and set to status to completed.

Preview

Opens a preview of the generated quotation pdf.

Extra \ Create shipment

The option to generate a shipment based on the quotation.

Extra \ Print filecover

Generate a hardcopy quotation pdf.

Extra \ Generate new quotation number

In case a new quotation number is needed because there were major changes made to the existing quotation (or quotation numbering has changed significantly) this option can be used the generate a new number.

Title Bar

In the title bar the following items are displayed:

Quotation number

The quotation number as assigned by the system, the format of the number can be changed by means of a request to Scope Support (F12).

Create date

The date the quotation was created

Main Carriage Leg

The origin and destination of the main carriage

Status

The status of the quotation, the following statuses are available:

Status	Description	Remark	Fields Enabled
In progress	Initial status of the quotation when work is still to be done by the user	If it has a different status, a quotation can be reset to "In progress".	✓
Waiting for	Status which can be manually set by the user, indicated the user needs information from a third party before being able to finish the quotation		✓
Completed	The quotation has been printed definitely and been sent to the customer.	Status can be manually changed to "In progress" , "Accepted" or "Rejected".	✗
Accepted	The quotation has been accepted by the customer but a shipment has not yet been created. Status must be set manually by the user.		✗
Rejected	The quotation has been rejected by the customer. Status must be set manually by the user. If reas on codes have been set up, the choice for a reason code is mandatory.	Status can be manually changed to "In progress", or "Completed".	✗
Shipment created	The quotation has been used to create a shipment.	No more status changes are allowed.	✗

Selected Option

A quotation can contain multiple options now: it can have different calculations depending on the products the prospect is interested in or if the prospect requires different suppliers for the transport.

Sales Person

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The sales person responsible for this quotation, if applicable, Scope will try to determine the sales person automatically, but it also can be set manually.

Shipment

If already linked to a shipment the quotation will show the linked shipment number as an action link

Prospect

In the field prospect the partner who requested the quotation, and who would be the expected customer on the related shipment, is entered in this field. Having the proper permissions, it is possible to enter a document address on the quotation.

Contact

The person to whom the quotation is to be addressed, either an existing contact from a partner or a new contract entered via the "Edit contact" option.

Module

The selected module, once a module has been chosen, the direction can be selected (import / export) but the module (air, sea, simple) cannot be changed anymore.

Incoterms

The incoterms applicable to the requested quotation

Incoterms place

The corresponding place of the incoterms

Movement Scope

The movement scope on which the quotation should be based

Place of Receipt

Place of receipt for the quotation. If a UN location code is selected, Scope will search for applicable tariffs available in the master data and add them to the quotation.

Place of Delivery

Place of delivery for the quotation. If a UN location code is selected, Scope will search for applicable tariffs available in the master data and add them to the quotation.

Place of Receipt Zip

Place of receipt zip code for the quotation. Scope will search for applicable tariffs based on registered zipzones available in the master data tariffs and add them to the quotation.

Place of Delivery Zip

Place of delivery zip code for the quotation. Scope will search for applicable tariffs based on registered zipzones available in the master data tariffs and add them to the quotation.

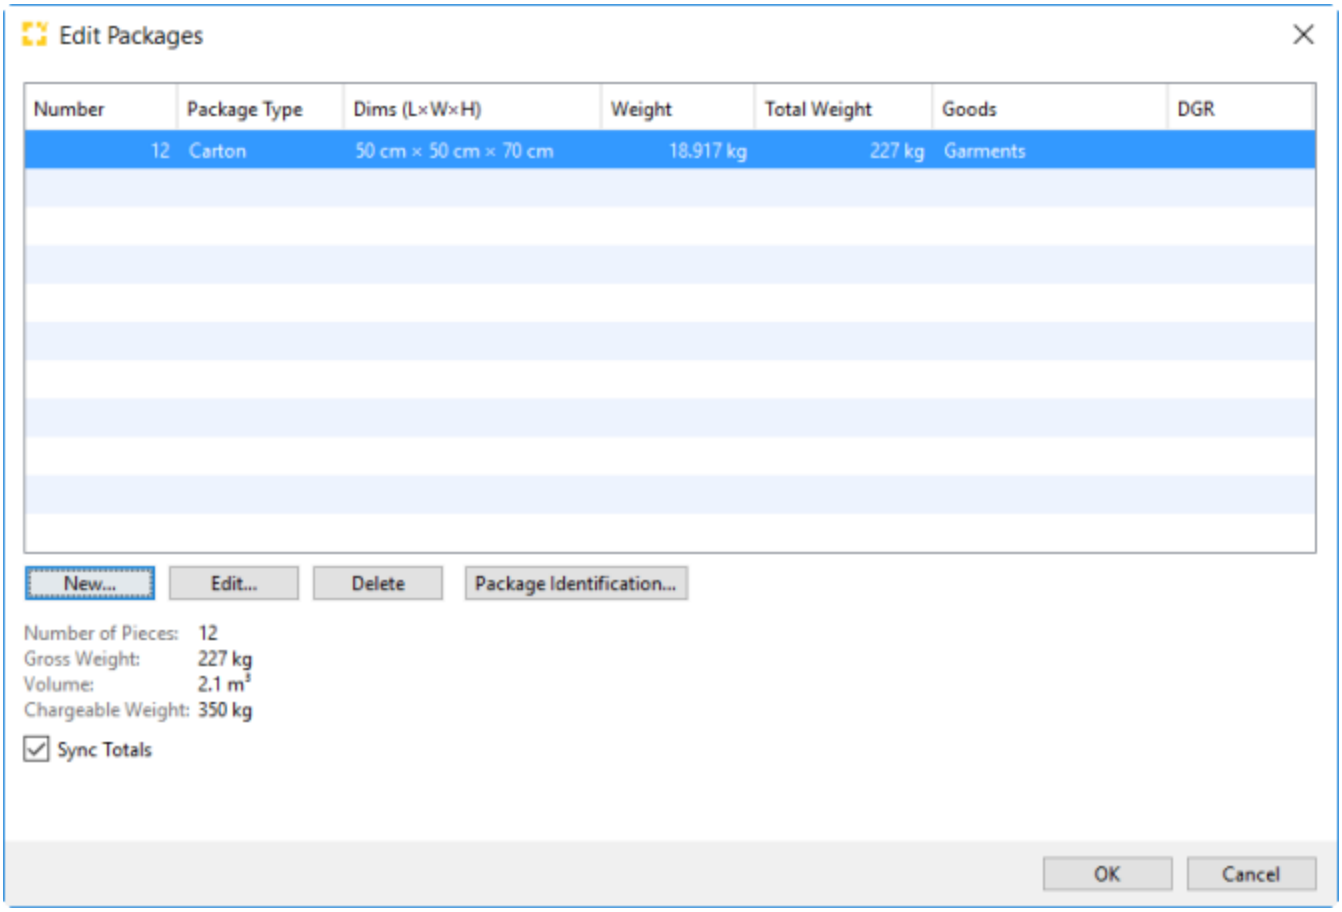
Module / Shipment Type Dependent Fields

Per selected shipment module there will be different fields available in the quotation and become available in the quotation basis calculation.

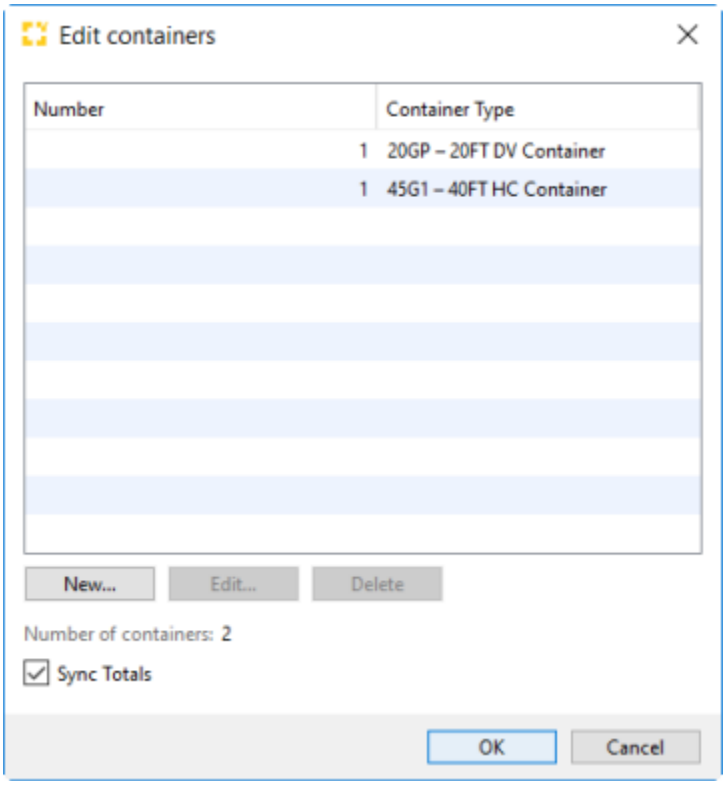
Module	Shipment Type	Available Fields						
		number of packages	package type	gross weight	volume	chargeable weight	number of container /types	container type
Air	-	✓	✓	✓	✓	✓	-	-
Sea	LCL	✓	✓	✓	✓	✓	-	-
Simple		✓	✓	✓	✓	✓		
Sea	FCL	-	-	✓	-	-	✓	✓

When the number of packages is available, the regular edit packages option (F3) with the standard dialog is available.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the number of containers is available, the entry for multiple containers for only 1 type can be entered in the mainscreen and using the edit containers (F3) option, a dialog can be started where multiple container types can be registered.



Send Quote Before

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Date before which the quotation should be sent to the customer.

Valid to

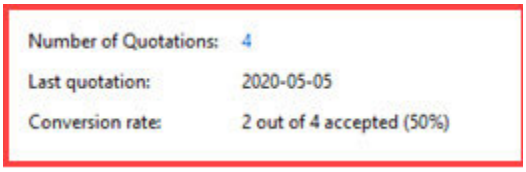
Last date of validity of the qoutation

Latest shipping date

The last date that the shipment should depart, this date value is also used to search for applicable tariffs.

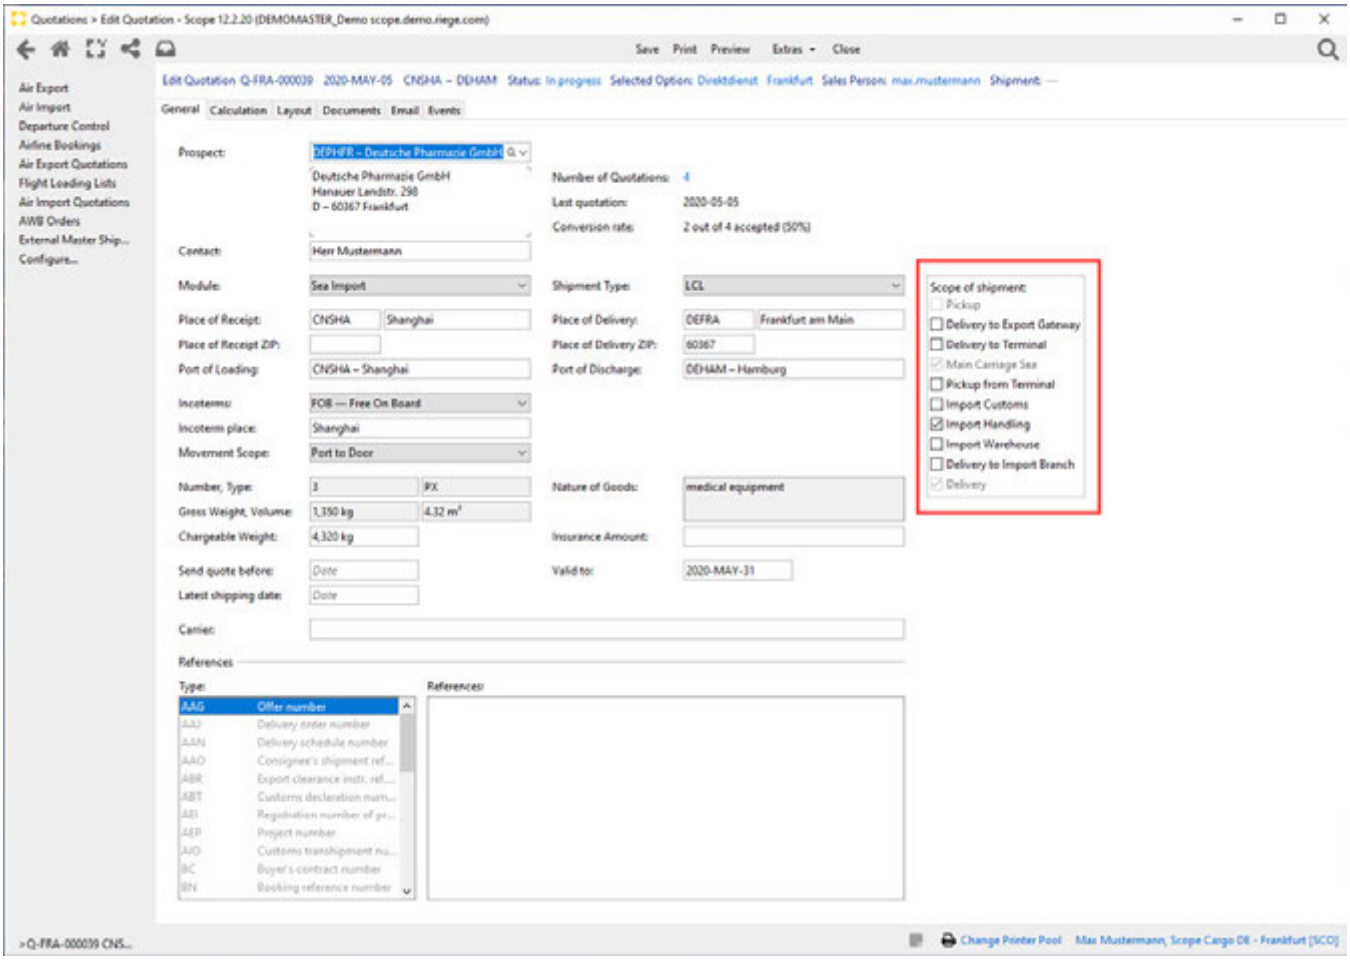
conversation rate

When a quotation is created or edited and the prospect has been assigned, you will see the total number of quotations created for him as well as a conversion- and percentage rate of accepted quotations by him. If you click on the number of quotations, you will get an overview of them.



Scope of System

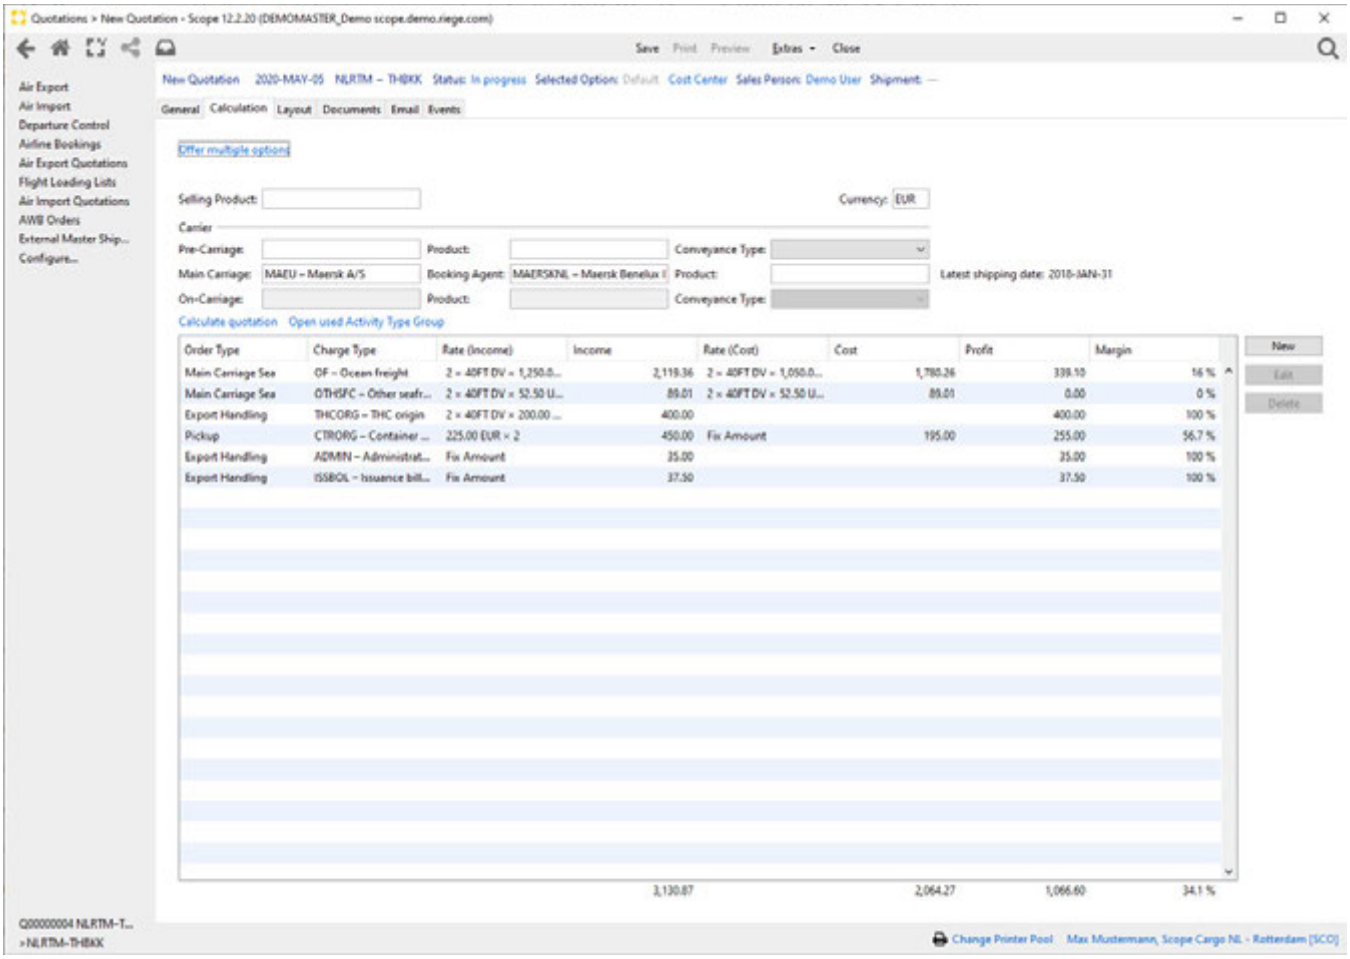
Besides the defined order types based on movement space the user can use additional order types. In this case defined charges codes/tariffs will take place at calculation tab (calculation quotation)



Calculations

On the tab Calculation all the actual rates are registered.

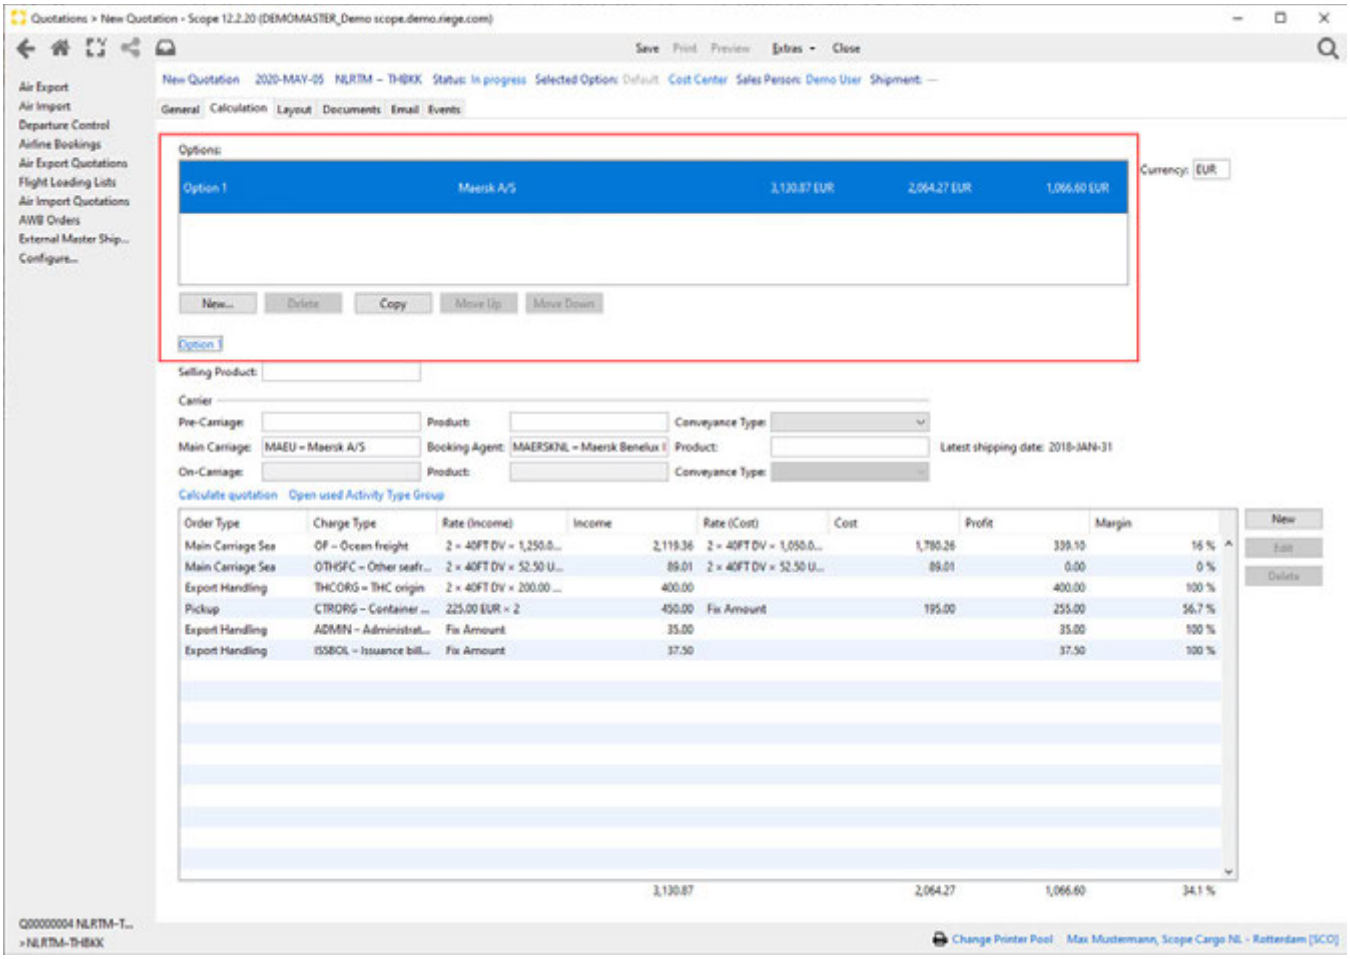
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Offer multiple options

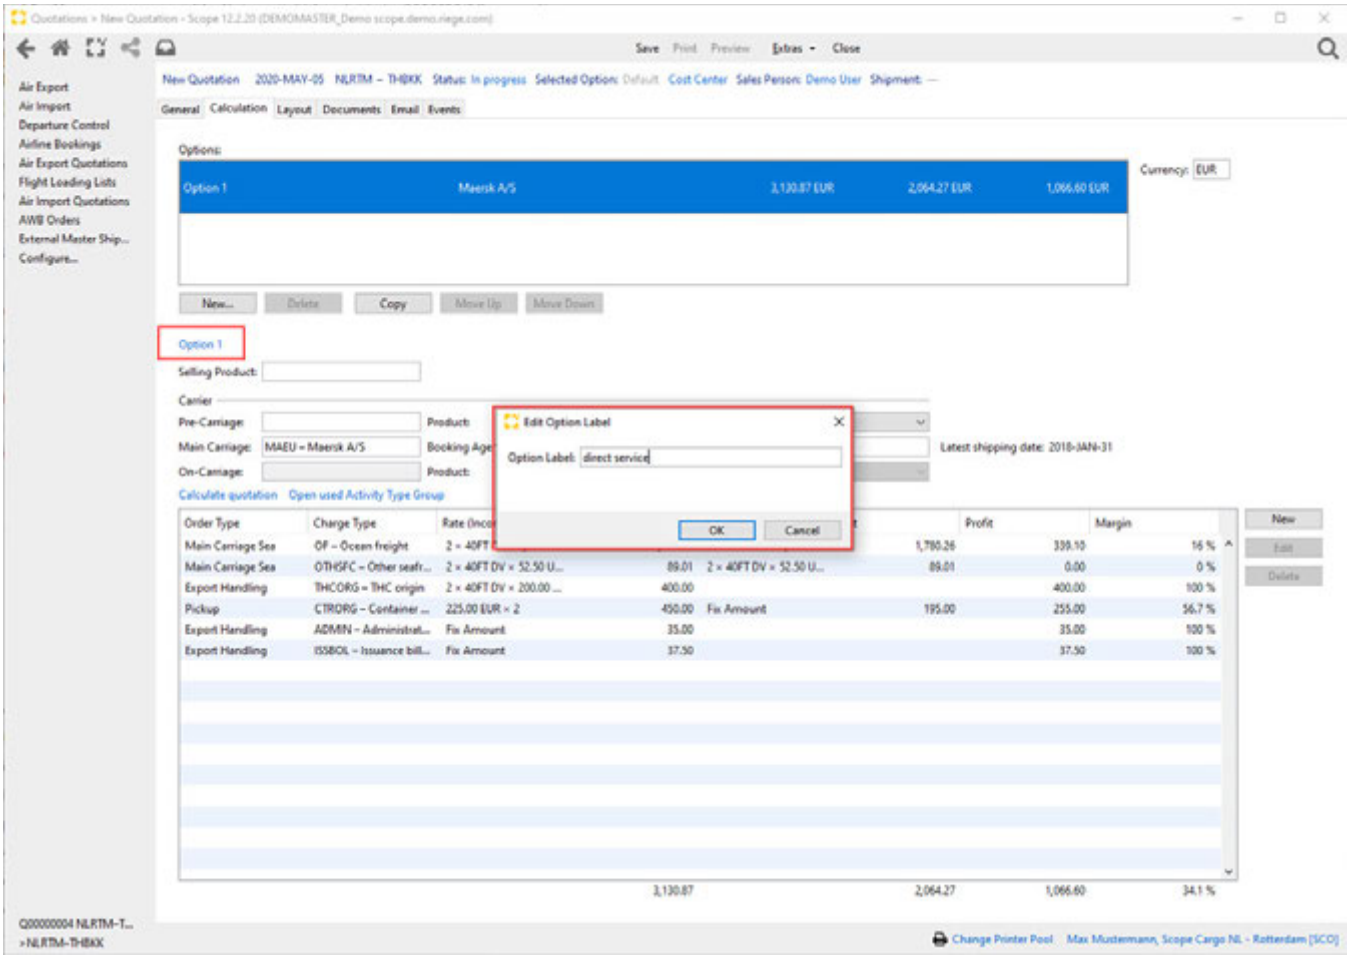
A quotation can be divided in different option, e.g. direct service or transshipment, airline Lufthansa or Cargolux. By checking "Offer multiple option the actual view will be fixed as a option.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



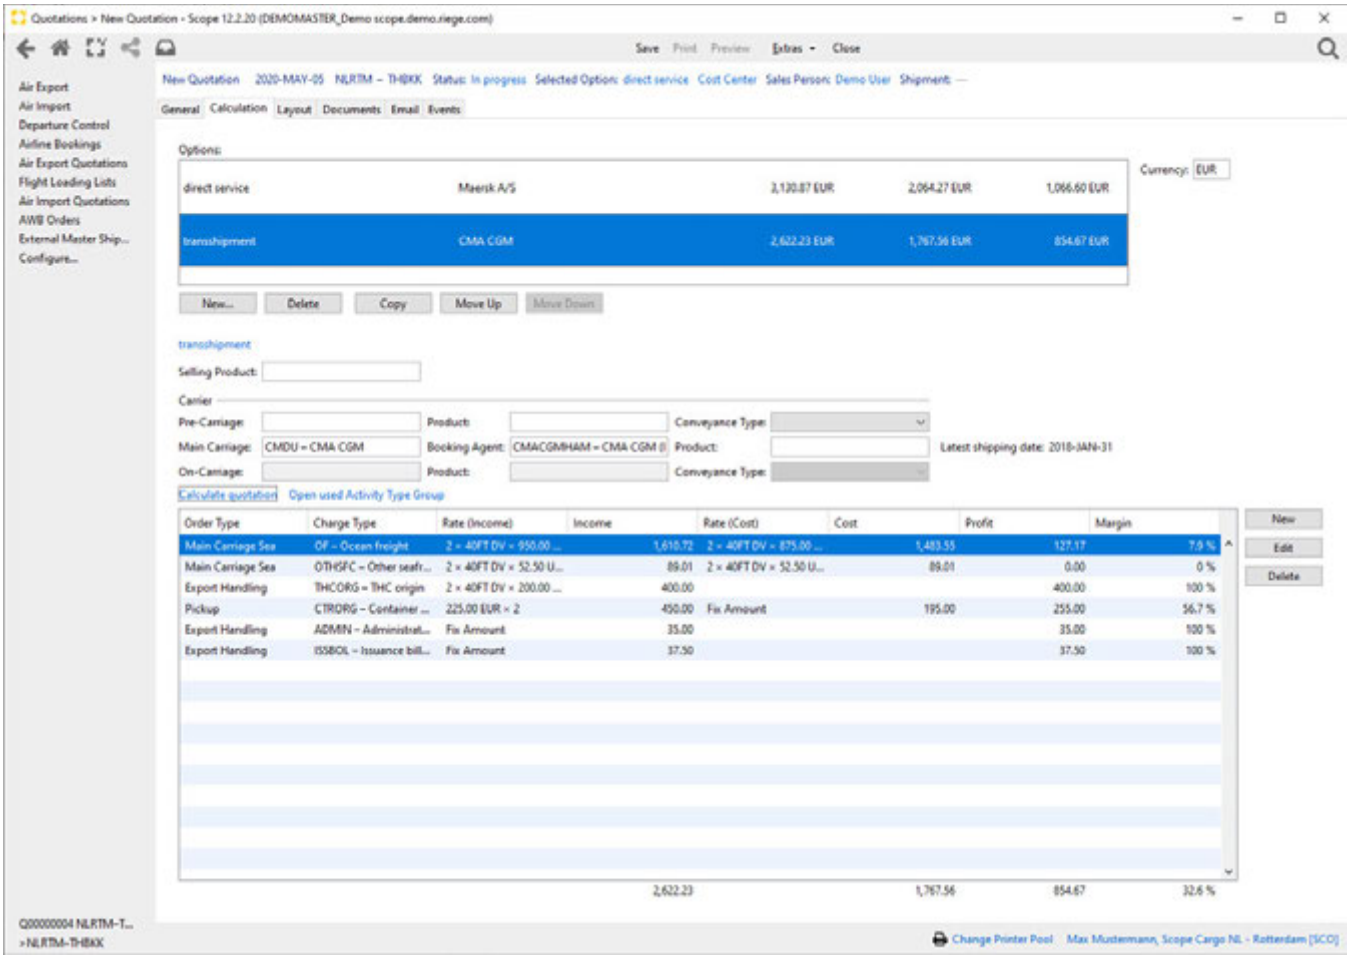
You can re-name options by clicking on the marked button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



New options can be added by "New" or "Copy". Also they can be deleted and moved up/down for Layout tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Selling Product

Buying product will be used to find corresponding selling tariffs.

Currency

The currency in which the quotation will be offered, any tariffs found in different currency will be converted using the current valid exchange rate.

Main Transport Carrier

The carrier of the main transport can be added optionally and will be used to find corresponding buying and/or selling tariffs.

Booking / Arrival Agent (not visible for Air / Simple quotations)

The partner serving as booking/arrival agent in the Seafreight modules can be added optionally and will be used to find corresponding buying and/or selling tariffs.

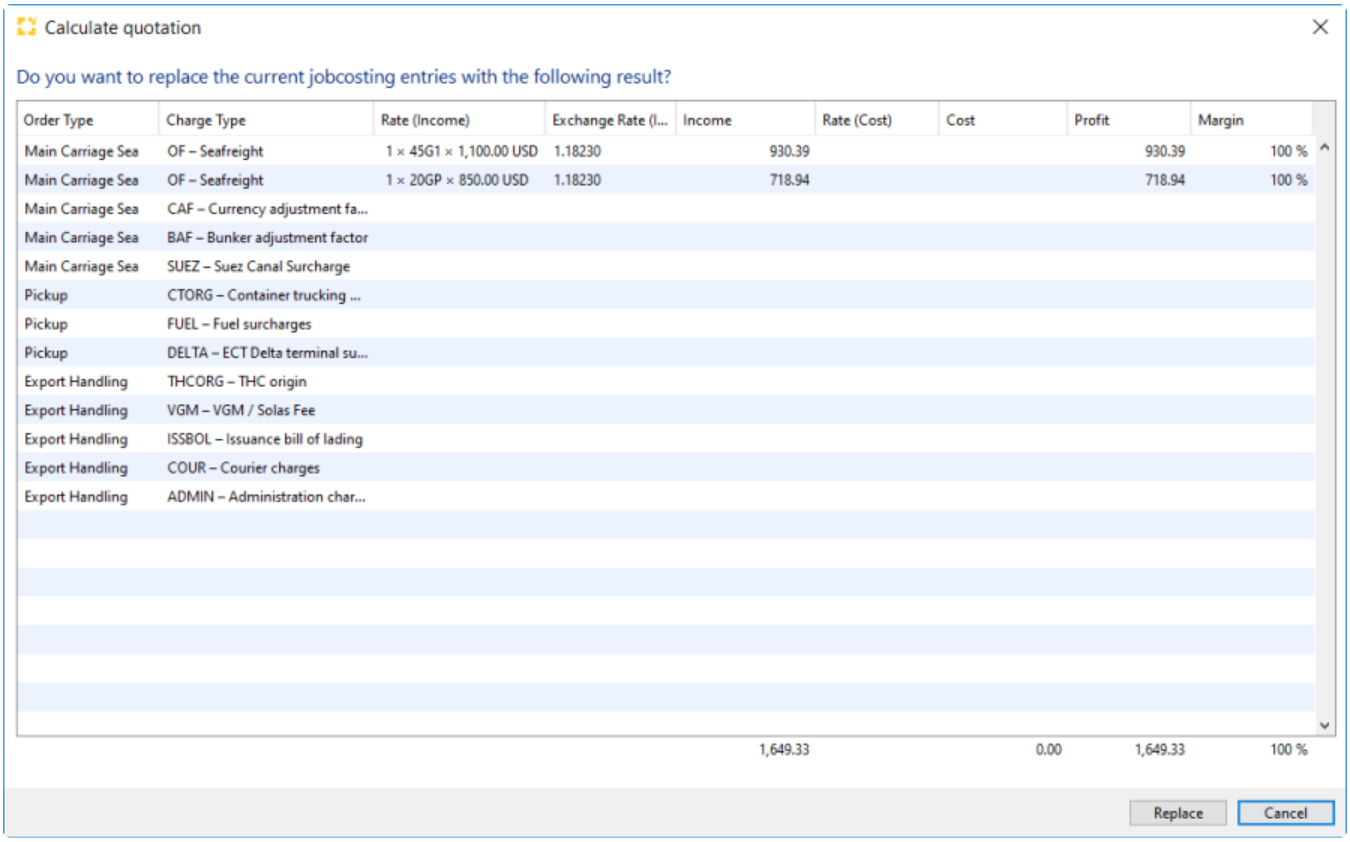
Product

Buying product will be used to find corresponding buying tariffs.

Calculate Quotation

Will trigger the base calculation on an applicable activity type, if found. If the link is used more than once, system will ask whether existing lines are to be replaced or the action should be canceled.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Open Used Activity Type

Will open the Activity Type found during the calculation, if the user has sufficient permissions he can adjust it.

New Button

Option to add a new charge type line to the quotation

Edit

Option to edit a charge type line of the quotation

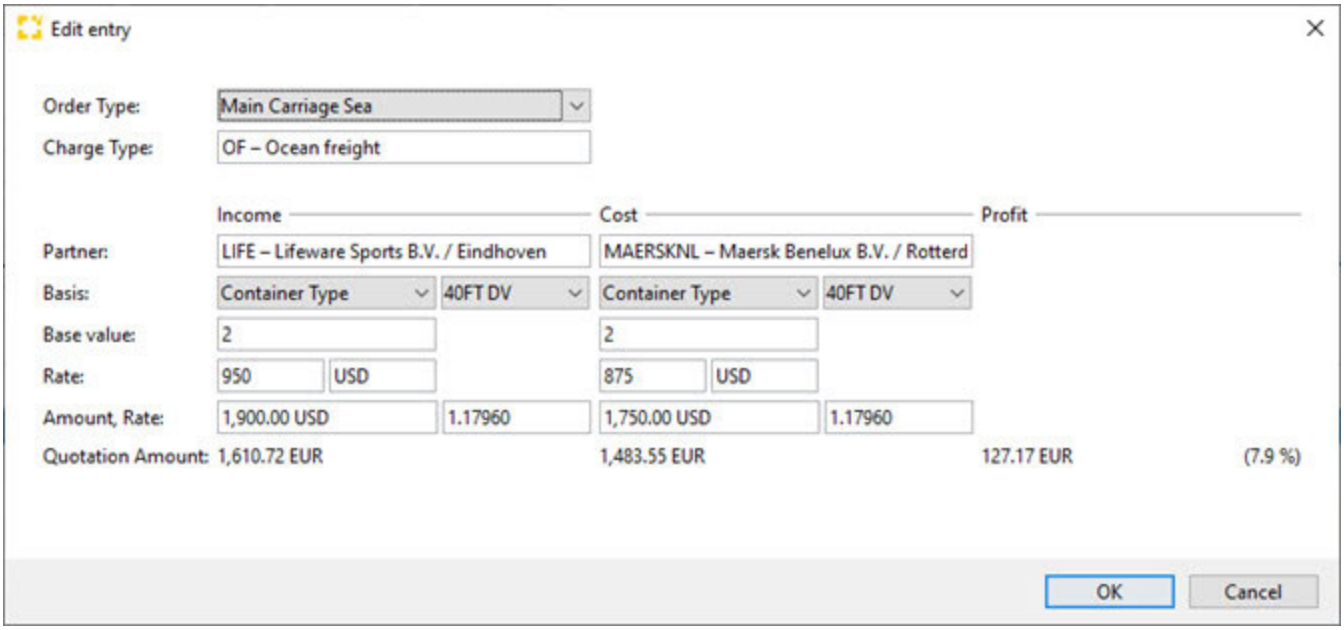
Delete

Option to delete a charge type line of the quotation

Charge Type Line Dialog

When using the add or edit option a new dialog will be opened where the selling and buying details for the quotation can be registered.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Order Type

The activity to which the calculation belongs, being either handling, Pickup (export), Delivery (import) or Main Carriage.
This is used to determine applicable tariffs and values to be calculated with.

Charge Type

The charge type as to be mentioned on the quotation

	Income	Cost	Profit
Partner	The partner for whom the selling rates are registered	The partner of whom the buying rates might be registrered	-
Basis	basis for calculation	basis for calculation	
Basis value	value for calculation	value for calculation	
Amount, Rate	The amount and currency and the exchange rate to be used	The amount and currency and the exchange rate to be used	
Quotation Amount	Converted to local currency amount	Converted to local currency amount	Profit & profit percentage

In the amount rate box there are 3 functions available.

F3 - Calculator : Standard job costing calculator allowing to select a basis and number, defaults the basis if possible and the rate

F5 - Recalculate Tariff : Standard job costing option to perform the tariff calculation again based on the tariff found and the details available in the quotation

F7 - Show Tariff : Standard job costing option to display the details of the tariff found and the details used to calculate the amount.

Column Overview

In the column overview of the calculation the following columns are available:

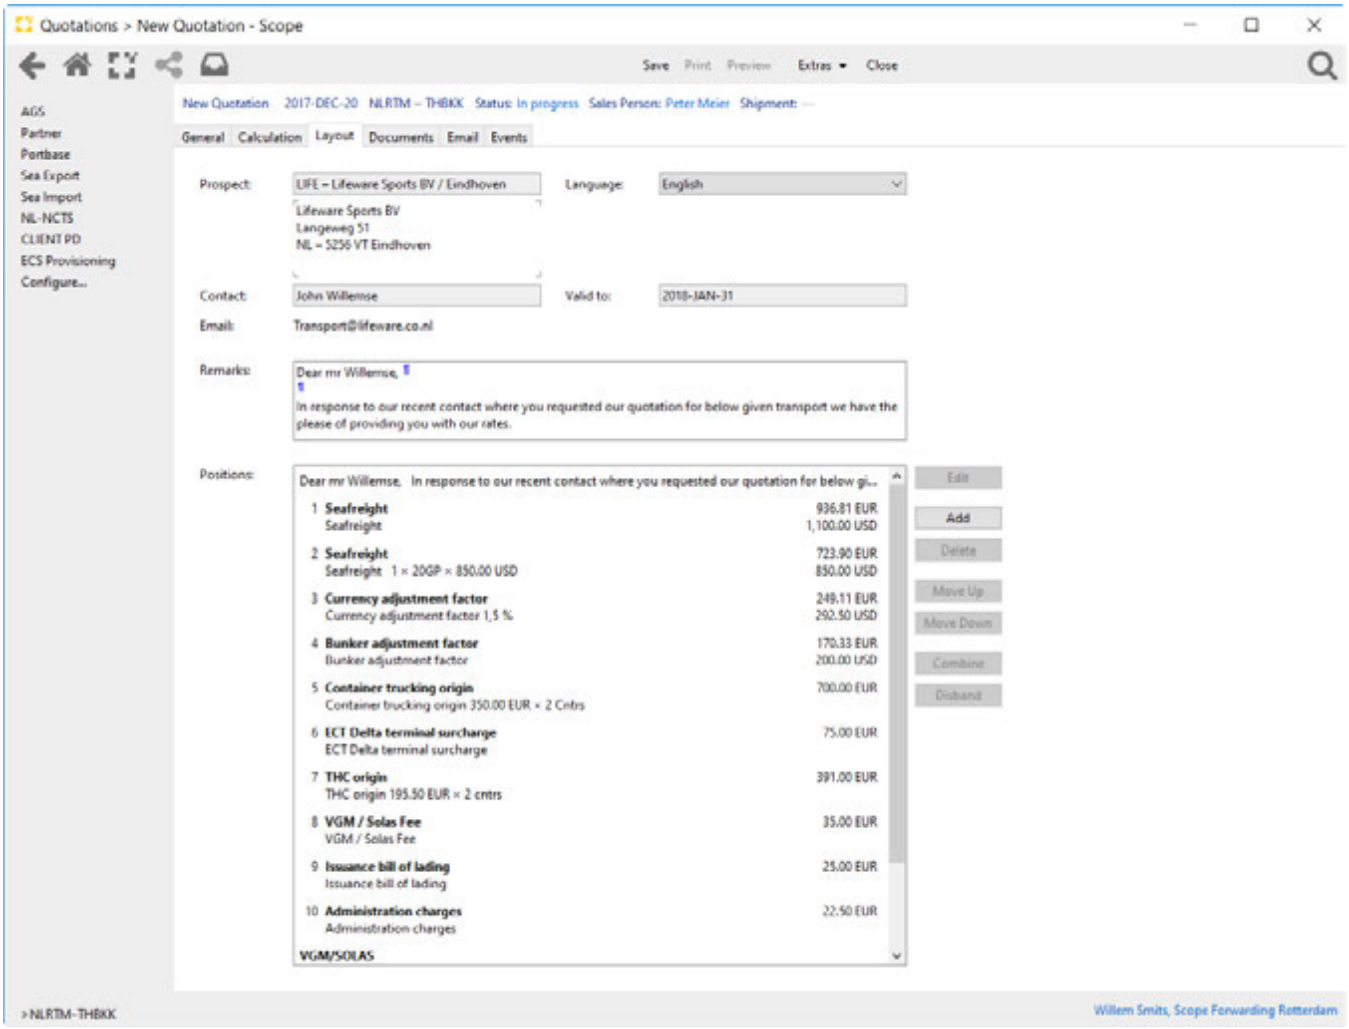
Column	Description	Totals Shown
Order type	The activity type for which the quotation line is registered	
Charge type	The charge type of the quotation	
Rate (income)	Display of the calculation construction	
Exchange rate (income)	Exchange rate used for the income of the quotation line, in case the rate is in a foreign currency	
Income	Total calculated amount in the currency of the quotation	✓
Rate (cost)	Display of the calculation construction	
Exchange rate (cost)	Exchange rate used for the income of the quotation line, in case the rate is in a foreign currency	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

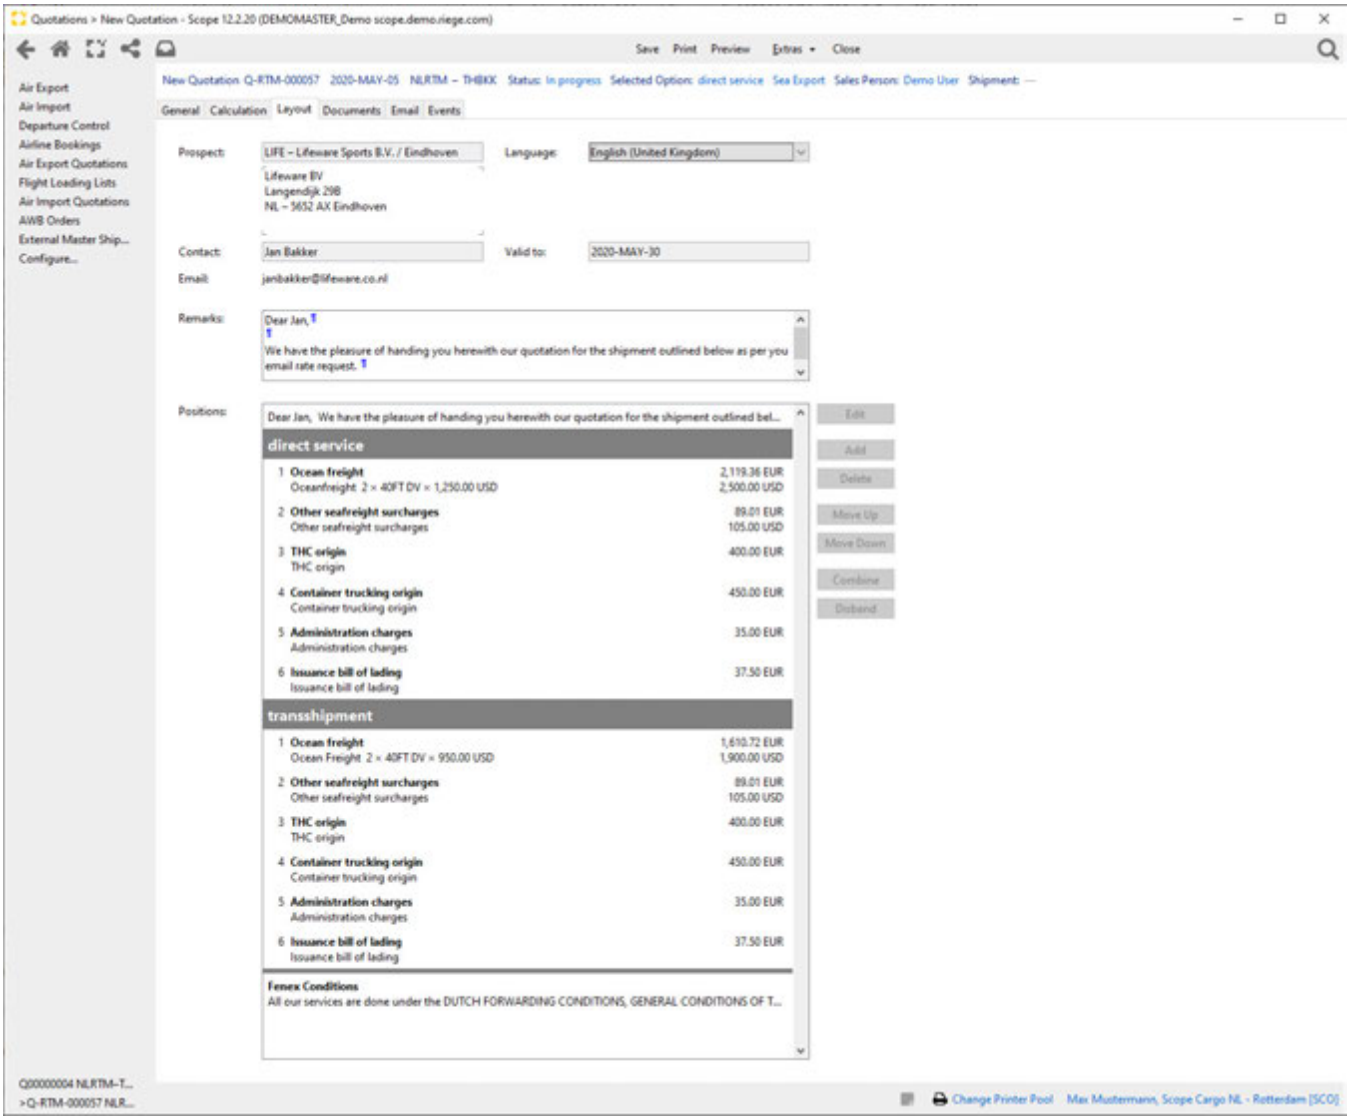
Cost	Total calculated amount in the currency of the quotation	✅
Profit	Profit amount per QT line	✅
Margin	Profit margin in percentage	✅

Layout Tab

On the layout tab of the quotation, the details of the actual print are added.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Prospect

The partner receiving the quotation, display only, changes are to be made on the general tab.

Language

The language in which the quotation will be sent to the partner, defaulted with the language of the partner

Contact

Addressee of the quotation, display only, changes are to be made on the general tab.

Valid to

The date till when the quotation is valid, display only, changes are to be made on the general tab.

Email address

The email addresses to which the quotation will be sent, display only, changes are to be made on the general tab.

Remarks

The remarks box is the header of the quotation, will appear as the top line in the positions grid.

Positions Grid

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the positions grid the body of the quotation can be adjusted. All income lines of the Calculation tab will be shown.

Edit

Using the Edit option depending on the type of line selected the following can be done:

Calculation line: Quotation text and construction of calculation can be added and or updated to fit the details.
Rate text blocks: The default rate text block can be overwritten with specific text for the single quotation.

Add

Using the Add option, standard created rate text blocks can be added to the quotation. The defaulted text can be updated for the specific quotation.

Move Up/Down

Using the Move Up/Move Down buttons, the position of the individial lines can be adjusted. Calculation lines can be moved respective to all the available calculation lines.
Rate text blockes can either be moved to the bottom or to the top (below the Remarks). They cannot be positioned in between calculation lines.

Combine / Disband

Allows the consolidation of multiple calculation lines into one quotation display line, or the reversal of the same

Generic Tabs

The Scope generic tabs Documents, Email and Events are also available in the quotation. Please note that at this moment no automatic email of a quotation is sent to the recipients.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Reason code - Master data

Introduction

For different actions it is possible to set Reason Codes which have chosen by user.

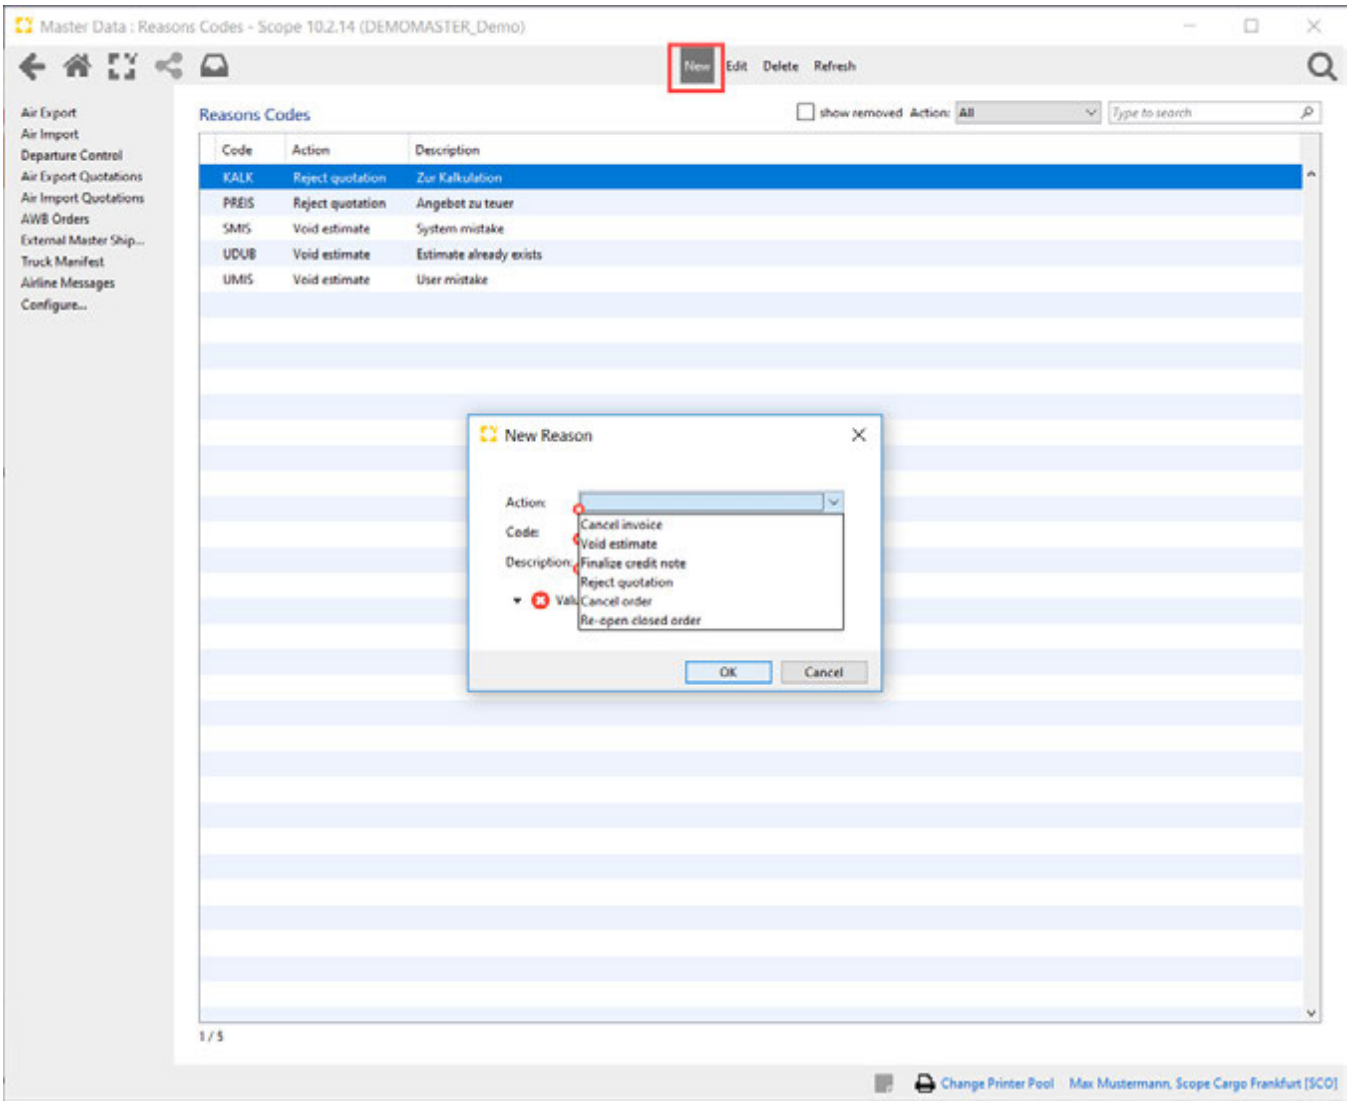
Description

Reason Codes can be set up in application Master data - Reasons.

For the following actions a reason code can be set:

- Cancel invoice
- Void estimate
- Finalize credit note
- Reject quotation
- Cancel order
- Re-open closed order

For above mentioned action the user have to choose an reason code and can add a comment.



Action

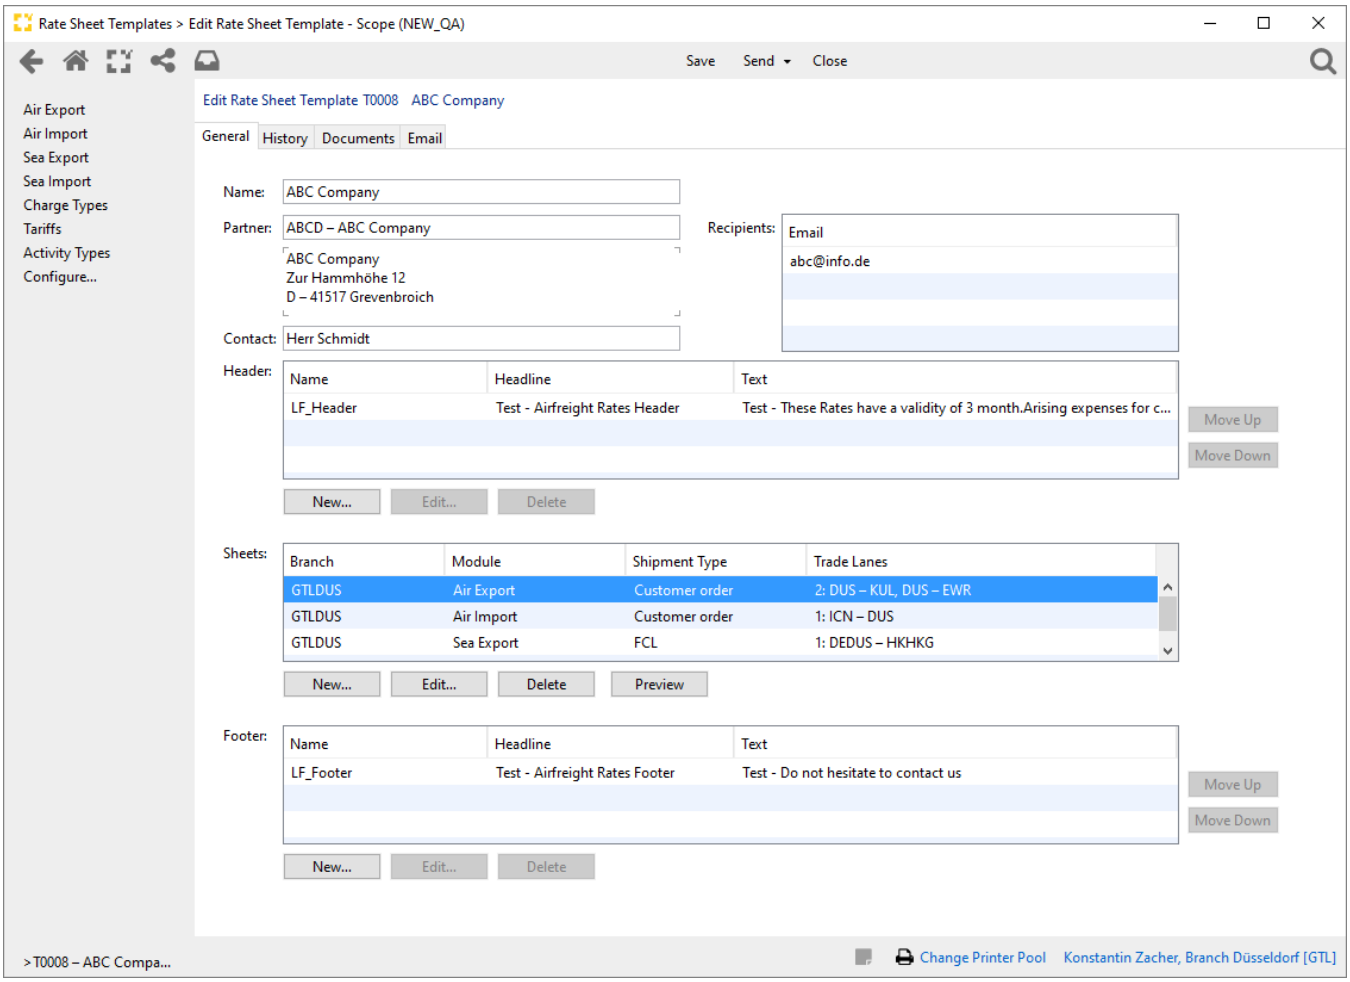
Rate Sheet Template

General

The application Rate Sheet Template gives your Partner an overview about your current (related, as well as general) sales tariffs for certain destination areas.

Choose between the modules Air Export / Import and Sea Export / Import - LCL / FCL, and define a branch as calculation base.

Beside the main carriage scope matches any charge type for the relevant activity type. (e.g. Pickup, Delivery to terminal, ...) + Fuel & Security



Name

The titel name for the description for your Rate Sheet Template in the overview

Partner

Customer to whom the corresponding tarrifs refer to.

Contact

A contact person with a linked email address

Header / Footer

In **Maintenance > Master Data > CRM > Rate Text Blocks** you maintain templates for Header and Footer.

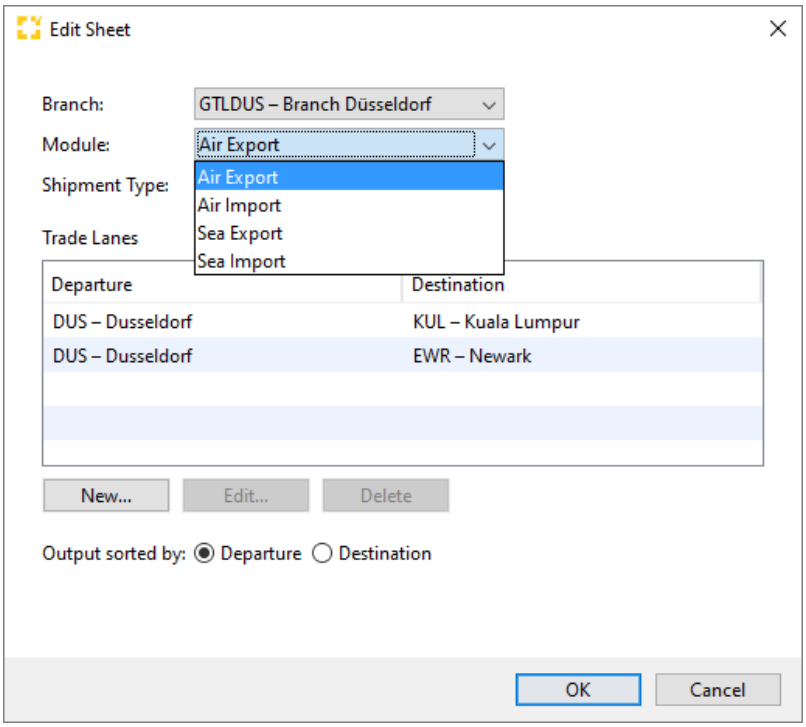
These contain for example general business conditions or excluded services

Sheets

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Define a "new sheet" per module.
It generates a document for every module !

In this way you display/cover various processes for a partner in one central template



Preview

Via this button you can get a preview on the one selected sheet

Send

By sending your Rate Sheet Template **all Sheets** are attached as single files

Choose between "To Myself" or directly "To Partner"

Rate Text Blocks

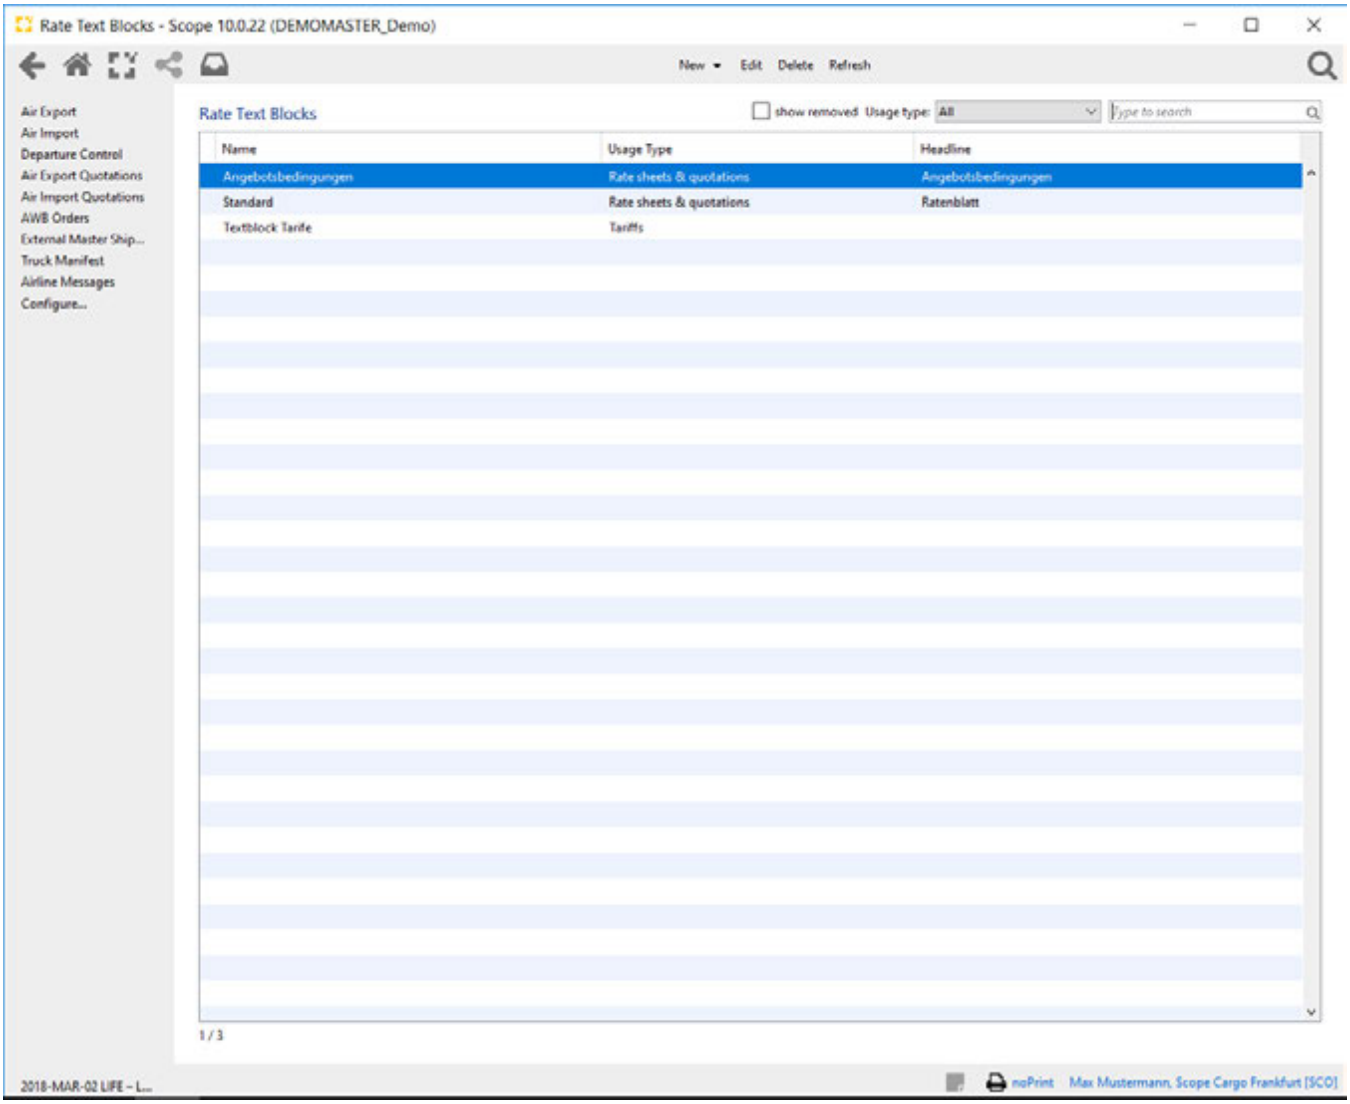
- Introduction
- Description

Introduction

Rate Text Blocks are used to create individual text blocks which can be inserted at rate sheets & quotations and tariffs. Through using Rate Text Blocks the user can create rate sheets and quotation which match his corporate design guidelines regarding to his business conditions or additional charges.

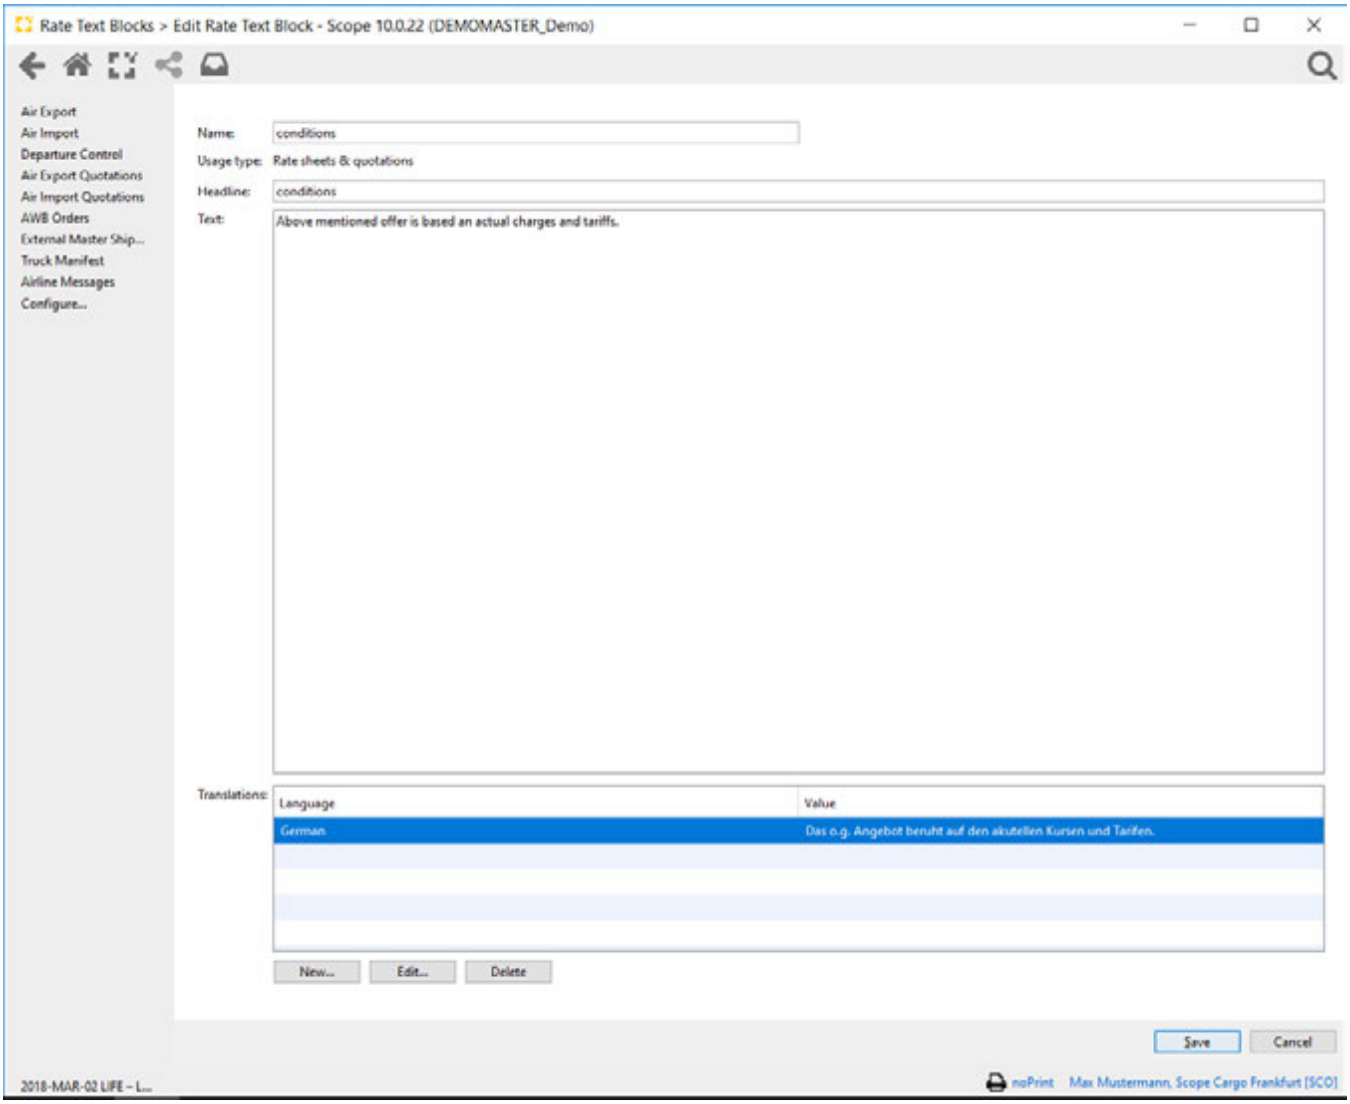
Description

The application Rate Text Blocks is started via *Master Data - CRM - Rate Text Blocks*.



New Text Block

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



To create a text block the user has to complete the following items:

- **Name:** Name of text block which can be selected at rate sheets & quotations and tariffs
- **Headline:** Headline is printed above the text block
- **Text:** content of text block
- **Translations:** After choosing a language the text block can be translated into another language. When a translation exists, Scope uses the translated text block by itself, e.g. changing the language of a quotation from English to German and the text block will be translated as well

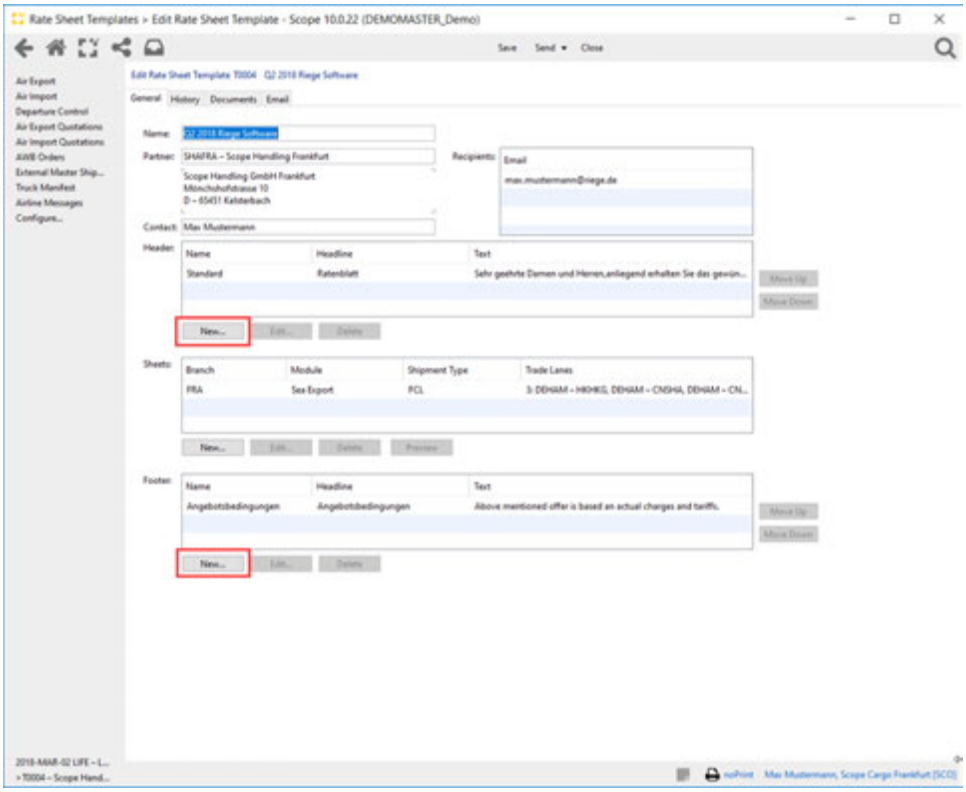
New

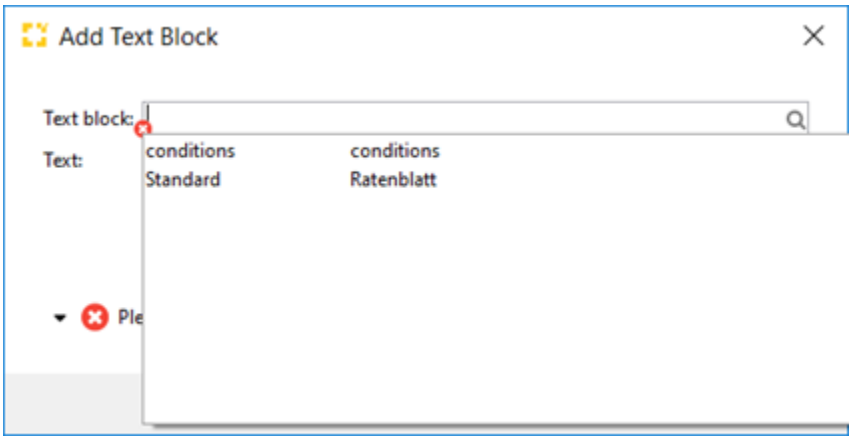
text block for rate sheets & quotations

Text block can be used for rate sheets & quotations

- **rate sheets** text block can be used by application rate sheet templates at Header and/or Footer. The user can select a text block by using "New"

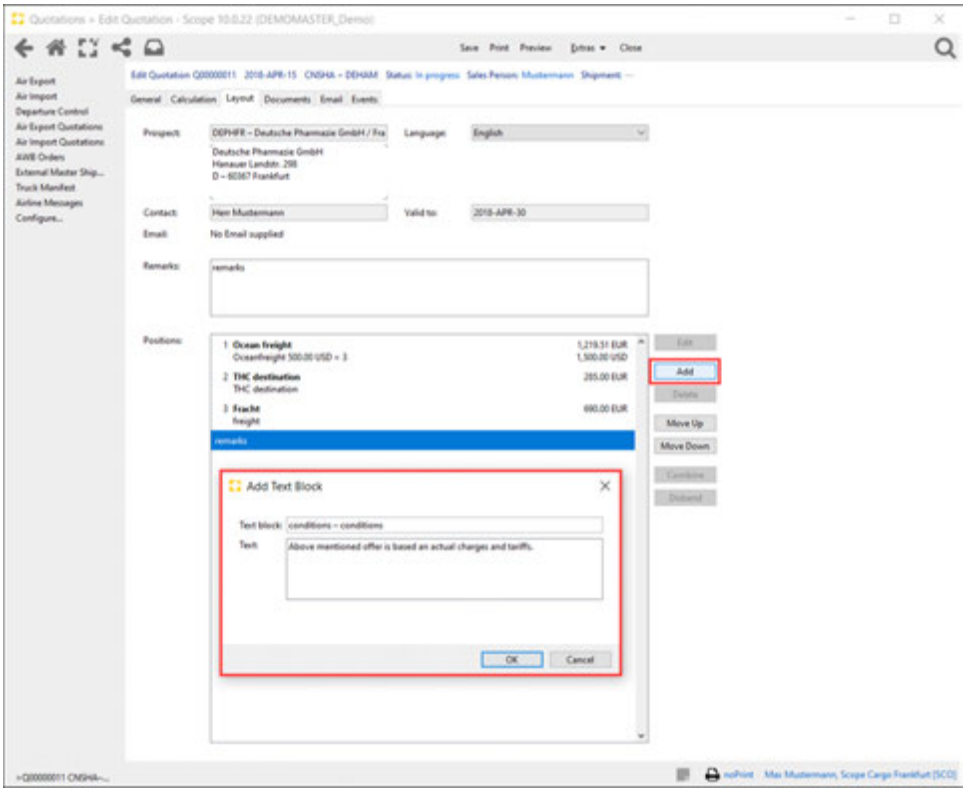
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **quotations**: text block can be used by application Quotations at tab Layout



text block for tariffs

Text block can be used for tariffs. The text block can be selected at application Tariffs (Master Data - Finance - Tariffs) and the text block will be printed at rate sheet templates

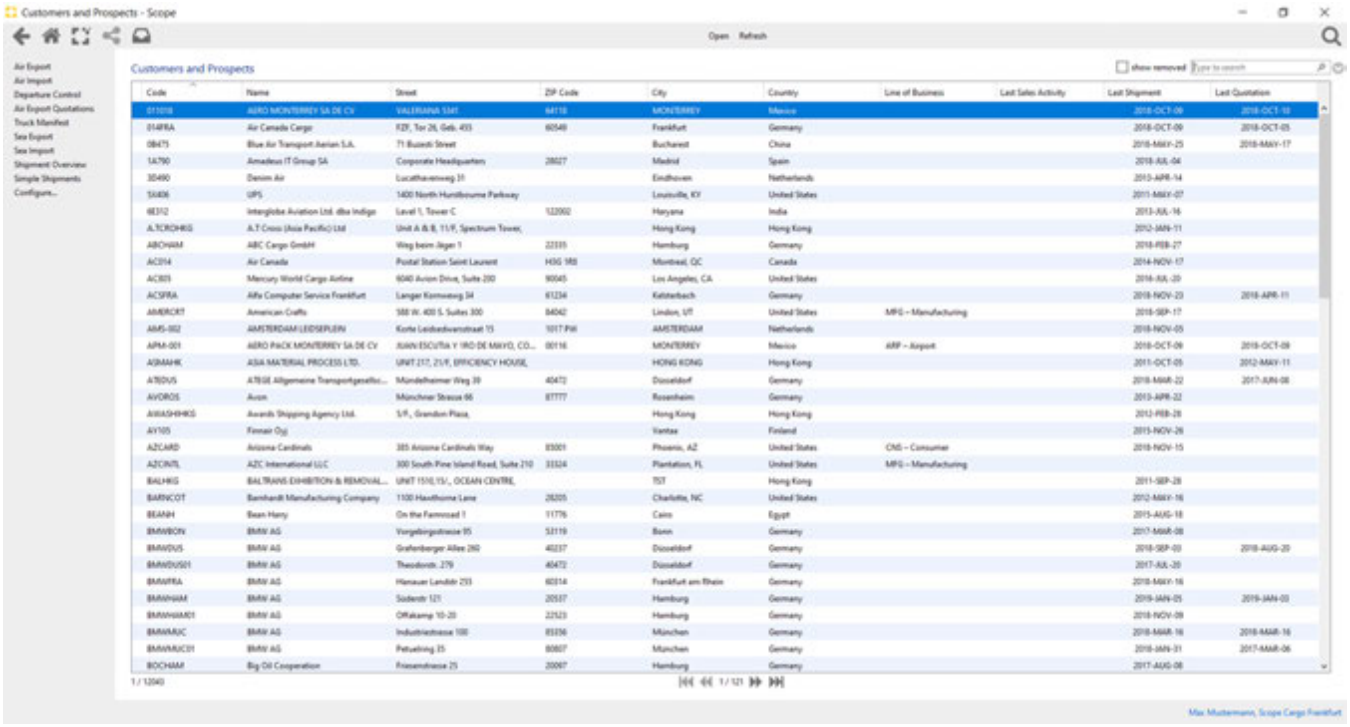
Customers and Prospects

- Introduction
- Description

Introduction

The application "Customers and Prospects" (CRM - Customers and Prospects) provides an overview of customers and prospects.

Description



Overview

In the overview, only the existing customers and prospects are displayed. Business partners are automatically flagged as those for whom a shipment, offer or sales activity has been created. Other business partners who have not yet created a shipment or quotation must be manually marked as prospects.

If a business partner is flagged as a prospect or customer, you can define the service type (line of business). A filter by service type in the overview can be used to find those prospects and customers for which no service type has been entered.

Open

Open the marked line

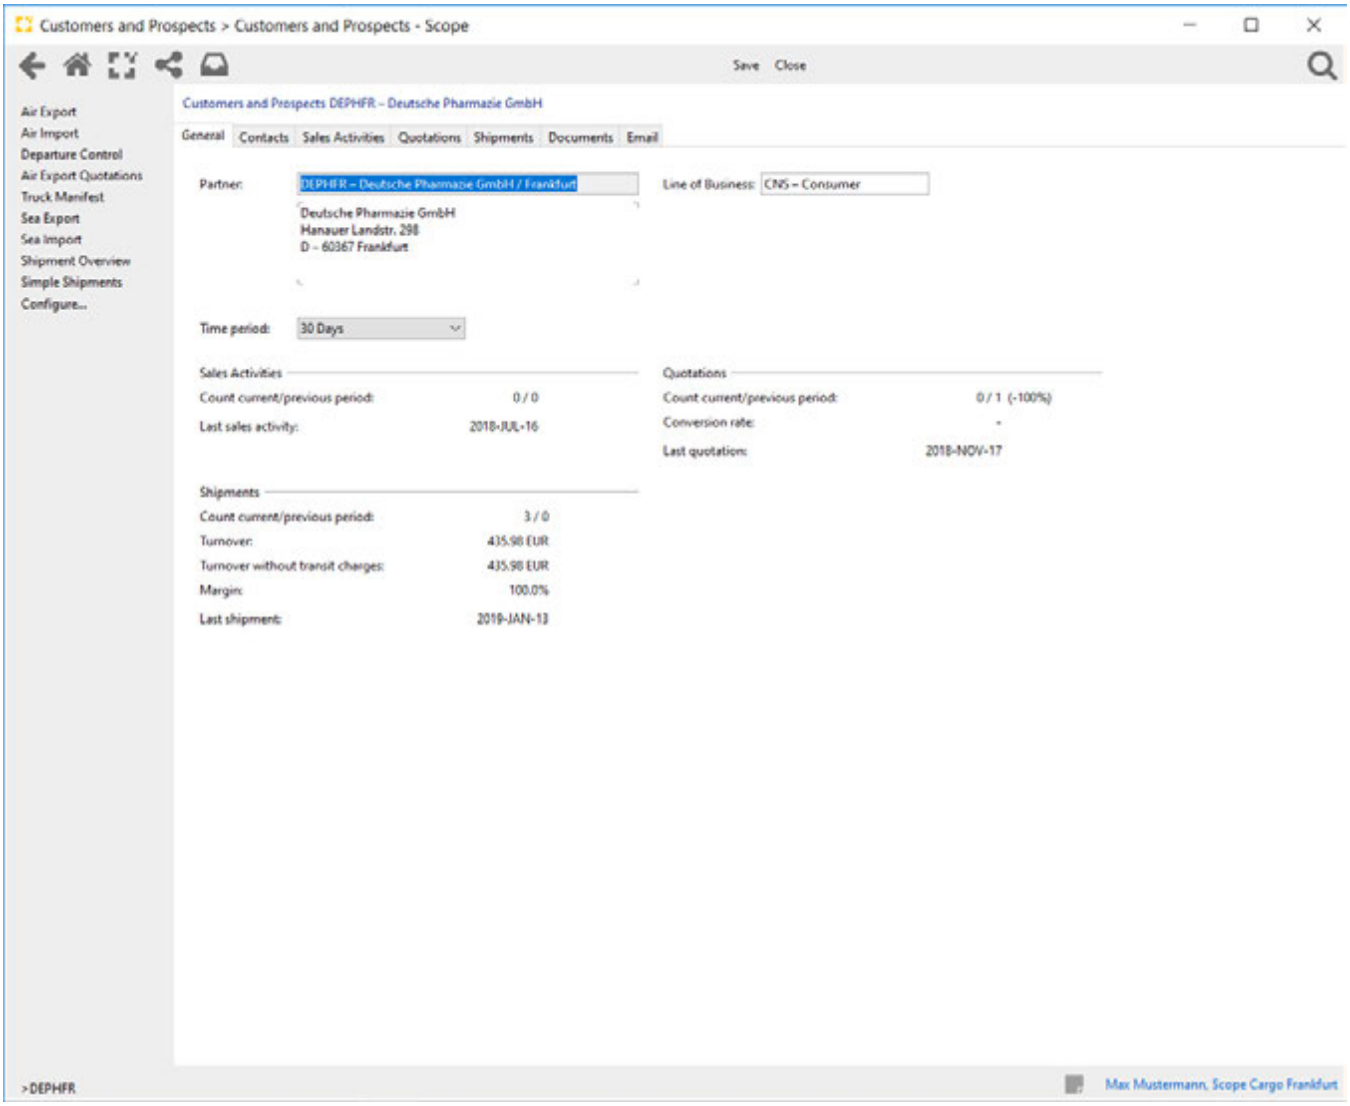
Refresh

Refresh the actual overview

General

Overview of the partner including the line of business, as well as the shipments, quotations and sales activities of the last 30 days, including the financial data. In each case, a comparison is made of the currently selected period with the previous period.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Line of Business

Display of the current service type (line of business) - a change in the line of business is possible in this screen.

Time period

Adjustment of the period - the interval 30 days is set by default. Further intervals are 90 days, 180 days, 360 days.

Contacts

The displayed contact details are linked to the application Partners (Master Data - Partners). Changes of contacts are not possible in this screen.

Connect

- Introduction
- Description
  - Login
  - Tracking
  - New Booking
  - Pre-Alert
  - Shipmentmonitor

Introduction

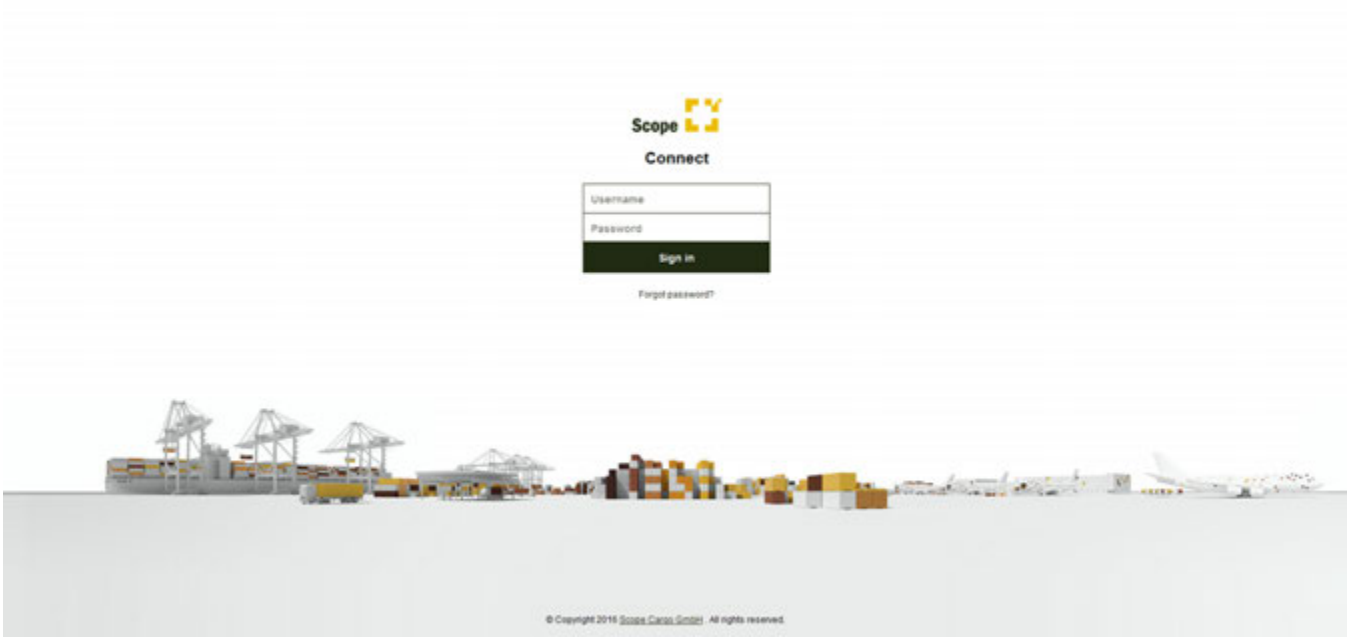
Scope Connect is used to provide third parties such as business partners, agents, customers and employees with information about air and sea consignments. These partners can search for shipments, see status events or create and submit bookings. There is no delay between activities on the web and Scope. Web information and Scope are always 100% up to date and synchronized. This is because the Scope system and the web services it provides utilize the same database.

Give access rights to third parties to add events in Scope Connect using their web browser. These are immediately visible to all users with permissions to view the shipment. You control the information your Scope Connect users can see on the web.

Bookings created by users in Web Connect are immediately available in Scope for conversion to full shipments. The ability to create bookings is of course managed via the Scope Connect user's access rights.

Description

Login

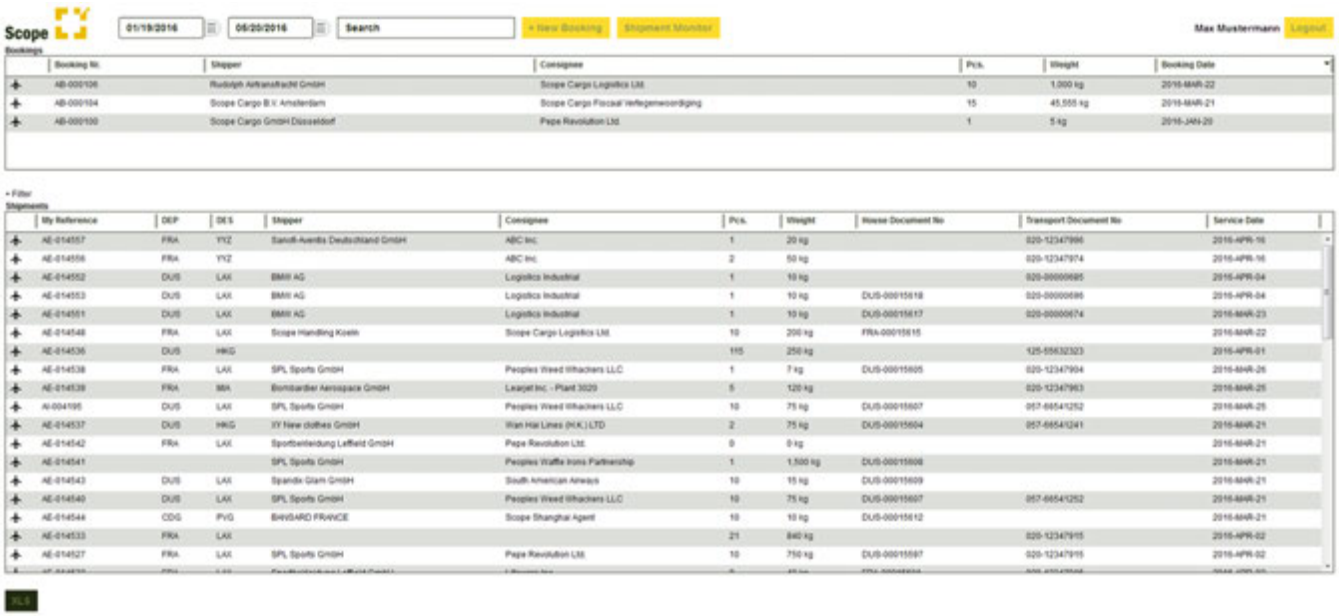


Tracking

Selection

After successful Login, the user has various options to search for shipments:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the upper action bar, the user can set search criteria, they can specify a time frame (4 months is the default). If they have the permissions, they can make a booking or view a shipment with the shipment monitor.

The date range field is always available for shipment search in Web tracking. The default 4 months is: from (today -3 months) to: (today +1 months)

The date range can be changed if necessary. The date range will also include booking (bookings must not be converted into shipments and not older than three month). The date range refers to the economic date.

The following searching criteria can also be used in the "Search" box:

Title	Description
Shipment number	Shipment number
Booking number	Booking number
From country or location	Add the UNLocode or the country of departure. e.g USLAX or HKG
To country or location	Add the UNLocode or the country of departure. e.g USLAX or HKG
Shipper	Name of the shipper
Consignee	Name of the consignee
HAWB/ BL-Number	Add the HAWB-No (Airfreight) or BL-Number (Seafreight)
MAWB / MBL-Number	Add the IATA AWB (Airfreight) or Master BL-Number (Seafreight)

The result can be further sorted: Click on the column headline, the data will be sorted using that column, click again to change ascending or descending sort.

Booking overview

The following columns are available

Column	Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Booking-Nr.	Air and Seafreight
Shipper	Shipper
Consignee	Consignee
Pcs.	No. of pieces
Weight	total weight of the shipment in KG
Booking date	Booking date

The result can be further sorted. With a click on the column headline, the data will be sorted using that column, click again to sort ascending or descending.

By clicking a selected line, the shipment details and the events will be displayed.

Additionally, there is the option to extract the records as a CSV file which can be opened with a spreadsheet like MS Excel.

Shipment overview

The following columns are available

Column	Description
My Reference	Shipment number Air / Seafreight
DEP	Departure (air)port
DES	Arrival (air)port
Shipper	Shipper
Consignee	Consignee
Pcs.	Number of pieces
Weight	Total shipment weight
House Document No	No of house document HAWB (air) or BL (sea)
Transport Document No	No of transport document (Master AWB (air) or Master BL (sea)
Service Date	Economic date

The result can be further sorted, click on the column headline, the data will be sorted using that column, a further click will sort ascending or descending.

By clicking a selected line, the shipment details and the events will be displayed.

Additionally, an option to extract the records as a CSV file which can be opened as a spreadsheet by MS Excel for example.

+Filter allows additional filters to be applied to the selected shipments. The drop-down menu in the filed field shows the filter options and one or more of these can be applied to the existing search results.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Filter Type	1. Criteria	2. Criteria
Conveyance Type	Air/ Sea/ Road/ Rail	./.
Origin	3-Letter Code	./.
Destination	3-Letter Code	./.
ETD/ETS	After	Before
ATD/ATS	After	Before
ETA	After	Before
ATA	After	Before

OK The filter is applied to the search results.

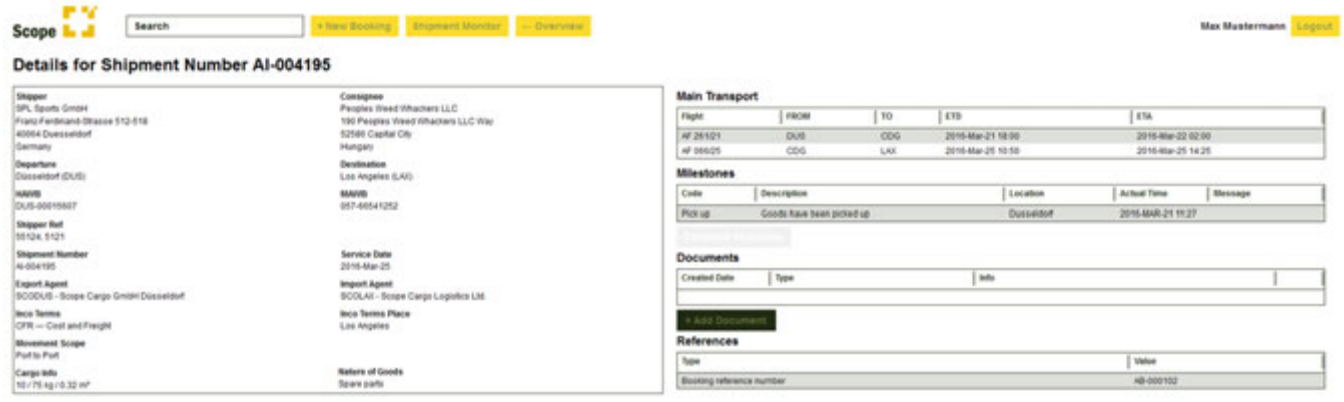
Cancel The action is canceled and all available shipments will be displayed.

Further filters can be applied as required. To remove a filter, click the "X" which is beside the filter. The shipments in the overview will automatically adjust as filters are applied or removed.
If all filters have been removed, all shipments are displayed.

Shipment overview and Milestones

Double click on a shipment to open it. The shipment details, events, documents and references will be shown.

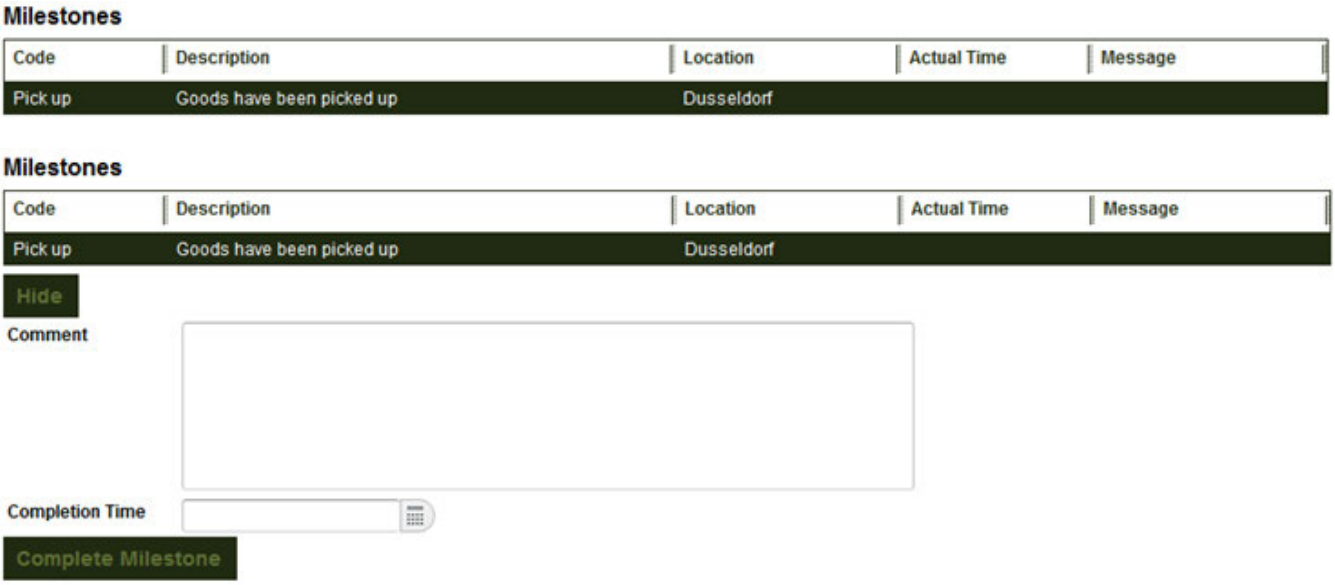
If the user has the permission, they can add documents or can complete milestones.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Completion of a milestone manually

To complete a milestone, the user must use the action button **complete Milestone**. The action is only available if the selected shipment has a valid tracking-plan template.



A field will appear where a comment can be added and a field to set the completion time. The date can be set manually, or by pressing the calender button .

Hide The data entered will not be shown in the event overview and the fields will be hidden.

Add Document + Documents can be added by uploaded by clicking the add document button. The explorer will appear to select the documents.

New Booking

At New Booking will be shown how to create bookingsdirectly over Web at Scope.

Pre-Alert

At Pre-Alert will be shown how to create Air or Sea Pre-Alerts directly over Web at Scope.

Shipmentmonitor

The Shipmentmonitor is a overview from tasks which has to be performed in a predefined time frame by the responsiple staff.

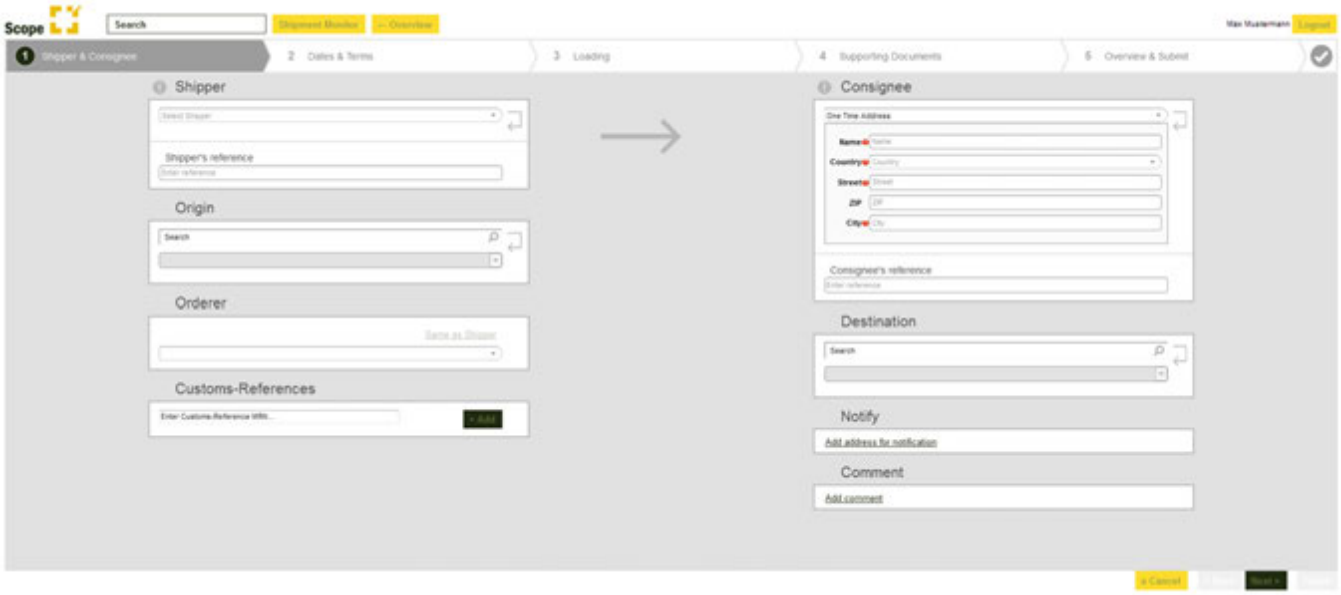
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

New Booking

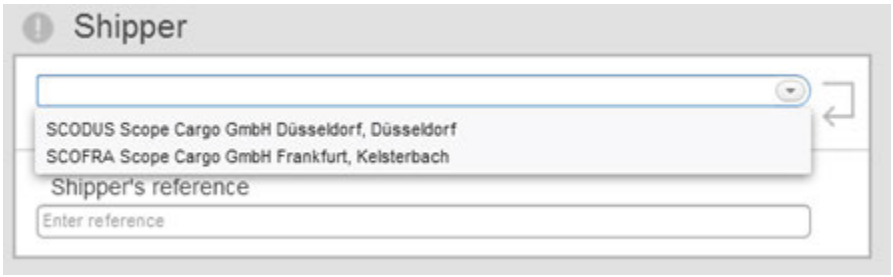
Customer bookings can be done via Web. The booking will appear in Scope automatically. Bookings can be done for air and seafreight shipments. Existing bookings can be used as templates.

Shipper and Consignee (page 1)

On the first page, enter the information for the shipper and consignee.



Shipper

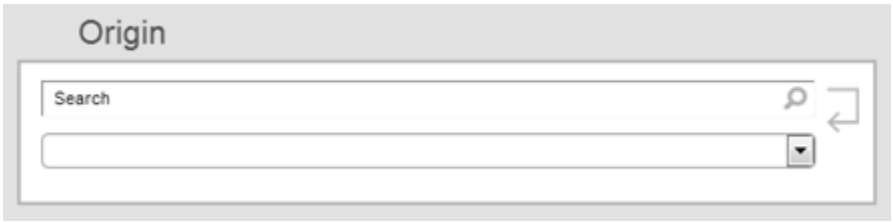


Add the shipper first. A shippers reference can also be added.

This is followed by entries for departure, customer and customs references if available.

Origin

Entered the origin here.



Orderer

Entered the orderer address. If the order is the same as the shipper, then click the the action link " Same as Shipper" , the address is automatically filled with the previously entered shipper details.

  - Conversion of a Pre-Alerts into Scope Import

Introduction

Scope Connect allows the user to creat Air- or Sea- Pre-Alerts.

A Pre-Alert contains details of an Air Cargo or Sea Cargo Shipment which ordinarily has been created from the Export Agents immediately before the export of the shipment.

The Export Agent or the Sender is able to handle the Import Agents by creating the Pre-Alerts at Scope Connect long before arrival of the shipment, information. These Pre-Alerts can be also converted by the Import Agents in Scope into a shipment which saves time and exactness improved.

At this document will be explained:

- how to create a Air Pre-Alert
- how to create a Sea Pre-Alert
- how to consolidate House Pre-Alerts to a Master Pre-Alert
- how to transmit a Pre-Alert
- how to convert a incoming Pre-Alert at Scope into a Import shipment

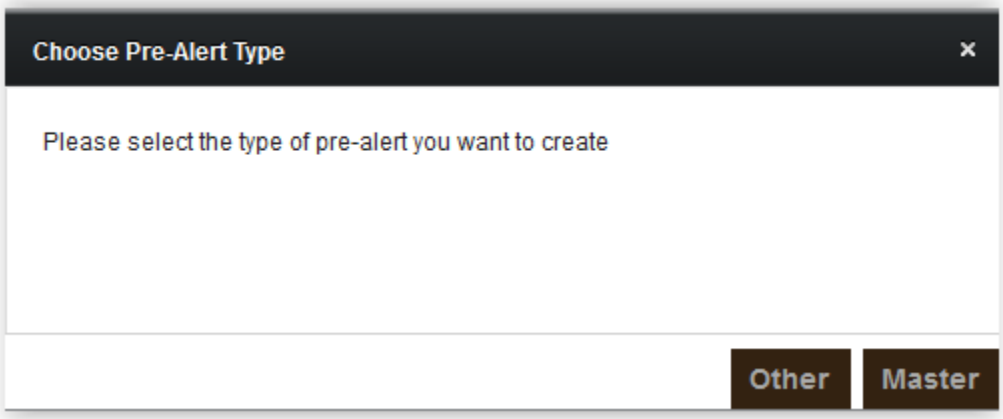
New Pre-Alert

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Pre-Alerts can directly created at Scope Connect.

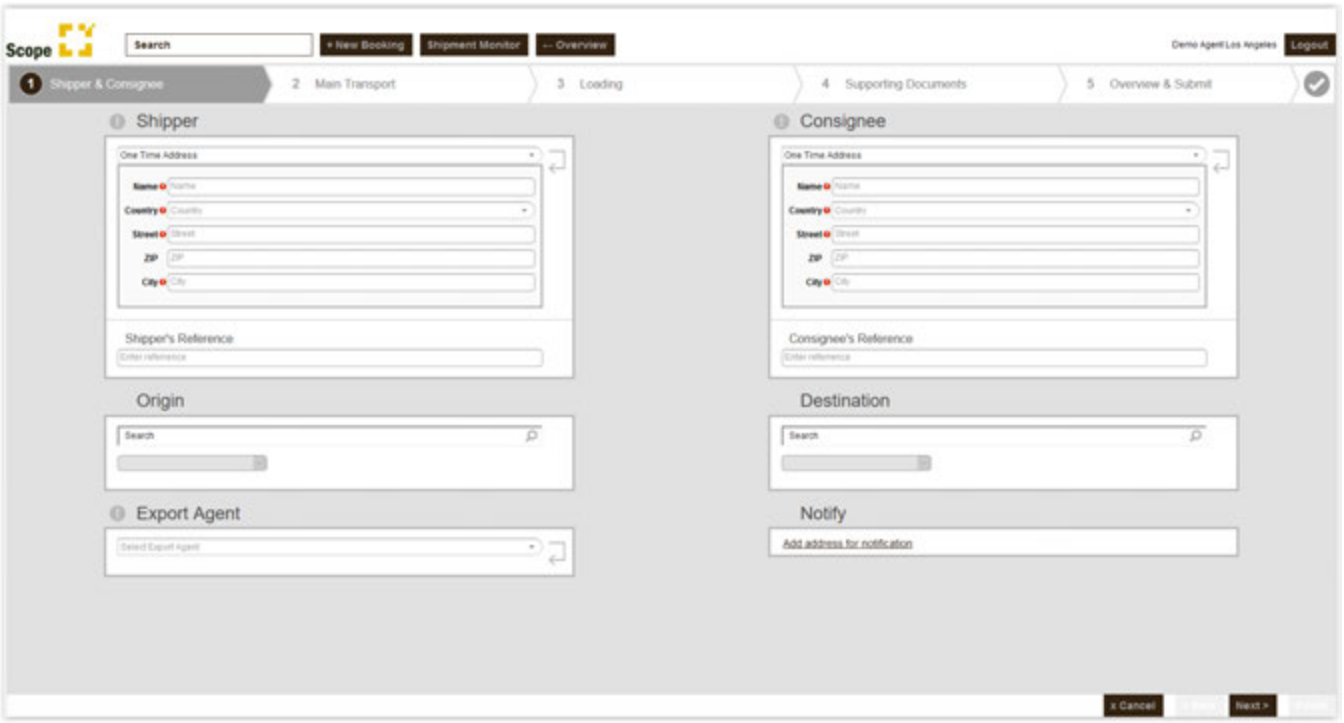
At the starting page at the top the user findes the option: 

If you like to create a new Pre-Alert you have the following choice. The following example will be a "Other", so any kind of shipment without a "Master":



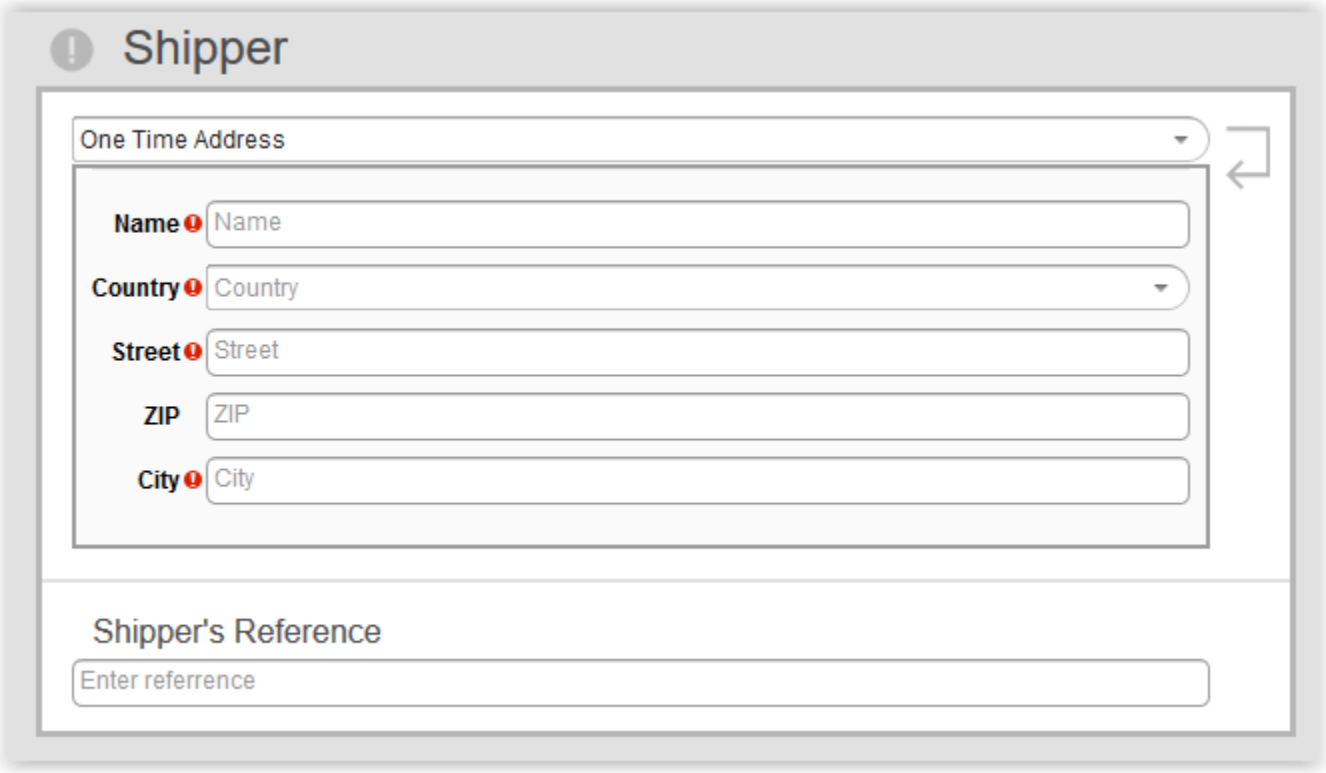
The new Pre-Alert open the first step to create Shipper and Consignee:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Step 1: Shipper and Consignee

Shipper



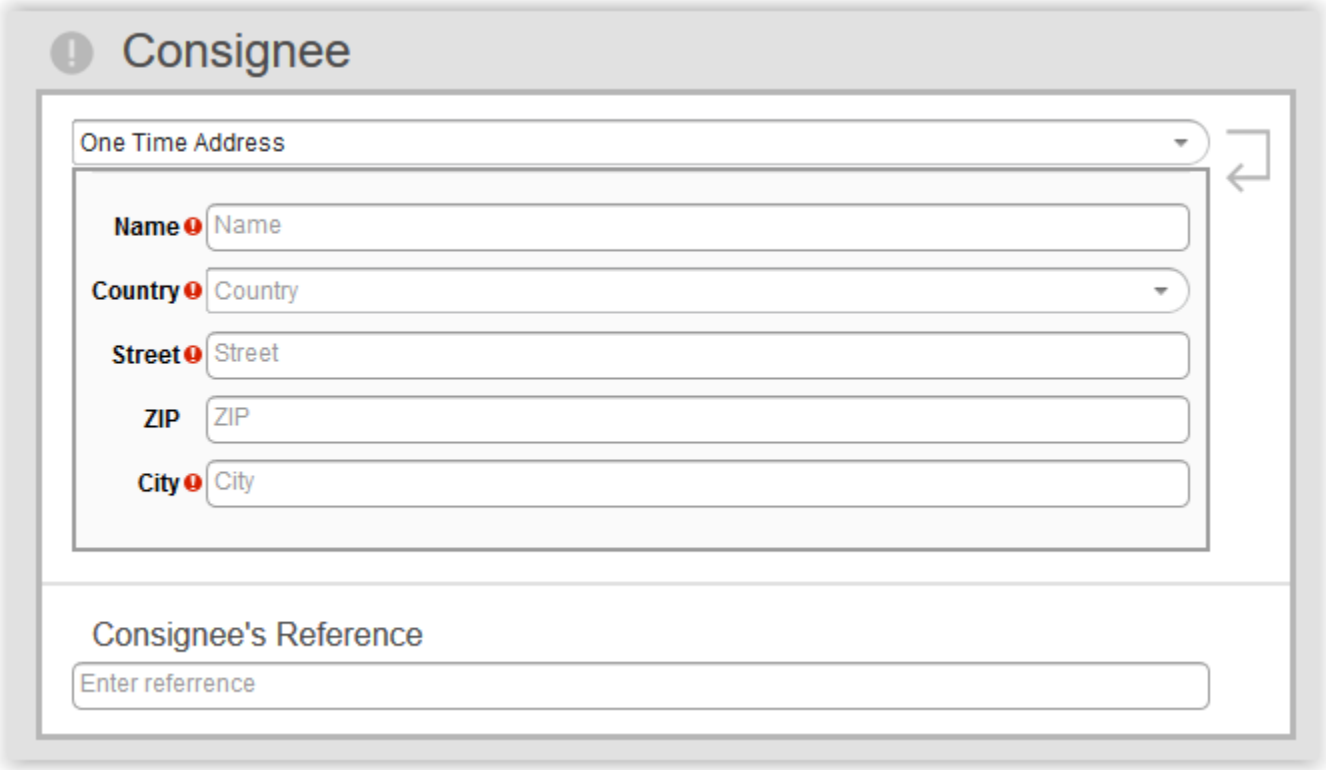
You have 2 modes to keyin the shipper details:

1. from a existing Address
2. as "One Time Address"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Existing address

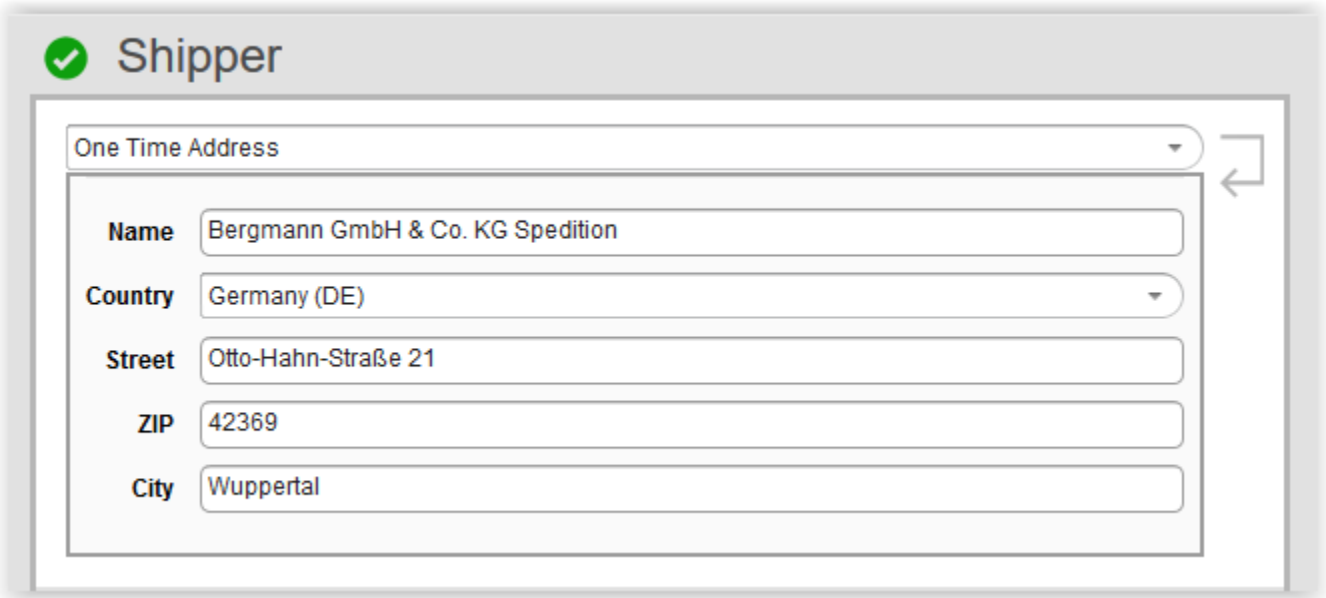
If the Scope Connect user will use a existing Scope Partner the field "One Time Address" can be overwritten. The founded addresses/business partner will be shown and proposed:



When the wanted partner has been found you can transmit the address.

One Time Address

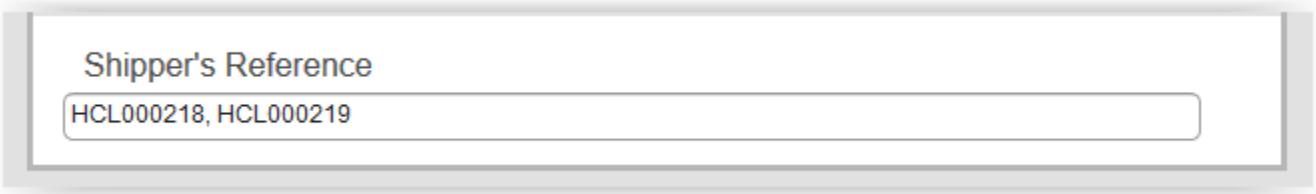
Here you can keyin the new address into the regarding fields:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

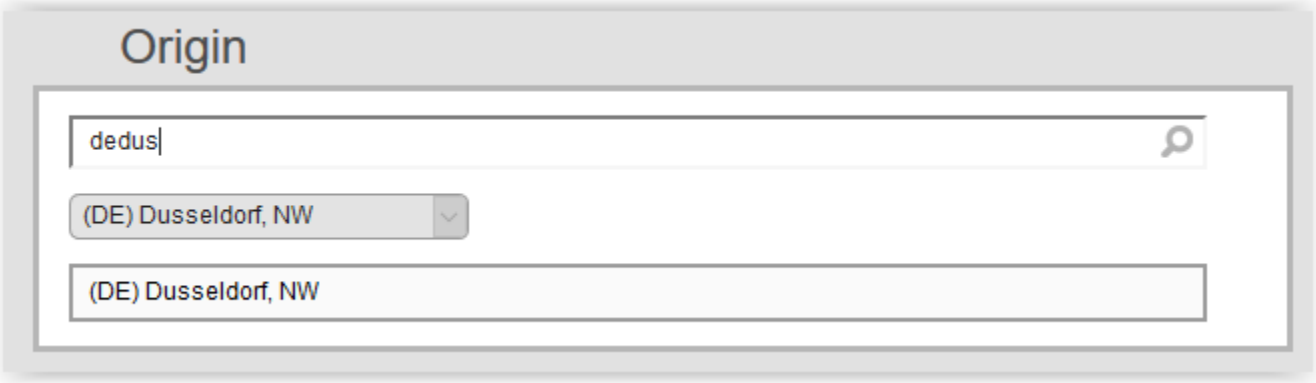
Shipper's Reference

Please keyin a note of the carrier if available. If there more than one notes seperate them with a decimal point. This notes will be transmitted to the shipment.



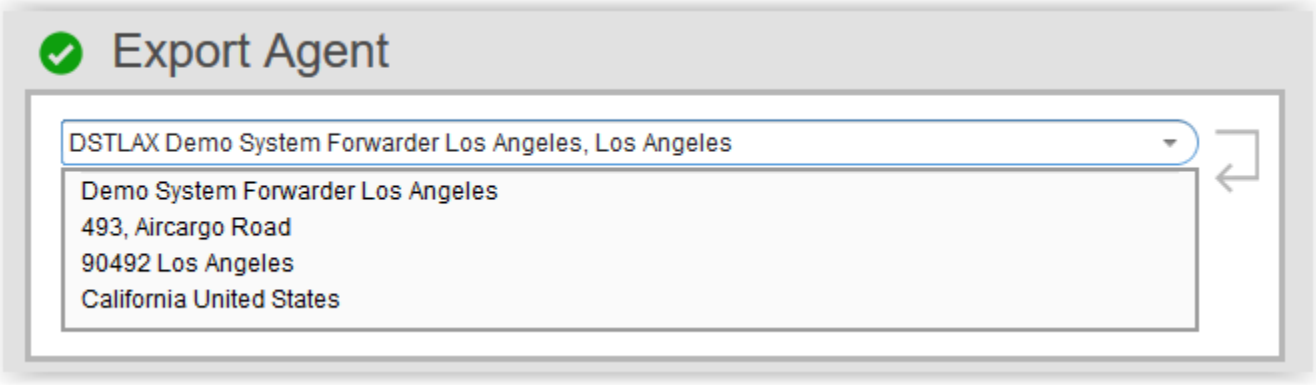
Origin

This is the place or airport, where from the goods come originally. Please keyin the name of the town, airport or code of the harbour to insert the correct origin:



Export Agent

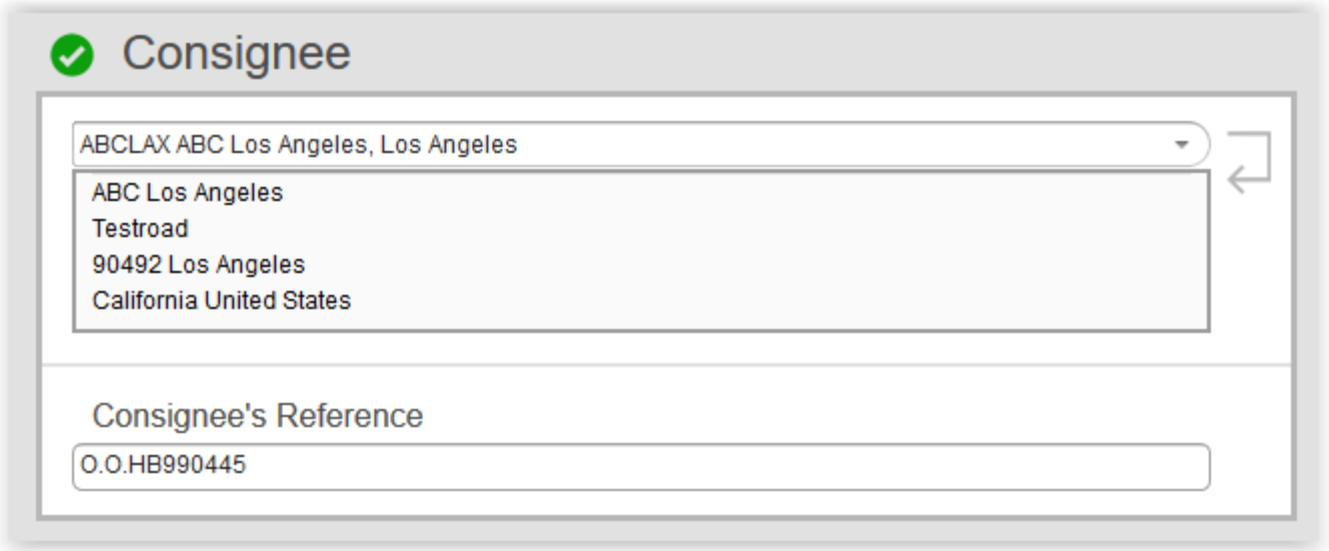
Here the Export Agent will be stored who is responsible for the Pre-Alert. There are only Export Agents allowed which are assigned to the regarding Scope Connect user at his user profile. Usually is of the Scope Connect user an employee of the agent who is selected:



Consignee and Consignee Reference

Here applies the same method as at the Shipper. Please keyin the informations for the Consignee and also References and Notes:

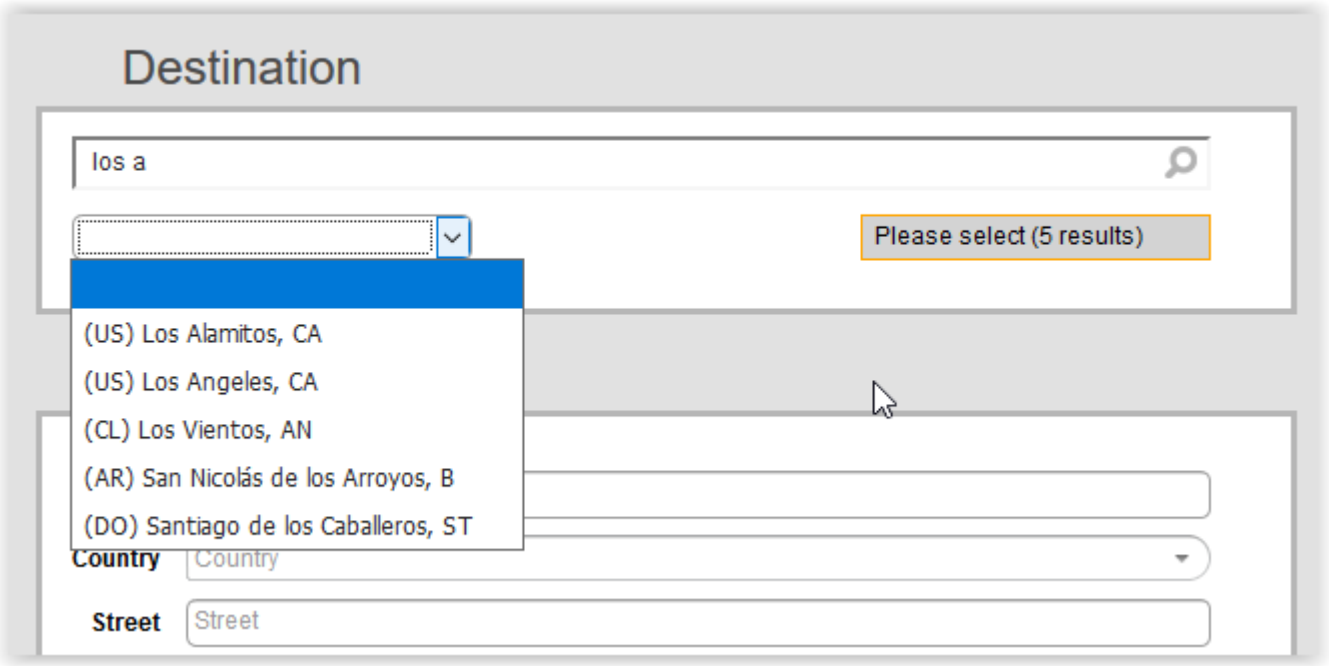
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Destination

This is the destination harbour or airport of the shipment. Start typing the name or code of the harbour or airport to find the correct destination.

The number of the successful searching results is indicated on the right and is able with a click on the dropdown list indicated and the desired harbour or airport can be selected.

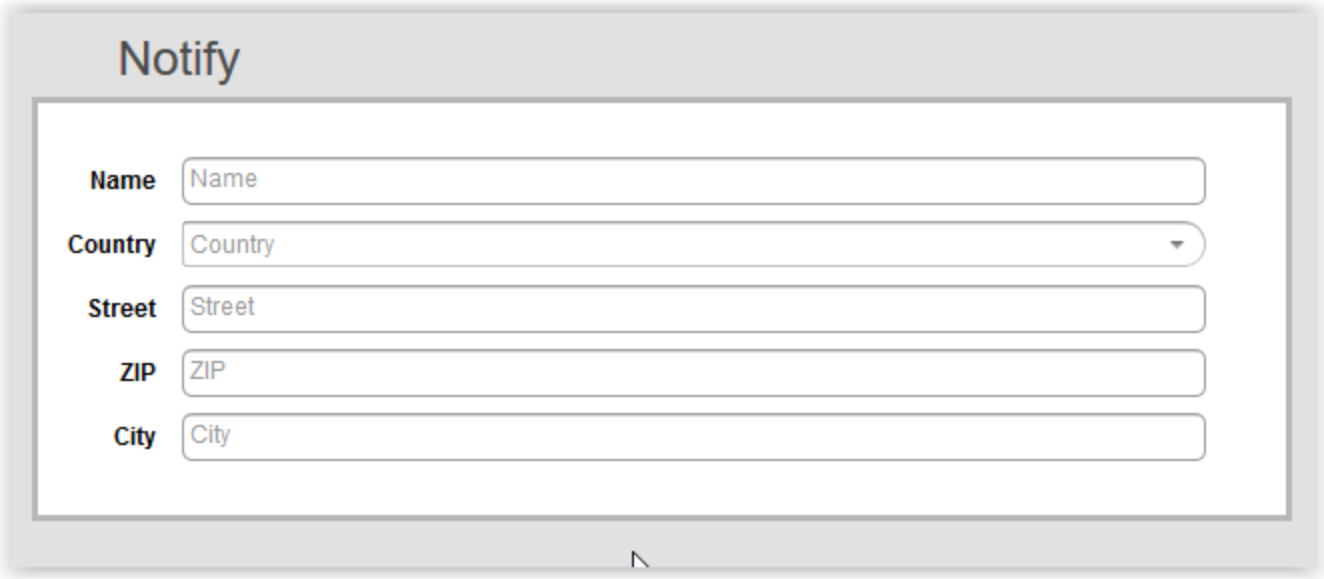


:

Notify

Here you can add a notify to the Pre-Alert. In addition you have to keyin a One Time Address:

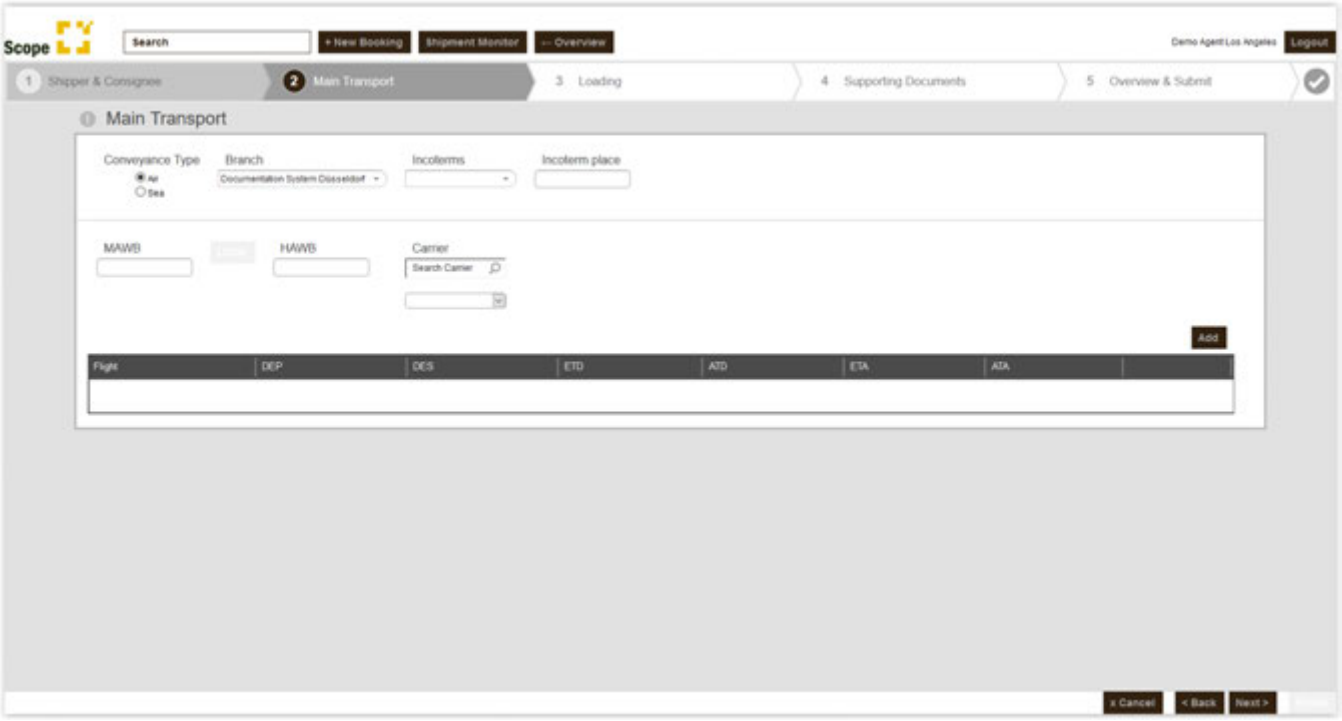
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



After completion of step 1, Shipper and Consignee click 
Air Pre-Alerts

Step 2, Main Transport - Keyin a Air Pre-Alert

The Main Transport Screen open and the first step ist to choose the means of the transport "Air" or "Sea". At this example we take "Air".



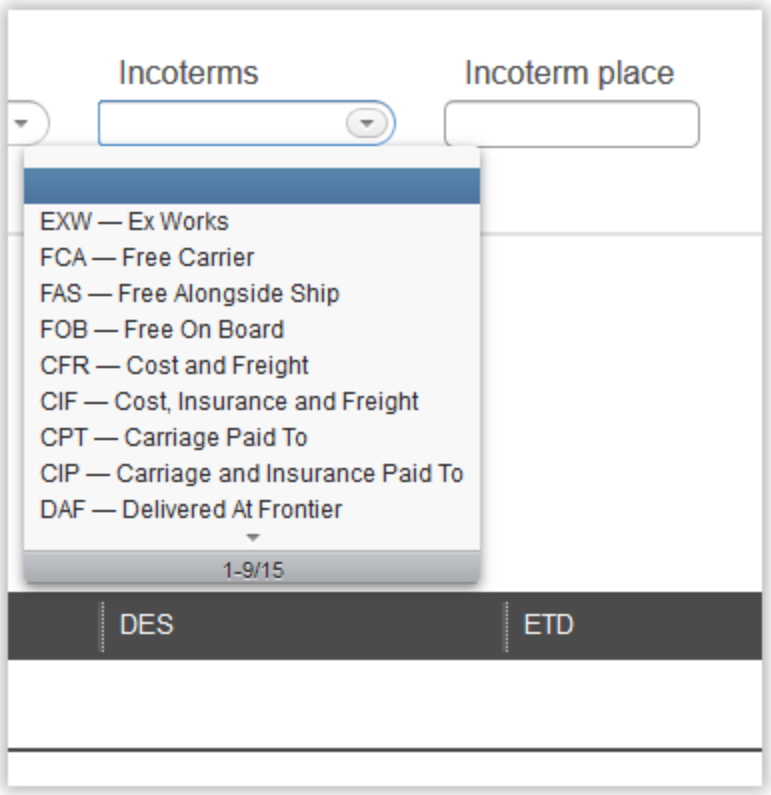
Branch

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The branch will be shown, where to the Pre-Alert will be send.

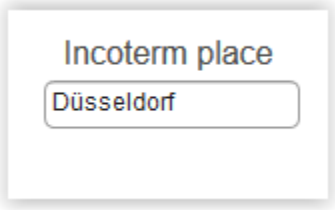
Incoterms

At Incoterms start writing at the regarding field or use the arrow key to choice. Then take the correct one:



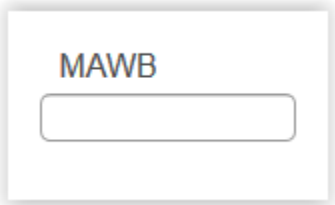
Incoterm Place

Here you can take the correct Incoterm place :



MAWB

If the MAWB is already known, it can be keyined there. If it is a House Shipment and the MAWB number is not know, just leave the field blank. The MAWB will be filled automatically when the shipment will be consolidated to the Master.



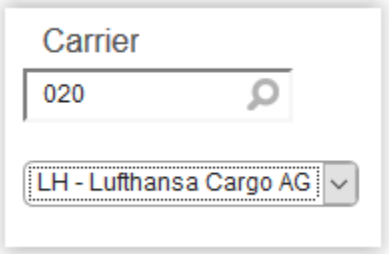
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

HAWB

Here the HAWB of the Air Pre-Alerts will be inserted.

Carrier

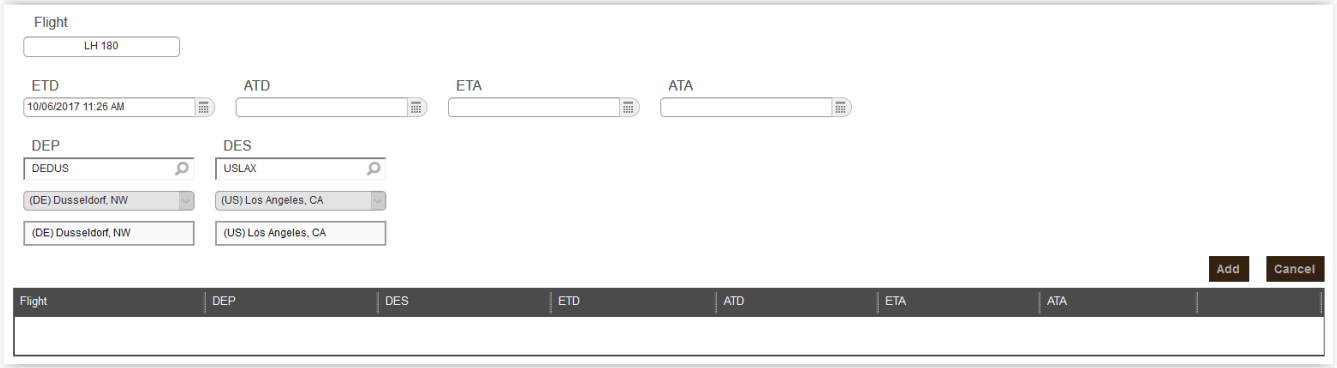
Please insert the Carrier of the transport. You can insert the name of the airline, the two digit airline code or the three digit AWB prefix.



Add flights to a Air Pre-Alert

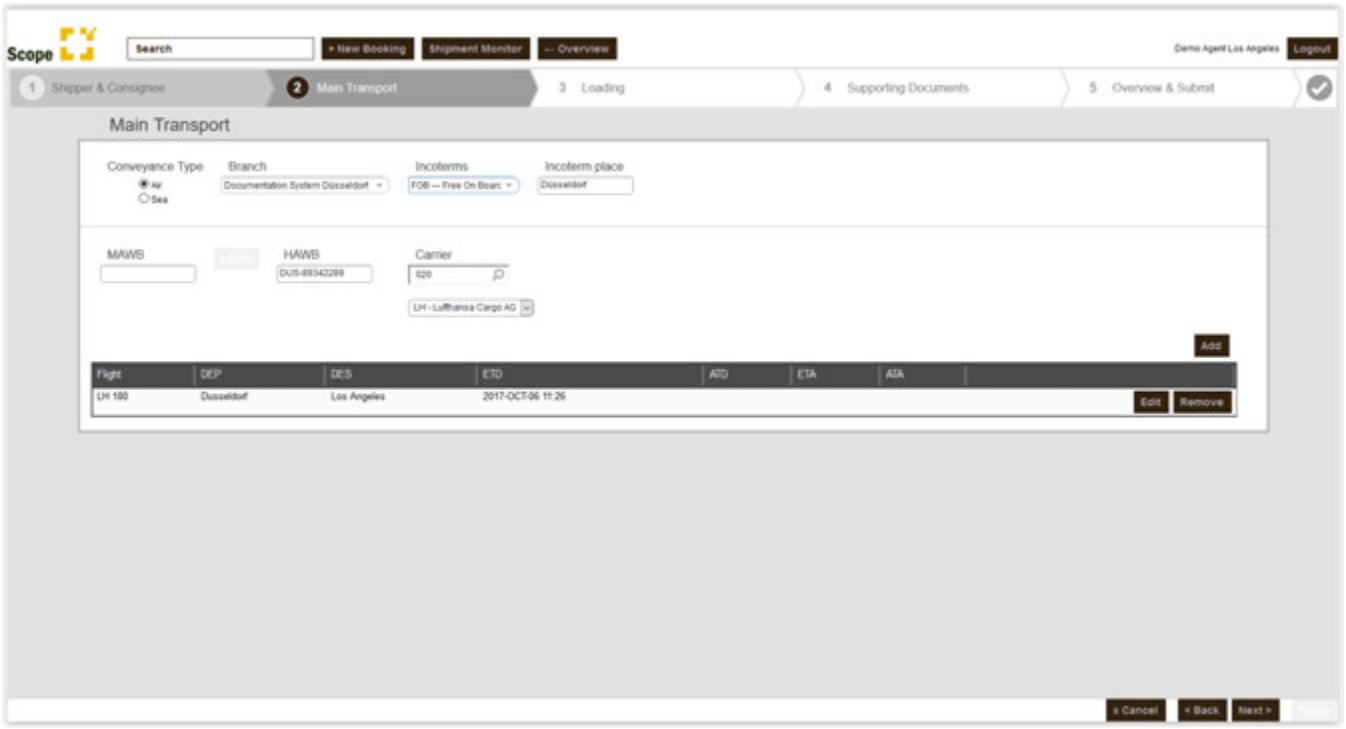
If the flights of a air export shipment are known you can add them to the Pre-Alert. If you create a Pre-Alert for a House shipment the flights will be overwritten by the Master Pre-Alert as far as the House will be consolidated to the Master.

To add a flight, click 
Now you can add the details of the flight:



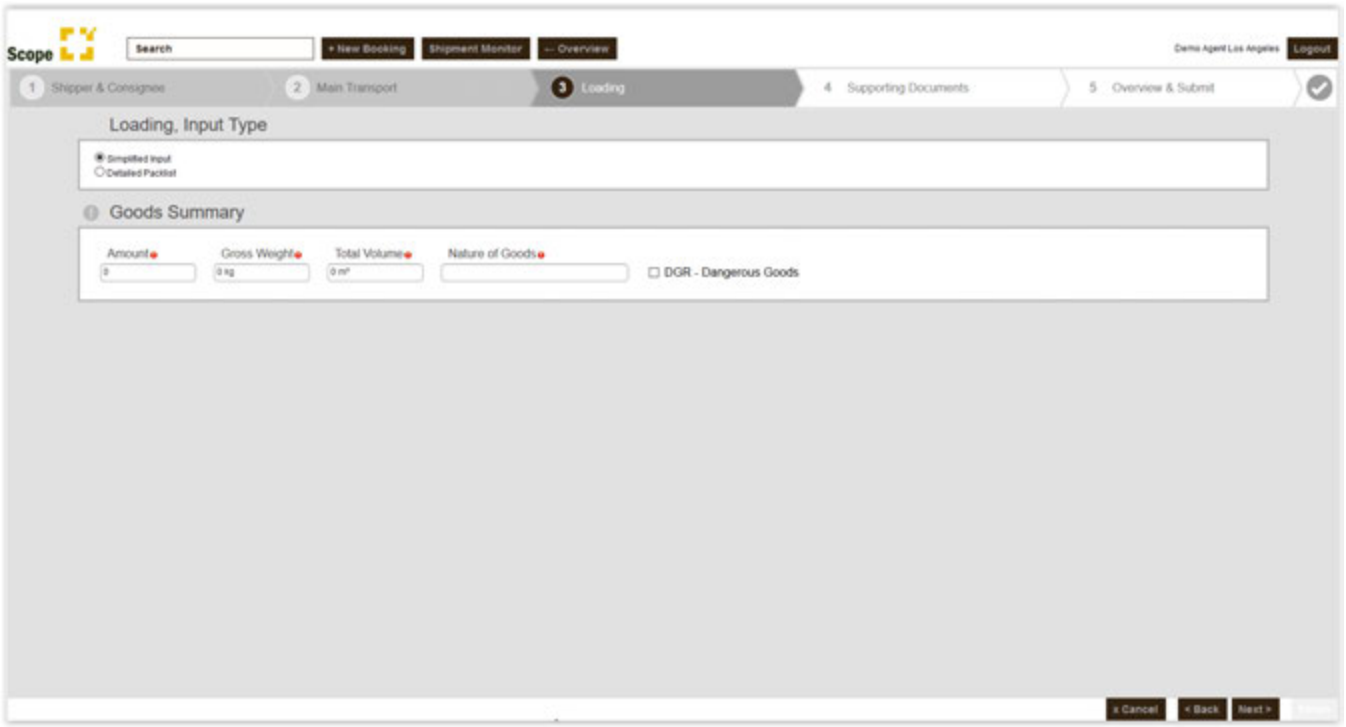
Click 
if you finished the entry. The finished Main Transport could be like the example below. To add more flights please the 
button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click  to turn up to step 3 - Loading.

Step 3, Loading - Air Pre-Alert



You use the Loading screen to add details of the goods for the Pre-Alert:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Quantity
- Gross Weight
- Total Volume
- Nature of Goods
- DGR - Dangerous Goods

There are two ways to add the specifications of the goods:

1. Simplyfied Input
2. Detailed Packlist

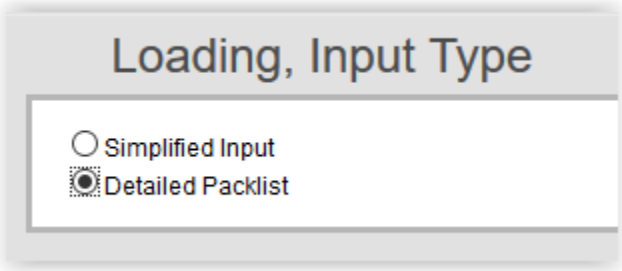
Simplyfied Input of the goods

Direct entry into the fields with to total values of the goods and the description. If dangerous goods please turn on the DGR Box.

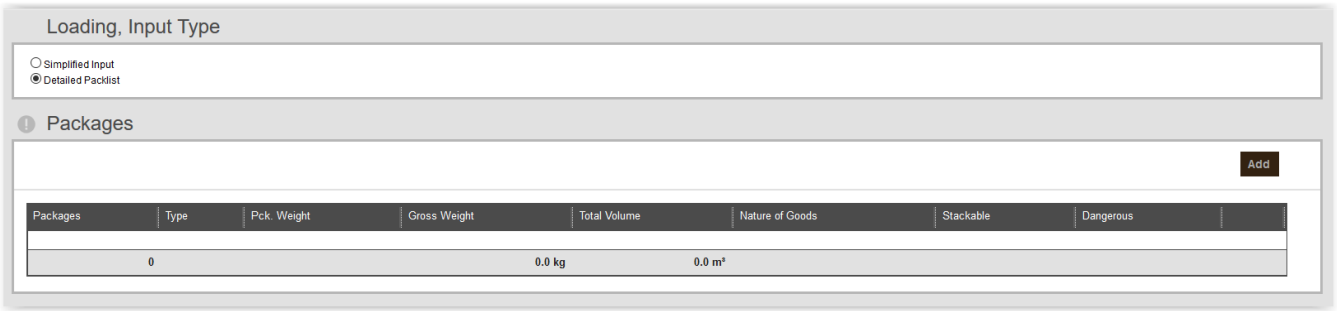
If the entry of the goods has been fininshed you can go on to the next step of the Pre-Alert. With 
you'll reach step 4, "Documents"

Detailed Packlist

Alternativ you can add a detailed Packlist. Instead of total values of the good you can add here detailed specifications:



The "Loading, Input Type" screen will be opened:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click Add and the detailed entry of the goods will be opened:

If the first enty has been finished pull Add

To add more goods pull again Add and repeat the process.

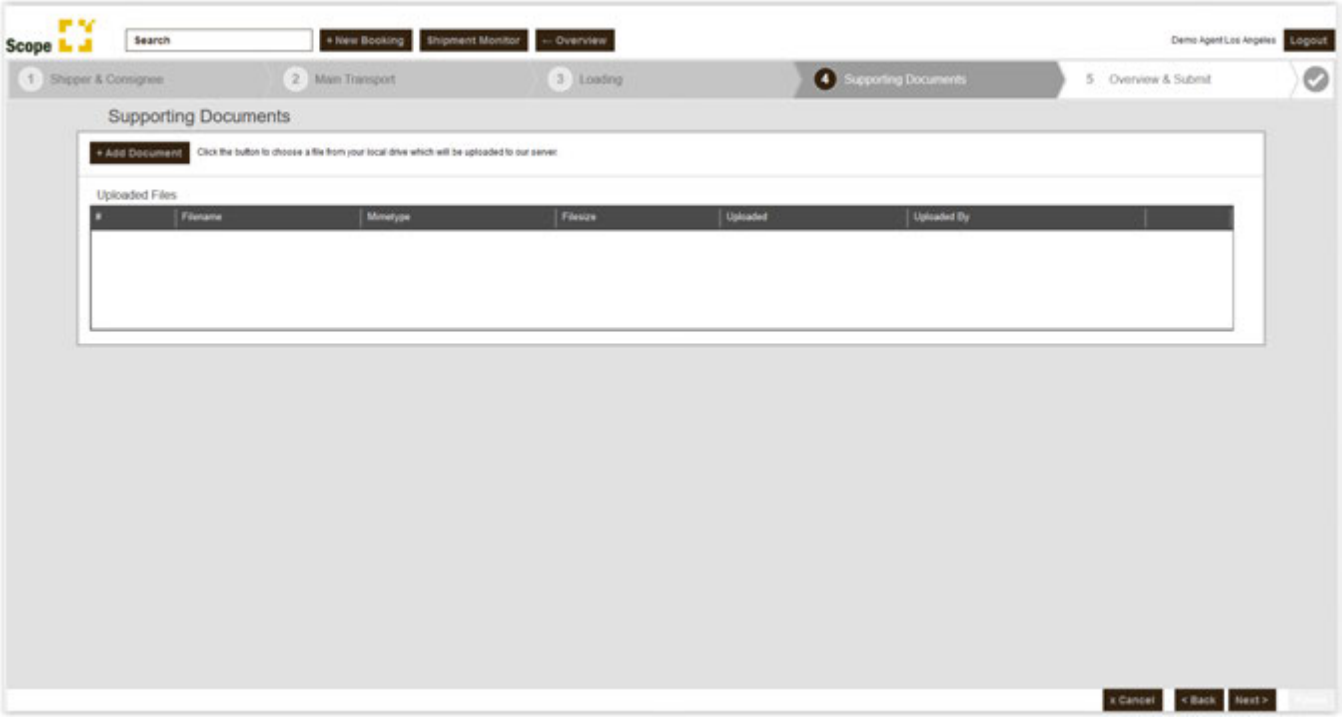
The following example shows 2 different kind of goods on one shipment. With the Edit button you can change the details and with the Remove button you delete a row from the Pre-Alert.

If you finished the enty of the goods for the Pre-Alert please pull the Next > button to come to the next step "Documents".

Step 4, Supporting Documents - Air Pre-Alert

If you want to add additional documents, for example a commercial invoice, to the Pre-Alert you can do that the screen "Supporting Documents".

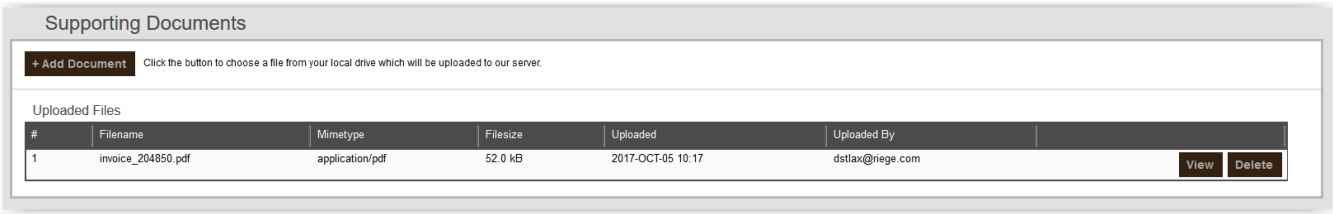
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click 
to upload a document.

The file browser opens and you can choice the wanted document for the Air Pre-Alert and upload it.

The uploaded document appears at the overview "Uploaded Files":



With the 
button you can see the uploaded document and with the 
button again delete from the Pre-Alert.

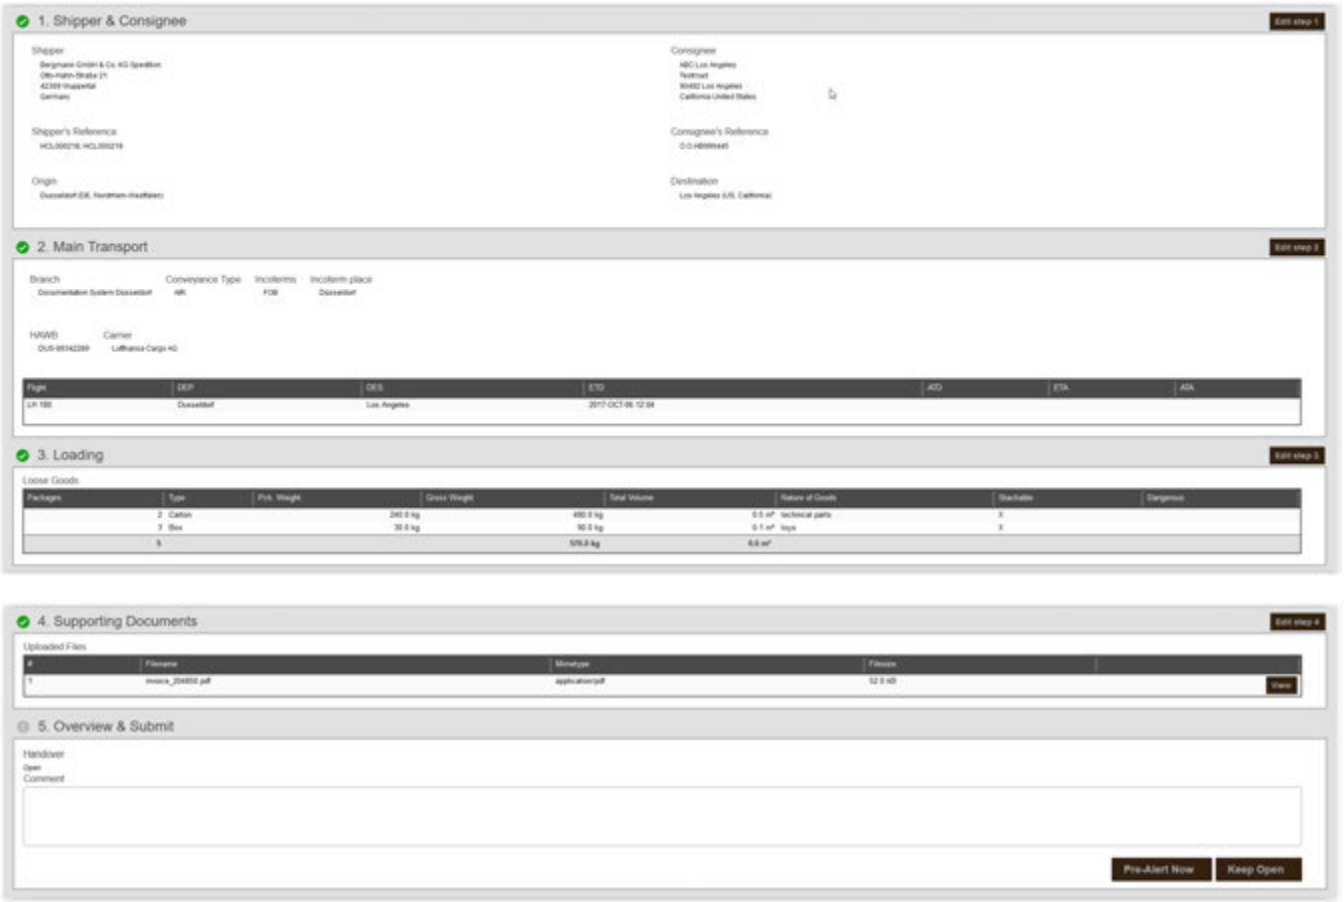
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

To add more documents to the Pre-Alert please use the + Add Document button.

If you finished adding all wanted documents to the Pre-Alert you can press the Next > button to the next step "Overview and Complete".

Step 5, Overview and Submit - Air Pre-Alert

The last step shows with a overview all added informations of the current Pre-Alert. All available dates can be executed again with the regarding buttons.



Sending the Pre-Alert

If all necessary informations has been finished and acceptably the current Pre-Alert can be completed with the button

Pre-Alert Now .

If you don't want the Import agent see the Pre-Alert please click Keep Open .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Sea Pre-Alerts

Step 1 of the Pre-Alerts works identical for Air and Sea. At step 2, Main Work, if the type of transport now is "Sea" you'll keyin a Seafreight Pre-Alert.

Step 2, Main Transport - Keyin of a Sea Pre-Alert

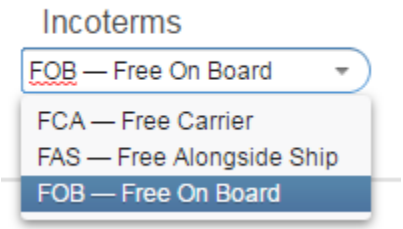
At the Main Transport screen the first step is to define the type of the Pre-Alerts which has to be created. You choice between Air- and Sea-Pre-Alert. At next example we create a "Sea-Pre-Alert".

Branch

The branch will be shown, where the Pre-Alert will be send to.

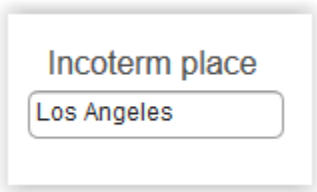
Incoterms

If you keyin the correct incoterm for das Pre-Alert the Incoterms will be proposed. Then you can choice the correct incoterm:



Incoterm-Place

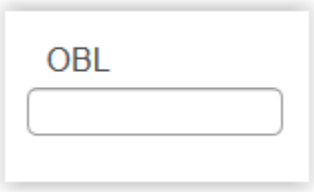
Keyin the correct incoterm place.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

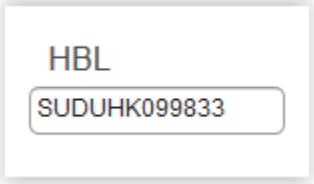
OBL

If the OBL is known, you can add it. If it is a House shipment, which already doesn't have a OBL, you can skip the regarding field empty. The OBL field will be filled automatically if the shipment will be consolidated later to a Master.



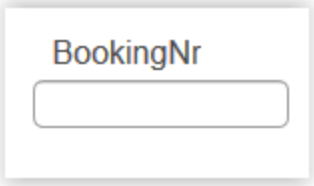
HBL

Add the HBL at the Pre-Alert



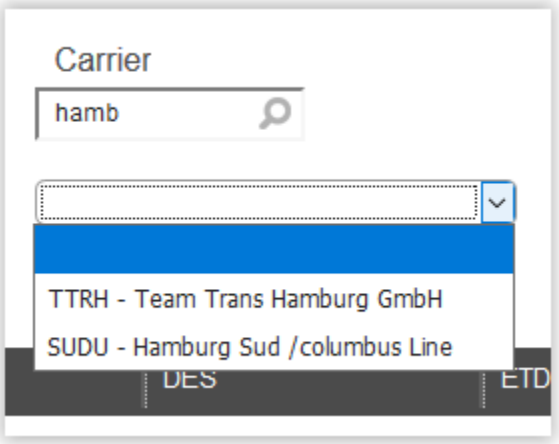
BookingNo.

If the Liner Agent provided a booking number for the shipment you can add this at the field "BookingNo".



Carrier

Here please add the Carrier, which transport the shipment. You can keyin the name of the carrier or the four-digit SCAC code. Scope Connect search the correct carrier.



Tour

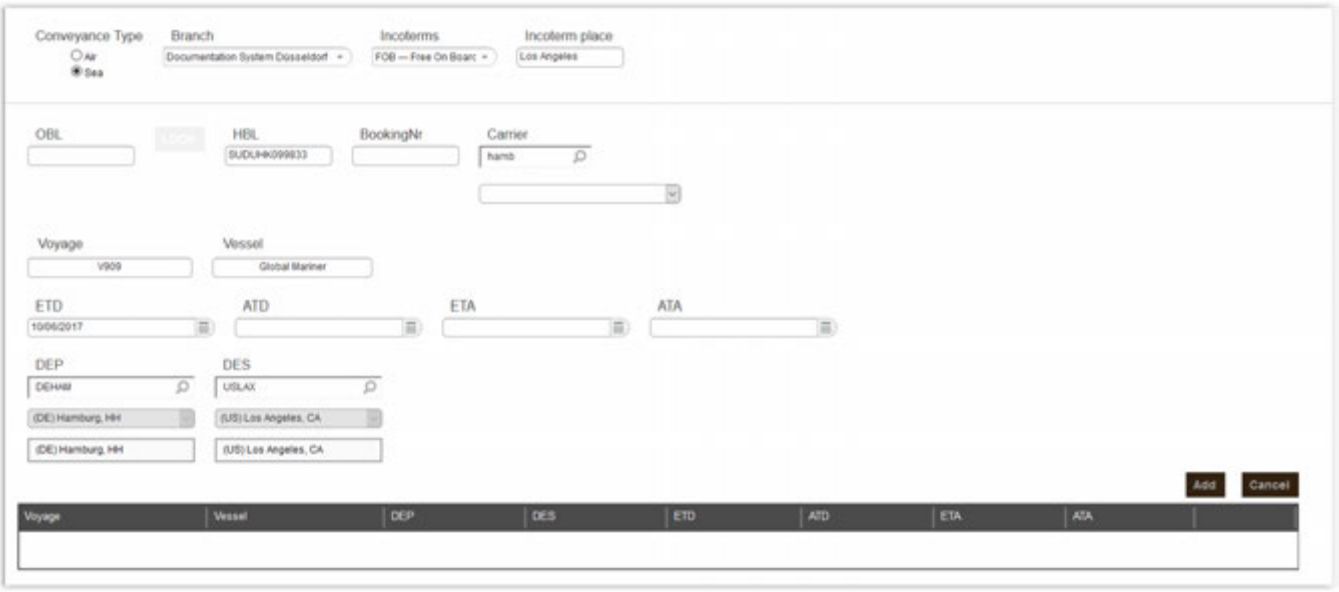
You can add one or several voyages to the Pre-Alert.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

To add a voyage please press the button 
.

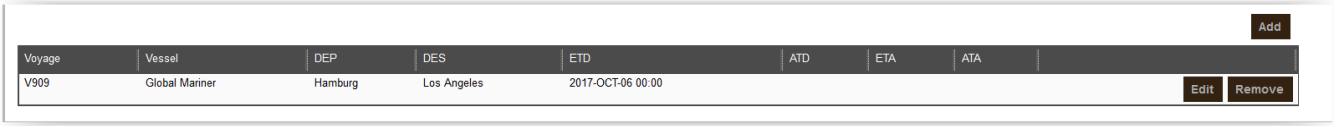
Then add the following fields:

- Voyage Number
- Vessel
- Port of departure
- Port of destination
- ETD of the voyage
- ATD of the voyage (if known)
- ETA of the voyage
- ATA of the voyage (if known)



Are the informations of the voyage complete then again press the button 
If you have more voyages please add them after pressing the 
button.

To change or delete a existing voyage use the buttons 
and/or 
.



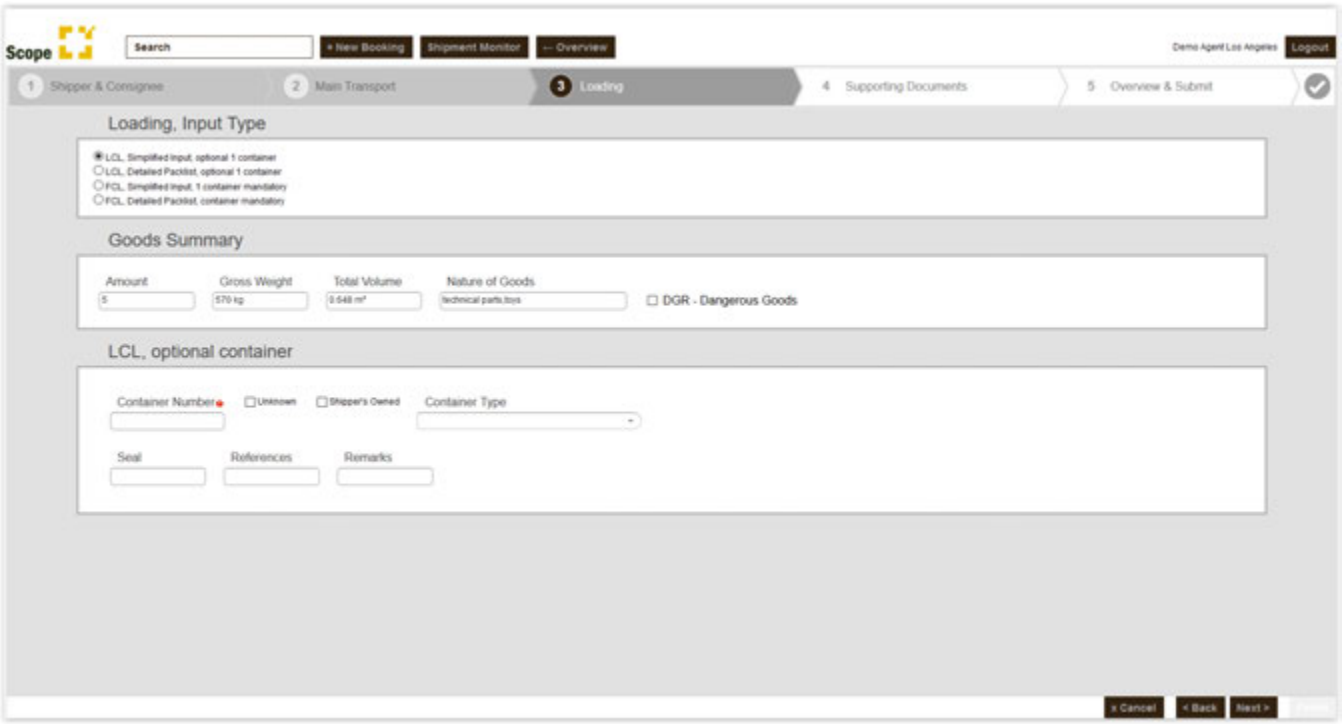
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If all the informations of the Main Work are complete click Next > , to reach the next step "Loading".

Step 3, Loading

There are two ways to add the specifications of the goods (each for LCL and FCL):

- Simplyfied Input - this is a simple total of all the goods and an overall description
- Detailed Packlist - Loose goods and container details - this is a detailed description of all the goods and the containers the goods are in



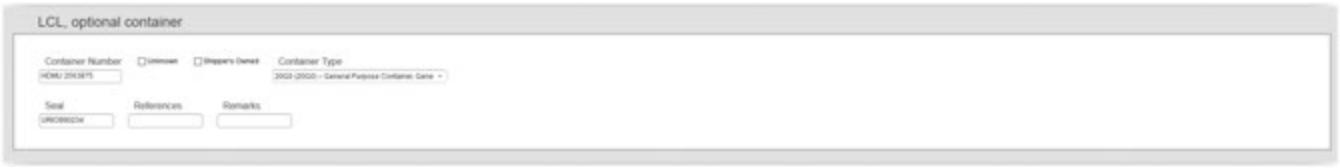
LCL Simplyfied Input, optional 1 Container

- Number of the goods
- Gross Weight
- Total Volume
- Nature of Goods
- if DGR - Dangerous Goods - please click the regarding checkbox

Optional you can add the following informations to a container.

- Container Number - Scope connect verifies the container check digit.
- Unknown or Shipper's Owned
- Container Type - in this field there is a list of the container types available. You can choice the correct type.
- Seal
- References
- Remarks

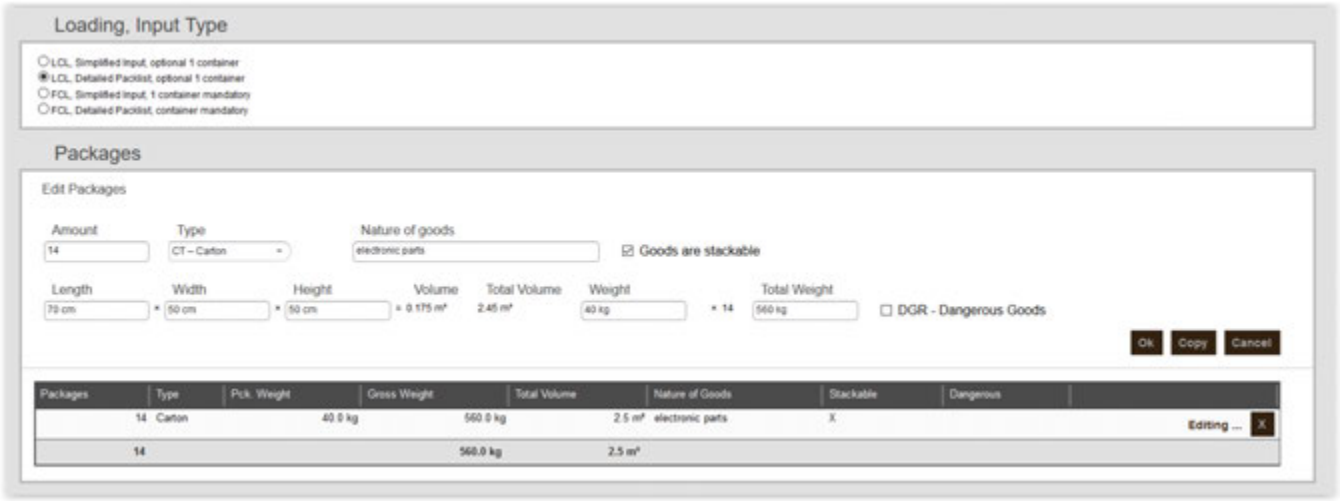
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



LCL Detailed Packlist, optional 1 Container

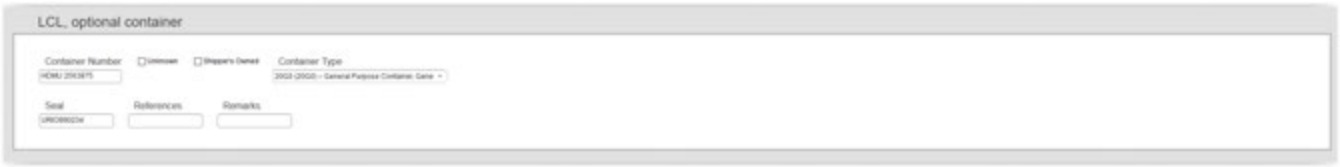
If you want a detailed packing list you can add the follwoing values:

- Number of the goods
- Type - kind of package - can be choosen from a list of available packages.
- Nature of Goods
- Goods can be stacked or not - relevant can be marked.
- Volume/Total Volume
- Weight/Total Weight
- if DGR-dangerous goods - please click the regarding checkbox



Optional you can add the following informations to a container.

- Container Number - Scope connect verifies the container check digit.
- Unknown or Shipper's Owned
- Container Type - in this field there is a list of the container types available. You can choice the correct type.
- Seal
- References
- Remarks



FCL Simplyfied Input, 1 Container mandatory

- Number of the goods
- Gross Weight
- Total Volume
- Nature of Goods
- if DGR-dangerous goods - please click the regarding checkbox

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Optional you can add the following informations to a container.

- Container Number - Scope connect verifies the container check digit.
- Unknown or Shipper's Owned
- Container Type - in this field there is a list of the container types available. You can choice the correct type.
- Seal
- References
- Remarks

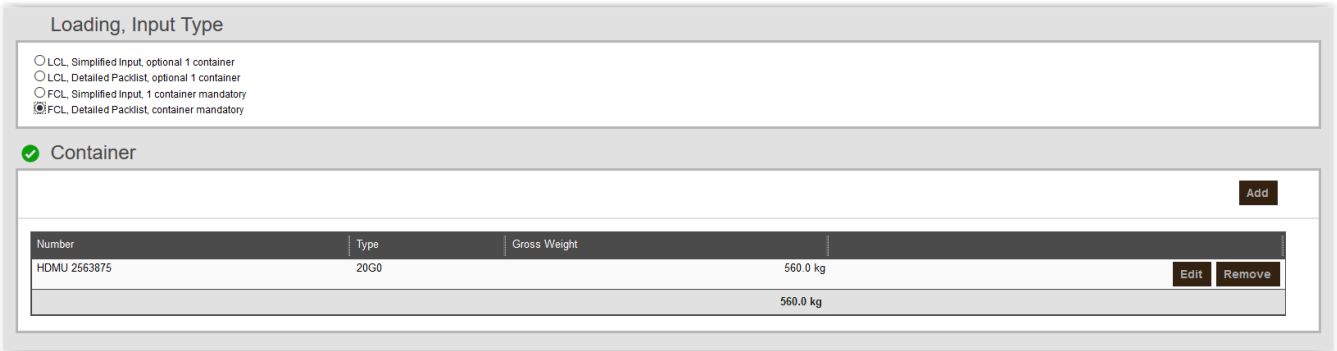
If the goods first are complete, press the  button

If you want to add some more goods also press  .

FCL Detailed Packlist, Container mandatory

Here you can add informations to several container.

- Container Number - Scope connect verifies the container check digit.
- Unknown or Shipper's Owned
- Container Type - in this field there is a list of the container types available. You can choice the correct type.
- Seal
- References
- Remarks

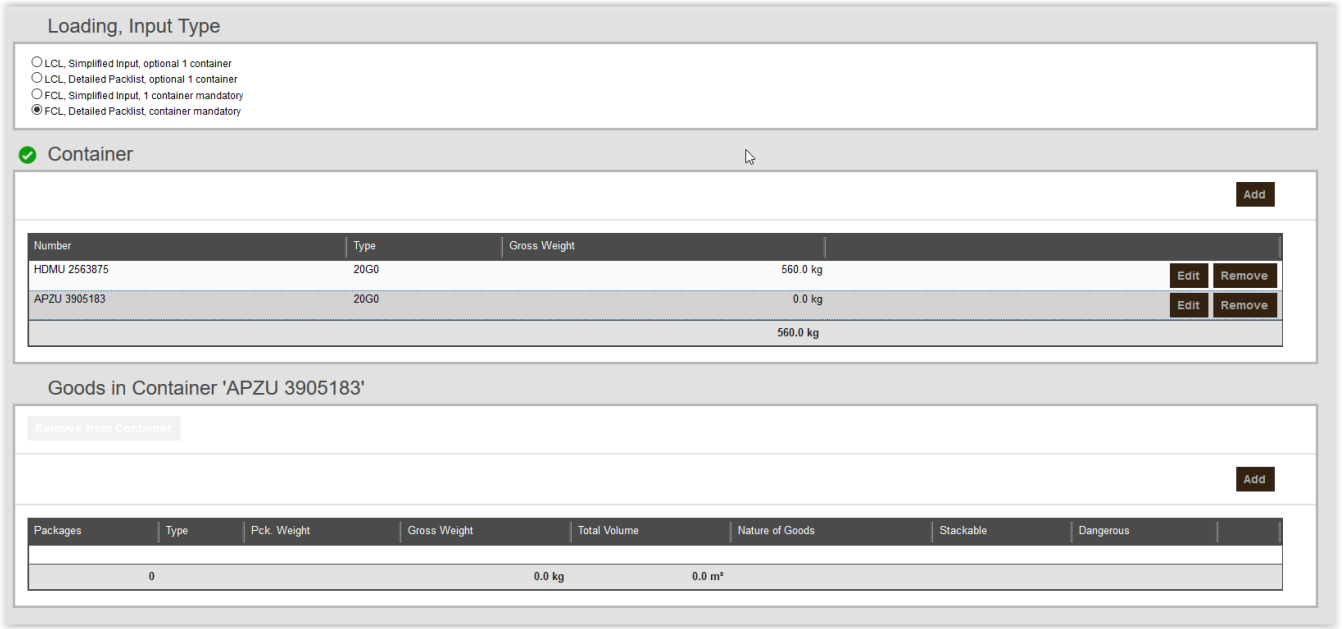


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

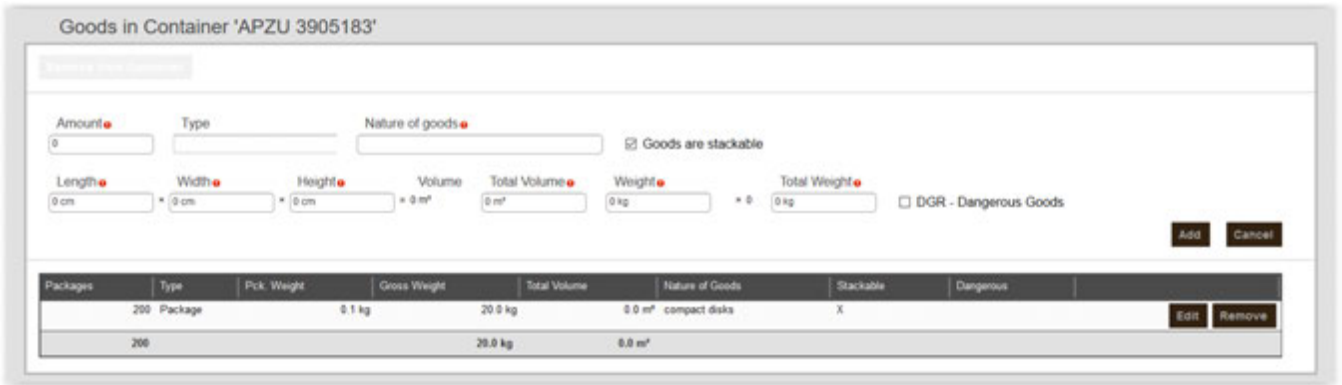
If the Container Details are complete click the 
button

Add Packing Pieces / Goods into a Container

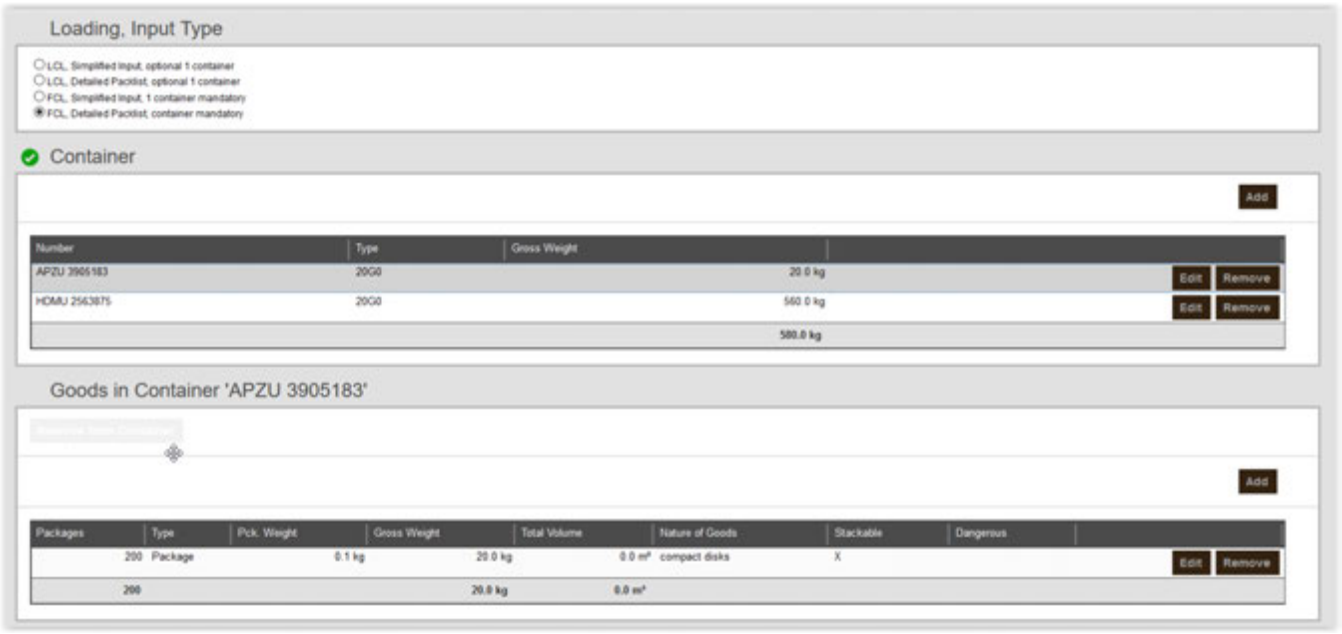
If you wand to add some more packing pieces into a existing container again use the 
.button.



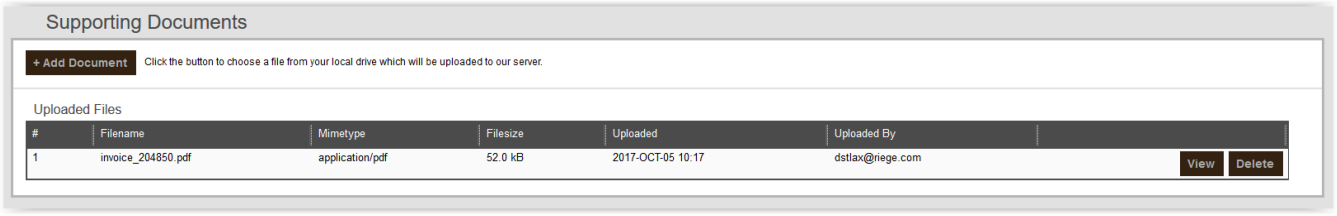
The wanted packing pieces can be added with button 
.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



If all packing pices/goods are added complete they will be shown with total numbers of the goods, total weight and total volume and you can go to the next step with  to "Supporting Documents".



This can be done like described before, in the sam way also the last step "Overview and Submit".

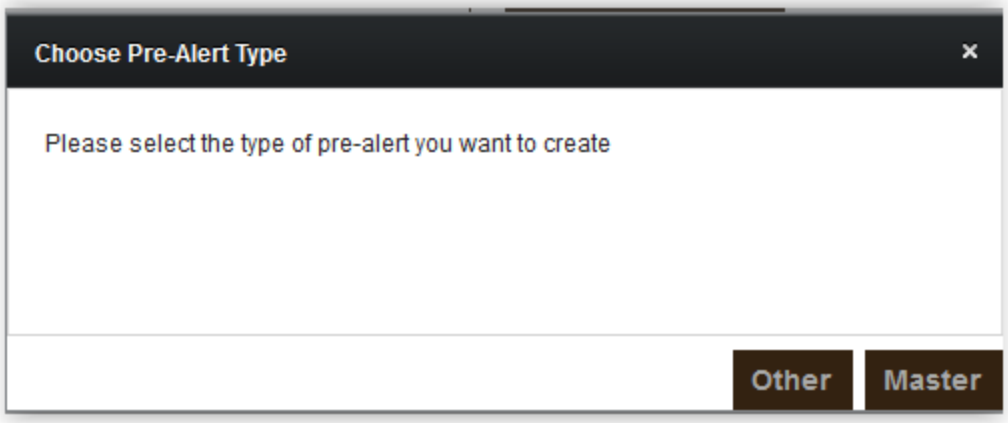
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Consolidation of a House Shipment into a Master

Creating a House Shipment Pre-Alerts as described before, but now be sure to choice the MAWB or OBL in the shiment:

If the House Pre-Alert(s) are ready you can create a Master Shipment with the buttons 

and then Master:



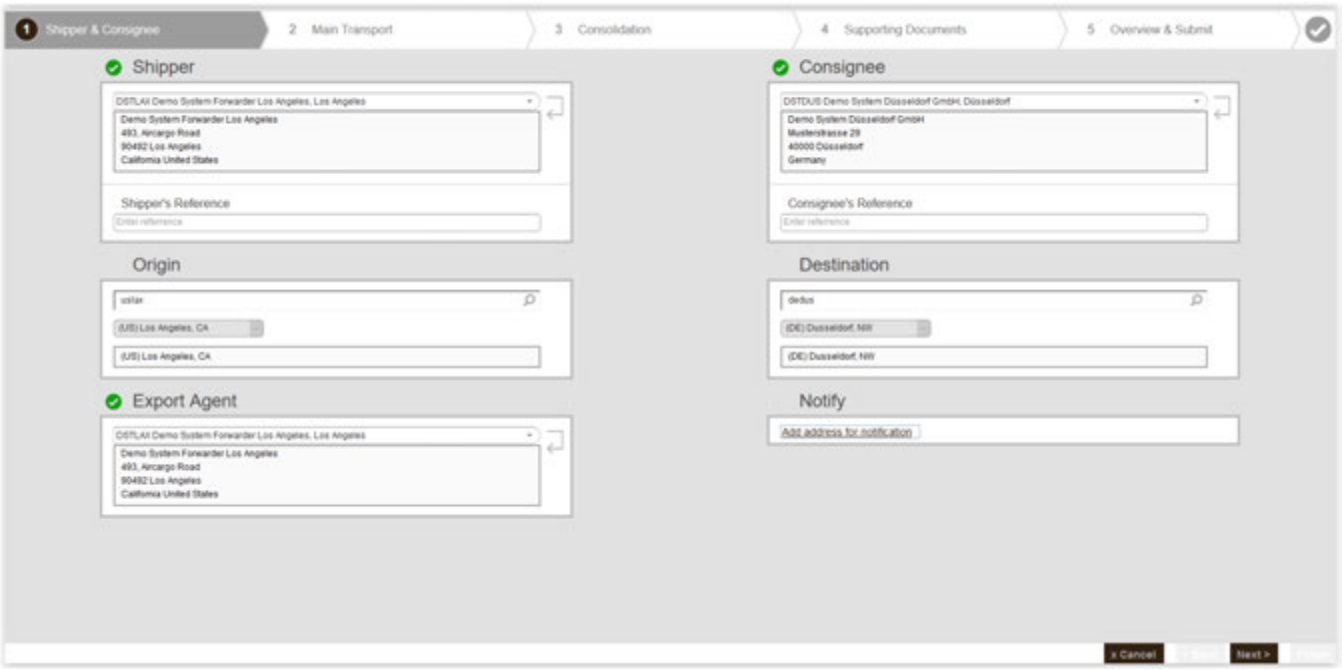
Master - Shipper and Consignee

Here you can add Shipper, Consignee and Export Agent of the Master:

- Shipper - here the Export Agent, who sends the Pre-Alert.
- Consignee - here the Import Agent, who gets the Pre-Alert.
- Export Agent - here the Export Agent, who sends the Pre-Alert.

Complete the place of Departure and Destination of the Master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



If all has been finished,  to the main work of the Master Pre-Alert

Master - Main Transport

Please choice again between Air and Sea.

Keyin of the MAWB or OBL number and the carrier for the Master

Here the flight dates has to be added.

I ready, then click the  button to get the screen Consolidation of the Master Pre-Alerts

Master - Consolidation

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The screen Consolidation shows at the bottom all House Shipments which can be added to the Master Pre-Alert. This ones will be displayed as "Available Pe-Alerts".

Please mark the House shipments, which will be added to the Master and use the 
button, to add them to the Master. They will bew transfered to the upper part of the screen as "Consolidated Pre-Alerts".

To remove a House from a Consol, mark the House at the window "Consolidated Pre-Alerts" and then use the 
button.

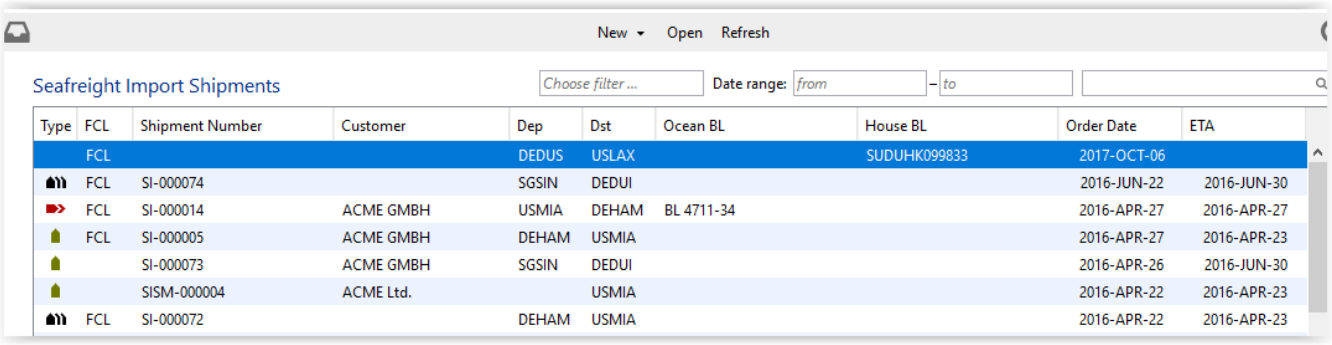
As described before now finish with 
the step "supplementary documents" and also the last step "Overview and Complete".

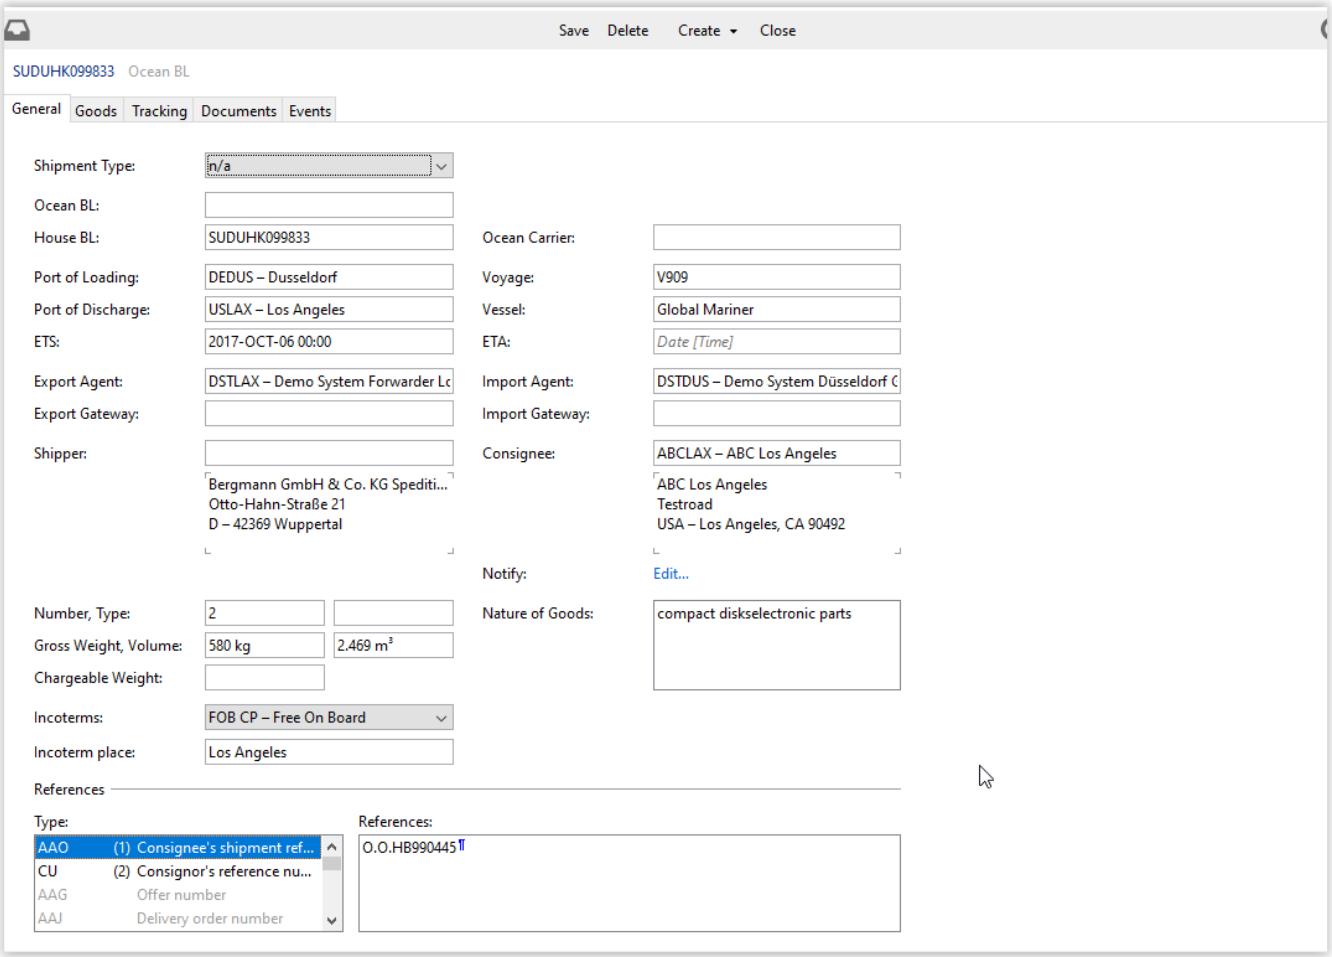
Conversion of a Pre-Alerts into Scope Import

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

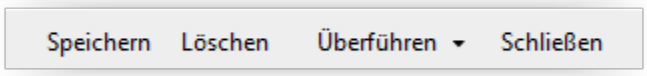
If the Export Agent press the button 
, to finish the Pre-Alert, the Pre-Alert will be visiable AT ONCE in Scope at Air- or Sea-Import Shipment overview.

The follwoing example shows a Pre-Alerts, which is ready for the convertion to a Sea Import Shipment by the Sea Import Agent. You see that it is a Pre-Alerts because the fields "Type" and "Orderer" are empty.

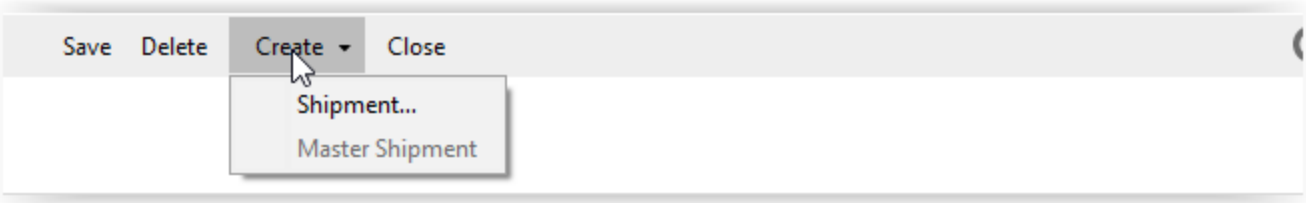




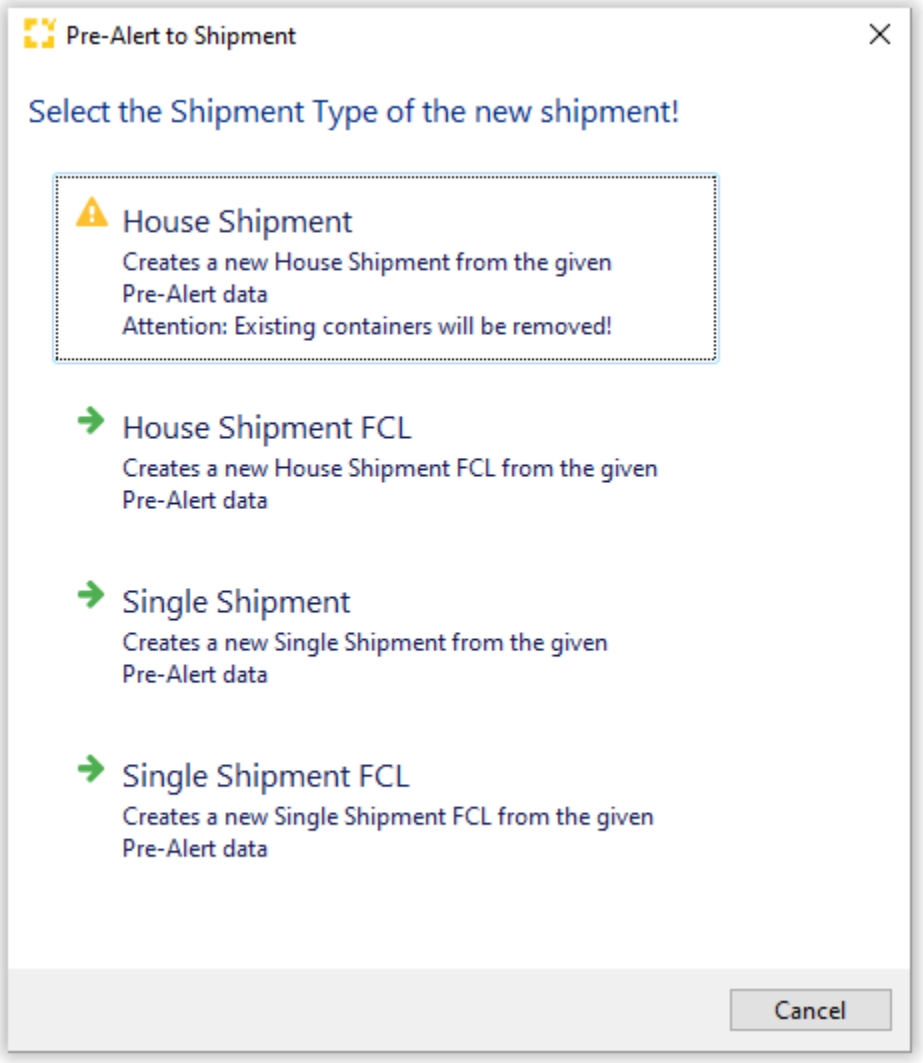
This Pre-Alerts can easily converted by choicing "Überführen" into "Shipment" from the menu.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Next step is to choice the shipment type, as at the "normal" Shipment Entry.



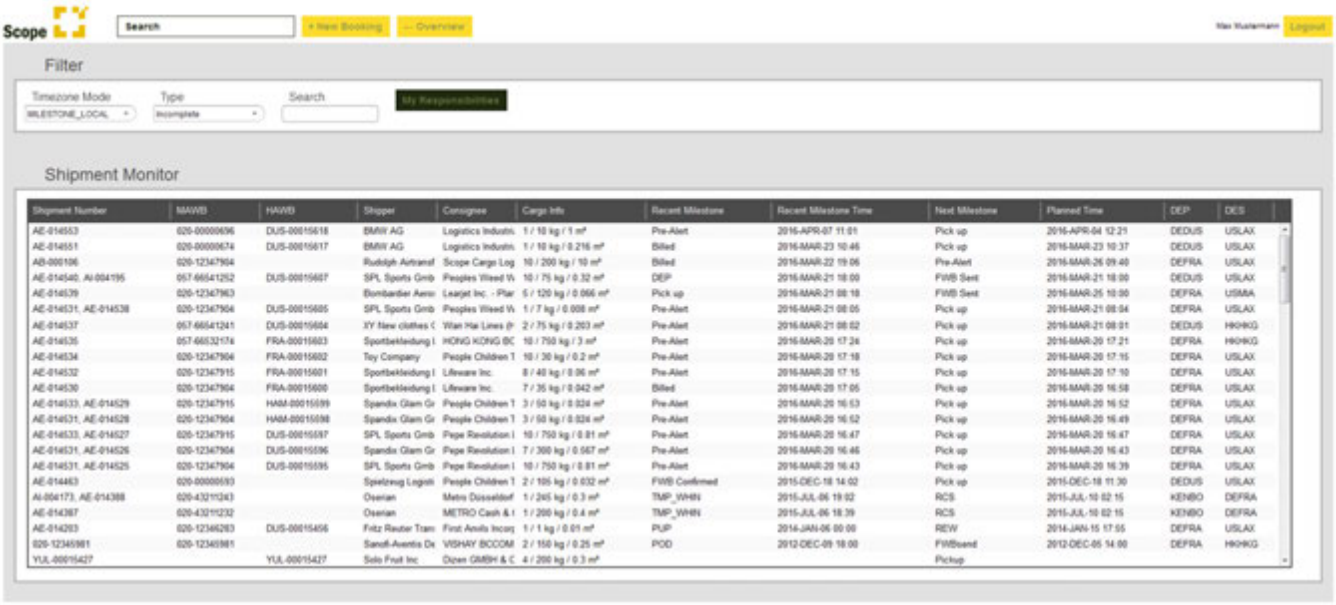
Once the Import Clerk converted the Pre-Alert into a shipment it is not any longer visible as Pre-Alert at Scope Connect but as a Shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Shipmentmonitor

The shipment monitor is an overview of tasks performed by the participants responsible for shipment milestones and which must be completed within a predefined time frame . For example the Carrier can show, which pickups and transfers have been done or are yet to be done, together with the dates and times for these activities. .

Once the milestones in Scope Connect are completed with timestamps (time) and remarks (comment), they are marked as done. They are then evaluated within Scope to determine whether fulfillment has been carried out within the allowed time frame. This in turn allows Scope to determine if the entire chain of processes is jeopardized by any delay.



Filter

Timezone Mode

The overview of shipments can be displayed using different timezones, this allows a better overview of the various participants. There are currently three time zones:

Timezone	Description
UTC	Universal Time Coordinated
Milestone_Local	Local time for to do
Local	Local time from the user

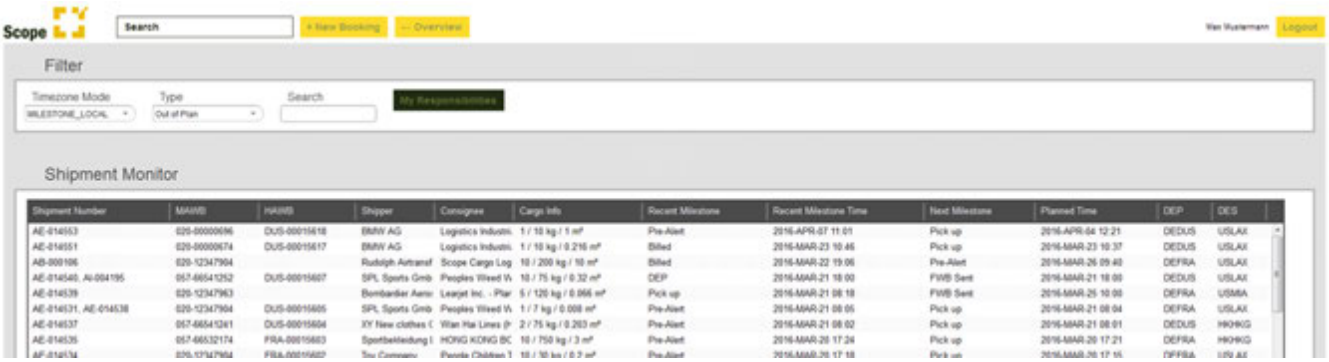
Type

Selection of the particular status of the milestone. If nothing is selected, all the milestones are displayed in the overview. The following types of status are available:

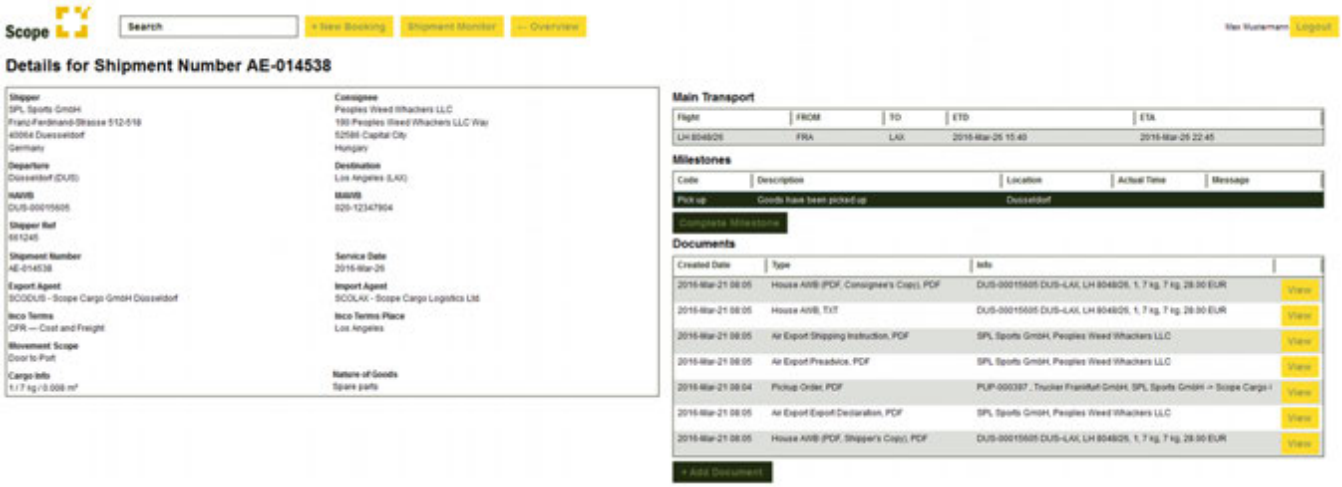
Type
Incomplete
Due
Critical
Out of Plan
To be approved
Failed actions
Any

After selection, only the shipments with the appropriate status will displayed.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



By ticking the shipment, the shipment opens to add or finalized the milstone.



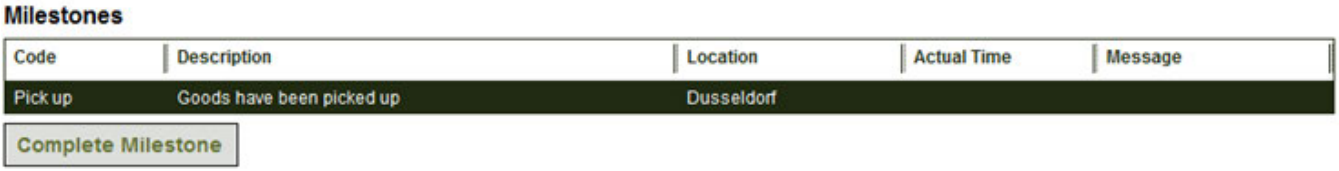
Shipment details are on the left and on the right the milestones can be add or finalized. Furthermore documents can be add.

Main Transport

Overview from the main transport of the shipment.

Milestones

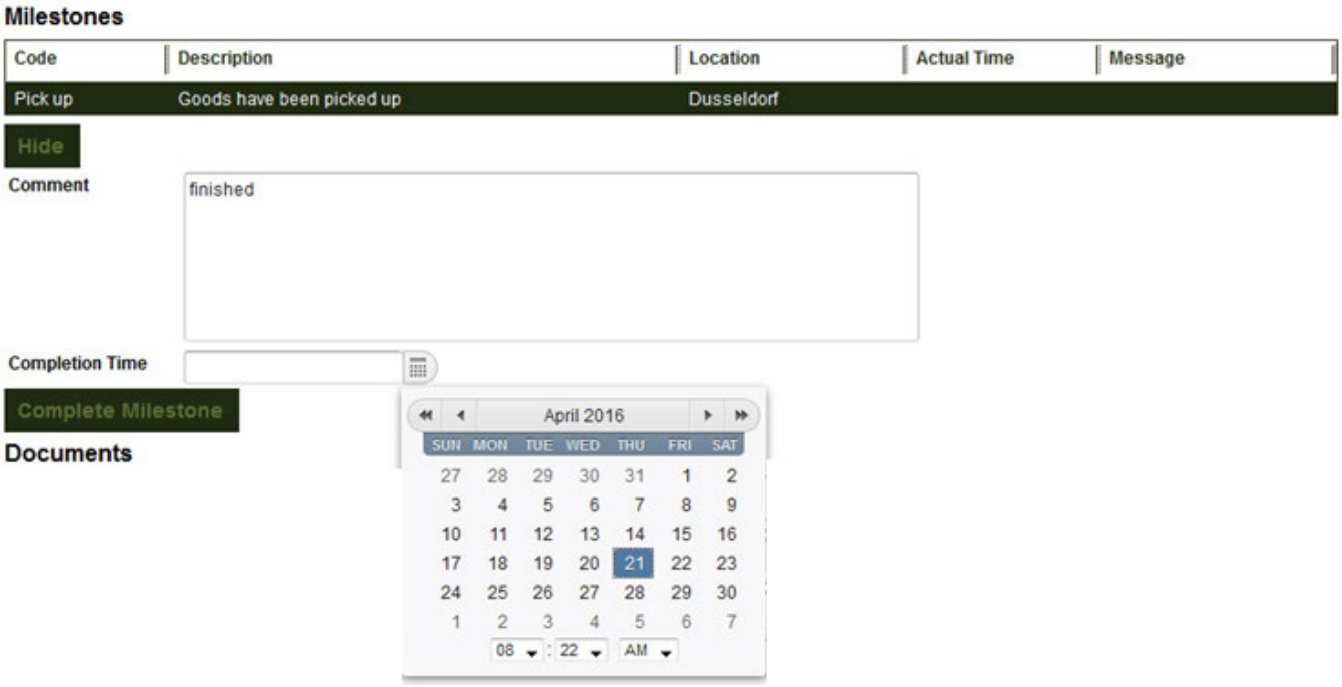
Overview of the open and finishes milestones. To finalize a milestone, mark the milestone and press **complete milestone**.



Comment

Add a comment and a completion time to finished the milestone.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Hide

Close the comment filed without any action. The milestone can be finished later.

Complete Milestone

Finalized the Milestone. The shipment will not displayed in the shipment monitor longer.

Documents

By ticking **add documents**, documents can be uploaded.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Master Data

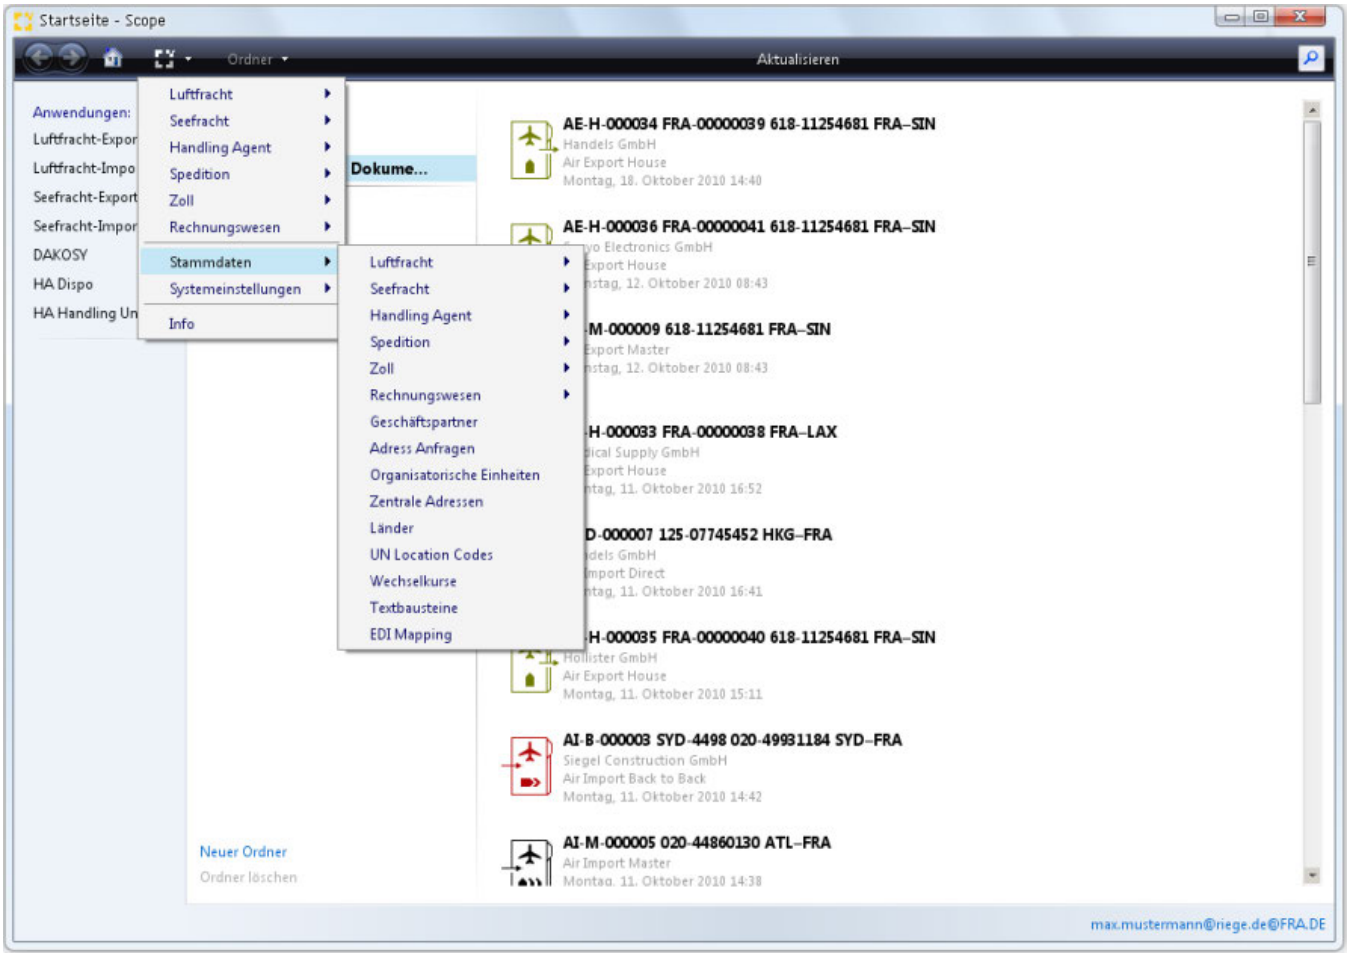
- Introduction
- Description

Introduction

Maintenance is also know as base data and is information that is used repeatedly within various Scope applications. In contrast, transactional data such as shipment data is not general used on a permanent like master data but is created for one-time usage and only sporadically amended or supplemented. Probably the most known type of master data are addresses which are often referred to as an address master. Within Scope of this type of master data is referred to as a business partner called because in addition to the address itself other data about the business partner is collected and managed. Other examples of master data are charge types, tariffs, country data and exchange rates. For most master data there are management applications where the data can be edited or enhanced. Some master data cannot be managed in this way by the user and instead may be maintained by Riege Software. This is necessary in instances where the master data is standardized internationally and in order to exchange data with other systems it is essential to maintain the integrity of this data. Examples of this kind of data is country codes or UN location codes.

Description

The applications menu has a Maintenance section that provided access to applications used to manage master data. Some master data such as business partner information can be managed within shipment applications by using the context menu in the address fields.



In the following chapters master data managment applications are described in detail:

- Airfreight - Maintenance
- Article Maintenance - Maintenance
- ATLAS - Stammdaten
- Countries - Maintenance
- EDI Profiles
- Exchange Rates - Maintenance
- Finance - Master Data
- Forwarding - Maintenance

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Holiday Maintenance - Maintenance
- Organizational Structure - Maintenance
- Partners - Maintenance
- Reasons - Master Data
- Seafreight - Maintenance
- Text Blocks - Maintenance
- UNLocodes - Maintenance
- Webtracking
- Handling - Master Data

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airfreight - Maintenance

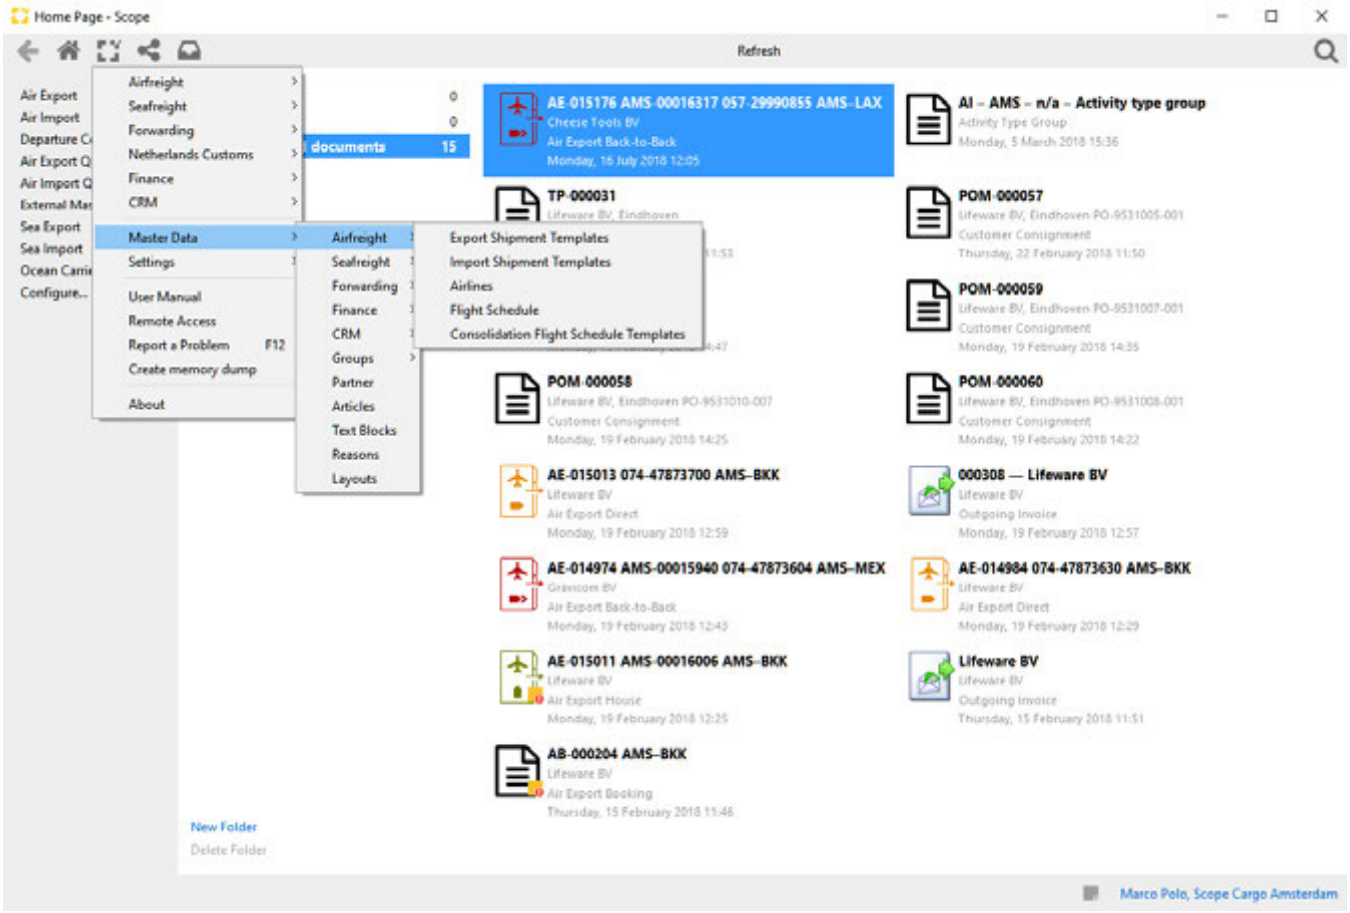
- Introduction
- Description

Introduction

Master data that is specific to airfreight is managed in this area, for example Net Rates and Flight Schedules.

Description

Air master data management applications are accessed from the "applications" list by selecting "Master Data" and then "Airfreight".



In the following chapters air master data management applications are described in detail:

- Airline Maintenance - Airfreight - Maintenance
- Consol Flight Schedule - Airfreight - Maintenance
- CPA Templates - Airfreight - Maintenance
- e-Rates - Airfreight - Maintenance
- Flightschedule - Airfreight - Master Data
- Net Rate Info - Airfreight - Maintenance
- Shipment templates - Airfreight Export
- TACT-Rates - Airfreight - Maintenance

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airline Maintenance - Airfreight - Maintenance

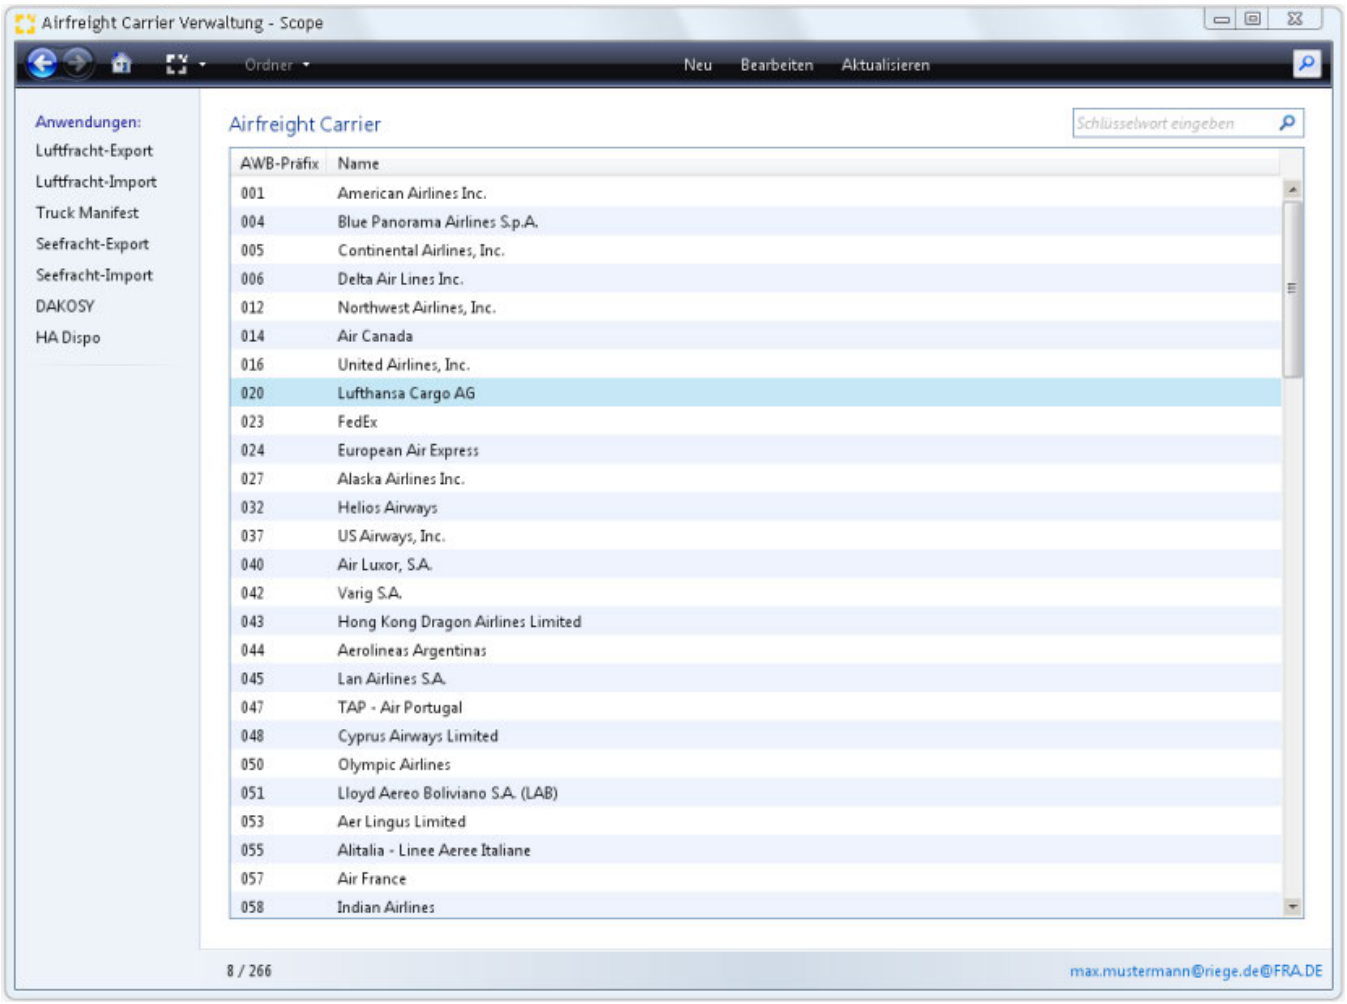
- Introduction
- Description

Introduction

This application is used to create and store airlines and their details, this included related information such as AWB pools and ULD pools. This airline information is then available in many areas of the air import and air export applications.

> Airline codes are internationally standardized. To ensure error free data exchange with other systems, this airline data is managed entirely by **Riege Software International** and automatically distributed to all Scope systems, ***adding, deleting or changing this information is therefore not possible for ordinary users. Management of AWB and ULD pools is only available to users with special permissions.***

Description



New

> This button is not visible to the ordinary user - see the *introductory* note.

This action is used to create a new airline with the airline editor.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Edit

Opens the airline highlighted in the list of airlines using the editor. Alterniatively the airline can also be opened in this way by clicking any airline in the list.

Refresh

refreshes the list of airlines to ensure the latest data is present.

AWB Info

Produces a dialogue box that allows search by AWB number and then produces results specific to that AWB.

Keyword Search

Enter one or more keywords to filter the list of displayed airlines.

Summary Table Airlines

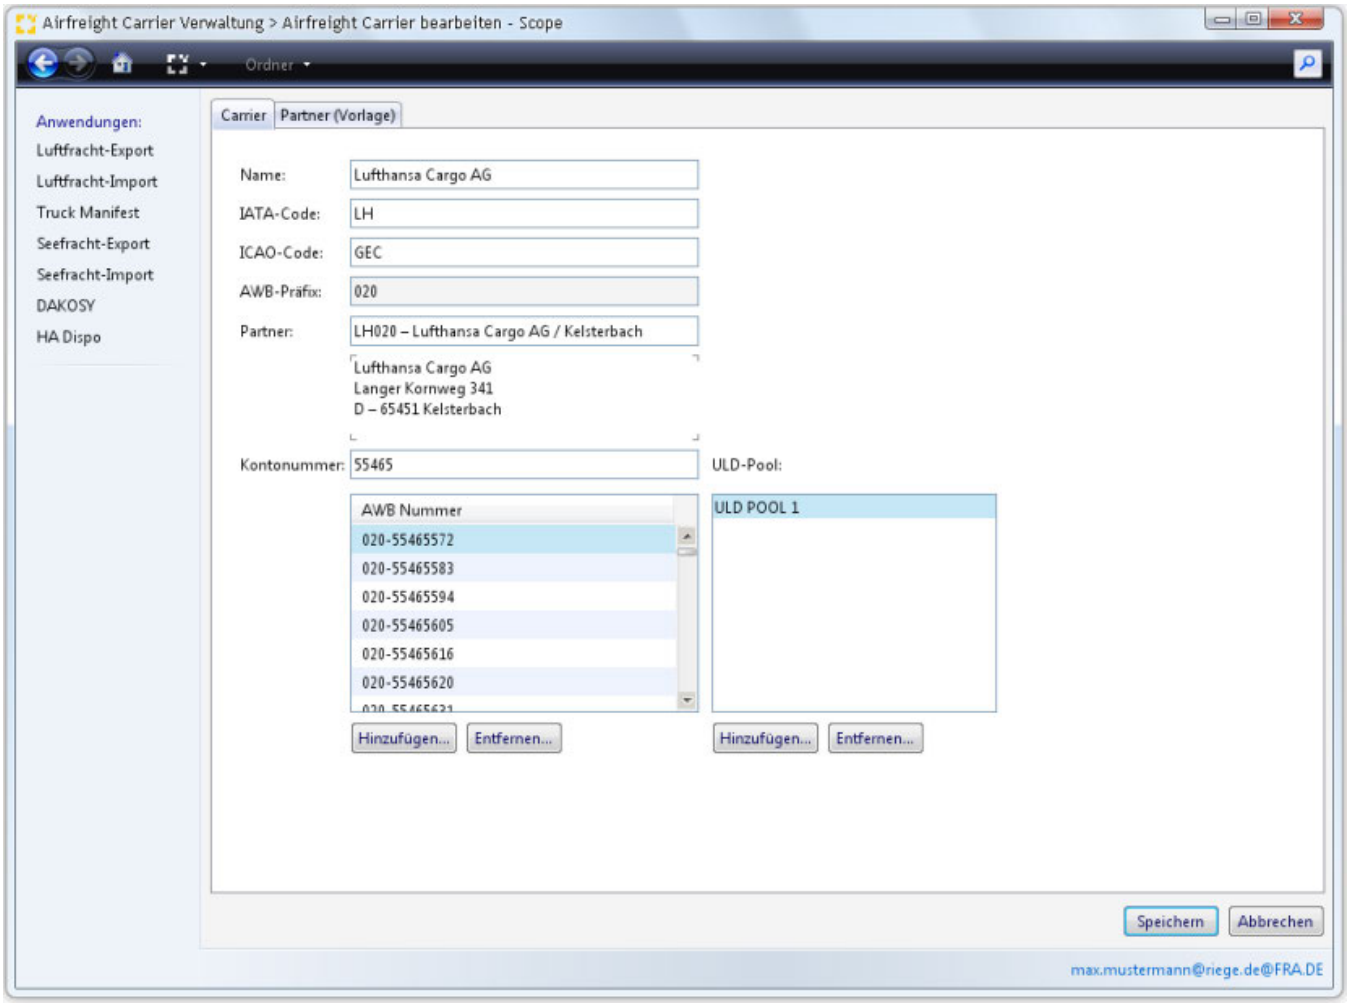
The summary table displays the airline prefix followed by the airline name.

Editor

Carrier

The **Carrier** tab maintains the airline name, codes, account details and pools.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Name

The name of the carrier

IATA Code

The 2 digit alpha-numeric carrier code as issued by IATA.

ICAO Code

The 2 digit alpha-numeric carrier code as issued by ICAO (International Civil Aviation Organization).

AWB-Prefix

The 3 digit numeric carrier prefix as issued by IATA.

Partner

The partner address is created when the airline is added to the list of available airlines. The code for the partner will always be a combination of the airline IATA code and AWB-prefix, for example LH020.

The address printed on the AWB can be maintained using the *Partner* tab of the carrier maintenance program.

The fields ***Name***, ***IATA Code***, ***ICAO Code***, ***AWB-Prefix*** and ***Partner*** are not editable for the user.

Account Number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

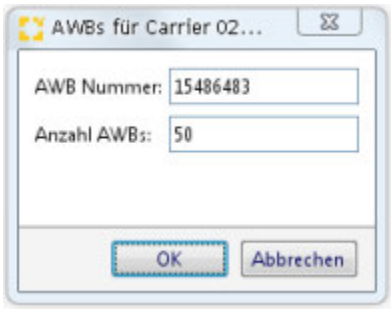
The CASS account number issued by CASS (IATA - Cargo Accounts Settlement Systems).

AWB Pool

AWB numbers already issued by the airline and entered in the system will be visible.

Add

Opens a pop-up window where a new AWB number or range of numbers can be entered.



The first AWB number can be entered (last 8 digits), followed by the number of AWB's to be automatically created following the first AWB. Alternatively the last AWB number can be entered. If the AWB has been lent by another agent, the address of the lendee can be stored. Click *OK* to store the new AWB data or click *Cancel* to exit with changing the AWB pool.

> If a large number of AWB's are added to the pool, the process of generating these may take some time.

Remove

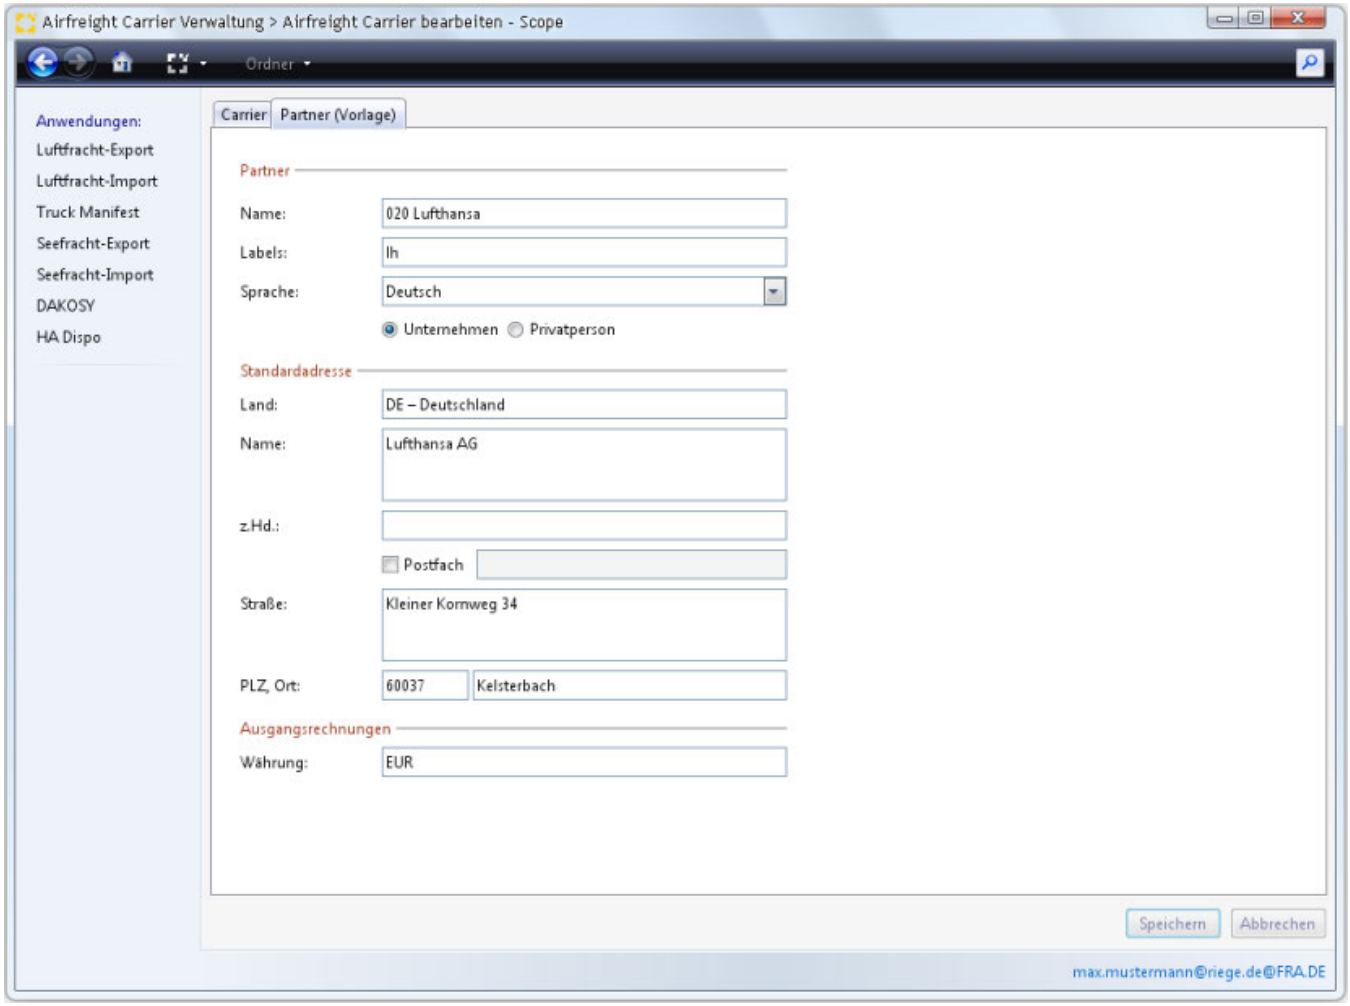
Removes the AWB highlighted in the pool of AWB's.

Partner Template

> This tab is not visible to the general user, see *Introduction*.

The partner tab stores the address for the airline. New partner details here automatically updates the Scope master partner data. This is required to maintain the tariffs associated with the airline.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Name

The name of the carrier.

Labels

Any keywords to be associated with the airline to assist in locating the airline during a full text search.

Language

This drop-down list allows a language to be selected for use when printing documents associated with this carrier.

Country

The search field can be used to locate the country of the carrier.

Name

The name of the carrier - to be used for the postal address.

C/O

The name of any "Care of" party.

P.O. Box

The post office box number (if any).

Street

The street address, (street name and number etc.)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ZIP, City

The postal code and city of the address.

Currency

The 3 digit currency code for the currency to be used with this airline. Currency codes can be found using the field's search function

Questions

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

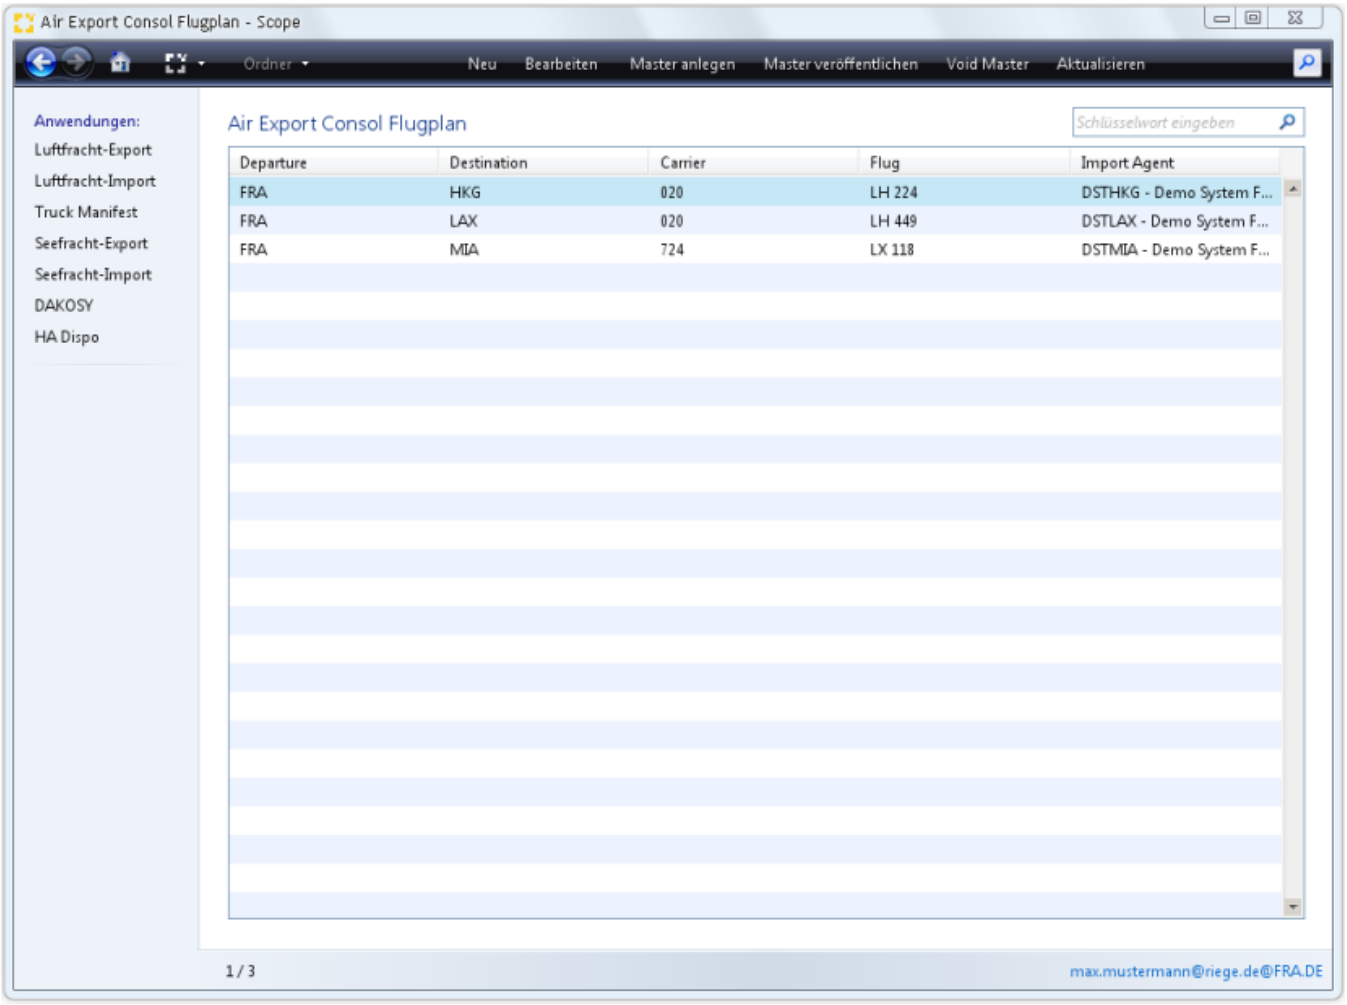
Consol Flight Schedule - Airfreight - Maintenance

- Introduction
- Description

Introduction

Airlines issue flight schedules and airfreight forwarding and logistics companies use these to develop their own consol flight schedules. These record the details of a flight which is identified by a flight number and always departs from and arrives at the same airports. The flight may occur at any interval from once a week to all days of the week. The amount of space allocated to the agent by the airline is recorded and this assists the agent in keeping track of space availability as consolidations are created. The agent flight schedule data is available during the creation of export shipments.

Description



New

Opens the flight schedule editor to create a new flight schedule.

Edit

Opens an existing flight schedule, highlighted in the list of flight schedules using the flight schedule editor, in order to adjust the flight schedule.

Create Master

Create a new master shipment based on the flight schedule highlighted in the overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Refresh

Updates the summary table

Enter keyword

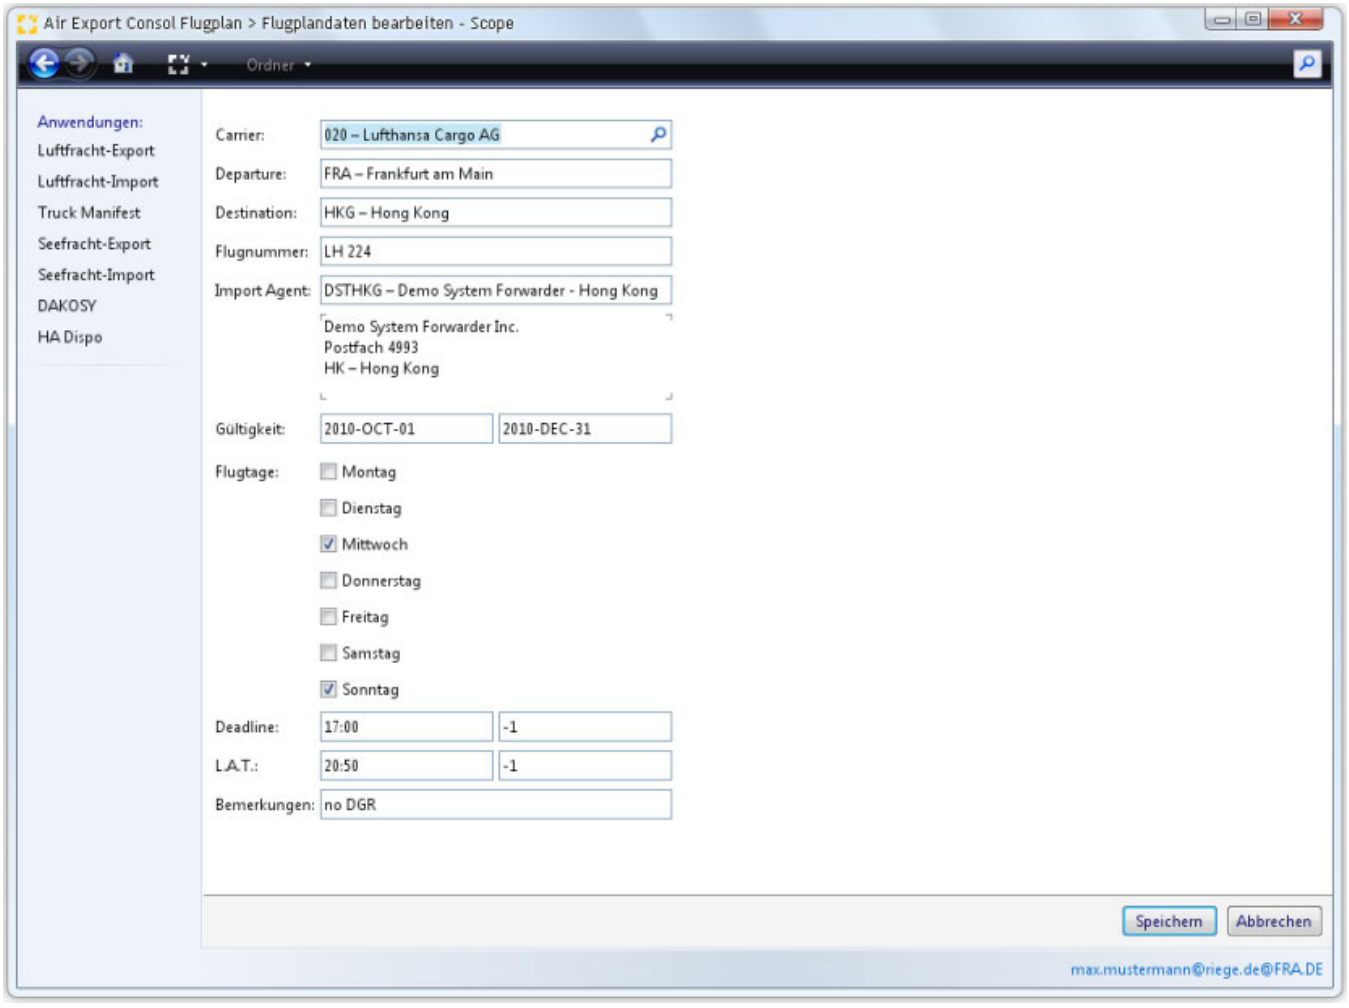
enter keywords to filter the list of displayed flight schedules. This is a full text search field.

Table *Air Consols Export Flight Schedules (Templates)*

The summary table displaying an overview of flight schedules with departure, destination, carrier, flight and import agent.

Flight Plan Editor

Opens a pop-up window showing the flight schedule selected from the summary table. This may be used as the basis of a new flight schedule.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Master flight schedules are created using the following data:

- Issuing Agent (own office)
- Import agent (according to flight schedule entry)
- Departure (according to flight schedule entry)
- Destination (according to flight schedule entry)
- MAWB number (from the AWB Pool of the carrier)
- Flight number / date (according to flight schedule entry)
- Incoterm CFR (default value)
- Deadline visitors (according to flight schedule entry)
- LAT (according to flight schedule entry)
- Remarks (according to flight schedule entry)

Tracking numbers are not generated. These are generated on consolidation during master exports.
The shipments are automatically created in the air freight export index and the Consol Flight Schedule is displayed and can be edited there.

Date Range

The date and time on whihc the new master shipments should be created.

Status

The status to be applied to the master shipments when they are created.

The master shipments may have three difference statuses:

Status	Description
Prepared	The master shipment is not available for consolidation with any house shipments
Open (Local)	The master shipment is available for consolidation only with house shipments from the local branch
Open	The master shipment is available for consolidation with any house shipments

These restrictions apply only to consolidation from the perspective of house shipments . From the perspective of the master shipment additional house shipments may be consolidated on the master.

OK

Save the master shipment data and closes the pop-up window.

Cancel

Closes the pop-up window without saving any changes.

The functions of the flight plan editor are described in the following chapters:

- General - Consol Flight Plan - Airfreight - Maintenance
- Airline Booking - Consol Flight Plan - Airfreight - Maintenance

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

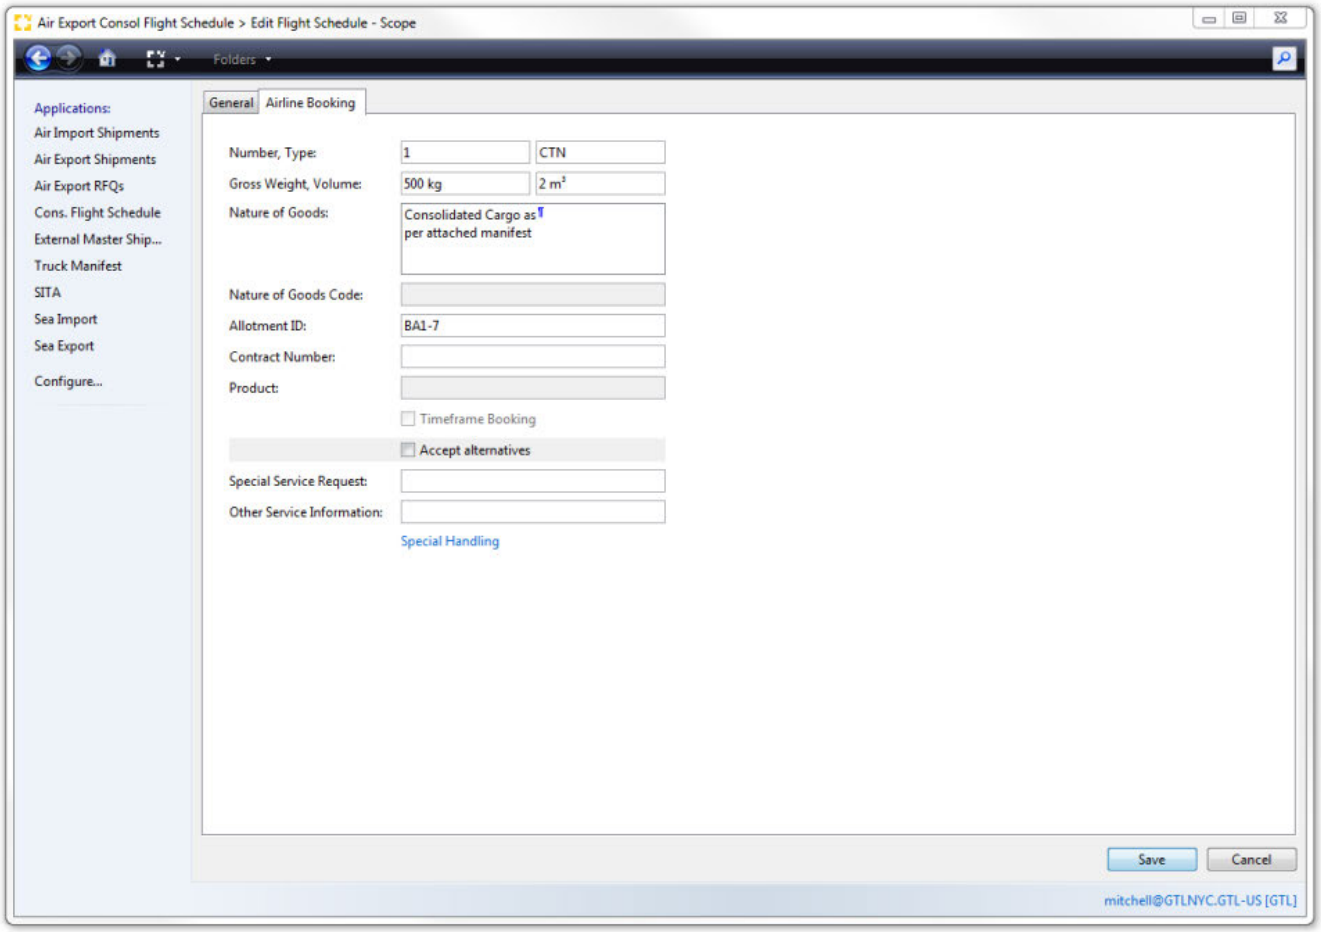
Airline Booking - Consol Flight Plan - Airfreight - Maintenance

- Introduction
- Description

Introduction

When a regular allotment of space on a flight is offered by an airline, the details of this allotment are stored in the **Airline Booking** Tab. This will include the amount of space/weight allocated and the identifiers of this allocation.

Description



Number

The number of packages that are allocated for the flight.

Type

The type of packages allocated for the flight. This is a search field .

Gross Weight

The total gross weight allocated by the airline to the forwarder for the flight.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Volume

The total volume allocated by the airline to the forwarder for the flight.

Nature of Goods

A standard description of the consolidated cargo. This will default to the description: _Consolidated Cargo as per attached manifest_

Nature of Goods Code

This field is not currently active

Allotment ID

Depending on arrangements with the airline, cargo on this flight may need to be identified by an ID issued by the airline.

Contract Number

Depending on arrangements with the airline, cargo on this flight may need to be identified by the contract number agreed with the airline.

Product

This field is not currently active

Timeframe Booking

Indicates if bookings must be made within a given time frame.

Accept Alternative

This check box indicates that alternatives to the current flight are acceptable.

Special Service Request

This text field stores any special service request information.

Other Service Information

This text field stores any other special service information.

Special Handling

This action link opens the Special Handling editor where information about *paperless air waybills* (e-freight) may be recorded.

Save

Saves the airline booking information and closes the application.

Cancel

Exits the airline booking information application without saving any changes.

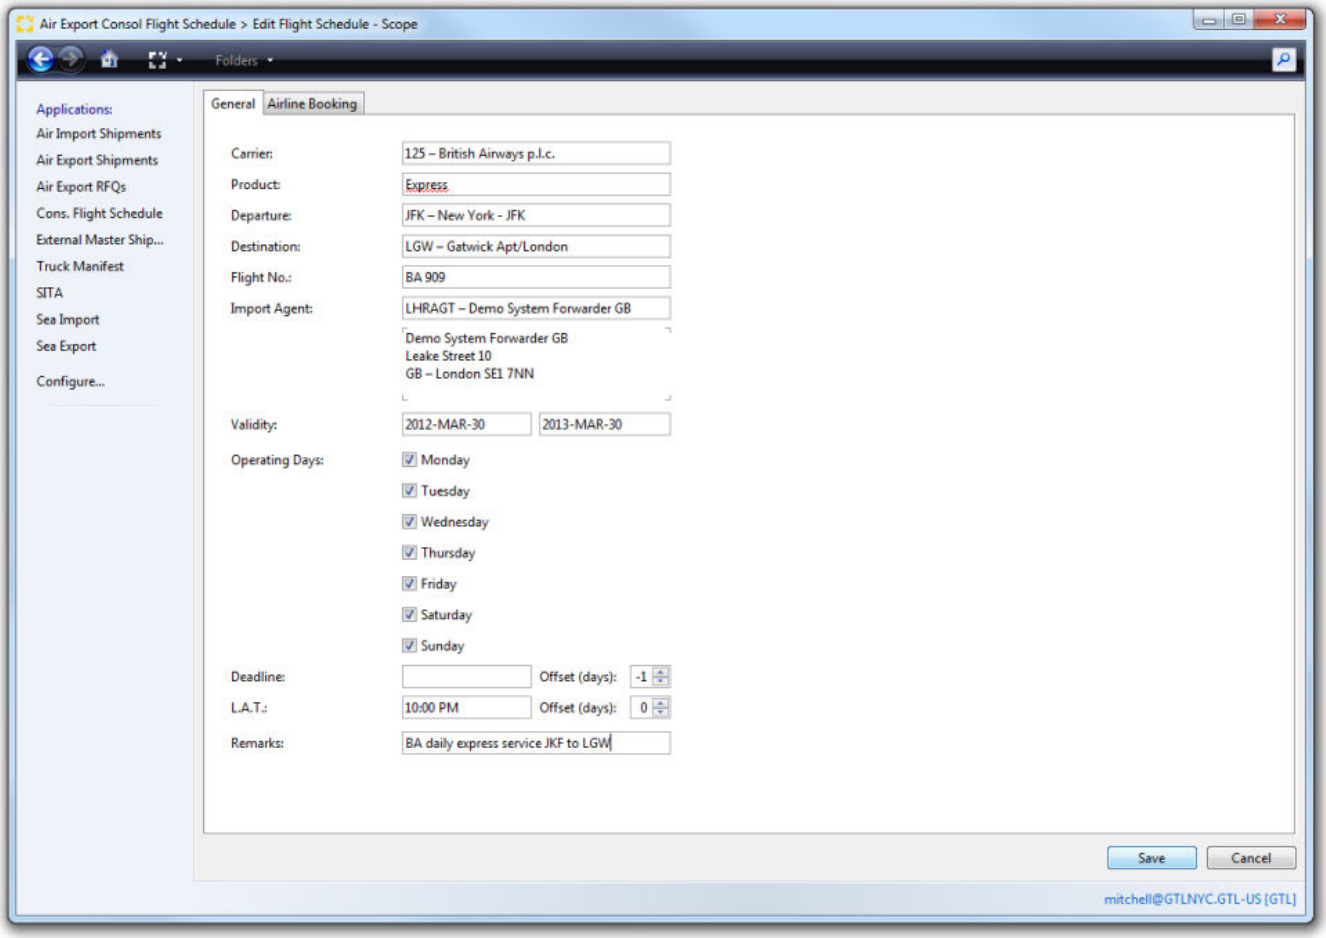
General - Consol Flight Plan - Airfreight - Maintenance

- Introduction
- Description

Introduction

The **General Tab** is were all the basic data about the flight schedule is stored, this will be the carrier, departure, destination, flight number, agents, references, valid from and to dates. Days of the week when the flight operates, deadlines and last available delivery times (LAT).

Description



Carrier

The carrier who operates the flight. This is a full search text field . Start typing the name or carrier codes to see a list of available air carriers.

Departure

The airport of departure for the flight. By default this is set as the airport of the current branch. Alternately, use another depart airport by typing in the name or code of the departure airport in the search field .

Destination

The airport of destination for the flight. Search of the correct destination airport by typing in the name or code of the airport in the search field .

Flight Number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The flight number of the scheduled flight. (The flight number is entered without a tag or date as this will change when the shipment is created.)

Import Agent

The import agent who will be responsible for receiving cargo on this flight. The agent can be found. by typing the name or address of the agent.

> ⚠ This is an agent field which will behave according to this description.

Validity

The date range during which the flight schedule is valid.

Deadline

The last possible time at which the cargo may be delivered to the gateway. It is also possible to indicate on off-set in days to the right of the time using relative days .

LAT (Latest Acceptance Time)

The last possible time at which the cargo may be delivered to the airline terminal. It is also possible to indicate on off-set in days to the right of the time using relative days .

Remarks

Comments related to the flight schedule.

Save

Saves changes to the flight schedule and exists the application

Cancel

Exits the application without saving any changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

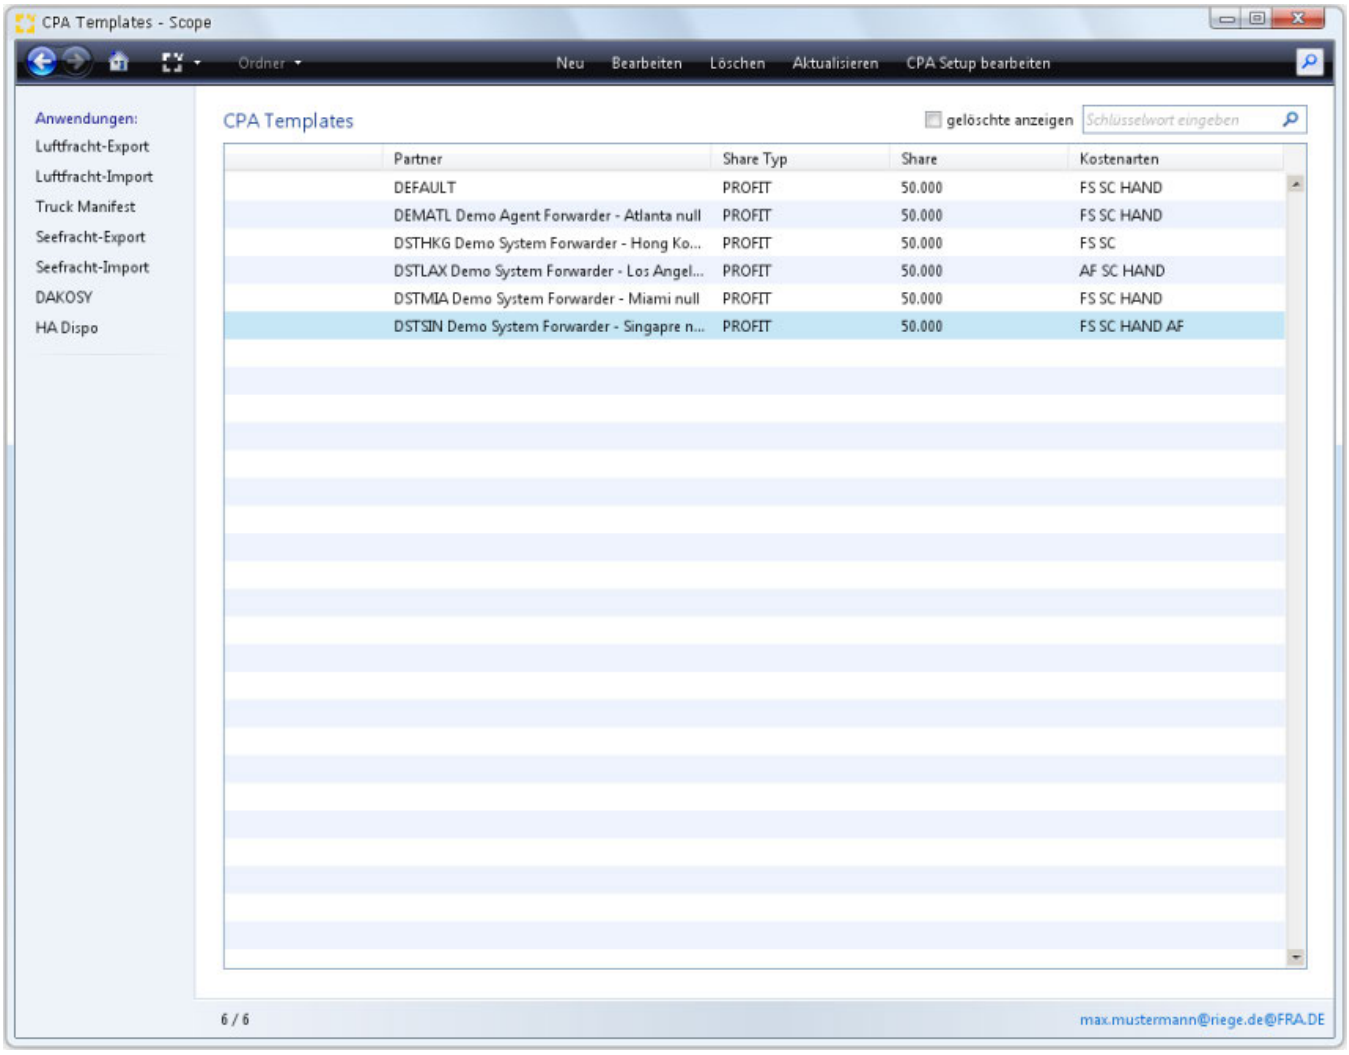
CPA Templates - Airfreight - Maintenance

- Introduction
- Description

Introduction

CPA templates are used for automatic calculation of profit share and the branch consol profit analysis per house bill. These templates are used to highly automate the profit share process. A "default" template can be created which serves as the basis for new, more specific CPA templates. The "default" template can also be use in the Consol profit analysis for agents who have no specific templates.

Description



New

This function is used to create a new CPA template and pops-up a dialogue window where the partner for the CPA template can be inserted or searched for. Only partners who are agents will be available. If the field is left blank, this indicates the default template is being created and only one instance of this default CPA template may exist.

Click "OK" to proceed and the CPA template editor opens.

> ⚠ Multiple instances of CPA templates for the same partner or multiple instances of the default template cannot be created and will produce an error message.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Edit

Opens the highlighted CPA template in the CPA Template Editor.

Delete

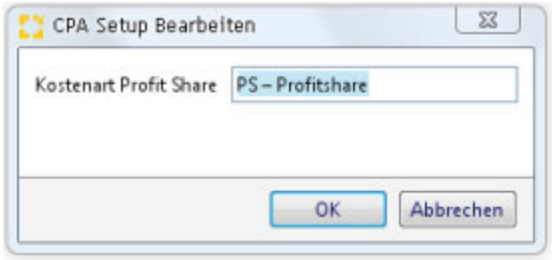
Removes the highlighted CPA template from the overview. This is not permanently deleted, but marked as inactive and removed from the field of view.

Refresh

Refreshes the list of CPA templates to ensure the latest information is visible.

Edit CPA-Setup

A pop-up window appears where the charge code to use for profit share can be defined.



Charge Type Profit Share

A search field to find and store the charge code to use for profit share.

OK

Saves the selected charge code and exits.

Cancel

Cancels any selection and exits with no changes.

CPA Templates

The summary list of CPA templates displays the CPA partner name, the type of share, the amount of share - percentage or actual amount and the charge codes include in the profit share calculation.

Show removed

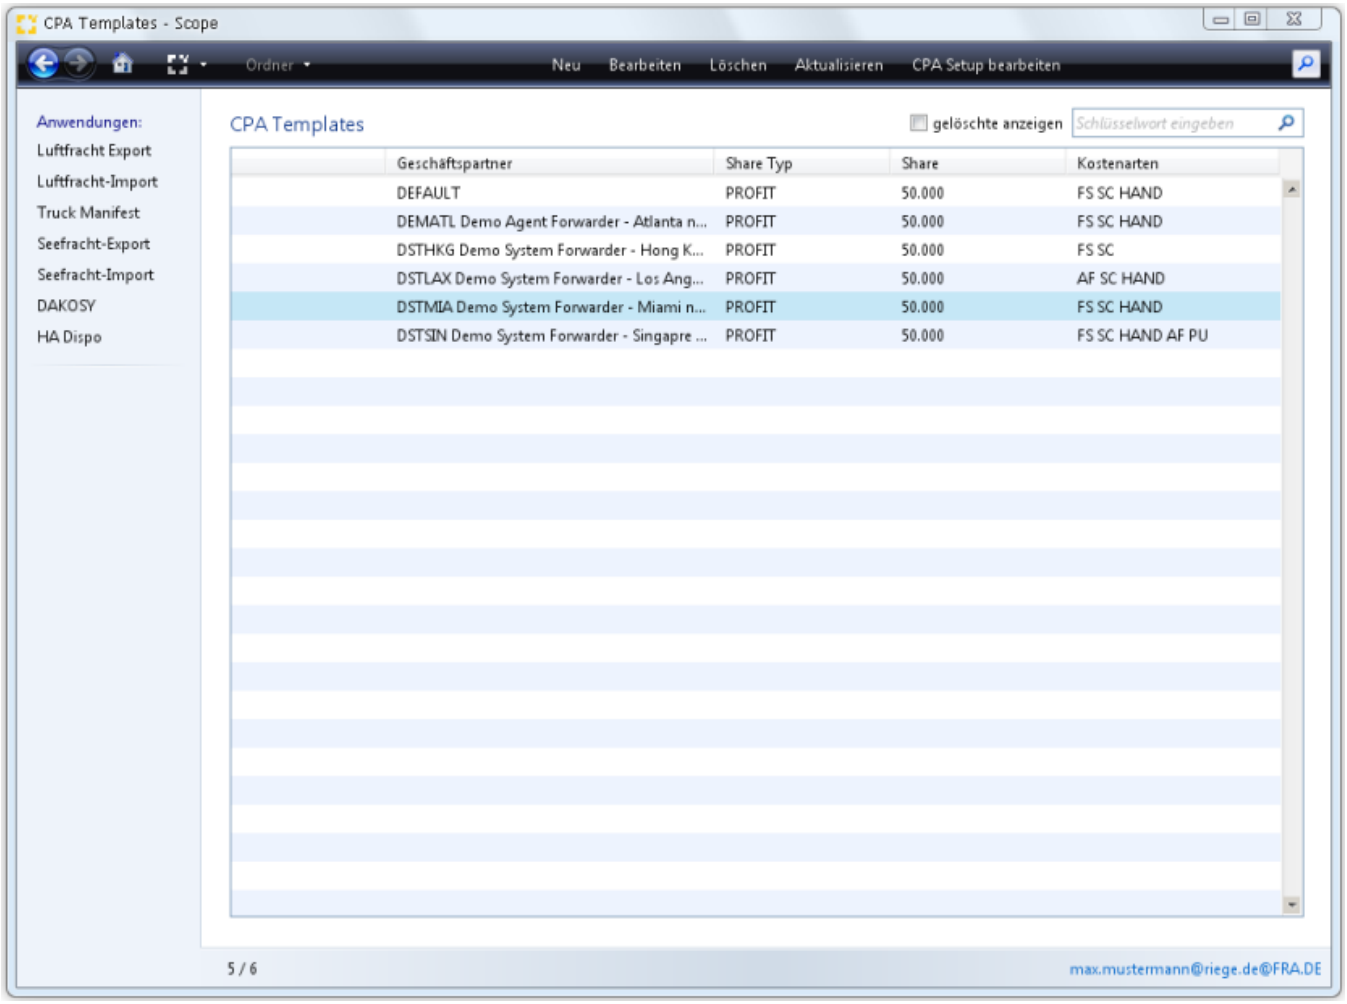
include any deleted CPA templates. This will be shown with the "trash" icon to the left. If clicked, they can be restored.

Type to search

enter keywords in the search field to filter the list of CPA templates.

CPA Template Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Partner

The name of the partner for whom the profit sharing arrangement is being created.

Share Type

The type of profit share arrangement with the partner selected from a drop down list:

Type	Description
Profit	Participation in profits
Income	Participation in revenue
Fixed amount	Participation via a fixed amount

Share

The "profit" or "income" share must be expressed as a percentage of the total in this field. A "Fixed Amount" will be recorded here as a fixed figure. The normal arrangement is a "Profit" participation with a 50% share for the partner.

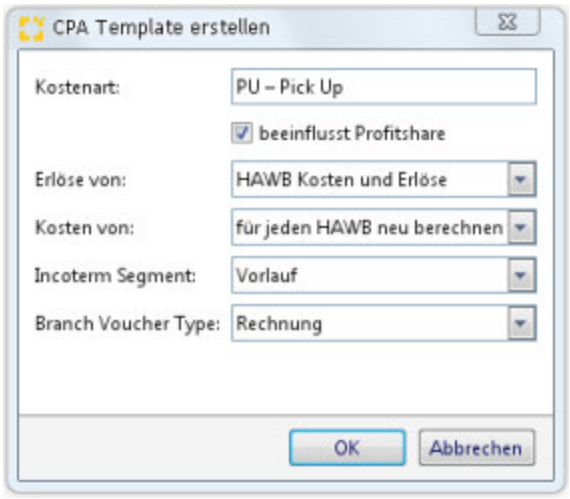
Charge types

The table displays the type of charges to be included in the profit share arrangement.

New

Opens a charge type editor where details of the charge code for the profit arrangement can be stored.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Charge Type

The Charge code to be used, this can be found using the field search function

Incoterm Segment

The segment to which the charge applies:

Segment	Departure	Destination
Pre-carriage	HAWB departure	MAWB departure
Main-carrige	MAWB departure	MAWB arrival
On-carriage	MAWB arrival	HAWB arrival

Example:

HAWB: STR Stuttgart -> BOS Boston
MAWB: FRA Frankfurt -> JFK New York

Pre-carriage:	HAWB departure = STR Stuttgart	->	MAWB departure = FRA Frankfurt
Main-carrige:	MAWB departure = FRA Frankfurt	->	MAWB Arrival = JFK New York
On-carriage:	MAWB Arrival = JFK New York	->	HAWB Arrival = BOS Boston

Settings to recalculate MAWB and HAWB_

- These setting are used primarily for imputed costs which do not appear on the MAWB or HAWB (eg. Pre-Carriage, Pallet etc.)
- Automatic calculation of these costs is done using internal tariffs .

Effects Profitshare

Indicates if the charge is to be used in the profit share or if to be used only for billing. By default this option is enabled.

Income from

Specifies how the costs are to be calculated:

Menu Item	Description	Standard
No automatic calculation	No amounts are calculated automatically but can be entered manually.	
HAWB Jobcosting	Proceeds are calculated from the area of costs and revenues of the HAWBs	✓

Cost vs. Agent From.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Menu Item	Description	Standard
No automatic calculation		
Master Jobcosting		
Recalculate on Mawb		
Recalculate for each HAWB		

OK

Save the CPA template and exits the editor.

Cancel

Cancels the entry and exits without changes.

Edit

Opens the highlighted charge in the charges editor for changes to be made.

> ⚠ In edit mode codes cannot be changed. Costs can only be changed by deleting a template and recreating it.

Delete

Removes the charge.

Move Up

moves the charge up the list.

Move Down

Moves the charge down the list.

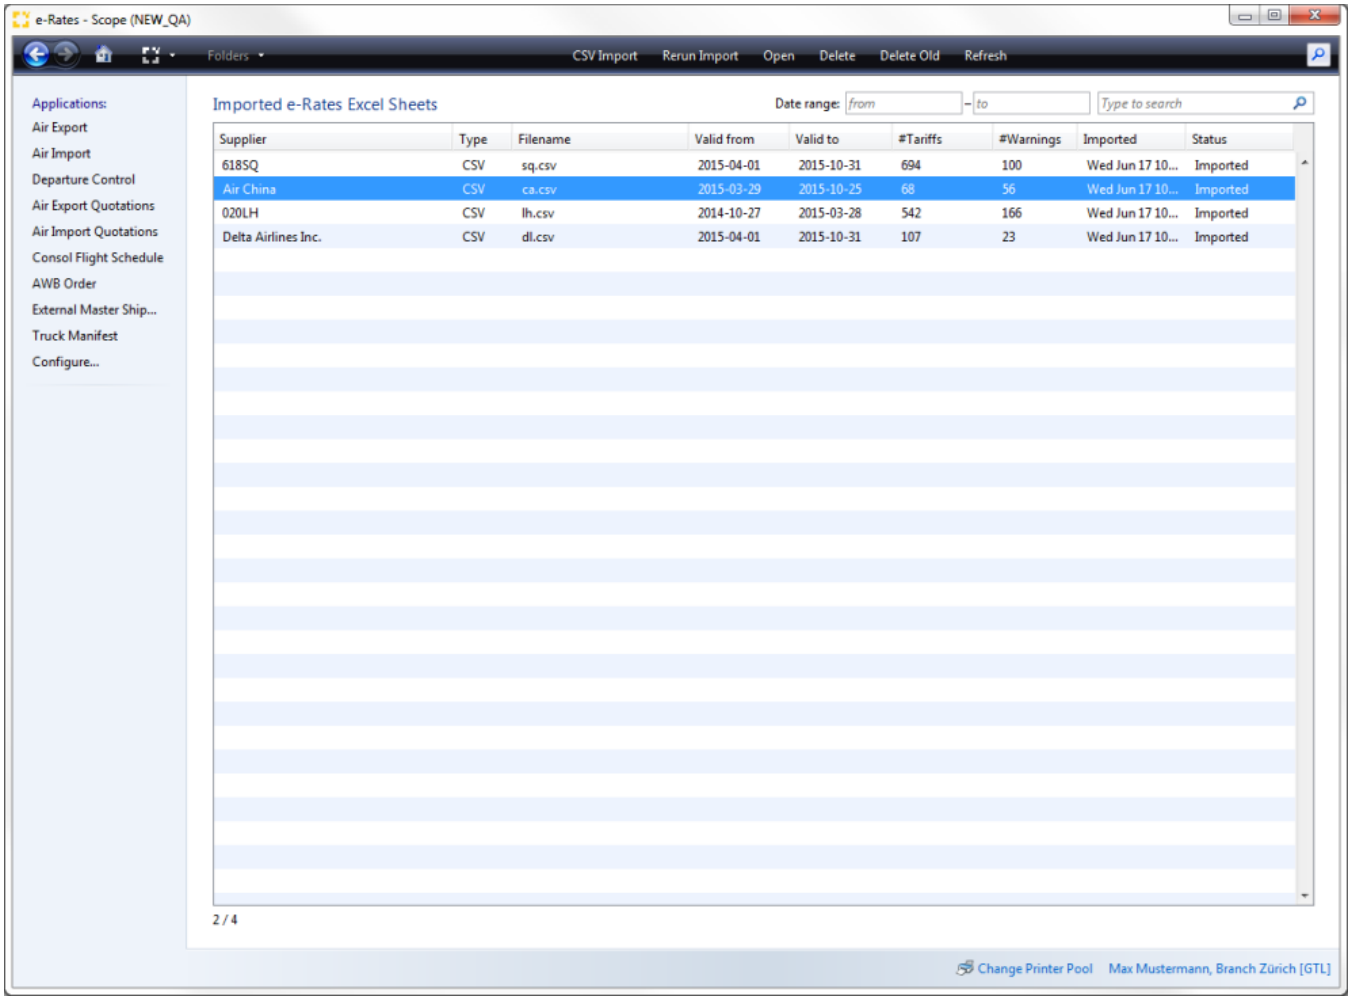
e-Rates - Airfreight - Maintenance

- Introduction
- Description

Introduction

Some airlines provide customers with spreadsheets that contain their services and the rates for these services. These are generally referred to as e-Rate sheets. The e-Rates maintenance application can import the data from these spreadsheets and post the rates automatically to the air export tariffs. During the creation of air export master and direct shipments, these rates are then available for automatic calculation of costs.

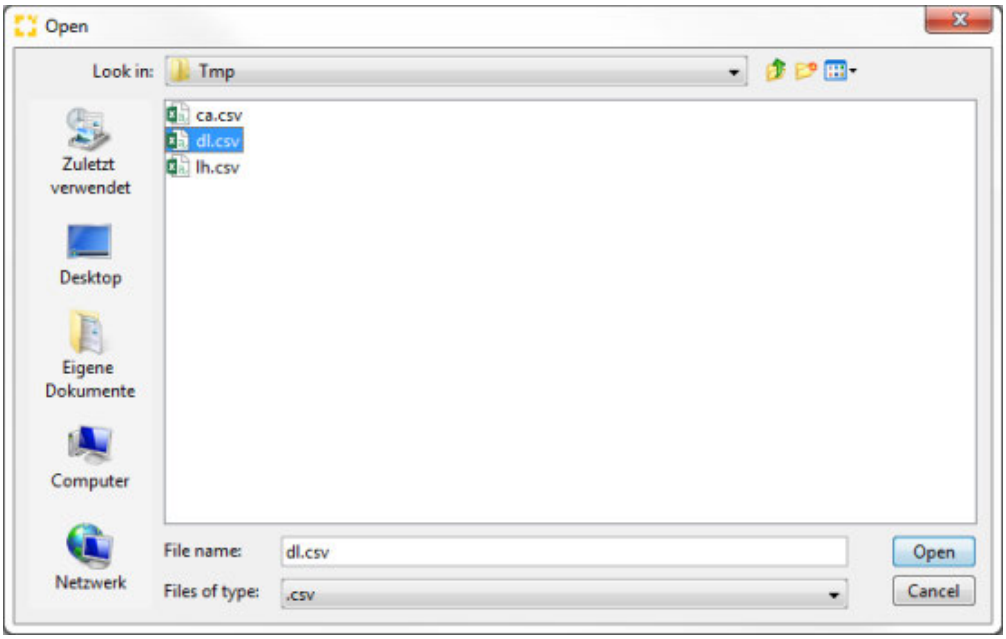
Description



CSV Import

This option will open a file browser that can be used to navigate to the file on the local computer that contains the e-Rates supplied by the airline.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



After selecting the desired file, click the *Open* button to start the import of the file.

Data format

- The old format as well as the new format of e-rates-sheet provided by Airlines is supporter
- The Excel-File needs to be saved in CSV Format to import the data.

Rerun Import

If corrections or supplements are issued to existing e-Rates, the file may be re-imported.

Existing tariffs that are correct will not be replaced by rerunning an import file.

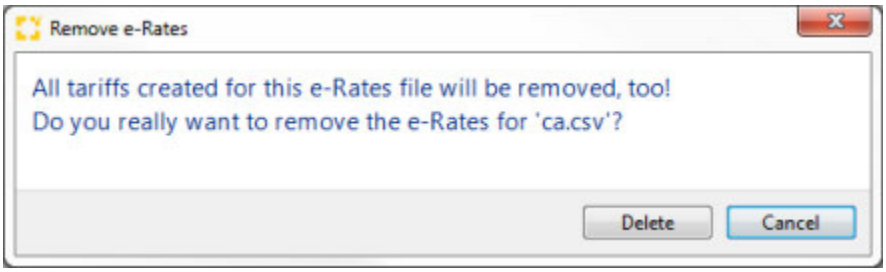
Open

Opens the product highlighted in the overview using the e-Rates import editor

Delete

Deletes the selected summary table record.

When deleting a record, **all related tariffs may also be deleted**. To prevent accidental erasure, a pop-up window will appear with a scurity question:



Delete

Deletes the record and it's rates.

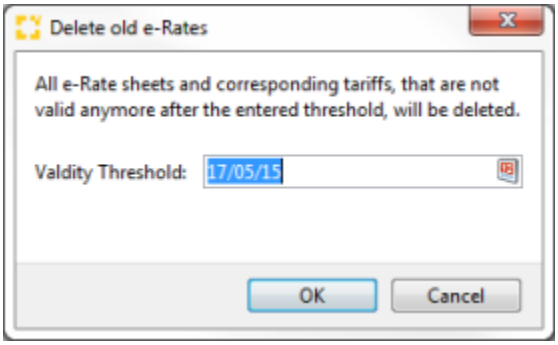
Cancel

Closes the pop-up window without deletion of any records.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete old

With this action, a pop-up window is opened where the date of validity threshold can be defined.



OK

Deletes all rates where the valid to date is before the defined validity threshold.

Cancel

Close the pop-up window without any further actions.

Refresh

Updates the list of records shown in the overview.

Date range

A date range (from/to) can be defined. The data in the overview are then filtered based on this date range.

Keyword Search

Keywords may be entered in the search field
to filter or find the desired e-Rates product.

Imported e-Rates Excel Sheets

A summary table displaying all imported e-rates, listing the supplier, filename, type, valid date range, tariff numbers, warnings, processing date and status.

- During the file import, the line is shown with the status 'importing....'. When completed, the status changes to 'Imported'
- Warnings can be reviewed in the e-Rates import editor.
- Successful imported e-Rates are available in the tariff master data.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

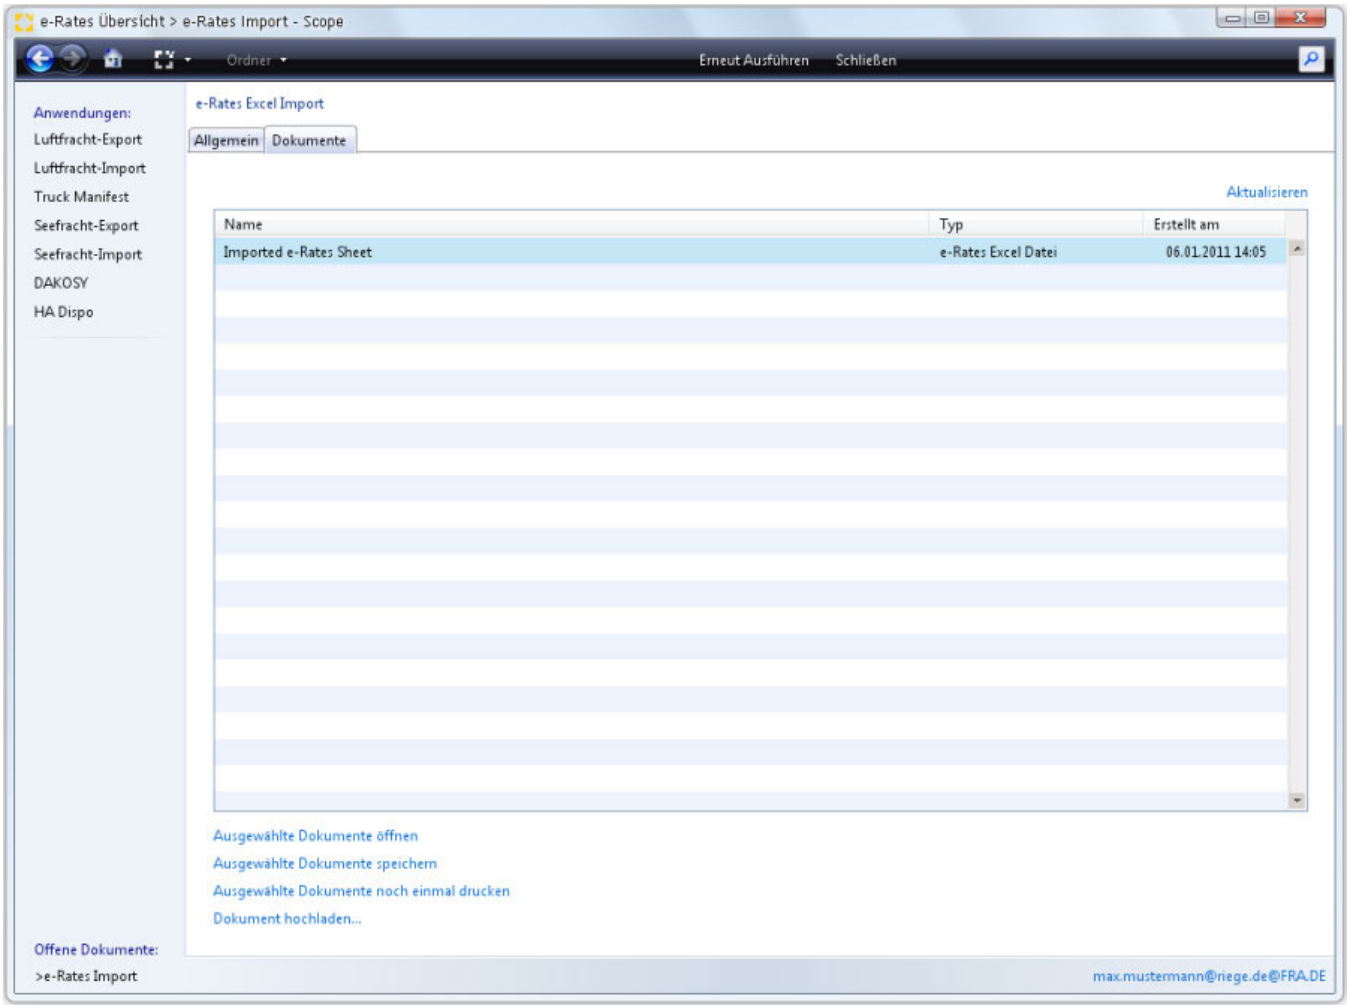
Documents - e-Rates - Airfreight - Maintenance

- Introduction
- Description

Introduction

The **Documents** tab of the e-Rates application displays all documents created or stored that relate to the selected e-Rates. The documents may be opened and printed, deleted and restored. Documents may also by uploaded from or downloaded to the local machine.

Description



Show deleted

When checked, this check box will ensure that any previously deleted documents are also visible. (See also: Restore selected deleted documents).

Refresh

updates the list of documents to ensure the latest documents are visible.

Documents Overview

This area displays all documents; the document name, type, creation date and time are all shown. By default only the latest version of a document is shown, but by clicking the appropriate icon it is possible to switch to the previous version of a document. Deleted documents are displayed with ~~strikethru~~ text. (See also: Restore selected deleted documents).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Open selected document

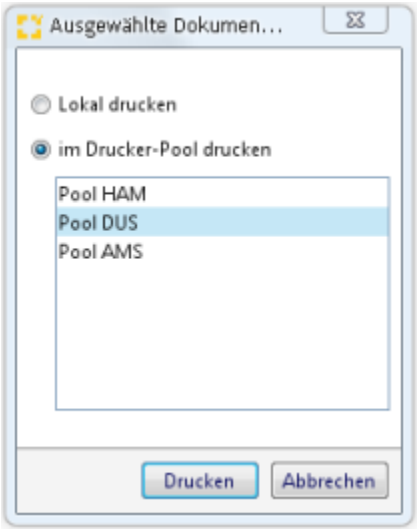
Opens the document highlighted in the overview. Alternately the document can be double clicked to open it.

Save selected document

Downloads the highlighted document to the hard-drive of the local pc.

Reprint selected documents

This action link opens a new pop-up window to manage where the document is to be printed



Local print

Prints the document on the predefined local printer.

Print to printer pool

Allows selection of the desired printer pool from the corresponding list.

Printer pools (List)

This window displays a list of available printer pools . These could be printer pools in other offices. With the selection of a printer pool, the document is printed to that pool immediately.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Print

Print the document to the selected printer.

Cancel

Close and exit the print pop-up window without further action.

Delete selected documents / Restore selected documents

When a documents or set of documents are highlighted and the action link **Delete selected Documents** is chosen, the documents are not physically deleted, but removed from view. By checking the **Show deleted** option described above, these documents can be included in the list of available documents. By highlighting *deleted* documents (those shown in ~~strikethru~~ text) and selecting **Restore selected documents**, the highlighted documents will be undeleted.

Upload document

On selecting the **Upload docuemtn** action link, A file browser will appear in order to navigate to the file that is to be uploaded from the local hard-drive. Alternatively, the file may be dragged and dropped from the local hard drive to the **Documents tab**.

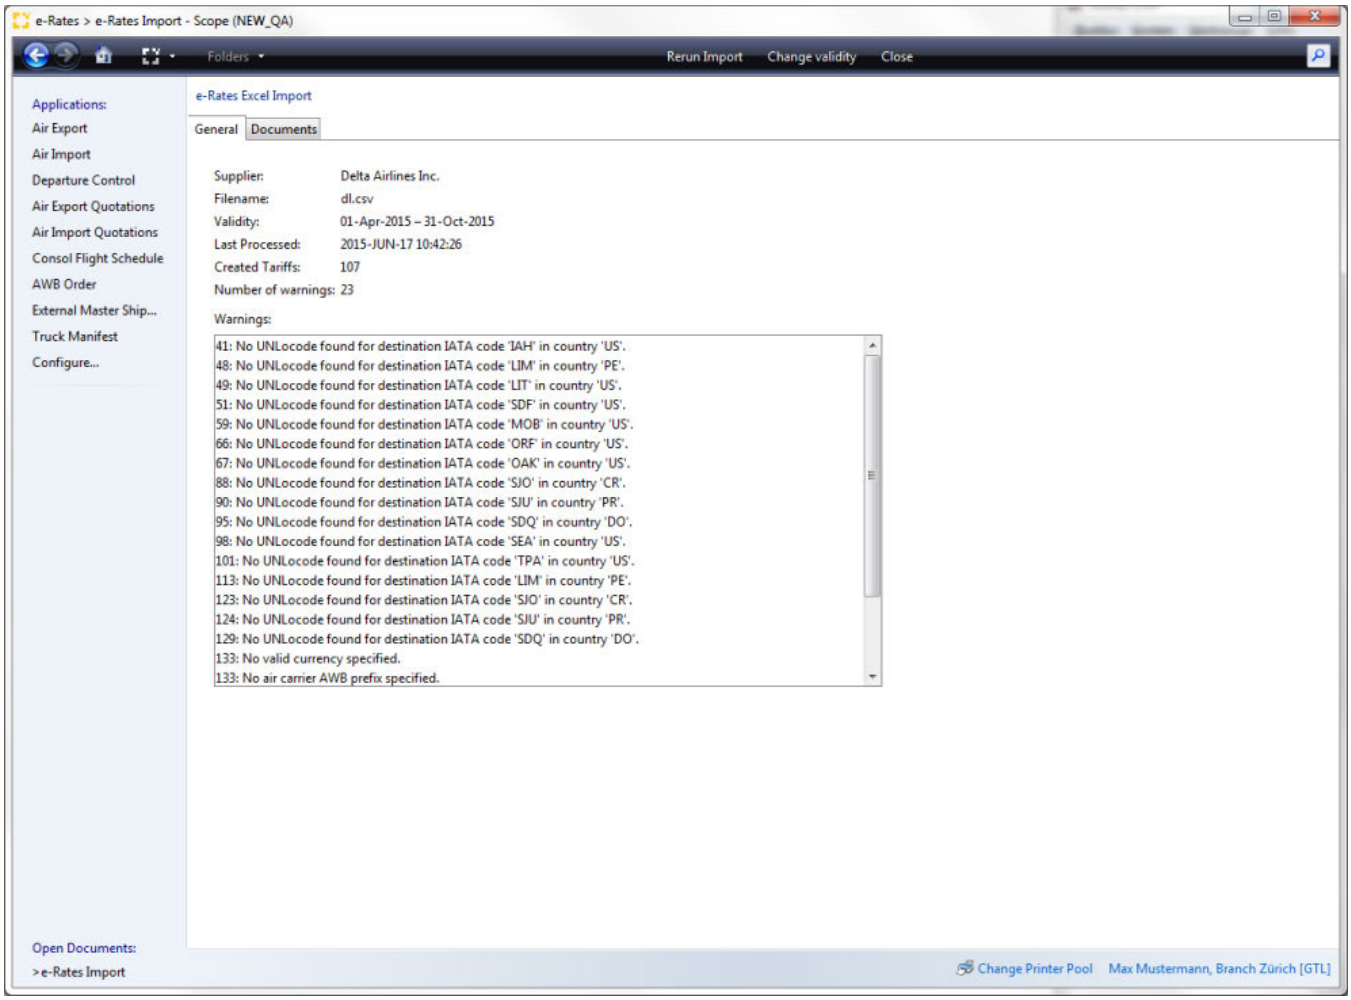
General - e-Rates - Airfreight - Maintenance

- Introduction
- Description

Introduction

When an e-Rates data file has been successfuly imported, the e-Rates Editor opens. The **General** tab displays details about the e-Rates file and the *Warnings* table will show any records that could not be successfully processed. Once action has been taken to correct errors, such as the creation of missing port codes, the e-Rates data file may be reprocessed.

Description



Rerun Import

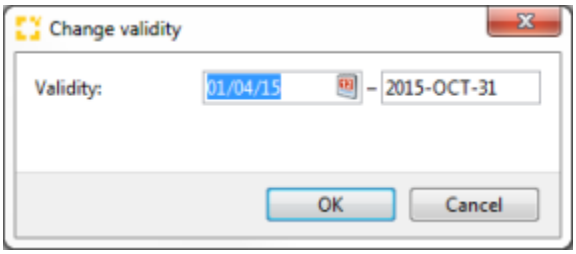
When errors are reported during the import of an e-Rates data file, once the errors are resolved, such as missing UNLOCODES , the data file may be rerun with this option.

> tariffs that have been created correctly will *not* be duplicated.

Change validity

Opens a pop-up window where a new validity date range (from/to) can be defined.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



OK

Changes all validity date in the related tariffs as defined.

Cancel

Close the pop-up window without further action.

Close

Closes the e_rates editor.

Supplier

The airline to whom the e-Rates belong.

File name

The name of the e-Rates data file.

Validity

The period for which the e-Rates are valid.

Last Processed

The most recent date on which the e-Rates file was processed.

Created tariffs:

The Number of rates created using the e_Rates data file.

Number of Warnings

The number of errors or warnings that have occurred during the import of the e-Rates file.

Warnings

A listing of the actual errors and warnings that occurred with line number of the line in the e-rates-sheet and and a detailed description of the error.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Flightschedule - Airfreight - Master Data

- Introduction
- Description

Introduction

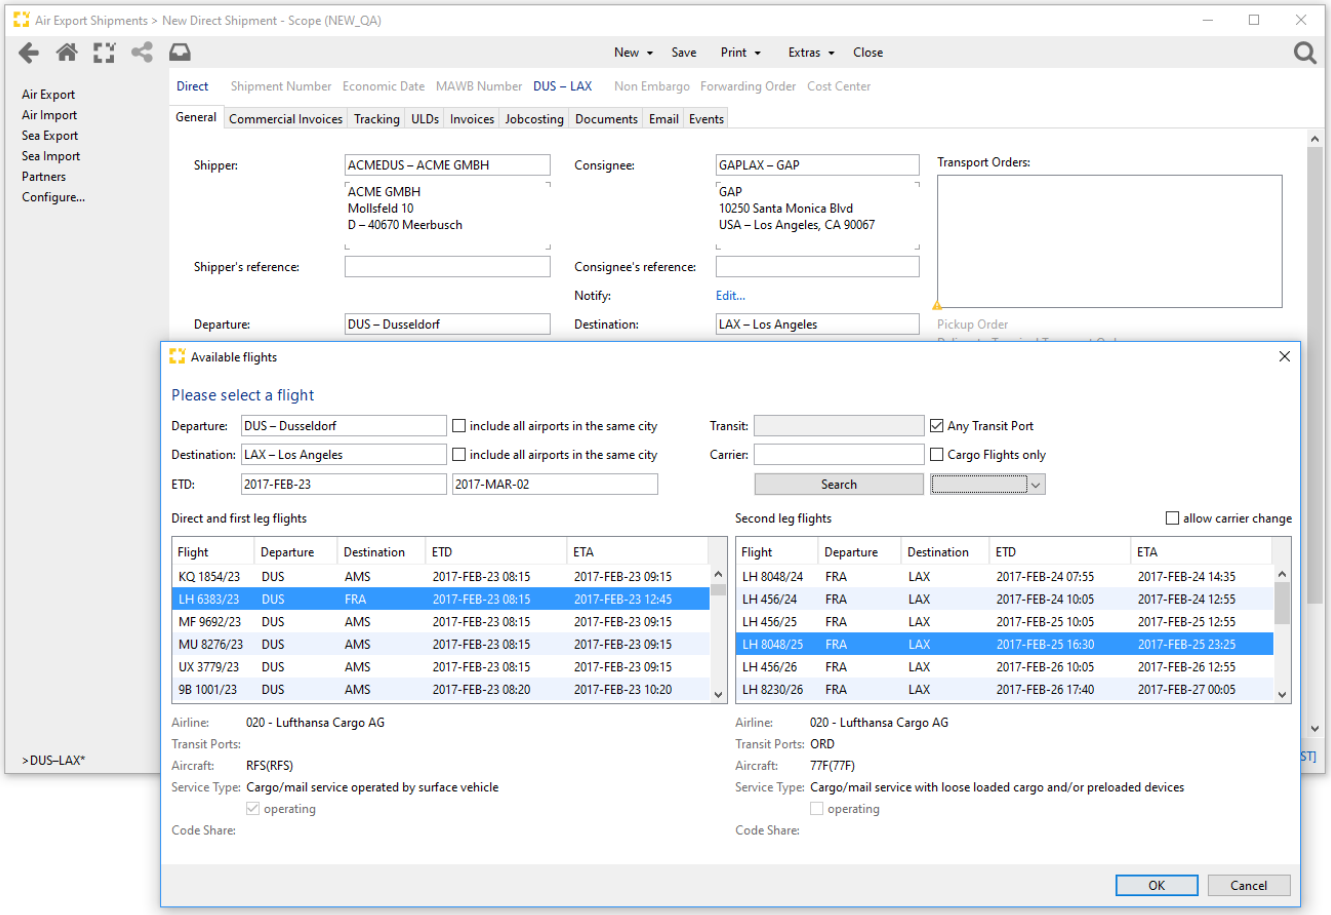
In this module you have an overview of all imported flight schedules from airlines provided by OAG or Innovata.

> **Remark**
>
> The flight schedule module is chargeable. Please contact your Scope Support Team, if you would like to order this feature.

Description

This module can be used as an overview of all available flights in maintenance --> airfreight or directly in the air shipment entry (export and import) via field "flights":

Via shipment entry the corresponding entries (such as departure, destination and carrier) will be automatically pulled in the pop-up screen in order to find the requested flights for this shipment:



Departure

Airport of departure

Destination

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airport of final destination

ETD

Estimated time of departure

Transit

Airport, which is required as a transit stop to reach the final destination.

Carrier

Airline, which is used for the transport with its corresponding AWB

Cargo Flights only

For security status "SCO" only cargo flights are allowed to be selected for this transport, no PAX flight (= transport with passengers and cargo)

Aircraft

type of air plane

Service Type

Service type, which is provided by this carrier

Code Share

Flight number of other carriers, which are also providing this flight

OK

To save the selected data into the shipment and to exit the pop-up screen

Cancel

To exit the pop-up screen without saving

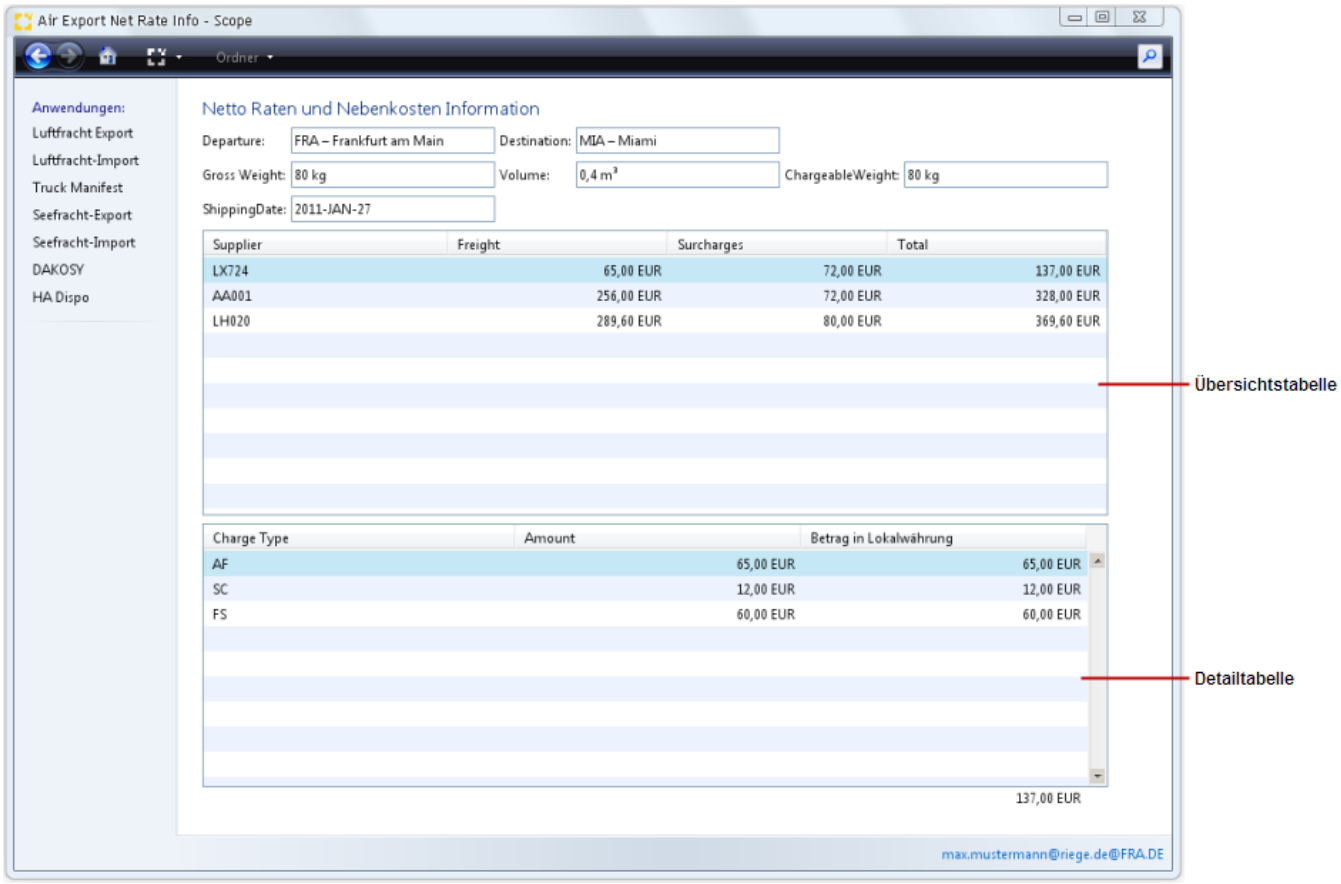
Net Rate Info - Airfreight - Maintenance

- Introduction
- Description

Introduction

This application enables quick and easy search for air cargo net rates (buying rates). The application will use the chargeable weight, flight dates and departure and destination details from the master shipment to create a listing of all airlines and their services for the desired route. This listing will also display the net rate freight costs. This allows a comparison of costs between different airlines.

Description



Tariff selection

The following rates and types of costs are used in this application

Rates	Tariffs	Buying Rates
Cost types	Activity types	Context: *Direct/Standard* order: *Main Air Carriage* Activity type (example): *Standard for Export* Table: *Cast*

Departure

Departure airport of the shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Destination

Destination airport of the shipment.

Gross Weight

Shipment gross weight

Volume

The volume of the consignment in cubic meters.

Chargeable Weight

Volume Weight of the shipment. This is usually calculated automatically based on the volume and gross weight of the shipment, but it may also be entered manually.

Date

The estimated depart date of the shipment. This is required to determine the tariffs valid for the period of the shipment.

> The rate data in the summary and detail tables are updated automatically after entering or changing the search criteria.

Summary table

This table will display all rates, airlines, the product name, total surcharges and total net rate amount for the cargo.

Details table

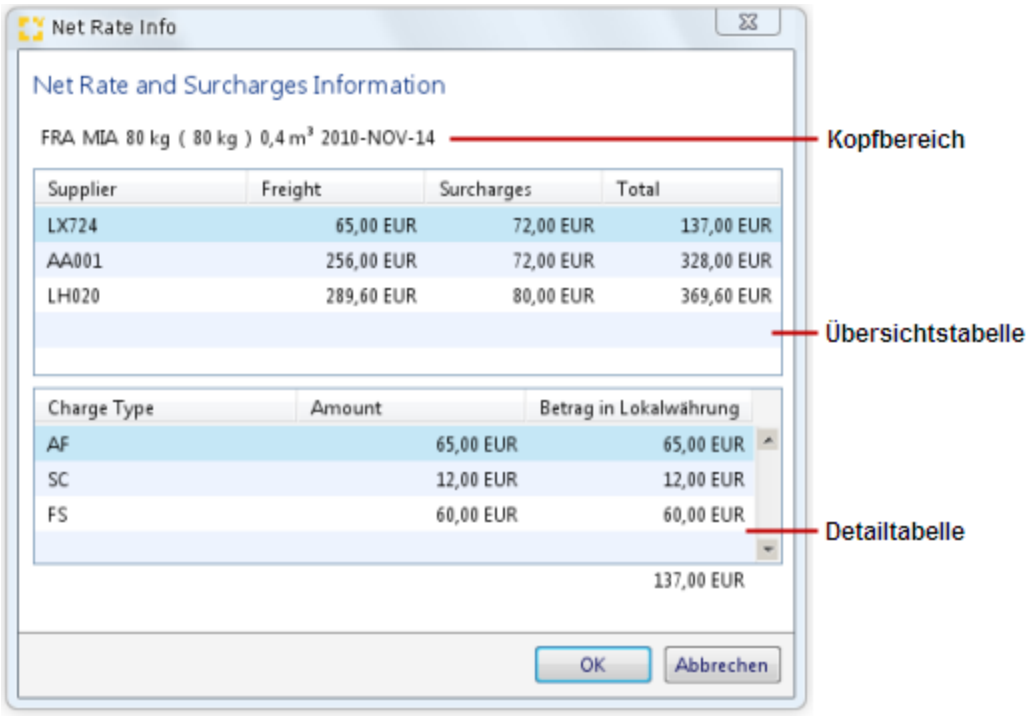
As each net rate is highlighted in the summary table, the details table shows a full breakdown of how the net rate is calculated, by showing all the charges included in each net rate tariff.

Net rate information within a shipment

The field master AWB or the AWB field of an IATA direct , back-to-back, and Master shipment provides a context menu with the option to call up net rate information using the *F2* function key or by clicking the option.

Header details

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The header details of the pop-up window will display the departure, destination, weight, volume and date of the shipment.

Summary table

This table will display all rates, airlines, the product name, total surcharges and total net rate amount for the cargo.

Details table

As each net rate is highlighted in the summary table, the details table shows a full breakdown of how the net rate is calculated, by showing all the charges included in each net rate tariff.

OK

By highlighting one of the net rates displayed in the summary table and selecting *OK*, the net rate will be applied to the shipment.

Cancel

Cancels the net-rate lookup without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

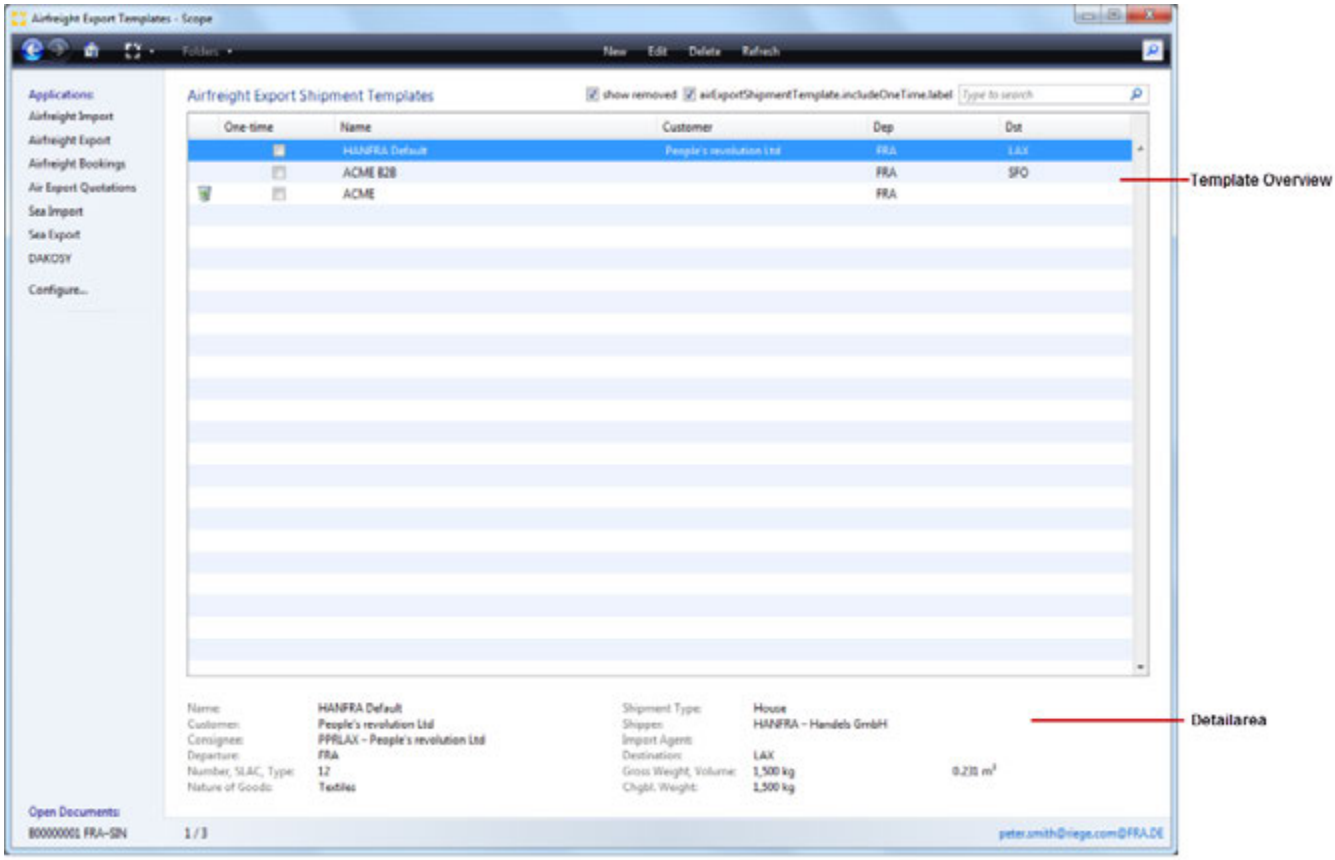
Shipment templates - Airfreight Export

- Introduction
- Description

Introduction

The air export shipment templates application enables templates to be created which can then be used as the basis for House Direct- and Back-to-Back shipments. These template are available in the airfreight Export overview where they can be selected to create new shipments. *Permanent templates* can be created or *temporary templates* can be created for use only in particulate shipments. There is no template option for master shipments since there is no business case for this requirement.

Description



Template Overview

An overview of all existing templates showing the name of the template, the customer and departure destination airports.

Detail Section

The details pane shows the most important information about the template highlighted in the template overview.

New

Opens the {tempate editor |#editor] to create a new editor.

Open

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens the template highlighted in the overview for editing.

Delete

Deletes the template highlighted in the overview.

Update

Updates the list of templates.

Close

Closes the application and returns to the {airfreight export index|Airfreight Export].

Show removed

Displays deleted or inactive templates. These appear with the trash icon in the left hand column. These deleted or inactive templates can be restored by double clicking them to open them again.

Include one time templates.

Templates created for single use will be included in the list of templates.

Search field

entering a search term in the search field will filter the list of matching templates accordingly.

Template Types

Permanent Templates

Permanent templates are stored indefinitely and intended to be used repeatedly. Shipments can be made from these templates both from within the template editor and by choosing the corresponding template function in the the air export shipment overview

One time templates

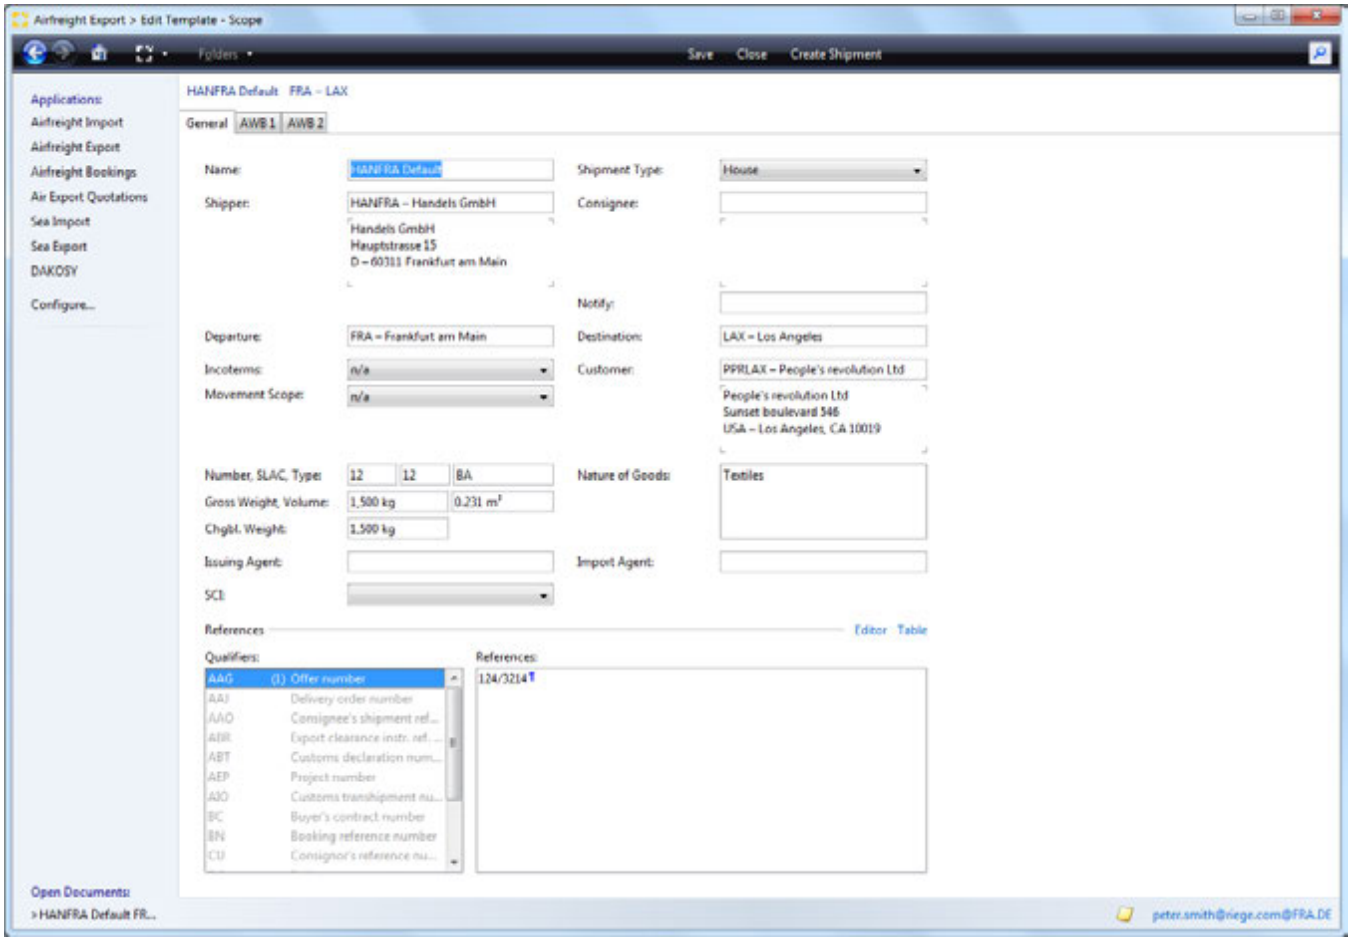
One time templates are intended to be used once for a single shipment. They are created within an existing shipment and are normally used immediately and for this reason they do not appear in the overview of templates. This kind of template can also be viewed as a shipment copy function, to copy the data from an existing shipment into another shipment as a one-off exercise.

If an unused one time template is opened with the template editor, it is converted into a permanent template when stored. The user is informed of this action.

Templates

Template Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Save

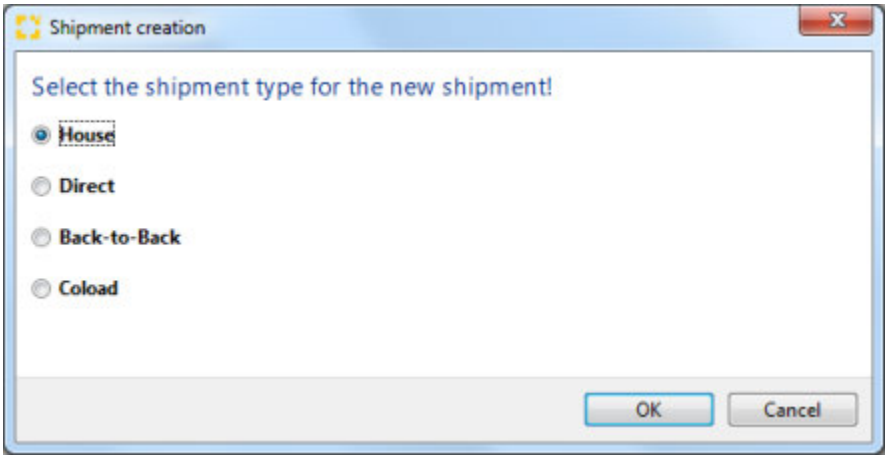
Saves the current template.

Close

Closes the current template.

Create Shipment

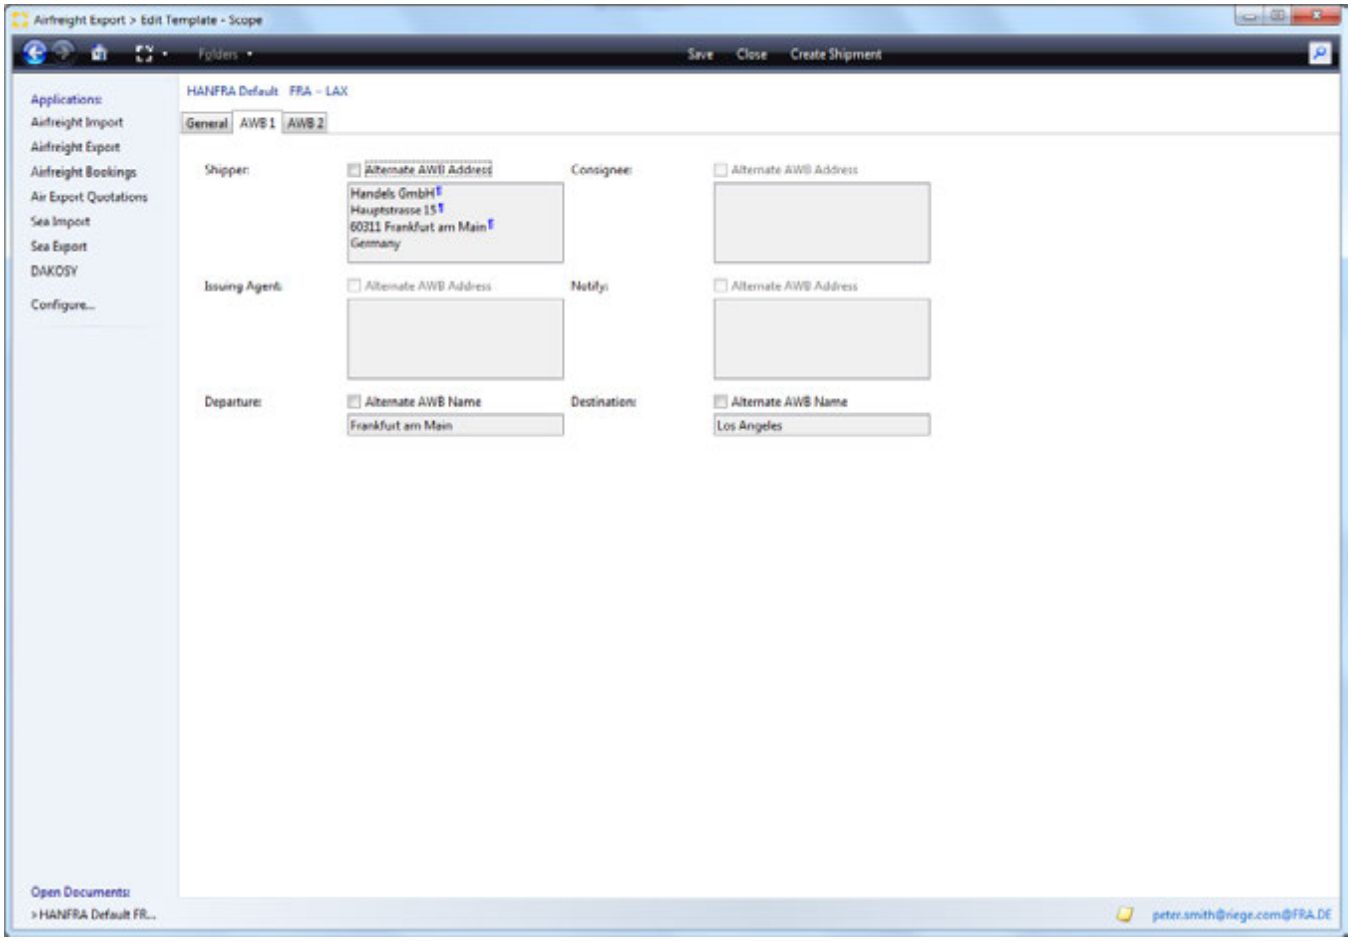
This action allows the open template to be used as the basis for a new shipment. On selecting this option a pop-up window appears where the correct shipment type must be selected. This can be a house , direct, or back to back house shipment .



General

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

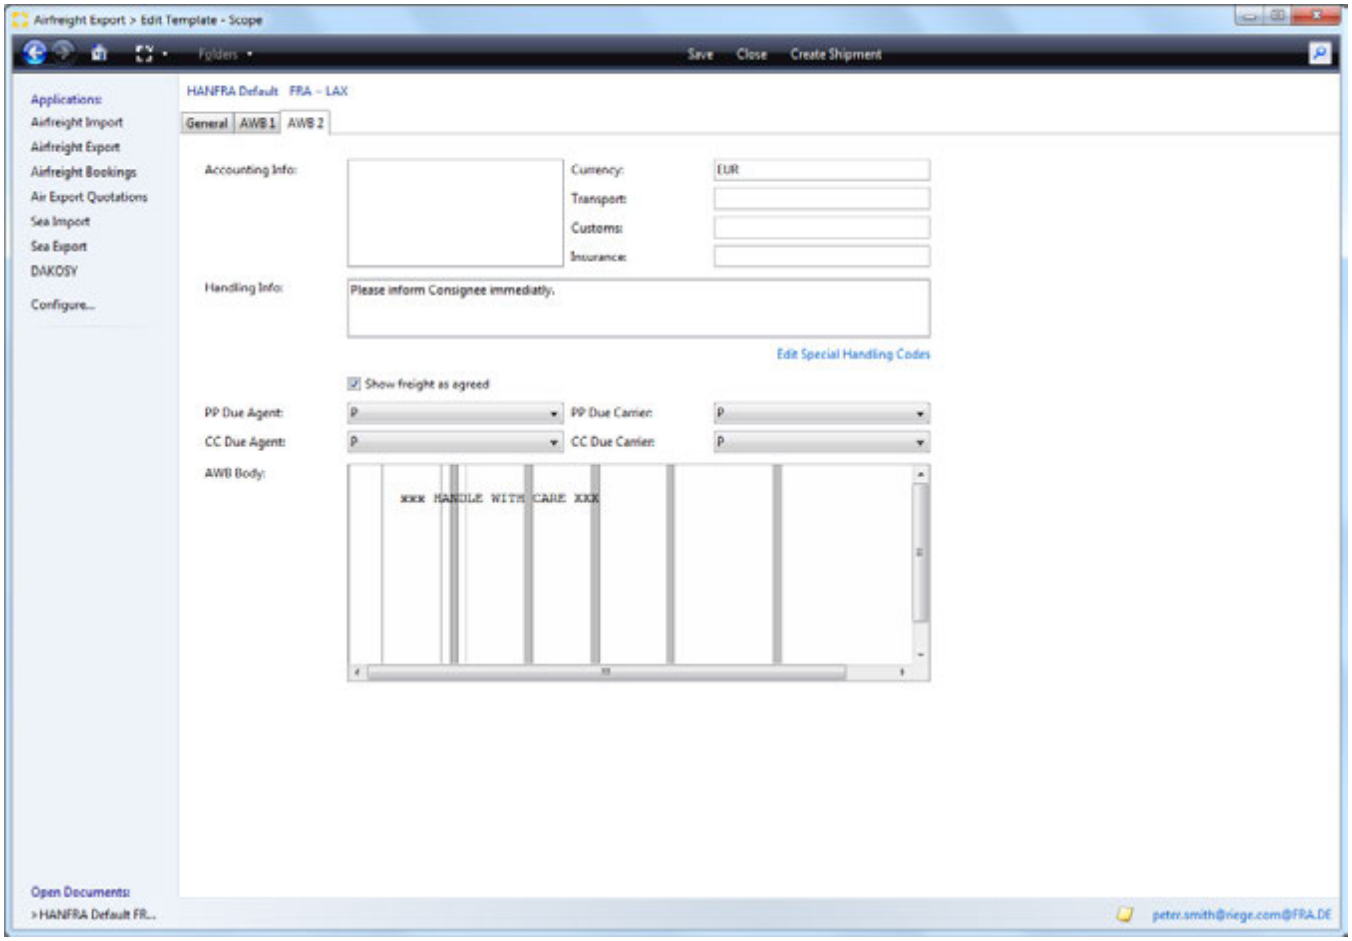
Here house information similar to that in a house shipment is collected. The flight details and shipment numbers are not included as these will change with every shipment.



AWB 1

This tab will collect data similar to the kind of data entered in the AWB editor. This can be edited and deleted as desired.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



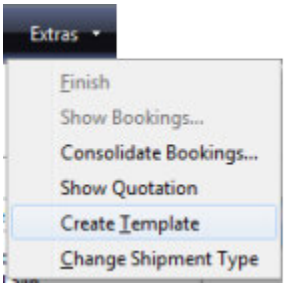
AWB 2

The AWB 2 tab collects all data typically found in the middle portion of an AWB for a house shipment

⚠ Normally templates are created using existing shipments.

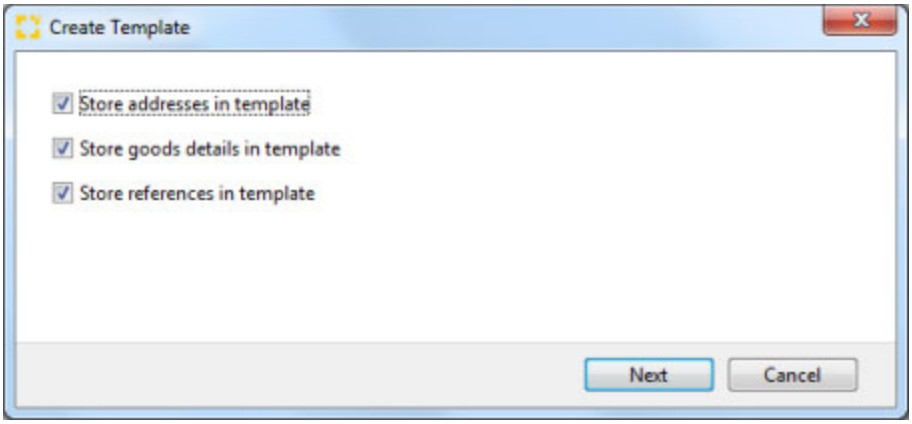
Creating a template within an existing shipment

In the shipment editors for House ,Direct and Back-to-Back shipments an action exists to *create template*. This will quickly create a template using the details from the open shipment.



On clicking this action, a dialogue appears where the type of data to include in the template can be selected.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The check box are used to indicate if address details, packages and references from the open shipment should be included in the new template.

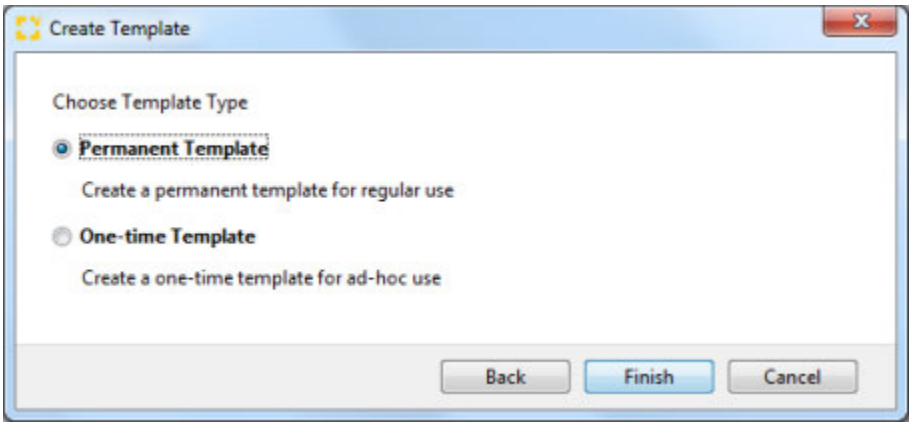
Next

Select the *Next* button when the type of data to included has been included.

Cancel

Cancel the creation of the template without further action.

If *next* has been selected the diaglogue below appears where the type of template can be selected.



Back

Return to the first step in creating a template.

Finish

Opens a permanent template in the template editor where it may be further edited if necessary. In the case of a One time template, the shipment editor is opened where the new shipment (based on an existing shipment) may be completed.

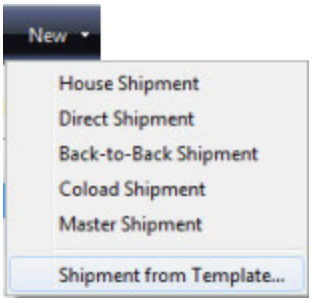
Shipment from template

Shipment creation from the template editor

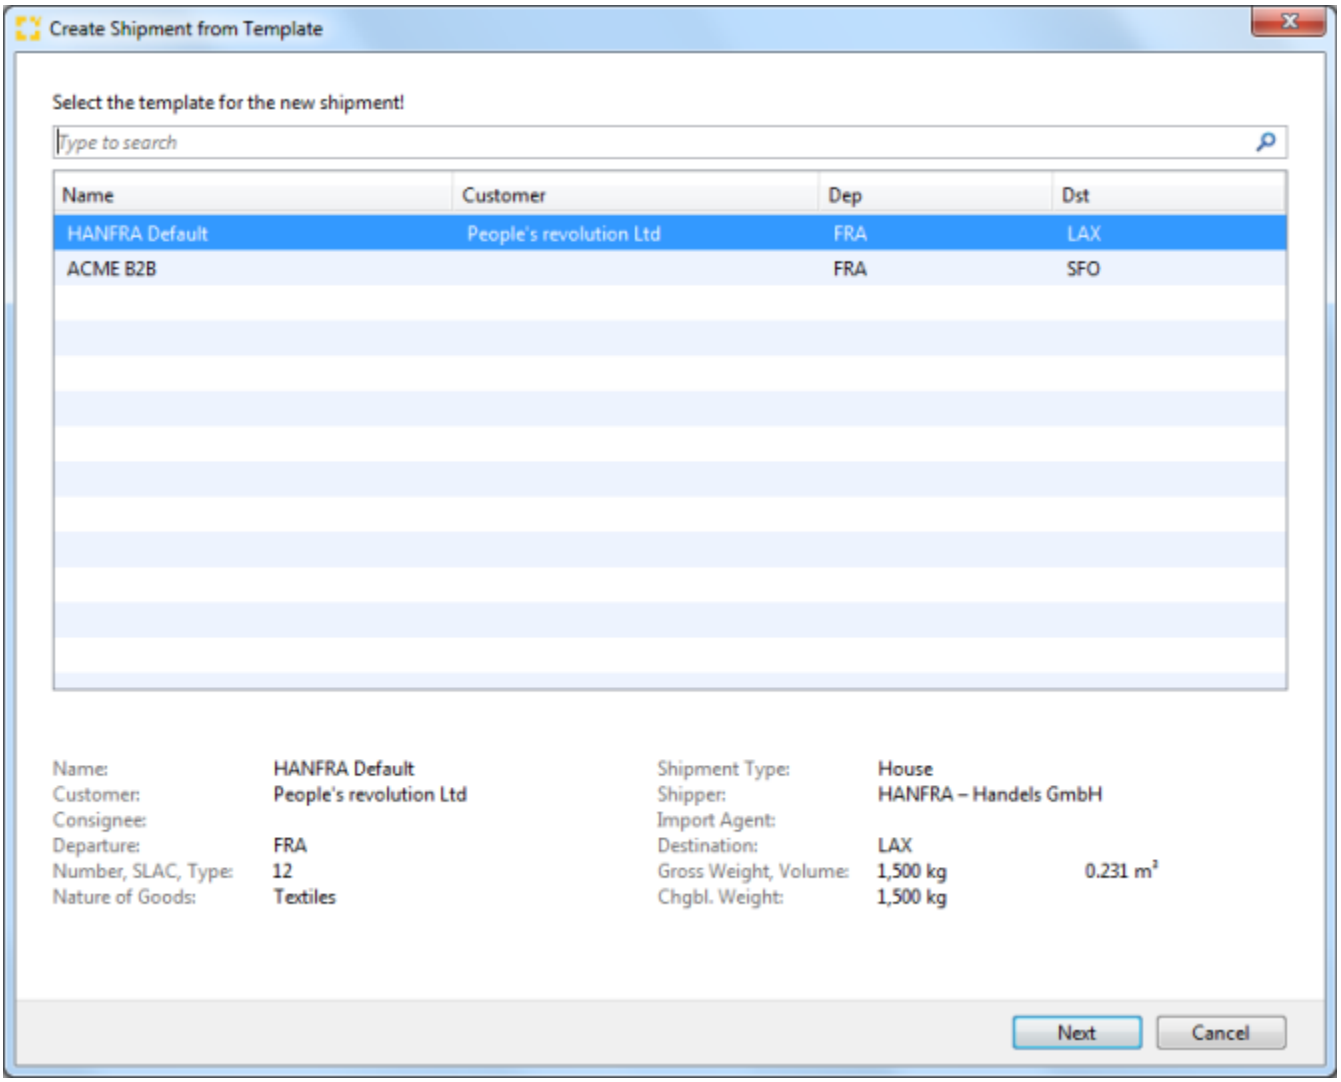
A shipment can be created directly from the template editor and this process is described here.

Shipment creation using a template from the airfreight export overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Using the action *New* and *Shipment from template* in the air export overview, a new shipment can be created using a template.



After selecting the *shipment from tempate* option, a pop-up window appears listing available templates. The lower pane shows further important information about the template highlighted in the list.

Keyword search

Entering a keyword in the search field will filter the list of available templates accordingly.

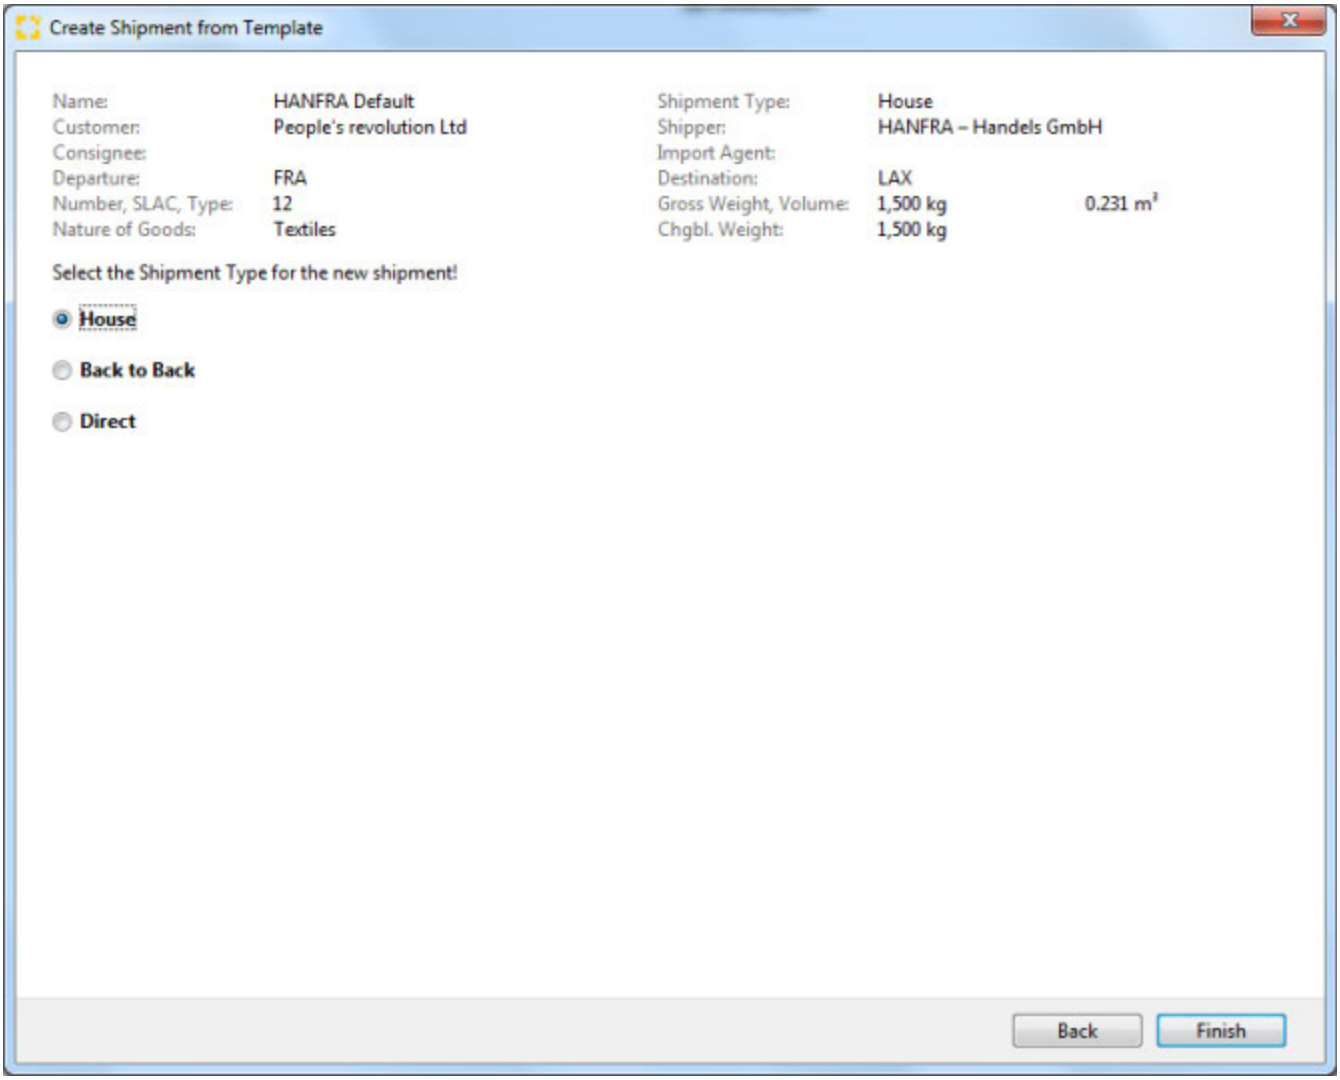
Next

After selecting the desired template from the list, the next button activates the next step in creating a shipment from the template. (See below)

Cancel

Closes the pop-up window without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the *Next* option has been selected, a pop-up window appears where the type of new shipment can be selected. This can be a House Direct or Back-to-Back Shipment. In addition the the upper portion of the window shows greater detail about the new shipment.

Back

Returns to the previous step showing the overview of available templates.

Finish

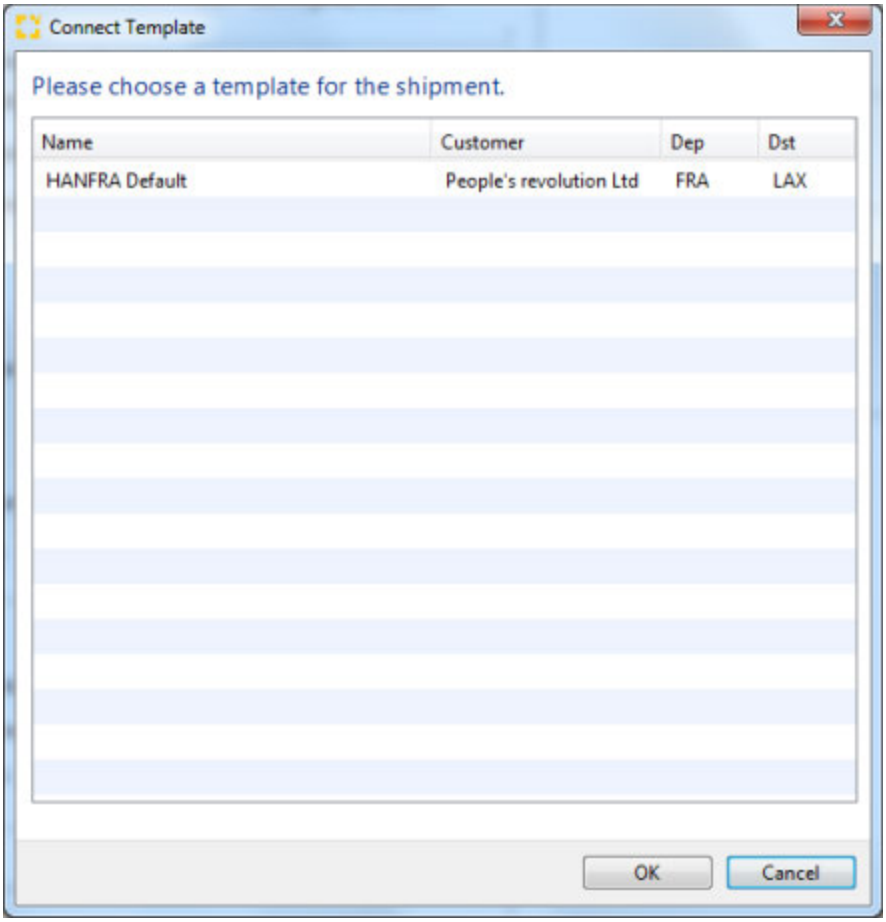
Closes the pop-up window and opens the shipment in the appropriate shipment editor where it can be further processed and completed.

Detecting templates during shipment creation

When a shipment is created a check is done to find if templates already exist for the the client.

If one or more templates for the shipment is found, the notification shown above appears. Clicking the message text will open a pop-up window from which the desired template can be selected. If only a single template exists for the client, then the new shipment is created immediately using the existing template.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



OK

Creates a new shipment using the selected template and closes the pop-up window.

Cancel

Closes the pop-up window without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

TACT-Rates - Airfreight - Maintenance

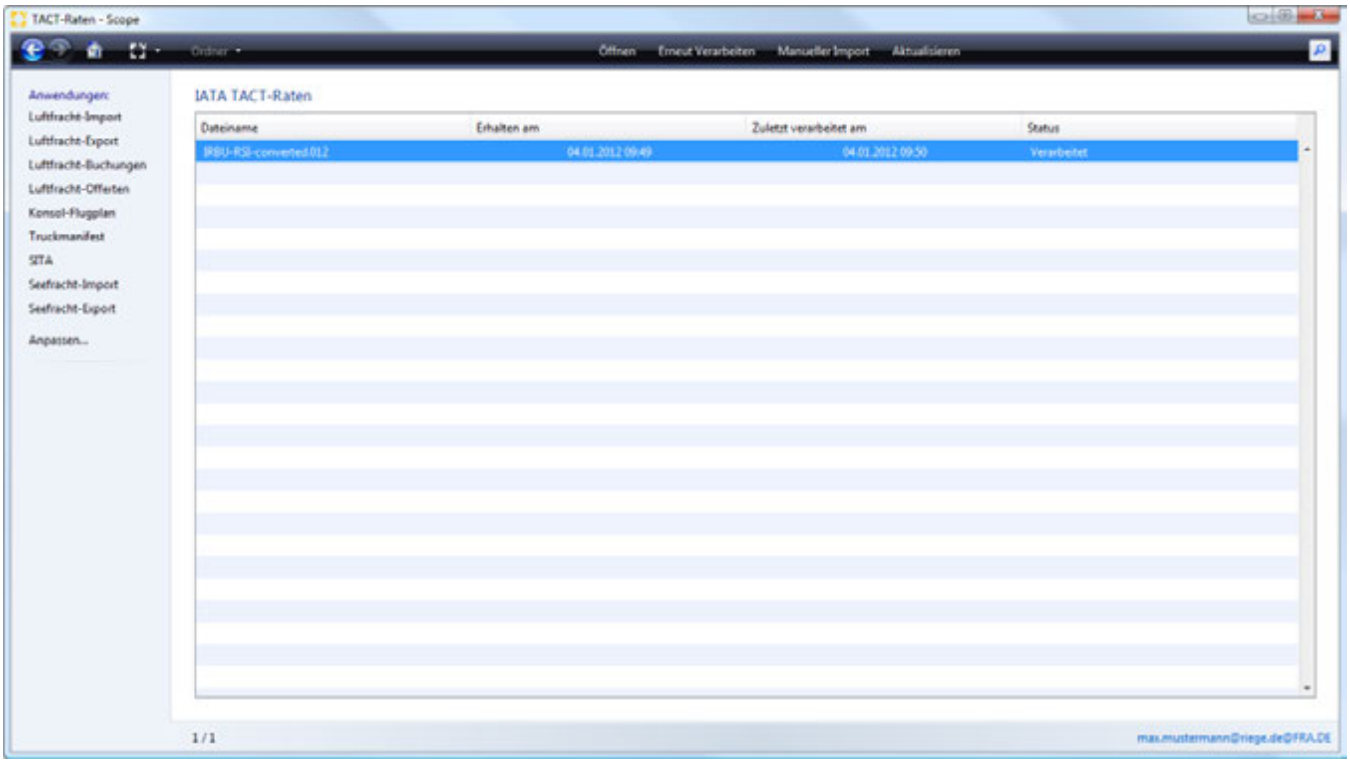
- Introduction
- Description

Introduction

When TACT rates are maintained for the branch, IATA rates become available during AWB creation. If TACT rates are required, this should be reported to the support team in order for these to be imported into the Scope application. These rates are shown in the rates maintenance as the type "IATA" and are used automatically during the preparation of a MAWB. IATA rates can be manually inserted on one-off basis within the rates maintenance application

> ⚠ Due to the large number of records an considerable processing time required, Scope TACT rates are only maintained after consultation with customers and outside of agreed Scope support hours.

Description



The following actions are available:

Open

Opens the TACT rates Editor to edit a currently resident TACT file.

Re-processing

Repeats the processing of a selecting file. This function should only be used after consultation with your scope support team.

Manual import

Import a new data file into the Scope system. This function should only be used after consultation with your scope support team.

Update

Update the summary table and include any newly imported files or changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Editor - TACT Rates - Airfreight - Maintenance

- Introduction
- Description

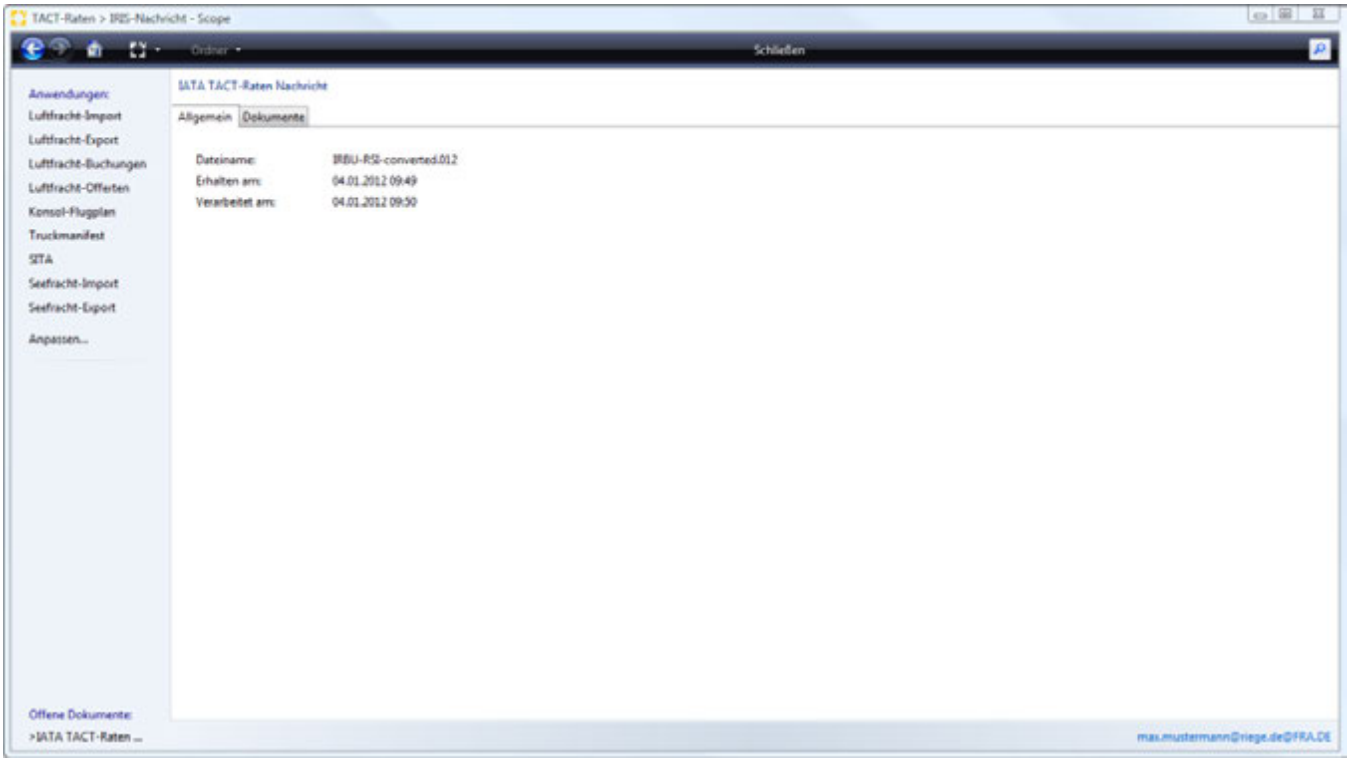
Introduction

The TACT rate editor opens existing TACT rate files.

Description

The TACT rate editor has two tabs:

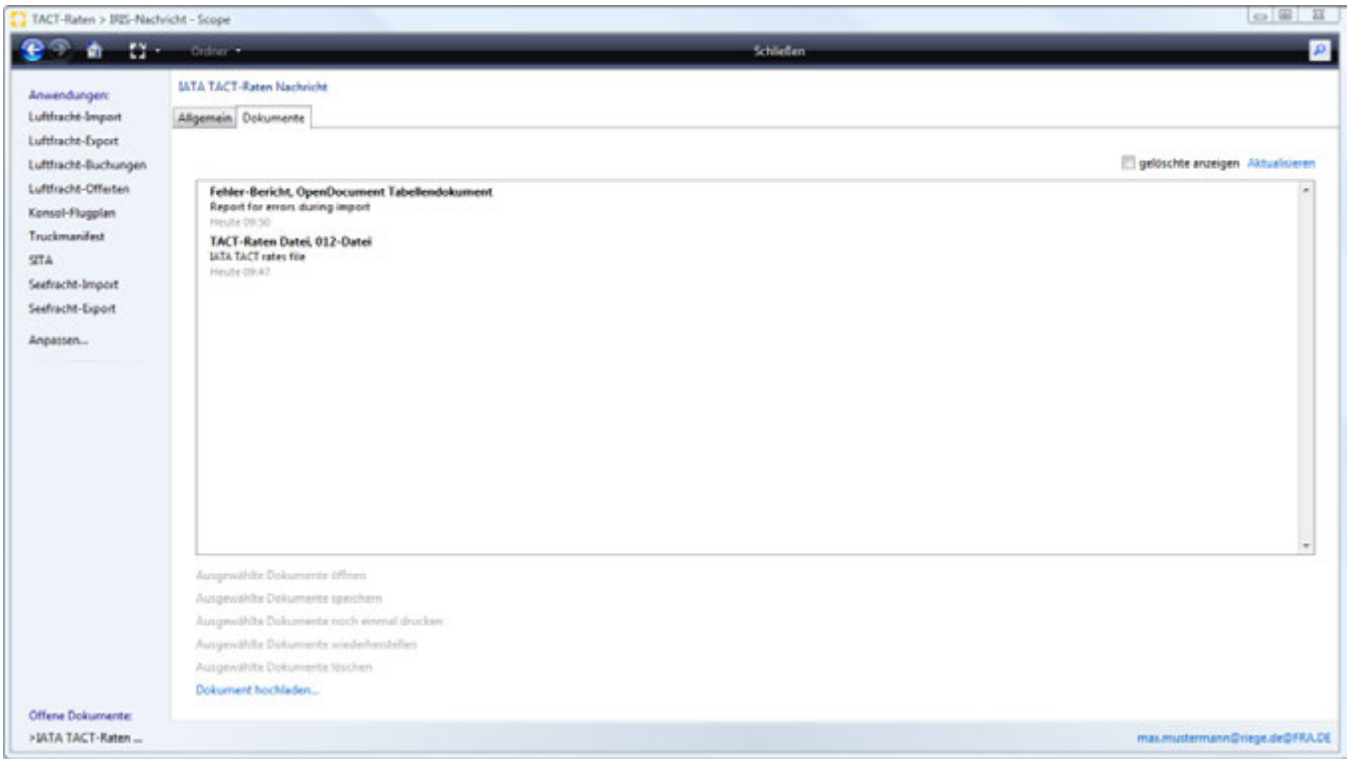
General



The general tab displays details about the selected file; the file name, date of installation and the date and time when processing the file was completed.

Documents

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The documents tab stores two possible documents for the selected file

Report errors

A report listing all data records from the file that could not be read, for example if an airport is unknown.

TACT rates file

The original file that was used to generate the rates.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Article Maintenance - Maintenance

- Introduction
- Description

Introduction

Article management is used to store information about articles. This information is the commodity codes, description and other customs data for the article. Business partners who use these articles may also be stored. This information is then used when creating new export or import declarations.

Description

The maintenance of articles consist of 2 parts, the first part is the global maintenance and the second part consists of the various profiles for different customs system. The options and requirements of Global details and the individual customs profilesare described in the following pages:

- Global Details
- ATLAS (Germany)
- e-dec (Switzerland)
- NL Customs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

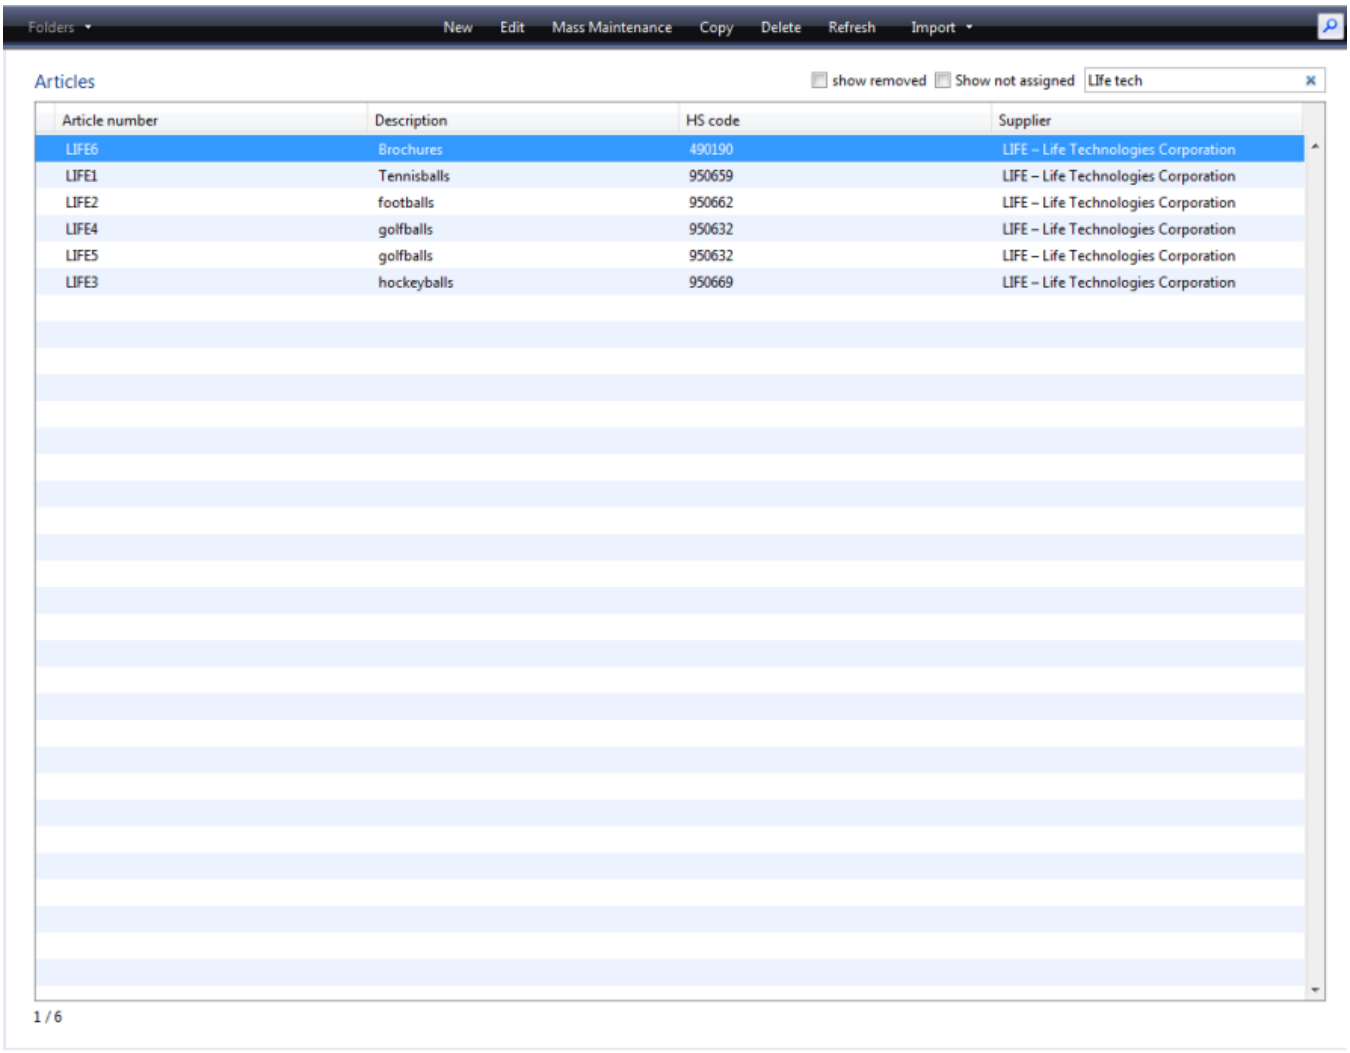
Homeview - Article Maintenance - Maintenance

- Introduction
- Description

Introduction

Under the base table "article maintenance" the creation and modification of a customized list of goods is maintained.
An article is a customer specific description of a product combining the customer (article code and description) and customs information (Taric-number, Duty rate,etc), Through this function the articles are maintained although the maintenance and creation can also be done dynamically through the customs entries.
Functionality for importing or mass maintenance of articles are also available.

Description



New

Add a new article to the basetable through the option "new"

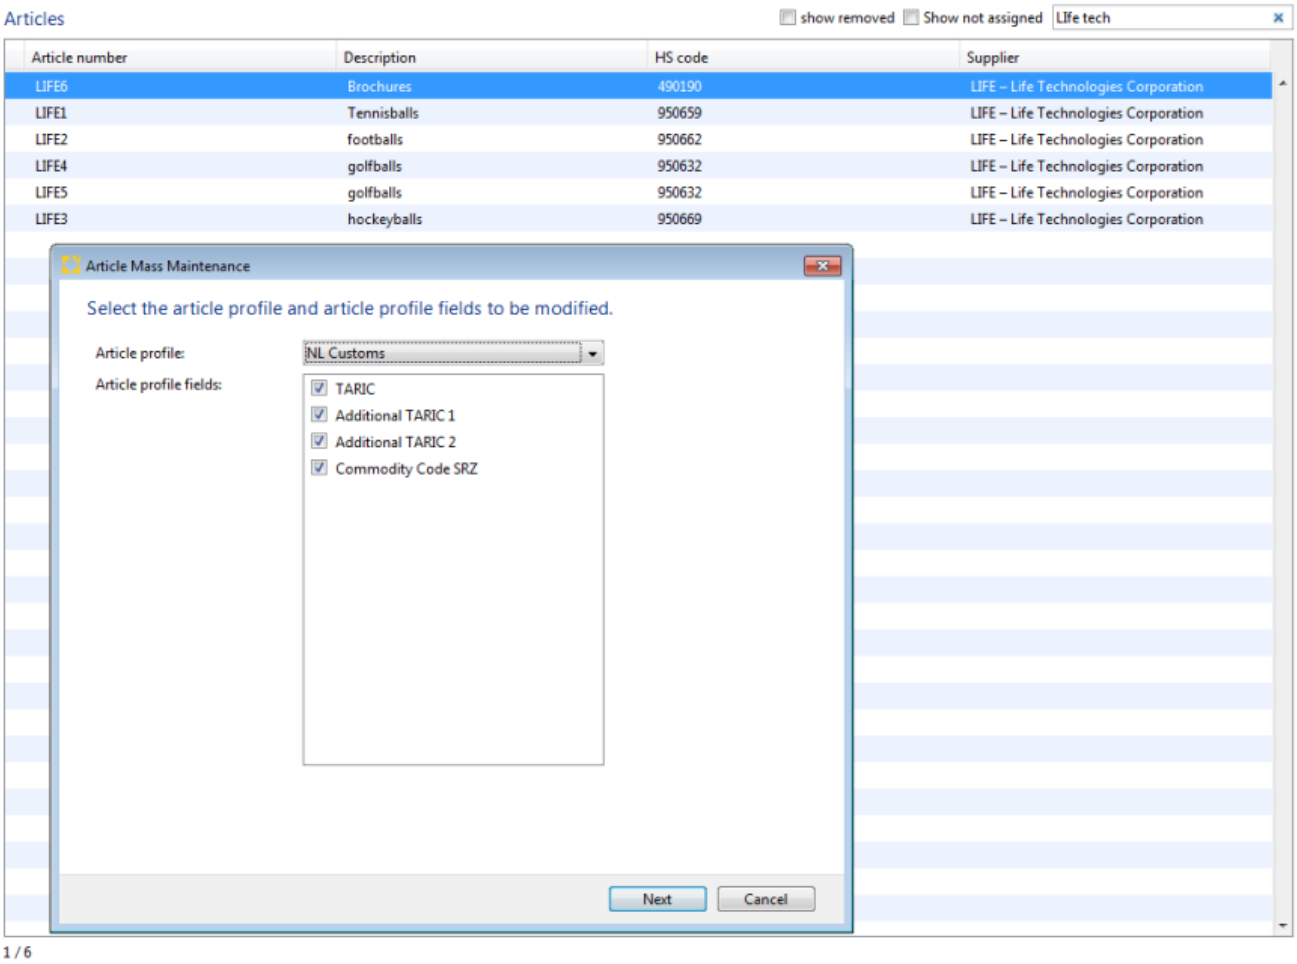
Edit

Use Edit (or double click) to modify the details of an article

Mass Maintenance

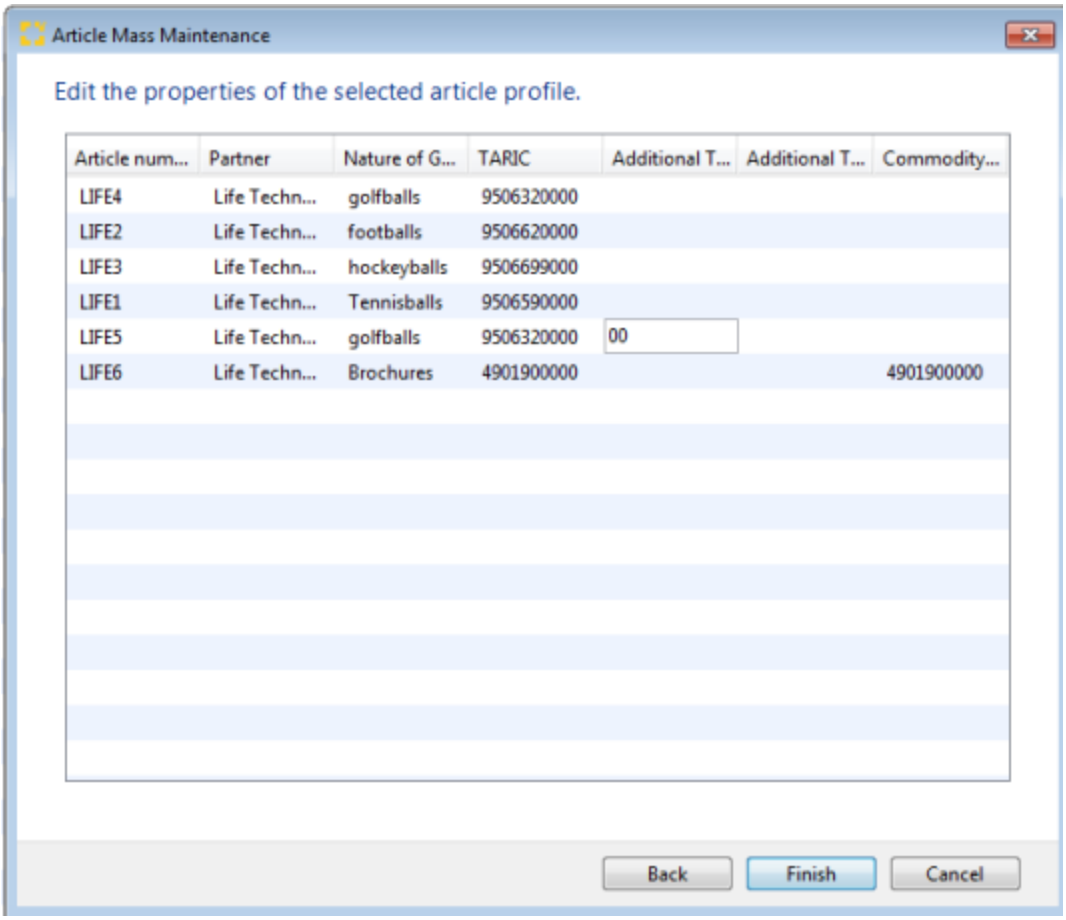
The option Mass Maintenance allows for a quick method to update the selected column(s) for specific profile for selected articles.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Only the checked columns will be available for modification, after the next option the articles are available for in-grid updates

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copy

To create a copy on an existing article, after using the option the newly created article is opened for modification.

Delete

To remove an article from the active article list

Refresh

To refresh the displayed homescreen with the latest details available

Import

Under the import function to options are available, to import an article base file, being :

- Import from CSV

Show removed option

With the option "show removed" activated, previously deleted article records are also displayed and can be restored if required.

Show not assigned.

When the "show not assigned" filter option is selected, only the article codes without a Partner are displayed.

Search

in the search option it is possible to search any article on basis of any detail of the article itself.

Homeview Columns

In the homeview screen the following columns are being displayed.

Column Header	description

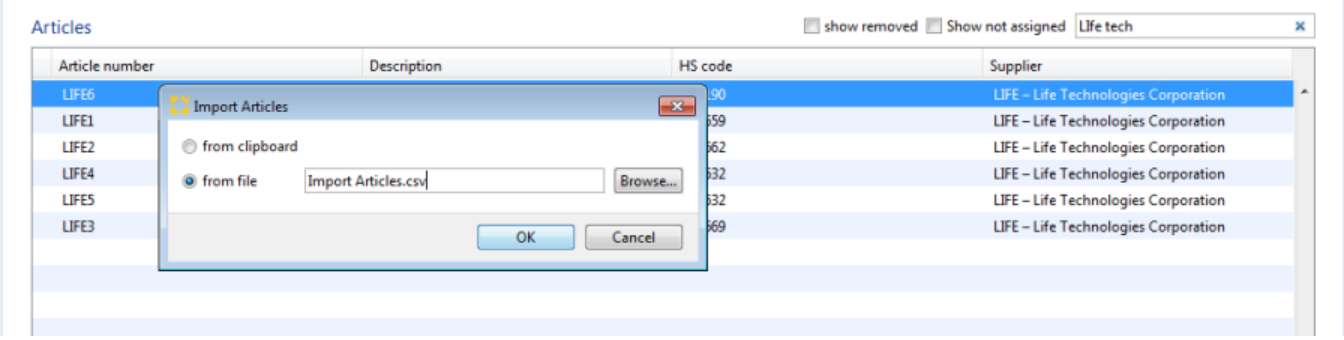
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Article number	the in scope assigned article code / number
Description	Description of the article
Tariff Numnber	Customs HS code (the international HS code)
Supplier	Partner to which the article has been assigned

Import from CSV

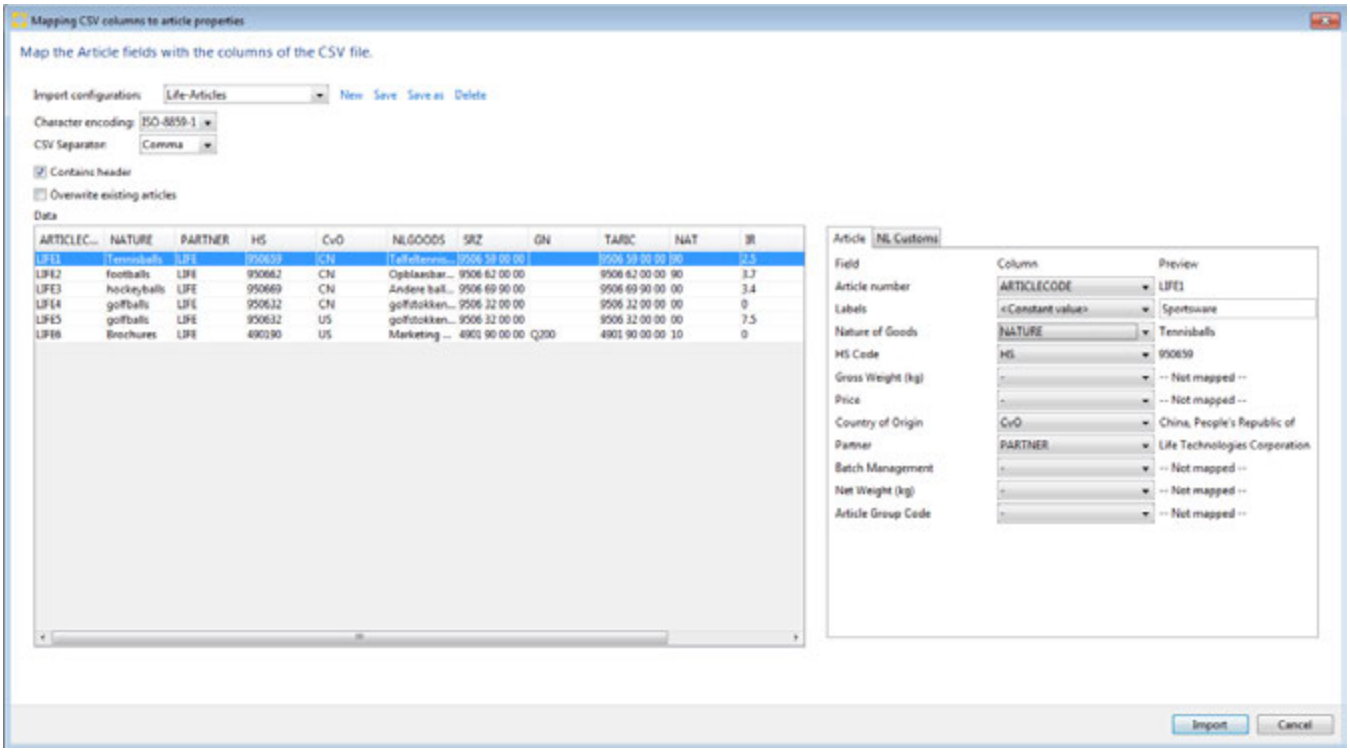
Scope supports the upload of articles through the import of a CSV-file, it is not necessary to confirm to a specific format for the csv-file as the system offers remap functionality linking columns to the available article fields .

Start the function and select the option "Import from CSV" and set the option to "from csv file" and point the field to the applicable CSV file. After ok, the file will be processed and show in the dynamic mapping screen.



Dynamic Mapping

The imported data is shown in columns with either a column header (incase so indicated) or a column letter assigned to each column,



Import Configuration

- New : Stores the created mapping under the entered name for later re-use
- Save: Stores the existing changed mapping under the entered name
- Save As: Stores the existing changed mapping under a new name
- Delete : Removes the existing mapping from the system

Character encoding

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Determines the character set used in the CSV file, choice between ISO-8859-1 or UTF-8.

CSV Separator

The option sets the separator used in the, to be imported, CSV file. The choice being:

- Comma
- Semi-Colon
- Tab

Document Grid

In certain profiles there exist grids with 2 columns, 1 column for the code and 1 column for additional information and/or identification, this can also be upload in the CSV when 2 columns of the grid are between the chosen csv separator
and separated from each other by a colon (:)

Contains Header

Check box to indicate if the first row of the CSV file is an header row or actual data.

Overwrite existing articles

Check box to indicate that in case an existing article code-supplier combination is found, the details are to be overwritten or the imported details should be skipped.

Mapping

In the left half of the screen a preview of the read clipboard or csv file is seen and on the right half the actual mapping between the system field and column can be created.

Field

This column shows the scope field available to be mapped.

Column

In this drop down box the scope field can be linked to a column of the CSV file, the column is recognizable be the column letter of column header, if so indicated. If the csv does not offer the column it can be skipped "-" or populated with an <constant value>. Selecting the last option will open the field in the preview column and allow or a value to be entered.

Preview

In the preview column the mapped value of the first data row will be displayed, if a mapped or constant value is linked to a coded field in scope, such as partner, country of origin, a validation will take place and a indication "invalid value" will be displayed.

The mapping exists of all tabs available to your organisation being NL customs, Atlas-AES, -NCTS and -AFV (DE customs) and EZV (Swiss Customs)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

General Details - Article Maintenance - Maintenance

- Introduction
- Description

Introduction

In the general Part of the article, the details of an article which are available globally, throughout 1 organisation, are registered.

Description

NL Customs Profile

- Introduction
- Description

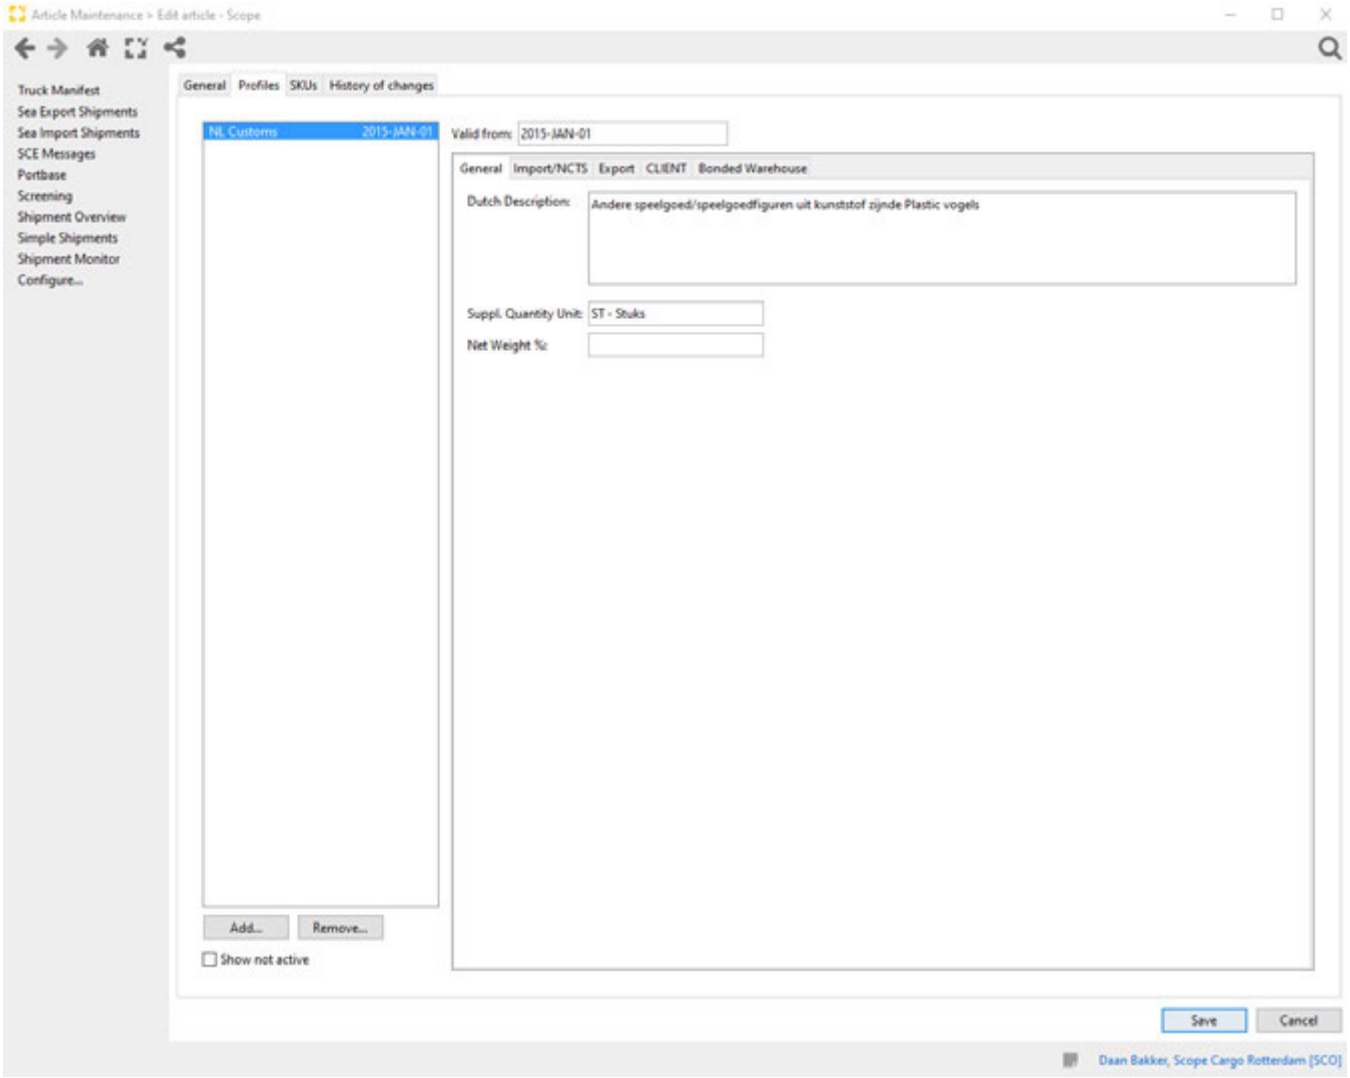
Introduction

In the NL customs profile the specific details applicable for this article in NL Customs entries is registered.

Description

General
Import / NCTS
Export
CLIENT
Bonded Warehouse

After adding the NL Customs profile the specifics for NL Customs can be added which has a validity start date the defaulting can be entered, The valid profile at the time of making the declaration will be used, a next profile date will be considered the end date of the previous profile.



General

Profile details that are valid for all NL customs modules.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Dutch Description

The goods description as used in NL Customs Entries.

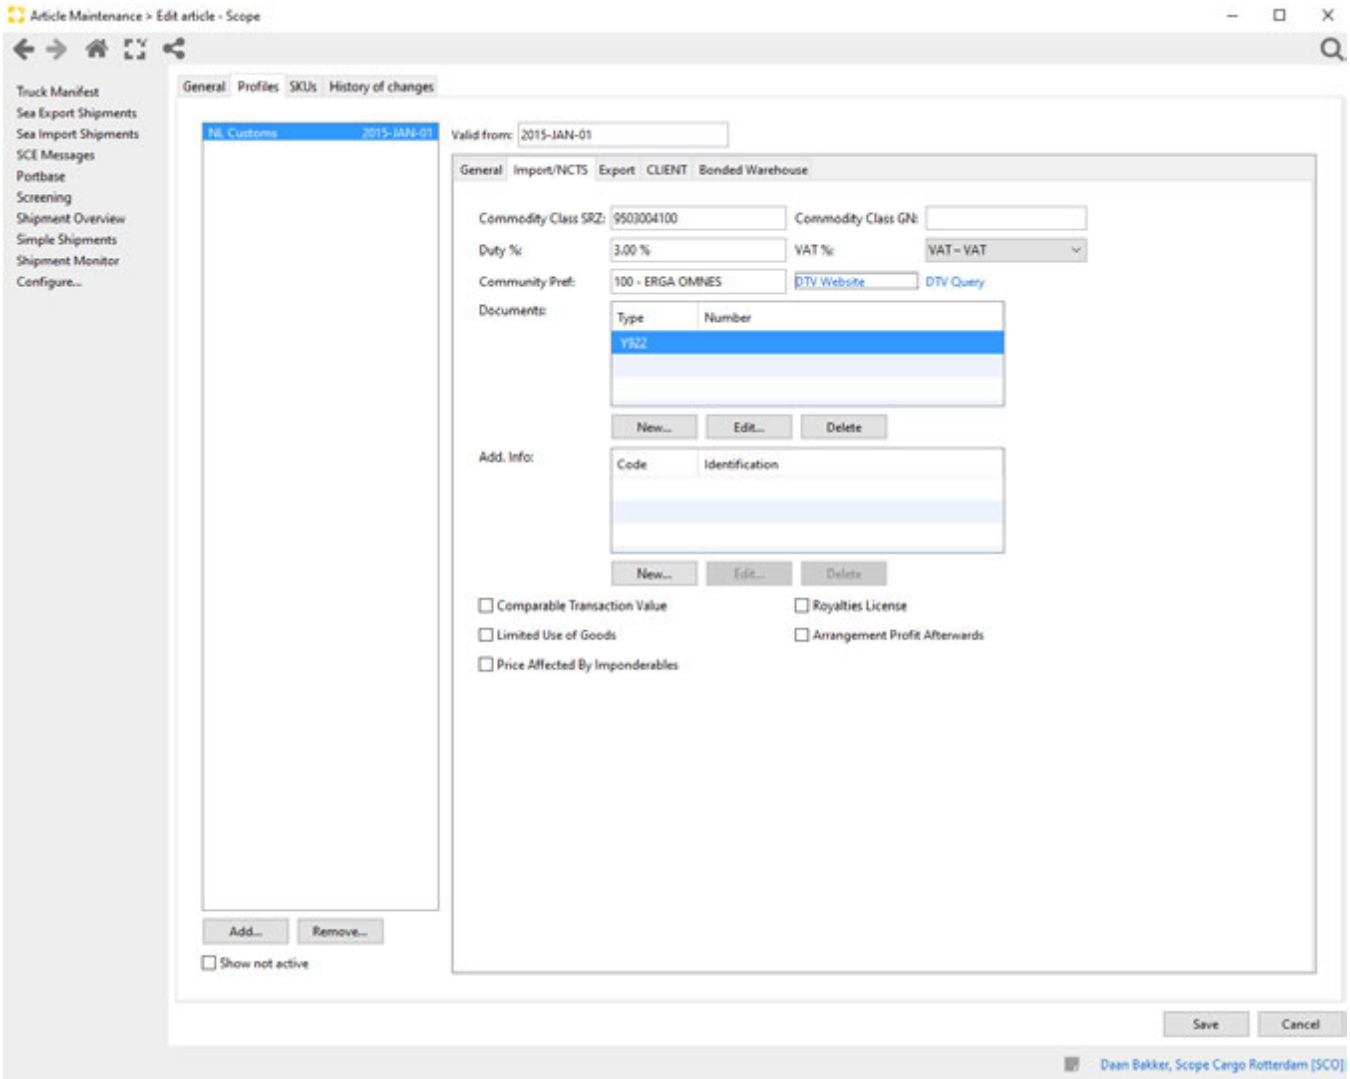
Supplemental quantity unit

Indication, if and what type of supplemental quantity is required for this HS code, if populated then the field supplemental quantity will be validated in AGS declarations

Net weight %

Optional the net weight calculation can be stored in the article, so it can calculate the net weight on the entered gross weight of a customs entry.

Import / NCTS



Commodity Class SRZ

The HS code as applicable in AGS declarations, minimal 10 positions extended with the EU applicable additional codes (as per NL Customs Tariff information)

Commodity Class GN

The NL applicable additional code (as per NL Customs Tariff information), exactly 4 positions long letters in CAPS, commonly used for National regulations such as VAT.

Duty %

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Duty percentage applicable for the selected HS code, will be used to calculate reference amount on Specific NCTS declarations.

VAT %

Indication which default VAT regime is applicable for this HS code, will be used to calculate reference amount on Specific NCTS declarations.

Community Pref:

Optional defaulting of Community preference code

DTV Website

Action link which opens the website for NL Customs Tariff information

DTV Query

Action link to activate the webservice interface with NL Customs Tariff information website to retrieve the base import duty percentage (100 ERGA OMNES) and applicable VAT percentage.

Documents grid

In the document Grid it is possible to register documents (bescheiden) which always need to be used for this article in a AGS declaration, when this article is then used in a AGS declaration the Document code and number (if entered) will be defaulted to the documents grid in the AGS declaration.

Additional info Grid

In the additional info code Grid it is possible to register additional info code which always need to be used for this article in a AGS declaration, when this article is then used in a AGS declaration the Document code and number (if entered) will be defaulted to the additional info code grid in the AGS declaration.

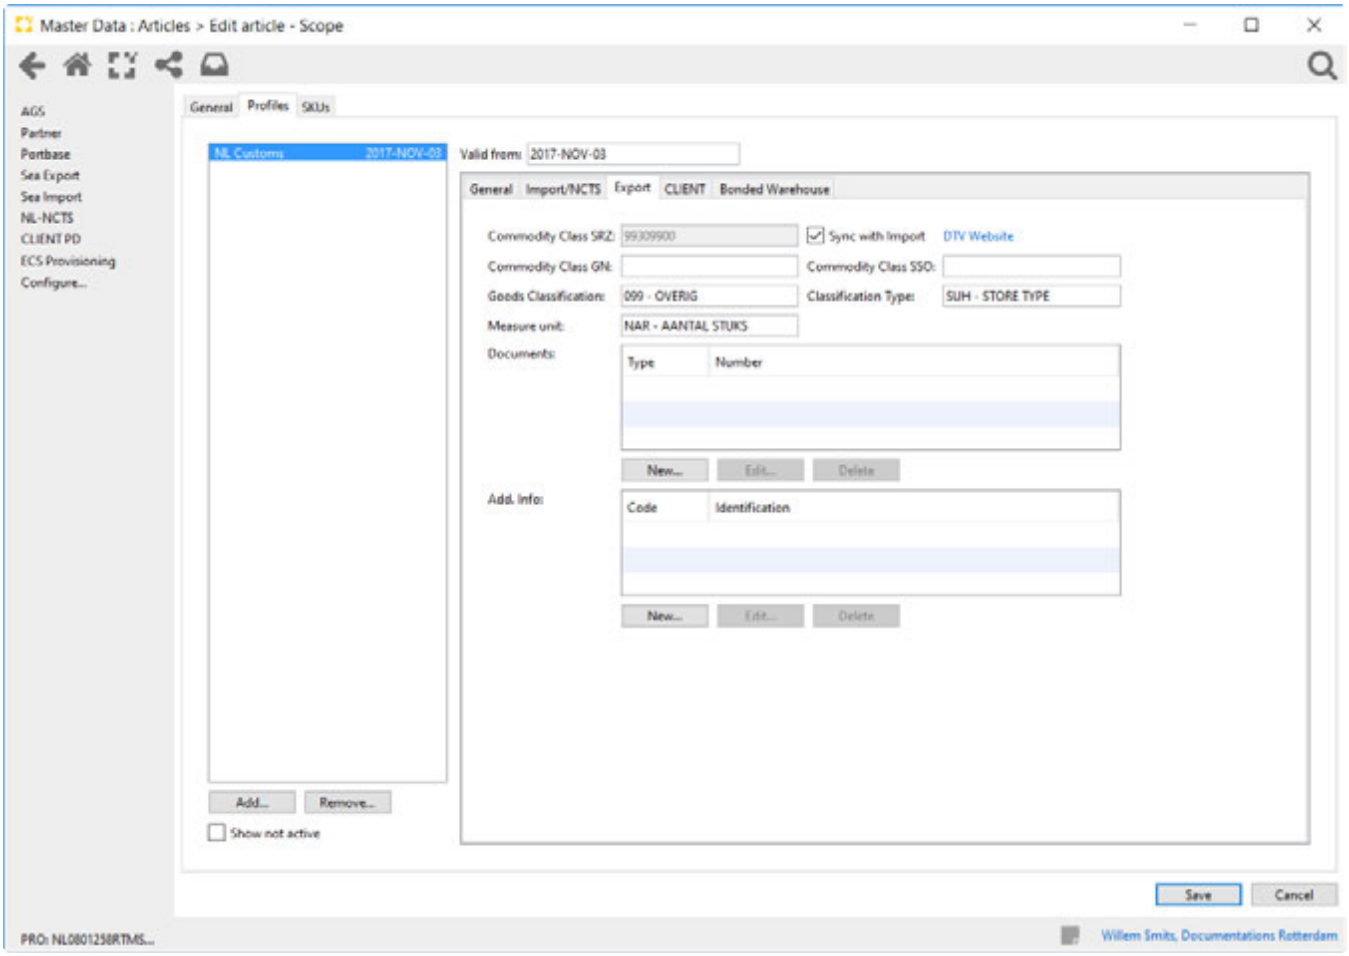
DV1 Field

The check boxes of the DV1 for an AGS import declaration can be predefined on a article.

Export

The details applicable for the article in Export declarations.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



AGS Exports

Commodity Class SRZ

The HS code as applicable in AGS declarations, minimal 8 positions extended with the EU applicable additional codes (as per NL Customs Tariff information)
If a additional code is applicable it should be entered on position 11 and further, so 2 additional zero's should be added.

So an SRZ with out additional codes is : 95030041
So an SRZ with additional codes is : 95030041004099

Sync with import

When this check box is activated the AGS export SRZ code will be the first 8 positions of the Import SRZ code,
This check box should be de-activated when export specific additional code are applicable.

Commodity Class GN

The NL applicable additional code (as per NL Customs Tariff information), exactly 4 positions long letters in CAPS,

Commodity Class SSO

This class field is used to store the DG - UN code. (4 digits)

Goods Classification (provisioning)

The Goods classification code applicable for provisioning.

Classification Type (provisioning)

The type of classification applicable in provisioning

ATLAS - Stammdaten

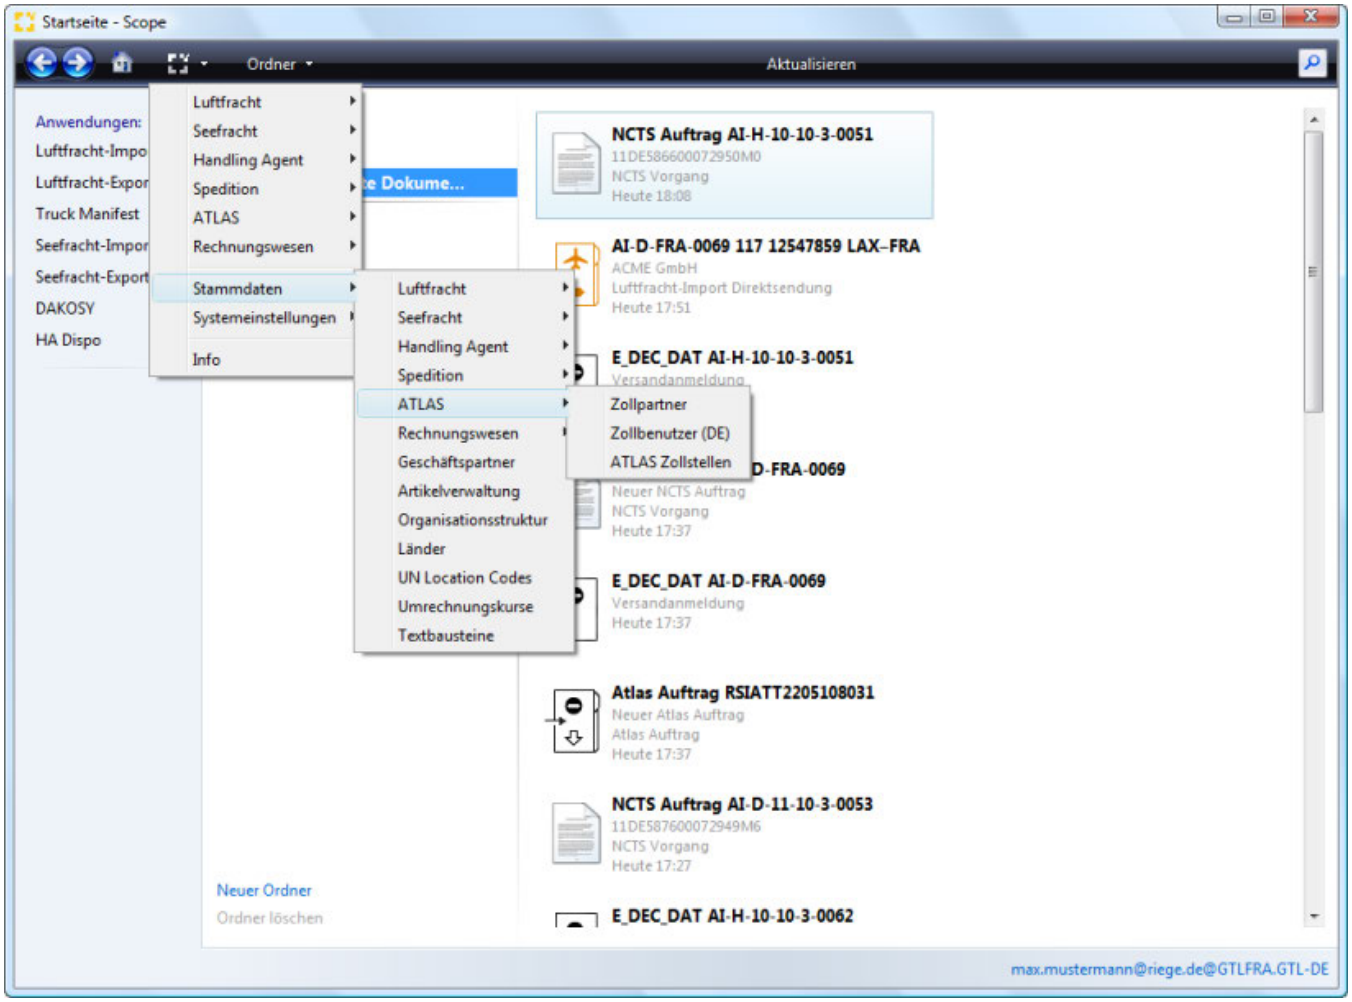
- Einleitung
- Beschreibung

Einleitung

Die Scope Anwendung Stammdaten-ATLAS , bietet die Möglichkeit zollspezifische Stammdaten zu hinterlegen, die dann automatisiert bei der Bearbeitung von Zollanträgen übernommen werden können. Neben Stammdaten zu vereinfachte Zollverfahren (Bewilligungsnummern/Ladeorte) können ein Tydensealstamm, Aufschubkonten, sowie BIN und TIN, oder Benutzerdaten und Informationen zu Zollstellen gepflegt werden.

Beschreibung

Über die Menüabfolge Scope Anwendungen - Stammdaten - Zoll, gelangt man zu den zollspezifischen Stammdaten.



In folgenden Kapiteln sind diese Anwendungen detailliert beschrieben.

- Zollbenutzer - ATLAS - Stammdaten
- Zollpartner - ATLAS - Stammdaten
- Zollstellen - ATLAS - Stammdaten

Fragen

Aufschubangaben - Zollpartner

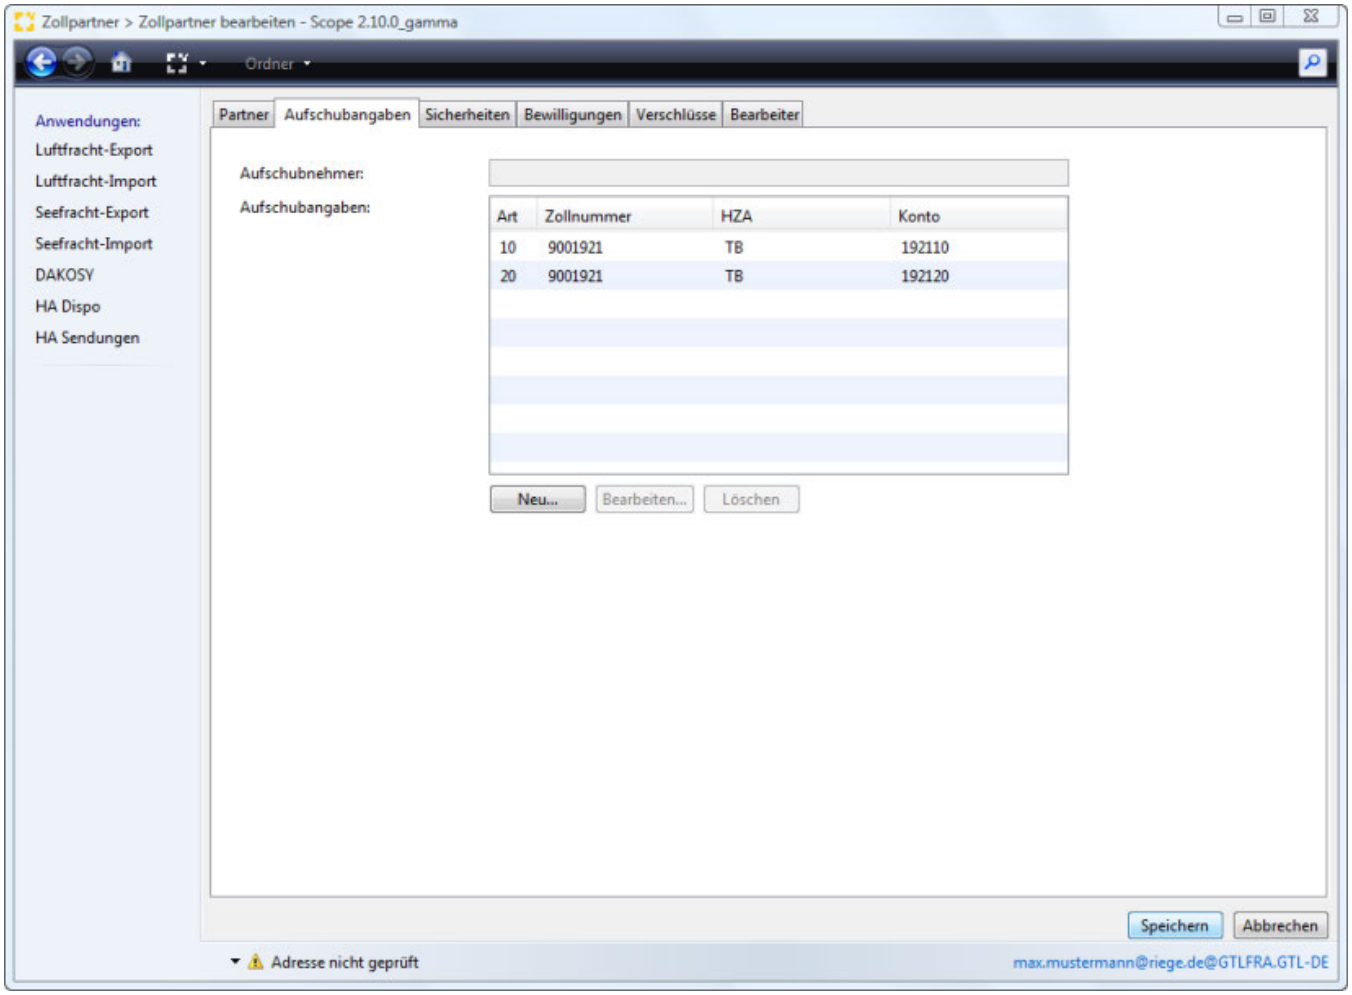
- Einleitung
- Beschreibung

Einleitung

Unter dem Reiter Aufschubangaben, werden fremde und eigene Aufschubkonten gepflegt. Diese Daten werden dann beim Zollantrag i.d.R. vollautomatisch aus den Zollpartnerstammdaten bestimmt. Die Pflege der Aufschubkonten im Zollpartnerstamm ist daher auch eine unabdingbare Vorraussetzung für eine korrekte Anmeldung. Durch die Nutzung eines laufenden Zahlungsaufschub müssen die Einfuhrabgaben nicht sofort bei der Zollabfertigung entrichtet werden. Die Zahlung erfolgt erst zu einem späteren Zeitpunkt, wobei alle Einfuhren, die in diesem Zeitraum getätigt wurden, zusammengefasst werden.

Beschreibung

Bearbeite Aufschubangabe



Aufschubnehmer

Da der Zoll nur unternehmensbezogen und nicht niederlassungsbezogen Aufschubkonten gewährt, kann man hier den entsprechenden Zollpartner (in diesem Fall sollte das die Hauptniederlassung sein) angeben, dessen Aufschubangaben auch für den anzulegenden Zollpartner gültig sind. Hat man einen Aufschubnehmer ausgewählt, kann man keine weiteren Aufschubangaben/neue Aufschubkonten hinterlegen.

Aufschubangaben - Art der Abgaben

Schlüssel für die Art des Zahlungsaufschubs

Bewilligungen - Zollpartner

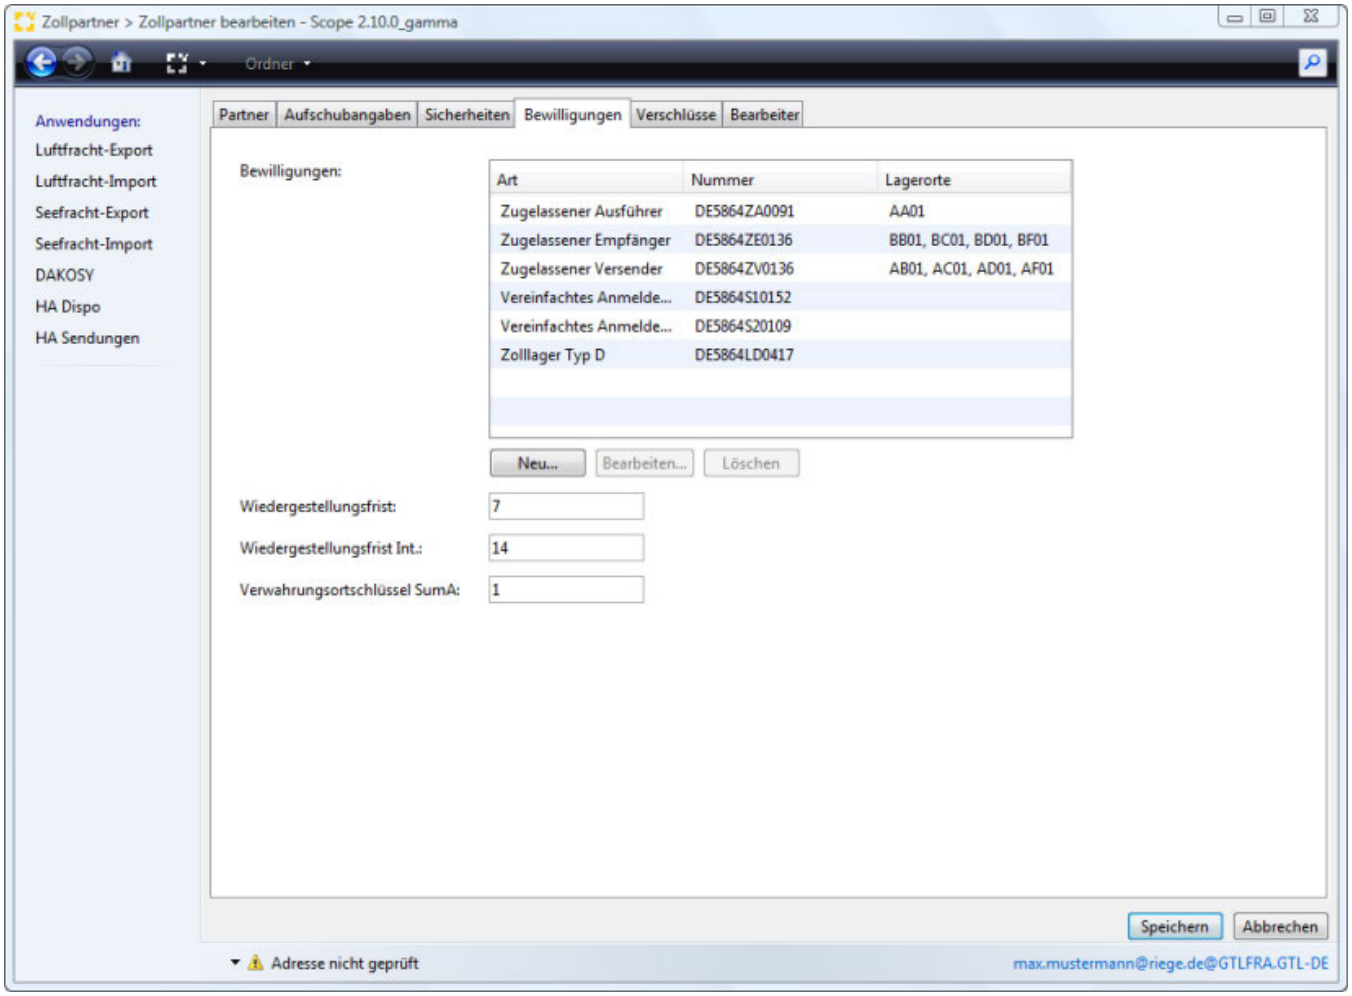
- Einleitung
- Beschreibung

Einleitung

Die Zollbehandlung von Waren bei der Ein- und Ausfuhr kann durch vereinfachte Verfahren wesentlich vereinfacht und, je nach Art des Verfahrens, beschleunigt werden. I.d.R. muss für die Inanspruchnahme einer solchen Vereinfachung eine Bewilligung beim zuständigen HZA beantragt werden. Unter dem Reiter Bewilligungen können die Daten zur Art, der Nummer, sowie zugeteilte Lageortcodierungen zum Zollpartner hinterlegt werden.

Beschreibung

Eigenschaften von Bewilligung
Eigenschaften von Lagerort



Bewilligungen - Art

In diesem Feld wird die Art der Bewilligung angezeigt.

Bewilligungen - Nummer

In diesem Feld wird die Nummer der Bewilligung angezeigt.

Bewilligungen - Lagerorte

In diesem Feld wird die Codierung des/der Lagerorte(s) angezeigt.

Neu

Der Dialog zur Erfassung der Daten einer Bewilligung kann mit der Schaltfläche "Neu" aufgerufen werden.

Bearbeiten

Mit der Schaltfläche "Bearbeiten" kann ein markierter Bewilligungseintrag zur Bearbeitung geöffnet werden.

Löschen

Mit der Schaltfläche "Löschen" kann ein markierter Bewilligungseintrag gelöscht werden.

Wiedergestellungsfrist (Nat.)

Hier kann eine Wiedergestellungsfrist (national) in Tagen für das Verfahren NCTS (ZV) hinterlegt werden. Die Gestellungsfrist wird dann in Abhängigkeit zum Bestimmungsland Code automatisch gezogen.

Wiedergestellungsfrist (Int.)

Hier kann eine Wiedergestellungsfrist (international) in Tagen für das Verfahren NCTS (ZV) hinterlegt werden. Die Gestellungsfrist wird dann in Abhängigkeit zum Bestimmungsland Code automatisch gezogen.

Verwahrungsortschlüssel SumA

Hier kann der Standardverwahrungsortschlüssel SumA hinterlegt werden. Der Standardverwahrungsortschlüssel wird dann in der Antragserfassung (z.B. Verwahrerwechsel) automatisch vorbelegt.

Speichern

Mit der Schaltfläche "Speichern" können Daten, bzw. Änderungen zum Zollpartner gespeichert werden.

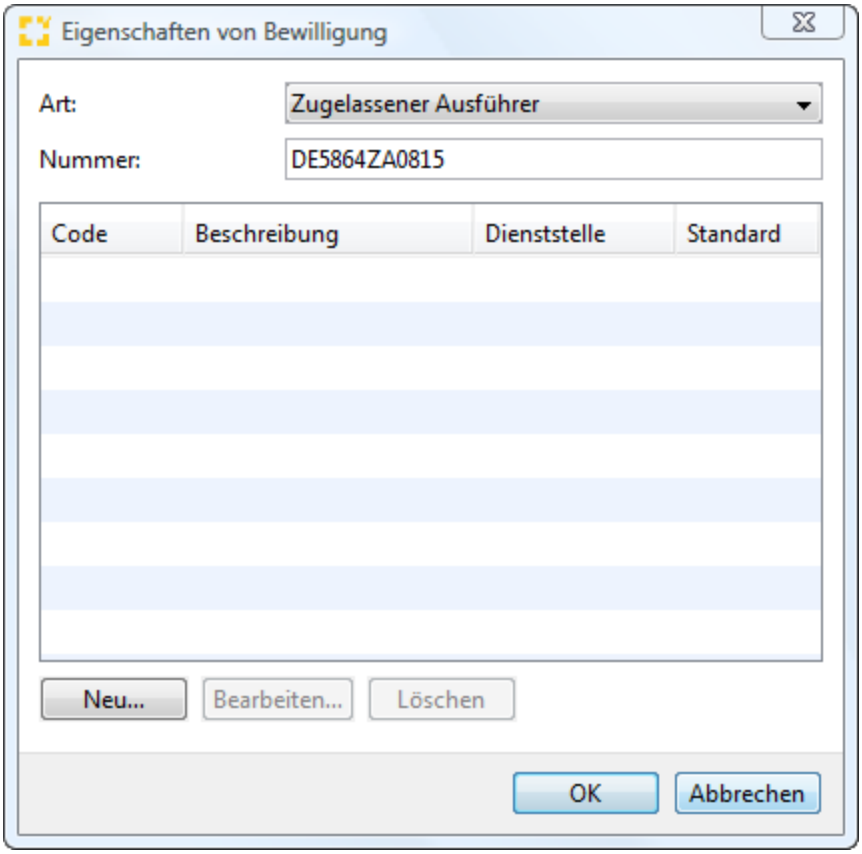
Abbrechen

Mit der Schaltfläche "Abbrechen" kann ein Eingabevorgang abgebrochen werden.

Eigenschaften von Bewilligung

Der Dialog zur Erfassung der Daten einer Bewilligung (Eigenschaften von Bewilligung) wird unter dem **Reiter Bewilligungen** mit der **Schaltfläche "Neu"** aufgerufen. Hier wird zunächst die Art der Bewilligung ausgewählt und die Bewilligungsnummer wird erfasst.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Art

In diesem Feld wird die Art der Bewilligung erfasst.

Nummer

In diesem Feld wird die Nummer der Bewilligung erfasst.

Neu

Der Dialog zur Erfassung der Daten des Lagerort Codes kann mit der Schaltfläche "Neu" aufgerufen werden.

Bearbeiten

Mit der Schaltfläche "Bearbeiten" können erfasste Daten zu einem Lageortcode zur Bearbeitung geöffnet werden.

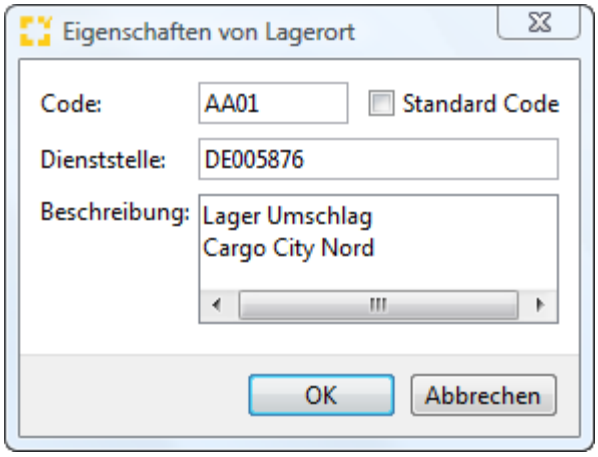
Löschen

Mit der Schaltfläche "Löschen" können erfasste Daten zu einem Lageortcode gelöscht werden.

Eigenschaften von Lagerort

Nachdem die Daten zur Bewilligung im Dialog Eigenschaften von Bewilligungen erfasst wurden, kann mit der **Schaltfläche "Neu"** der Dialog zur Erfassung der Daten des Lagerortes aufgerufen werden (Eigenschaften Lagerort).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code

In diesem Feld wird die Codierung des Lagerortes erfasst.

Standard Code

Hier kann durch das Setzen des Flags ein Lagerort Code als Standard Code hinterlegt werden.

Dienststelle

Dienststellennummer der zuständigen Zolldienststelle.

Beschreibung

In diesem Feld kann eine textuelle Beschreibung des Lagerortes hinterlegt werden.

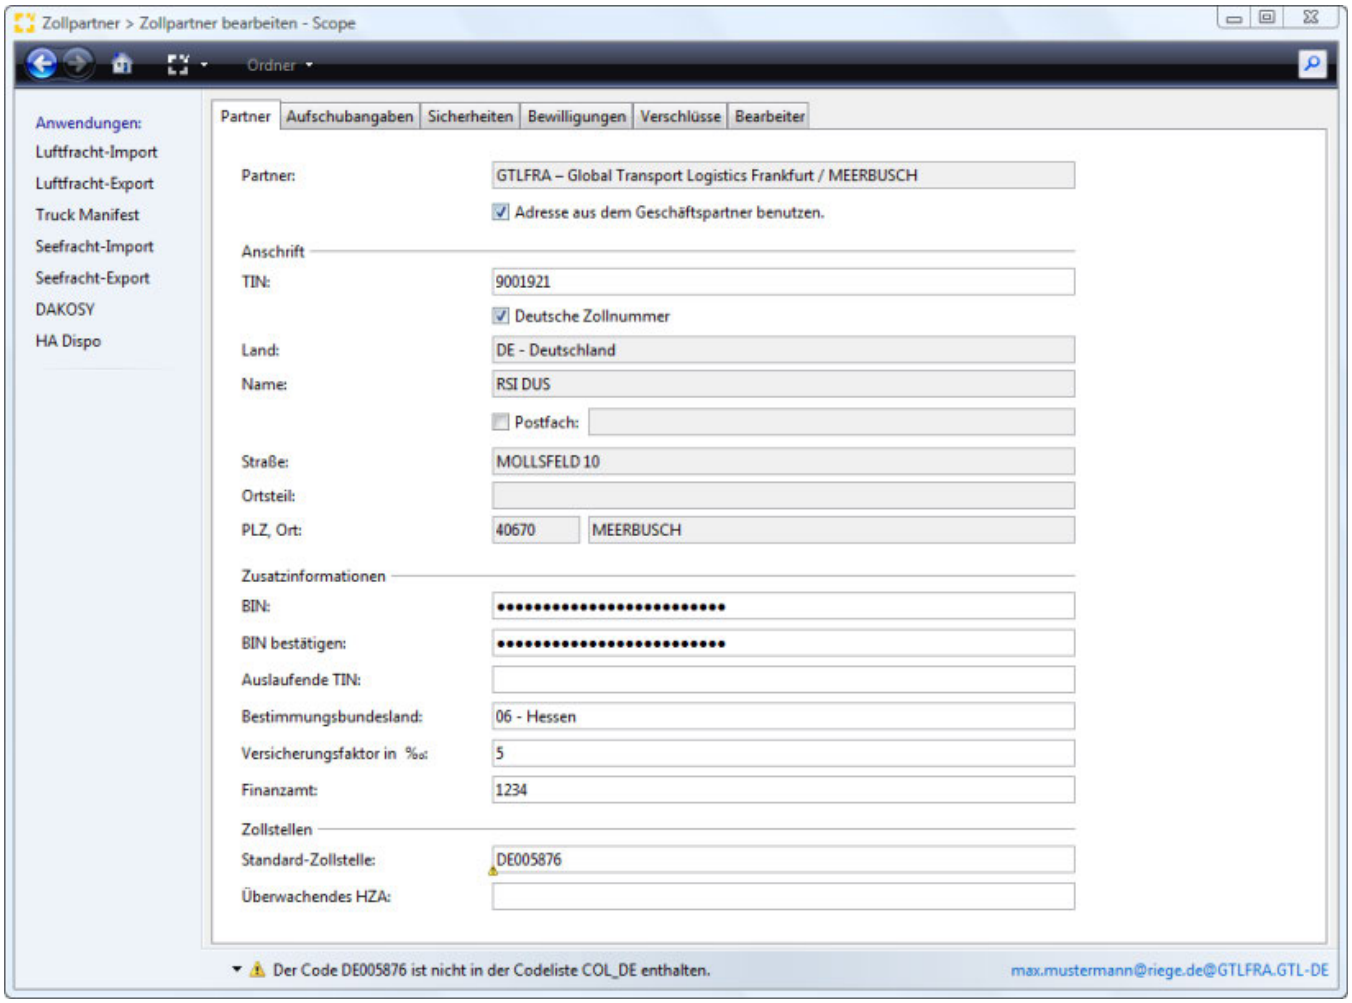
Partner - Zollpartner

- Einleitung
- Beschreibung

Einleitung

Unter dem Reiter Partner können die Adressdaten und wichtige Daten zur Zollkommunikation (TIN und BIN) zum Zollpartner hinterlegt werden.

Beschreibung



Partner

Die Adressdaten zum Zollpartner müssen in den Stammdaten Geschäftspartner hinterlegt sein. Sie können im Feld Partner über die Suchfunktion aus den Stammdaten Geschäftspartner übernommen werden.

Adresse aus dem Geschäftsparter benutzen

Das Flag wird bei der Erfassung eines neuen Zollpartners als Default gesetzt. Die aus den Stammdaten Geschäftspartner übernommenen Adressdaten können dann nicht geändert werden, da die entsprechenden Felder deaktiviert sind. Wird das Flag entfernt, sind die Felder wieder aktiv und es können abweichende Adressdaten erfasst werden.

TIN

Teilnehmer Identifikations Nummer des Zollpartners

Kennzeichen Deutsche Zollnummer

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Das Kennzeichen Deutsche Zollnummer wird als Default nach der Übernahme der Daten aus den Geschäftspartner Stammdaten gesetzt.

Land

Länderkennzeichen der Nationalität (Staatszugehörigkeit) des Zollpartners

Name

Name oder Firmenbezeichnung des Zollpartners

Postfach

Wird das Flag hier gesetzt, kann eine Postfachadresse ergänzt werden.

Postfachadresse

Postfachadresse des Zollpartners

Straße und Hausnummer

Straße und Hausnummer des Zollpartners

Ortsteil

Ortsteil zur Hausanschrift des Zollpartners

Postleitzahl

Postleitzahl zur Adresse des Zollpartners

Ort

Ortsangabe zur Adresse des Zollpartners

BIN

Beteiligten-Identifikations-Nummer des Zollpartners

BIN bestätigen

Feld zur Bestätigung der Beteiligten-Identifikations-Nummer

Auslaufende TIN

Gelegentlich kommt es vor, dass eine Geschäftsstelle eine neue Zollnummer beantragt. Es lässt sich nicht vermeiden, dass in diesem Fall die Geschäftsstelle nach Umstellung auf die neue Zollnummer noch Antwortnachrichten zu alten Vorgängen unter der alten Zollnummer zollseitig empfangen können muss. Man kann also hier eine zweite, "alte" Zollnummer "Auslaufende TIN" hinterlegen. Bei der Suche eines Zollpartners nach der alten Zollnummer wird der Zollpartner auch gefunden. Die auslaufende TIN muss eindeutig einer Branch gehören, sie darf in keiner anderen Branch als erste oder zweite Zollnummer eingetragen sein.

Bestimmungsbundesland

Wird hier der entsprechende Wert zum Zollpartner erfasst, wird das Bestimmungsbundesland automatisch in der Zollanmeldung vorbelegt.

Versicherungsfaktor in Promille

Muss eine Versicherung in der Zollanmeldung angegeben werden, kann hier ein Versicherungsfaktor in Promille hinterlegt werden und Scope berechnet die Versicherungskosten. Der Promilleanteil wird aus dem zum Anmelder (bzw. Empfänger, falls "Anmelder ist Empfänger" gesetzt) hinterlegten "Berechnungsfaktor für Versicherung" bestimmt (Das Flag „Versicherung automatisch berechnen" muss im Antrag gesetzt sein).

Finanzamt

Beim Verfahren 42XX und 63XX wird dieser Eintrag auf das entsprechende Feld auf dem Tab Abgaben gezogen.

Zollstellen - Standard Zollstelle

In diesem Feld kann die Standardzolldienststelle für die Verfahrensbereiche SumA, Einfuhr und NCTS als Default hinterlegt werden. Der Wert in diesem Feld wird automatisch in der Zollanmeldung vorbelegt.

Zollstellen - Überwachendes Hauptzollamt

In diesem Feld kann die Dienststellennummer des überwachenden HZA für die vereinfachten Verfahren im Bereich ATLAS Einfuhr und für das Zolllagerverfahren als Default hinterlegt werden. Der Wert in diesem Feld wird automatisch in der Zollanmeldung vorbelegt.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Speichern

Mit der Schaltfläche "Speichern" können Daten, bzw. Änderungen zum Zollpartner gespeichert werden.

Abbrechen

Mit der Schaltfläche "Abbrechen" kann ein Eingabevorgang abgebrochen werden.

Anzeige der Höhe der Belastung der Sicherheitsleistung

Neu

Der Dialog zur Erfassung der Daten einer Sicherheit kann mit der Schaltfläche "Neu" aufgerufen werden.

Bearbeiten

Mit der Schaltfläche "Bearbeiten", kann ein markierter Eintrag zur Bearbeitung geöffnet werden.

Löschen

Mit der Schaltfläche "Löschen", kann ein markierter Eintrag gelöscht werden.

Sicherheitsfaktor in %

Der Faktor Sicherheit NCTS (E_DEC_DAT) ist systemseitig standardmässig auf 25% gesetzt. Dieses Feld ermöglicht den Faktor Sicherheit in Prozent für den Zollpartner zu definieren. Der hier definierte Faktor wird dann anstatt der 25% als Default in die Versandanmeldung (E_DEC_DAT) gezogen.

Carnet TIR-Nummer

Carnet TIR-Nummer zu einer Carnet TIR-Sicherheit

Speichern

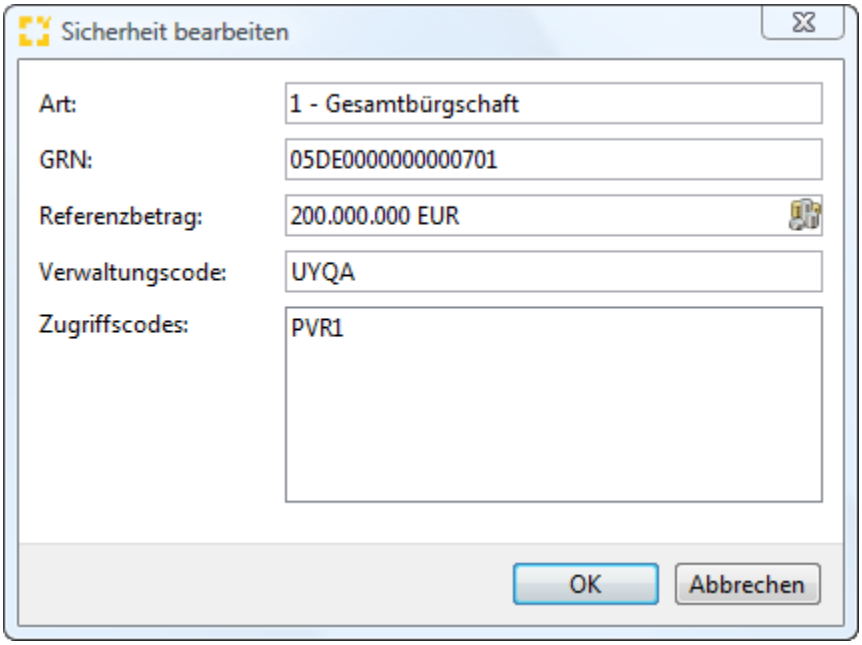
Mit der Schaltfläche "Speichern" können Daten, bzw. Änderungen zum Zollpartner gespeichert werden.

Abbrechen

Mit der Schaltfläche "Abbrechen" kann ein Eingabevorgang abgebrochen werden.

Sicherheit bearbeiten

Der Dialog zur Erfassung der Daten einer Sicherheit (Sicherheit bearbeiten) kann unter dem Reiter Sicherheiten mit der **Schaltfläche "Neu"** geöffnet werden.



Art

In diesem Feld wird die verschlüsselte Angabe zur Art der Sicherheit erfasst.

GRN

In diesem Feld wird die Guarantee Reference Number (GRN) hinterlegt.

Referenzbetrag

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In diesem Feld wird die Höhe der Sicherheitsleistung angegeben.

Verwaltungscode

Der Verwaltungscode wird vom HZA für registrierte Sicherheiten der Codes 0, 1 und 9 vergeben. Er wird für die Änderung, Ergänzung oder Löschung des Zugriffscodes sowie für die Änderung des Verwaltungscodes im Rahmen eines Nachrichtenaustauschs zwischen dem HV und dem HZA benötigt.

Zugriffscode

Der Zugriffscode stellt die Berechtigung dar, die Sicherheit in Anspruch zu nehmen. Abhängig von der Art der Sicherheitsleistung wird der Zugriffscode vom HZA, vom Bürgen oder vom HV festgelegt.
Er ist bei der Überführung in das Versandverfahren anzugeben. Im Rahmen der Benutzereingabe stellt die Abgangsstelle die verdeckte Eingabe des Zugriffscodes in geeigneter Weise sicher.

Verschluesse - Zollpartner

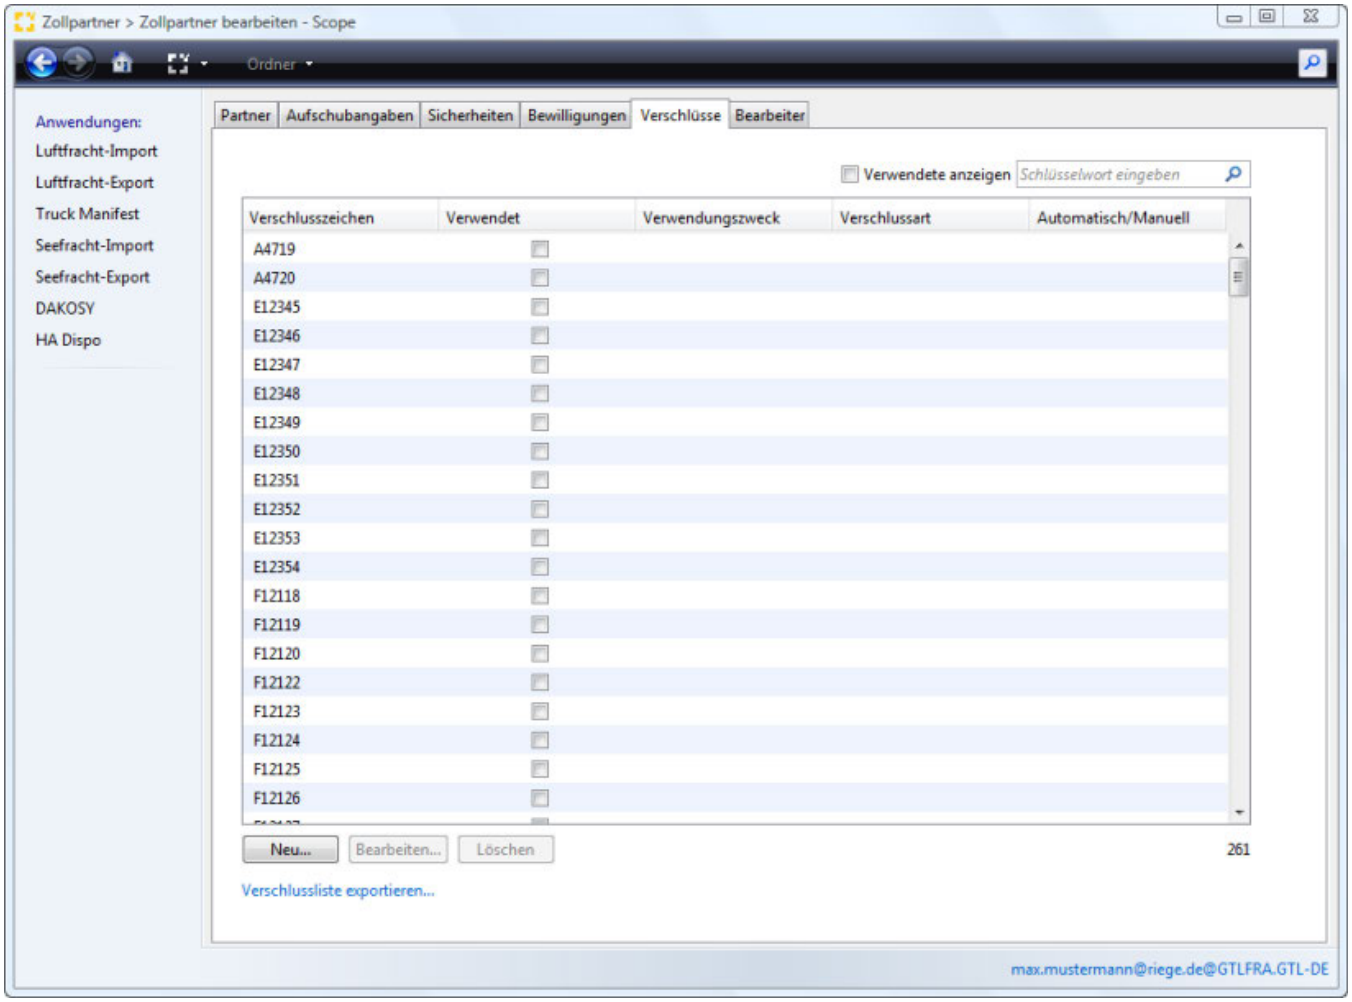
- Einleitung
- Beschreibung

Einleitung

Unter dem Reiter Verschlüsse werden die Verschlüsse (Tydenseals) angelegt und verwaltet. Eine Verschlussliste kann als Excel Datei exportiert werden.

Beschreibung

Verschlüsse anlegen
Verschluss manuell blockieren
Verschlussliste exportieren



Verwendete anzeigen

Ist in diesem Feld das Flag gesetzt, werden auch bereits verwendete Verschlusszeichen angezeigt.

Schlüsselwort eingeben

In diesem Feld kann nach einem Schlüsselwort gesucht werden (Verschlusszeichen).

Verschlusszeichen

In diesem Feld wird die Tydensealnummer angezeigt.

Verwendet

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Das Flag kennzeichnet in der Übersicht bereits verwendete Verschlusszeichen.

Verwendungszweck

In diesem Feld wird der Verwendungszweck angezeigt. Bei einer manuellen Erledigung, wird hier der händisch eingetragene Verwendungszweck angezeigt.

Verschlussart

In diesem Feld wird die Verschlussart angezeigt. **"R"** steht für einen Raumverschluss (Container/Truck), **"P"** steht für einen Packstückverschluss (Paket /Kiste).

Automatisch/Manuell

In diesem Feld wird angezeigt ob der Verschluss automatisch gezogen oder manuell eingetragen wurde.

Neu

Der Dialog zur Erfassung neuer Verschlusszeichen kann mit der Schaltfläche "Neu" aufgerufen werden.

Bearbeiten

Mit der Schaltfläche "Bearbeiten" kann ein in der Übersicht markiertes Verschlusszeichen manuell blockiert werden.

Löschen

Mit der Schaltfläche "Löschen" kann ein in der Übersicht markiertes Verschlusszeichen gelöscht werden.

Speichern

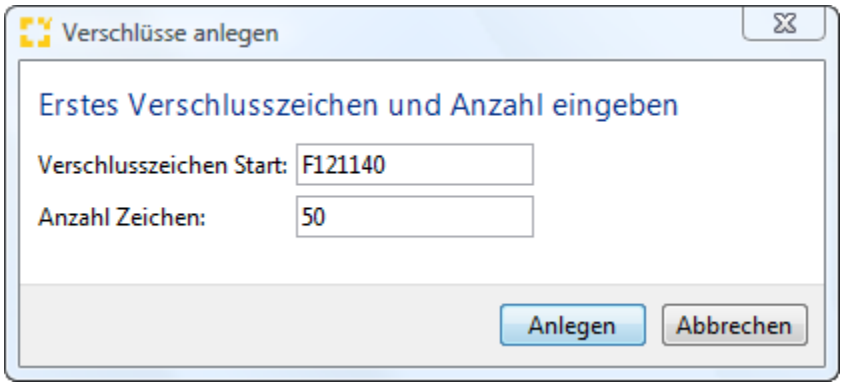
Mit der Schaltfläche "Speichern" können Daten, bzw. Änderungen zum Zollpartner gespeichert werden.

Abbrechen

Mit der Schaltfläche "Abbrechen" kann ein Eingabevorgang abgebrochen werden.

Verschlüsse anlegen

Der Dialog zur **Erfassung neuer Verschlusszeichen** wird mit der **Schaltfläche "Neu"** aufgerufen. Sobald die Nummer des ersten Verschlusszeichens und die Anzahl erfasst wurden, kann der Dialog mit der **Schaltfläche "Anlegen"** bestätigt werden. Das System legt daraufhin den neuen Verschlusszeichenstamm an.



Verschlusszeichen Start

Codierung des ersten Verschlusszeichens, das im Verschlusszeichenstamm hinterlegt werden soll.

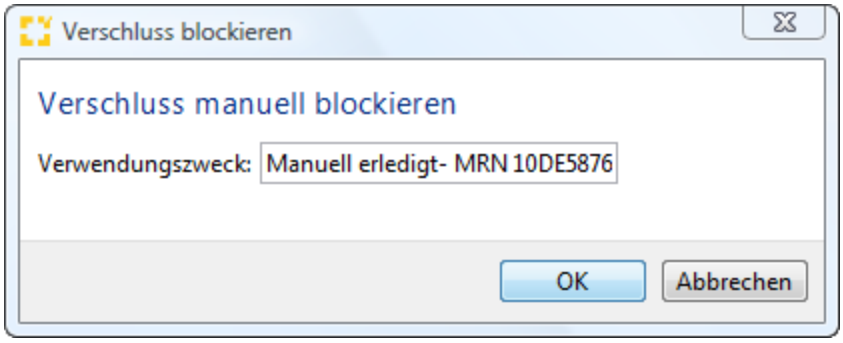
Anzahl Zeichen

Anzahl der Verschlüsse, die nachfolgend zum "Verschlusszeichen Start" angelegt werden sollen.

Verschluss manuell blockieren

Um ein in der Übersicht markiertes Verschlusszeichen manuell zu blockieren, muss der entsprechende Dialog mit der **Schaltfläche "Bearbeiten"** aufgerufen werden.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

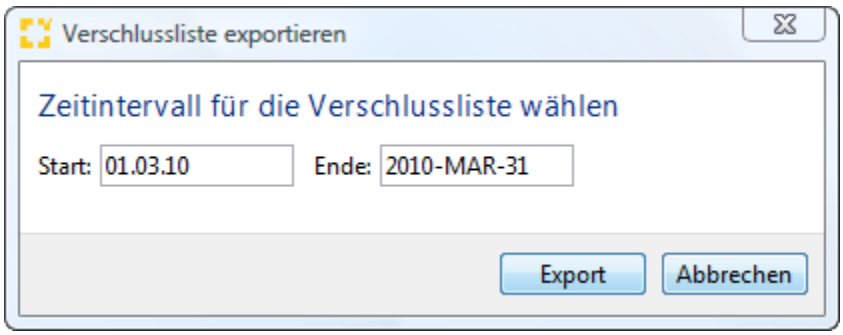


Verwendungszweck

Angabe des Verwendungszwecks (z.B. MRN, oder textuelle Beschreibung).

Verschlussliste exportieren

Aktiviert man diesen Link, kann einen Verschlussliste als Excel Datei exportiert werden. Der Dialog kann mit der **Schaltfläche "Export"** bestätigt werden und die Verschlussliste für den ausgewählten Zeitraum wird als Excel Datei generiert.



Start

Startdatum für den Zeitraum der Daten der Verschlussliste.

Ende

Enddatum für den Zeitraum der Daten der Verschlussliste.

Zollstellen - ATLAS - Stammdaten

- Einleitung
- Beschreibung

Einleitung

Bei der Abwicklung einer Zollanmeldung wird die Anmeldung unterschiedlicher Typen von Unterlagen verlangt. Es kommt vor, dass dabei manche Zollstellen die Anmeldung bestimmter Unterlagen auf Positionsebene verlangen, obwohl diese auch auf Kopfebene angemeldet werden könnten. Diese Vorgaben können in den Zollstellenstammdaten hinterlegt werden und werden dann von Scope in ATLAS Einfuhr (EZA,vZA/AZ) automatisch gezogen. Die Automatik greift jedoch nicht, wenn bereits Unterlagen auf Kopf- oder Positionsebene existieren.

Beschreibung

Countries - Maintenance

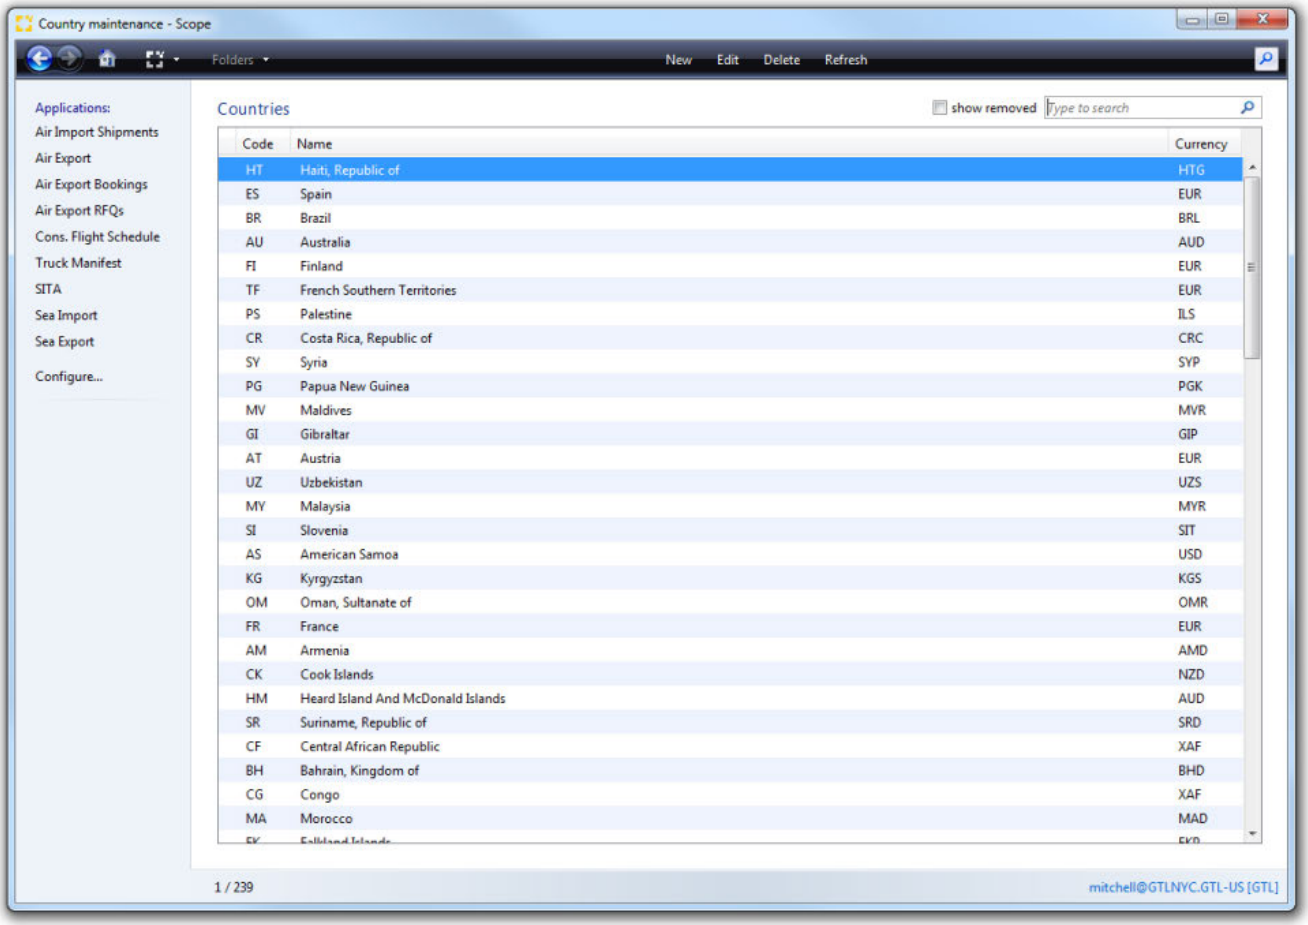
- Introduction
- Description

Introduction

This application is used to create and store details about countries that are used in many other areas of the Scope system. Country codes, currency, postcode format and tax details are all stored in country maintenance.

> This data is standardized internationally. To ensure error free operation, country data is therefore maintained by **Riege Software International** via the SDS master system and distributed to all customer systems. ***Users should not have access to, nor change in any way this data.***

Description



New

This action opens the Editor in order to create a new country.

Edit

This action opens the county highlighted in the overview using the Editor in order to change the country details.

Delete

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This action will delete the country highlighted in the overview. Countries are not physically deleted, but set to inactive and removed from view. Deleted countries may be view as shown below.

Refresh

Updates the index to ensure the latest country data is present.

Countries

An overview of all existing countries showing country code, name and currency.

Show removed

When checked, this check box will ensure that any previously deleted countries are included in the overview. Deleted countries will appear with the *Trash* Icon in the left hand column. They may be restored by editing them.

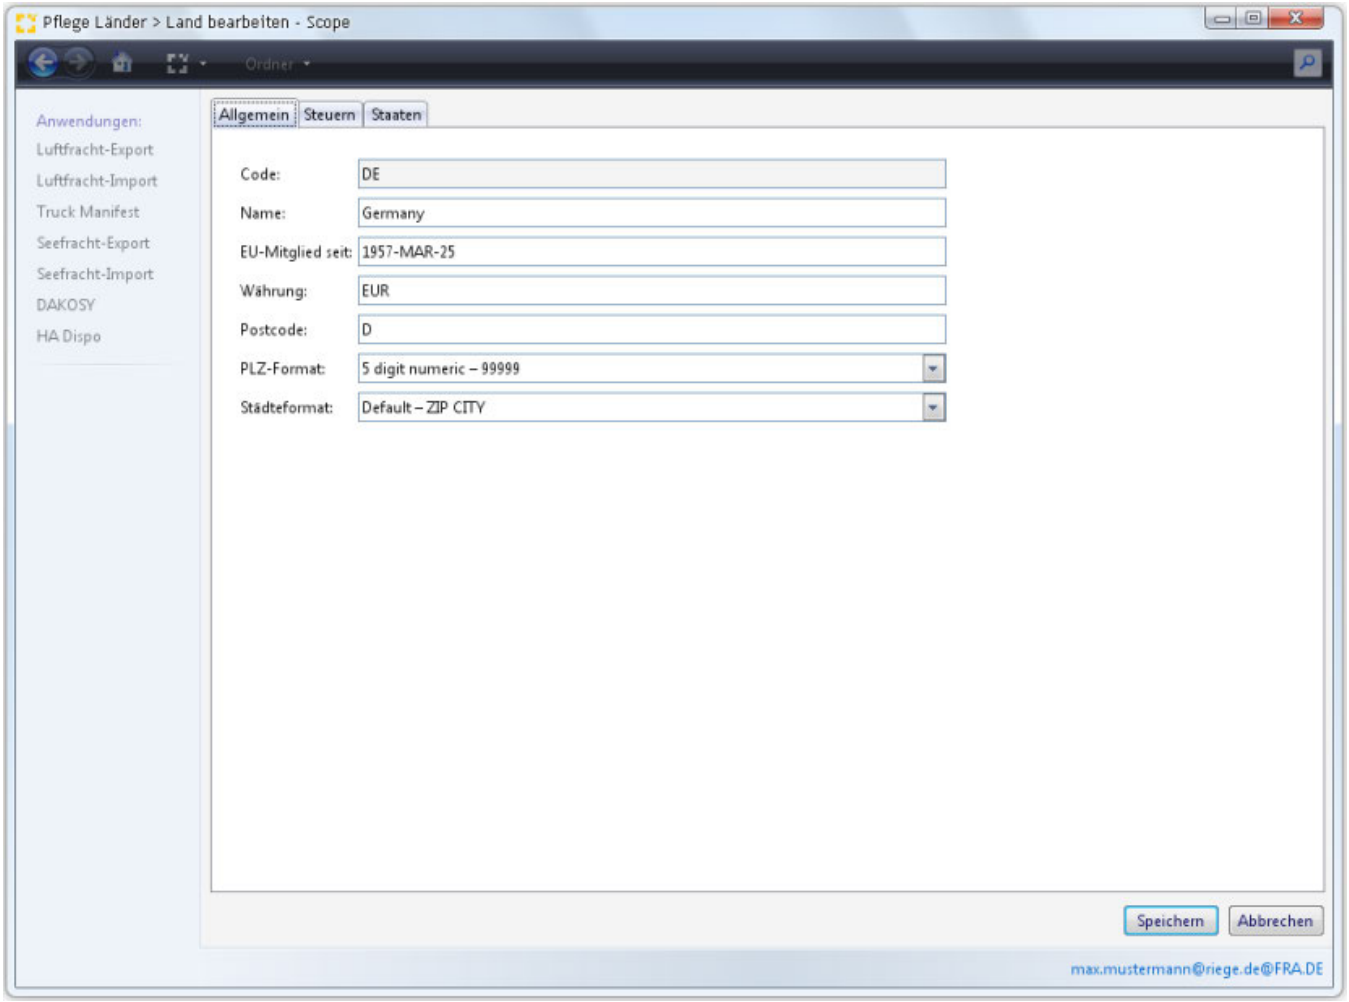
Type to search

This is a full text search field. An part of a country code or name may be entered in order to find that country in the list.

Editor

General

The **General** tab maintains the following information:



Code

The two- character ISO 3166 Alpha-2 country code.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Name

The country name.

EU Member since:

If the country is a member of the EU, the date of the countries accession to the EU.

Currency

The ISO 4217 currency code of the country.

Postal Code

The postal code, eg **D**-44030 Ort

Zip Format

This field will present a drop-down list of possible postal formats. The format selected will then be used in all {partner addresses |General - Business Partner - Master Data] which are located in that country.

City Format

This field will present a drop-down list of possible city format. This controls the order in which, the zip code, the country code and the city name will appear when printed.

Save

Saves the country information and returns to the overview.

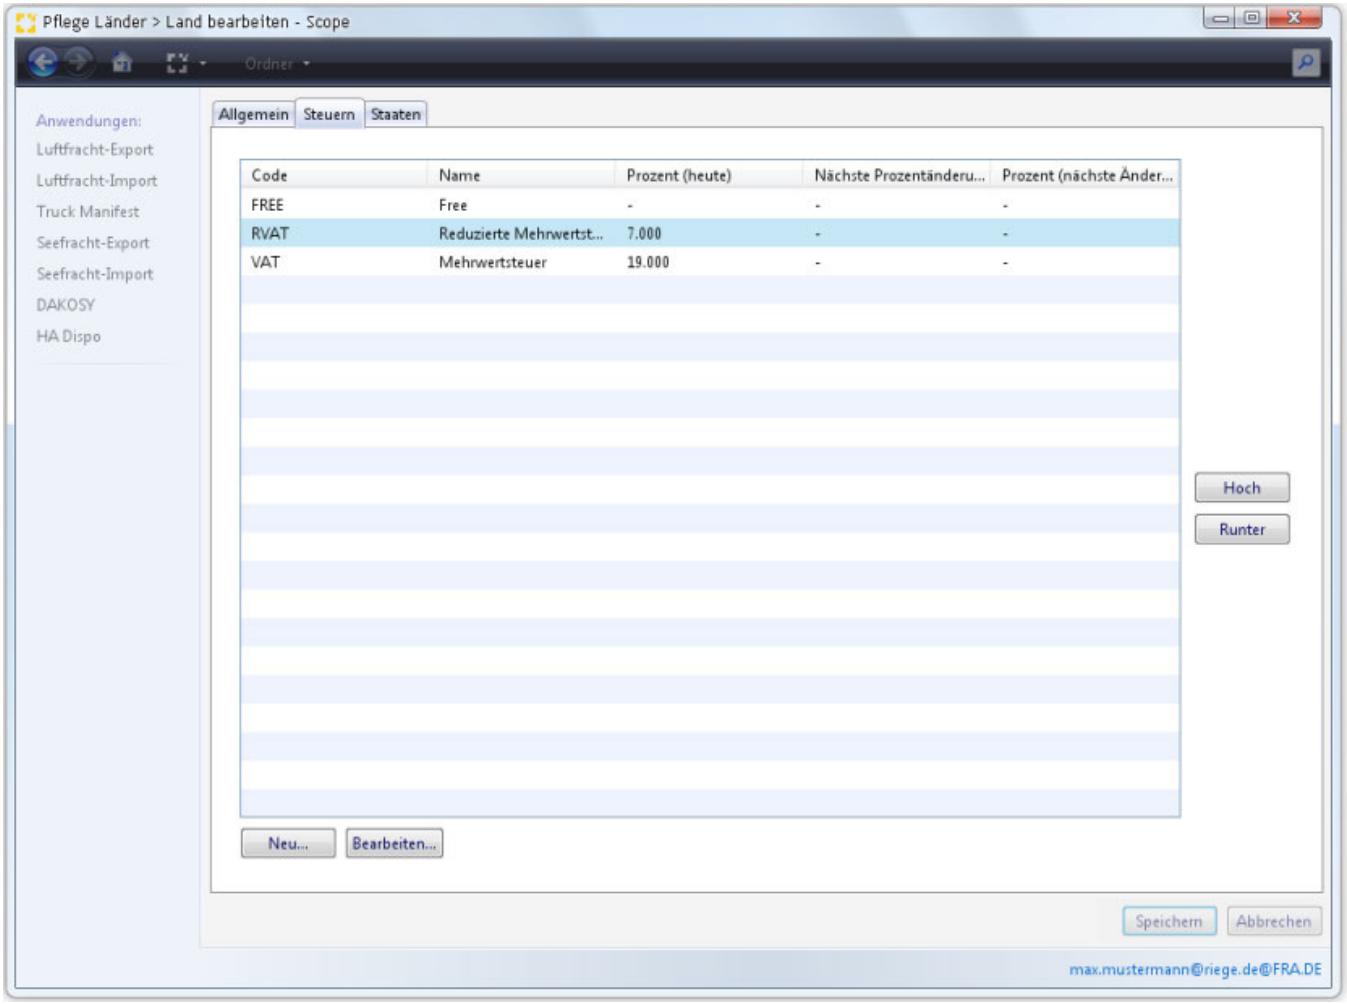
Cancel

Exits the country editor without saving any changes.

Taxes

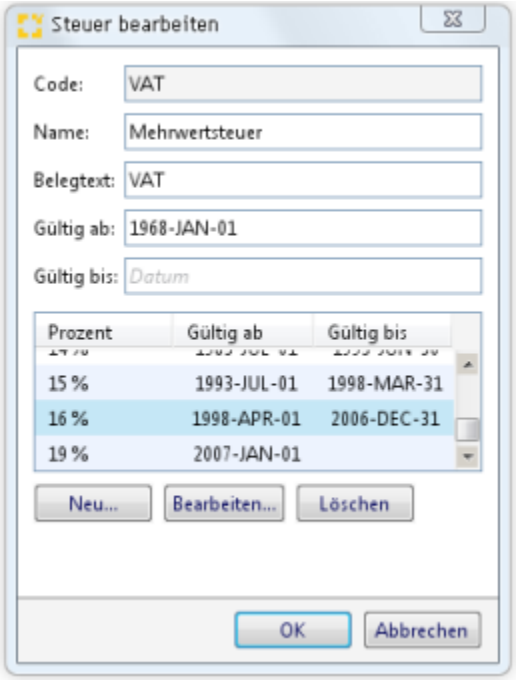
The **taxes** tab is used to maintain tax details for the selected country.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



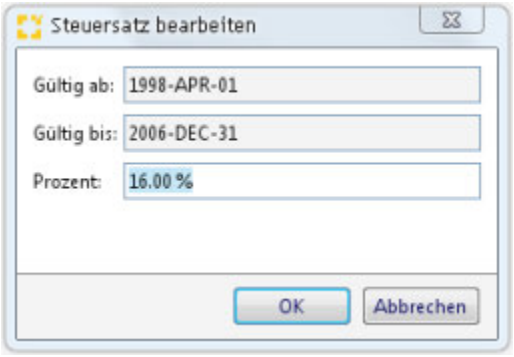
The summary table shows the existing tax entries.

New / Edit



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens a pop-up window where the code, name, Voucher text, valid dates and type of tax detail may be stored. Various tax percentages and their valid dates may be stored for each tax code. Use the *New* or *Edit* functions to adjust these percentages.

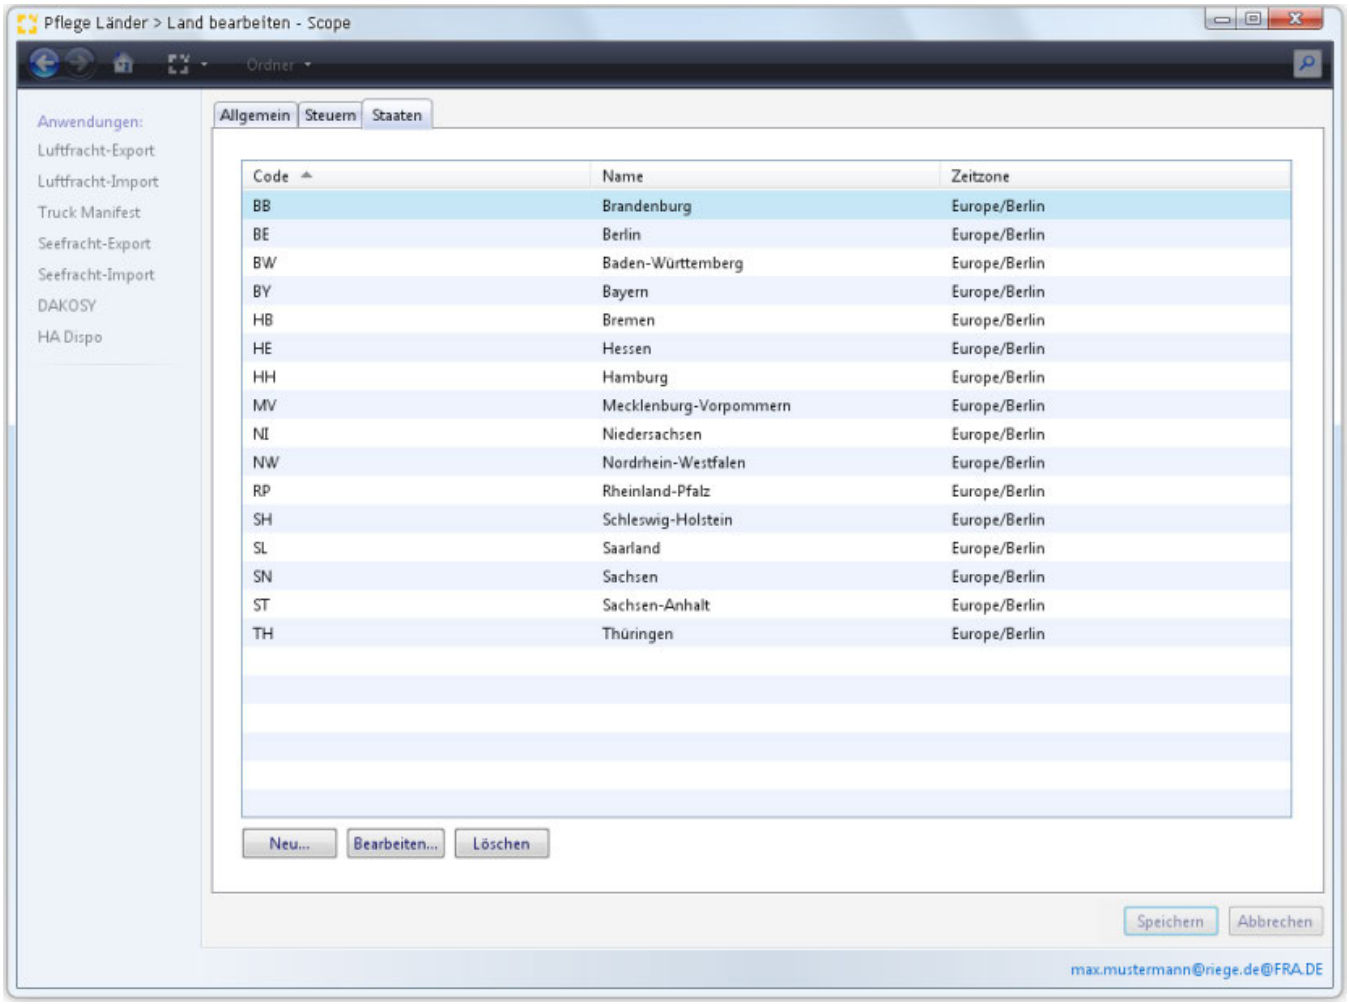


Move Up / Move Down

These control buttons are used to move the tax highlighted in the tax table, up or down the list of taxes.

States

The **states** tab is used to maintain states, cantons or federal districts that make up the country.



The summary table of states shows the state codes, names and the timezones where they are located.

New / Edit

Create a new state or edit an existing state. A pop-up window appears where the state code, name and timezone can be stored.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

Deletes the state highlighted in the overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

EDI Profiles

- Introduction

Code

Unique codes to identify the EDI profile. The code can mostly be chosen freely, but some interfaces require a specific code.

Reference type ID

The reference type ID determines which kind of data serves as identifying reference. In this example, DQ is an external reference so incoming data is selected by this reference. Another example can be PTT which selects by shipment number. Which reference type ID is selected depends on the interface.

> **Attention**
>
> There is no validation regarding spelling or availability of the reference type. Setup of the initial EDI profile should only be done by users trained in Scope EDI communication.

Type of Interface

The kind if interface can be selected per Drop-Down. The following interface are currently available:

- n/a
- Generic
- FCL Logisitk
- WinWeb Connect
- alH4
- TOCS Interface
- Aramex
- TNT GL+
- Sovex
- Sovex Line Haul
- Sovex Special
- TTH/TTL

Most of these interfaces are customer specific interfaces, for our Scope generic interfaces the option Generic is used.

Contact EMail

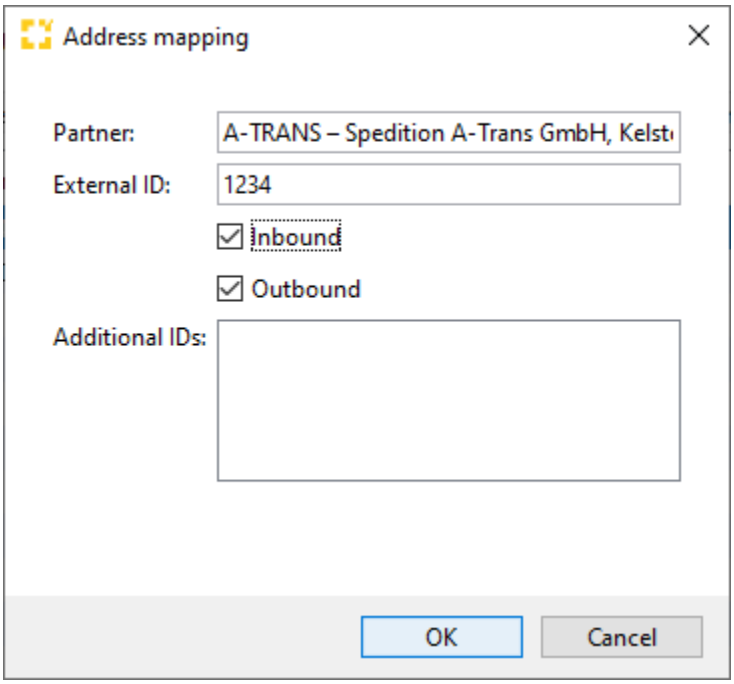
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In case an interface creates an error job in Scope, an email can be sent to the contact email address maintained in this field. One example would be missing EDI mappings.

Address mappings

Table ad*dress mappings* displays maintained partner mappings for interface. New partner can be mapped using the Scope partner selection and the external ID. External ID is the ID known by the recipient of the interface.

In this example, Scope Partner A-TRANS is mapped to value 1234. 1234 is the "name" of the partner in the recipients interface.

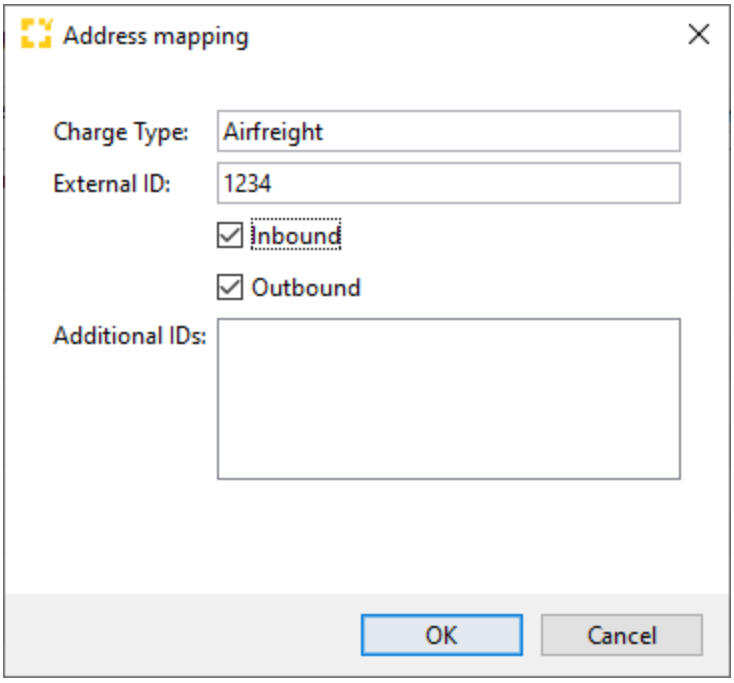


A mapping can be used for Inbound (incoming) or Outbound (outgoing) data. At least one type must be selected. Additional IDs are only used for inbound data.

Charge Type Mappings

If the interface supports transmission of charge types, the charge types can be mapped in this dialog. Scope charge type can be selected from the search (here: Airfreight) and mapped to an external value (here: 1234).

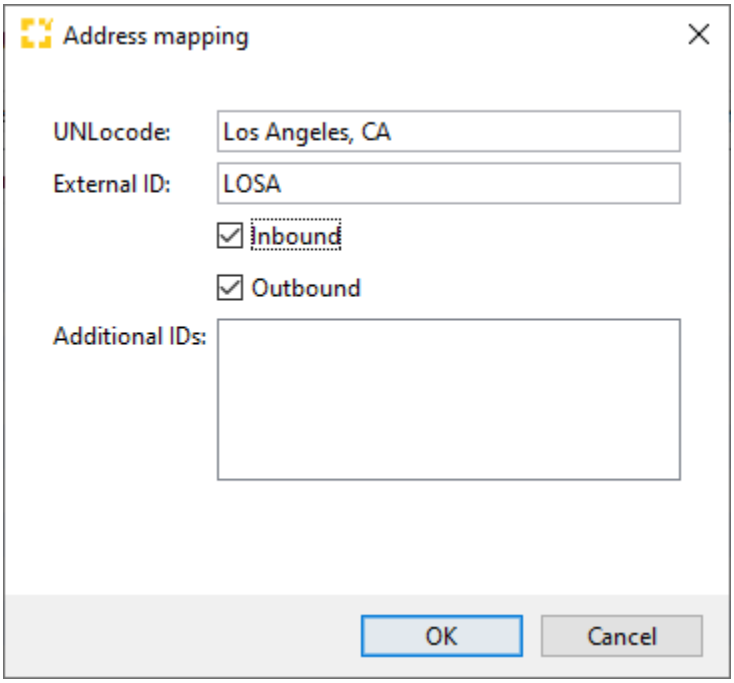
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



A mapping can be used for Inbound (incoming) or Outbound (outgoing) data. At least one type must be selected. Additional IDs are only used for inbound data.

UNLocode Mappings

If the interface supports transmission of UNLocodes, the UNLocodes can be mapped in this dialog. Scope UNLOcodes can be selected from the search (here: USLAX) and mapped to an external value (here: LOSA).

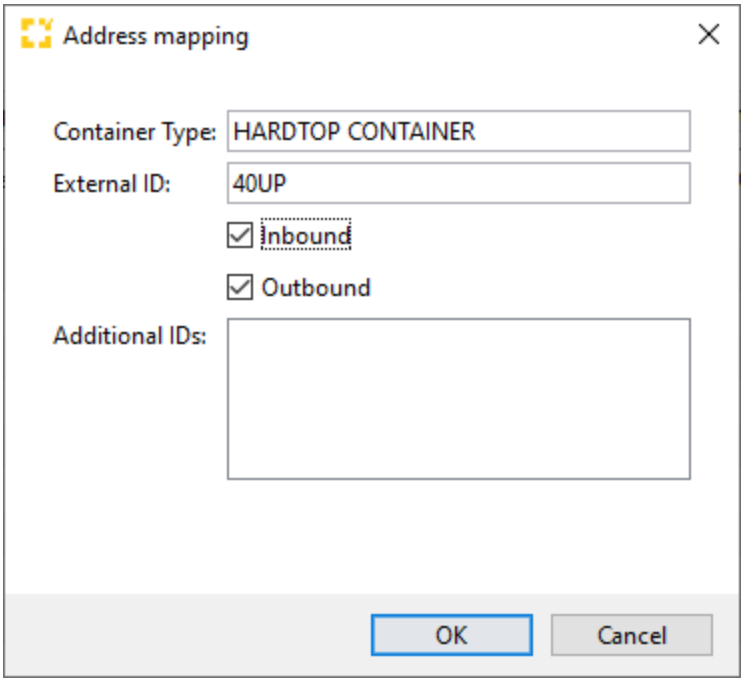


A mapping can be used for Inbound (incoming) or Outbound (outgoing) data. At least one type must be selected. Additional IDs are only used for inbound data.

Container Type mappings

If the interface supports transmission of container codes, the container codes can be mapped in this dialog. Scope container codes can be selected from the search (here: HARDTOP CONTAINER) and mapped to an external value (here: 40UP).

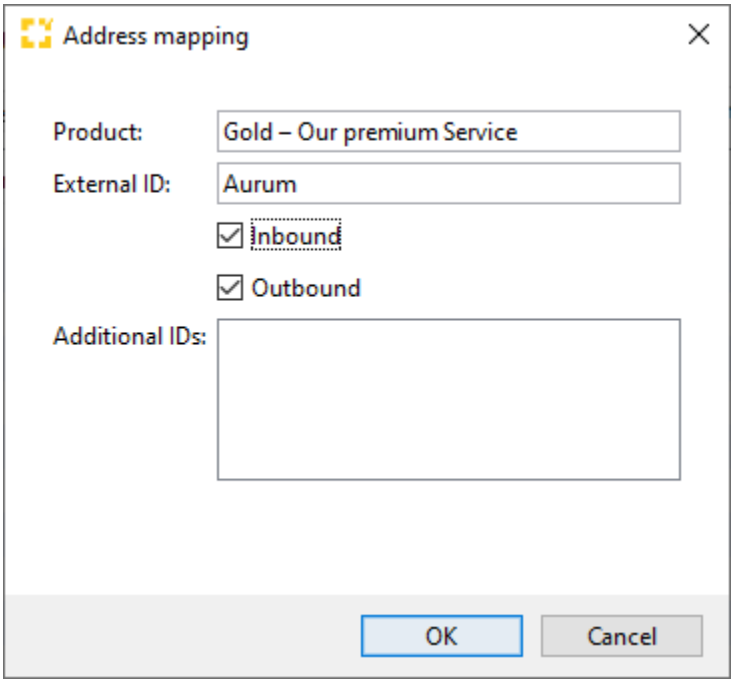
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



A mapping can be used for Inbound (incoming) or Outbound (outgoing) data. At least one type must be selected. Additional IDs are only used for inbound data.

Product mappings

If the interface supports transmission of products, the products can be mapped in this dialog. Scope selling products can be selected from the search (here: Gold) and mapped to an external value (here: Aurum).



A mapping can be used for Inbound (incoming) or Outbound (outgoing) data. At least one type must be selected. Additional IDs are only used for inbound data.

Export

Using function 'Export' a MS Excel file is created with the entries of the EDI profile.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

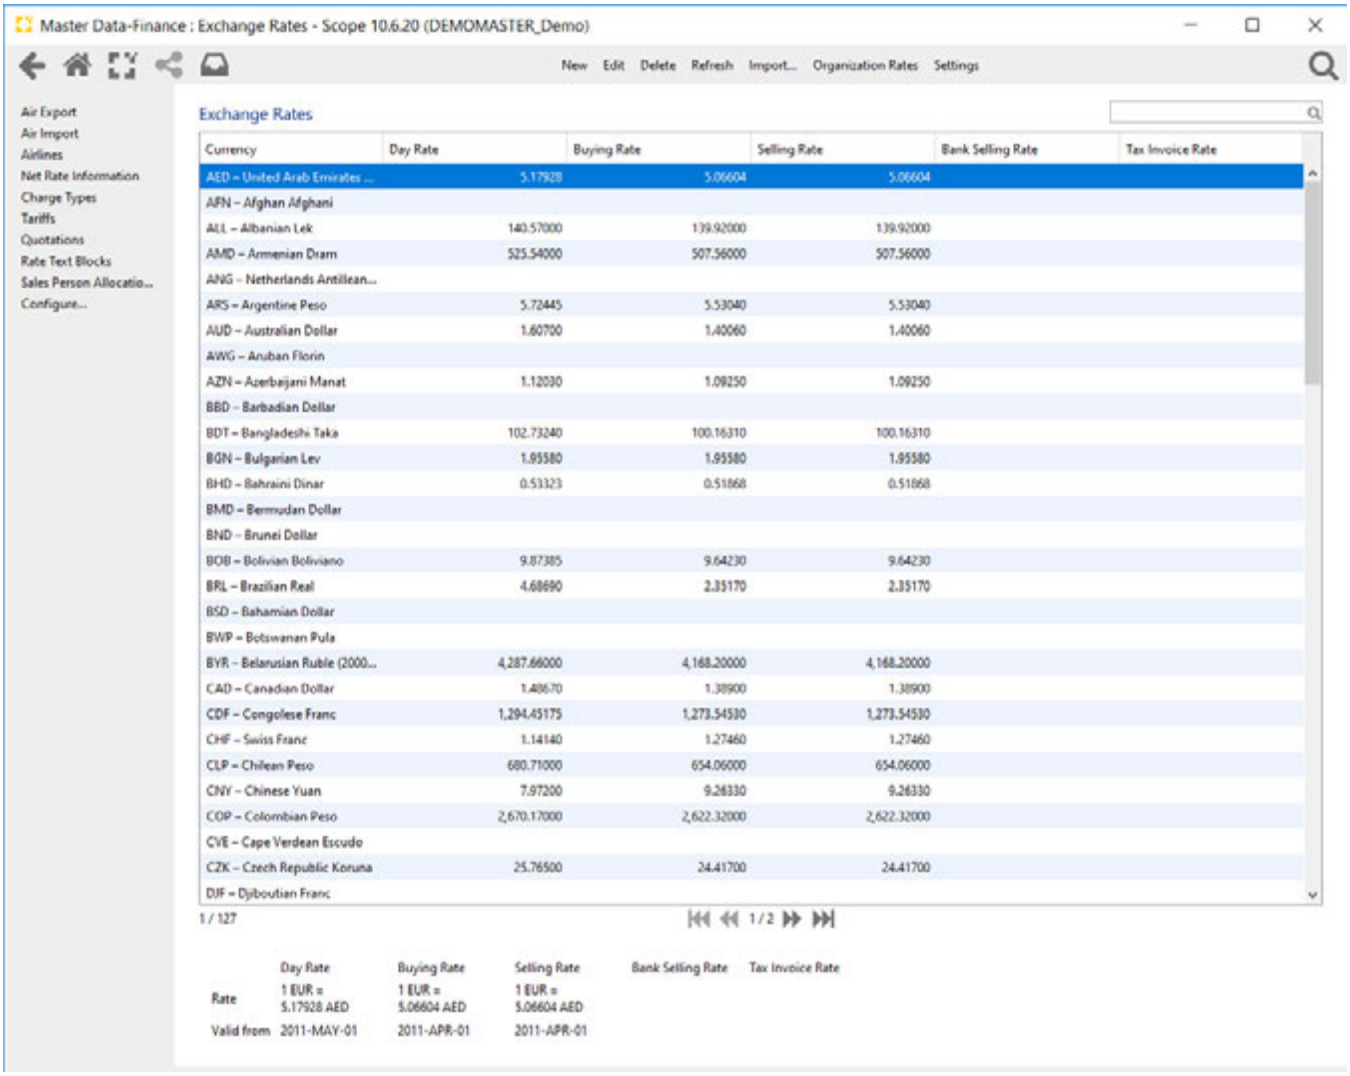
Exchange Rates - Maintenance

- Introduction
- Description

Introduction

Currency exchange or conversion rates are maintained in this application. This data is used in multiple areas of the Scope system such as billing, payables and tariffs.

Description



New

Opens a pop-up window in which a new currency can be created.

Edit

Opens the currency highlighted using the currency editor in order to edit the currency details.

Delete

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Deletes the highlighted currency.

Refresh

Updates the index to ensure the latest currencies and their rates are displayed.

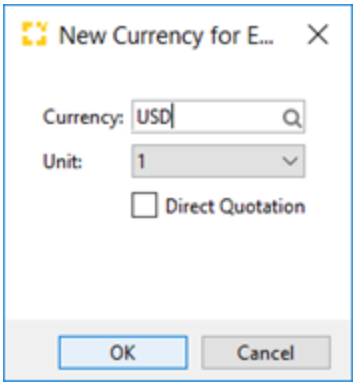
Import...

Opens a popup window that allows import of external exchange rates into the application.

Table - Exchange Rates

A complete list of currencies and their rates.

New Currency



Currency

The 3 digit currency code of the new currency. This is a search field that can be used to find currencies available on the system.

Unit

The drop-down list provides a list all possible units:

Local currency unit	=	Units of foreign currency
1		1
1		10
1		100
1		1000

Direct Quotation *(Parity)*

This checkbox is used to determine if the currency is quoted *directly* or *indirectly*.

Quotation	Description	Example
direct	The exchange rate is expressed per unit of foreign currency	Local currency = EUR 1 USD = 0.8084 EUR
indirect	The exchange rate is expressed per unit of local currency	Local currency = EUR 1 EUR = 1.273 USD

OK

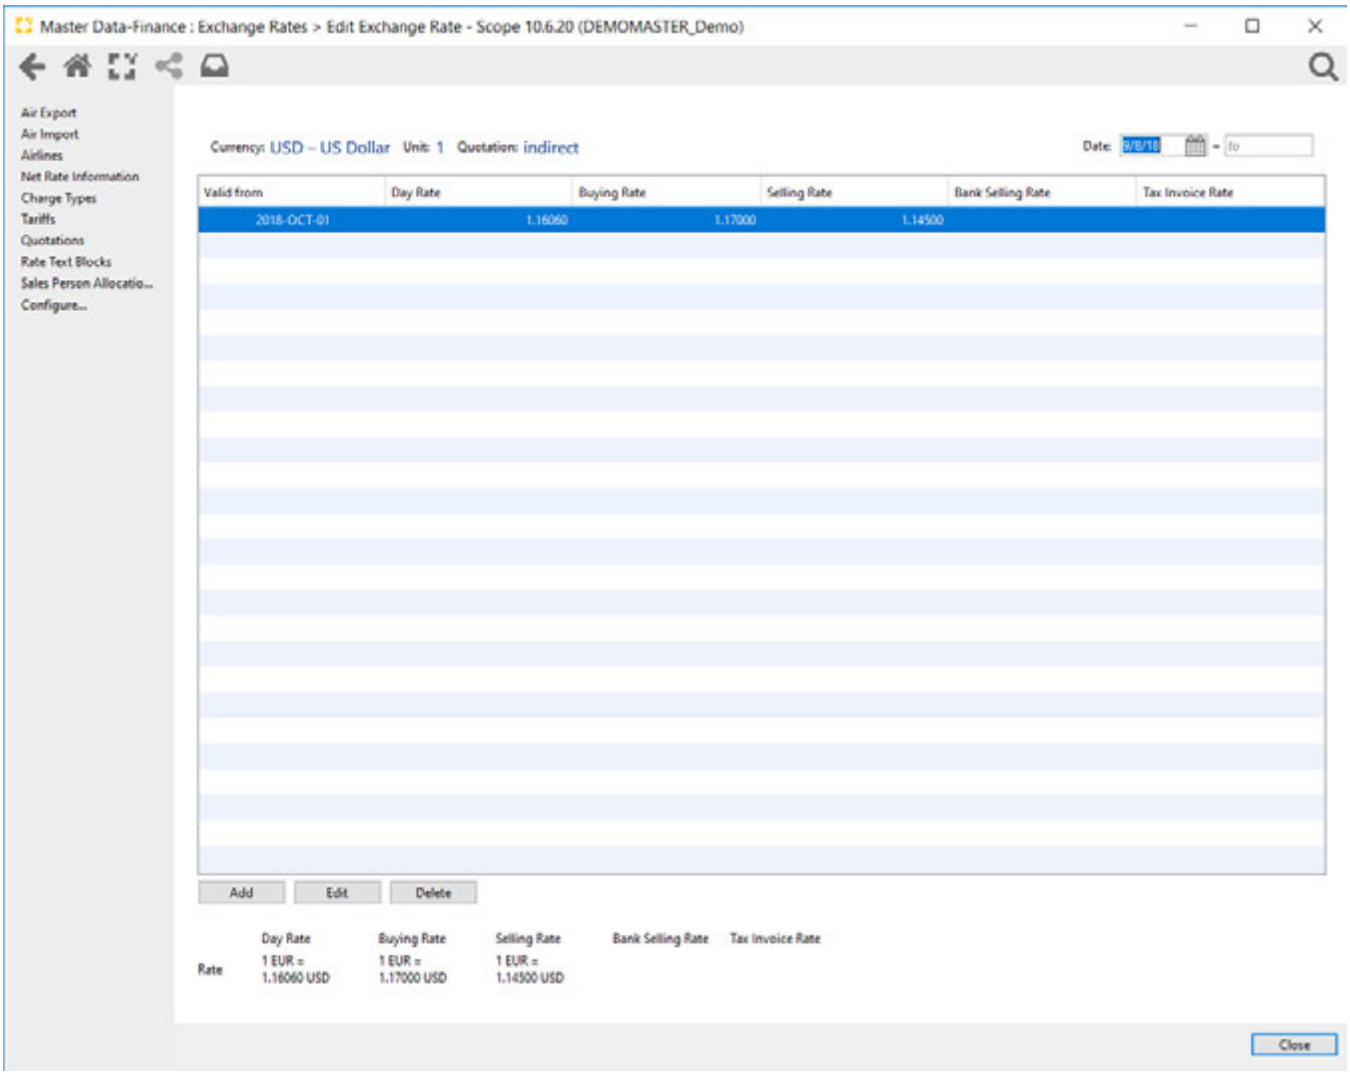
Saves the currency and exits the popup window.

Cancel

Exits the pop-up window without saving any changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Currency Editor



Currency Table: Code Units and Quotation type

The title of the currency table show the details of the currency and the listing beneath shows the actual exchanges rates. No rate is highlighted in the table, but any row may be selected and the details of this row will appear in the area below the table. This valid date and rates may then be adjusted. On selecting the *Apply* option, the new rates will appear in the table while the rates on which they were based will still be present.

> ⚠ Exchange rates should be maintained regularly. By appending new rows, an exchange rate *history* is created. This is useful since currency conversions are performed retrospectively. It is not necessary to maintain all the rate types of a currency, some may be left blank. *(See also the table exchange rates / rate types)*

Valid from

The Date, from which the exchange rate is valid.

Exchange rates / _Rate Types _

For each currency it is possible to maintain different types of exchange rates:

Rate Type	Description	Used In	Alternatively, if not maintained
Day Rate	Exchange rate at invoice level	Incoming and Outgoing vouchers	
Buying Rate *	Exchange rate on a single charge code line in foreign currency for a voucher in local currency	Incoming and Outgoing vouchers	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Selling Rate *	Exchange rate on a single charge code line in local currency for a voucher in foreign currency	Incoming and Outgoing vouchers	
Bankselling Rate	Exchange rate for Airfreight netrates	Airfreight export	
Country specific tariff rate	Exchanges rates specified by customs	Customs applications	

note:

For reduction of risk regarding business with foreign currencies it was normal to add a mutual buffer at the house rate.

This mutual buffer had some different effects:

example: official exchange rate EUR-USD 1.17 and rates with a small addition (1.20) or rather a small reduction (1.10)

local currency of forwarder = EUR.

Invoice in EUR with a line about 100 USD

rate on line	total amount (EUR)	result
1,10	90,91	good
1,17	85,47	~
1,20	83,33	bad

Invoice in USD with a line about 100 EUR

rate on line	total amount (EUR)	result
1,10	110,00	bad
1,17	117,00	~
1,20	120,00	good

To optimize above mentioned cases the house rate is split into a "buying rate" and "selling rate". At the setup of ECB-Download (https://www.ecb.europa.eu/stats/eurofxref/eurofxref-daily.xml) an addition or reduction can be adjusted.

Apply

Stores the rates and updates the summary table.

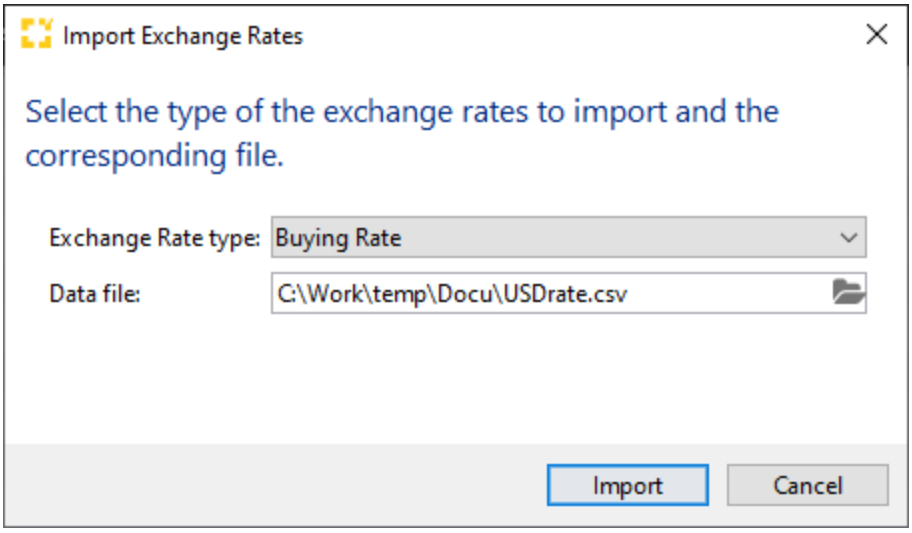
Close

Closes the currency editor.

Import of CSV-file

Exchange rates can be imported vis CSV file. Each exchange rate type must be imported seperately (see file format)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

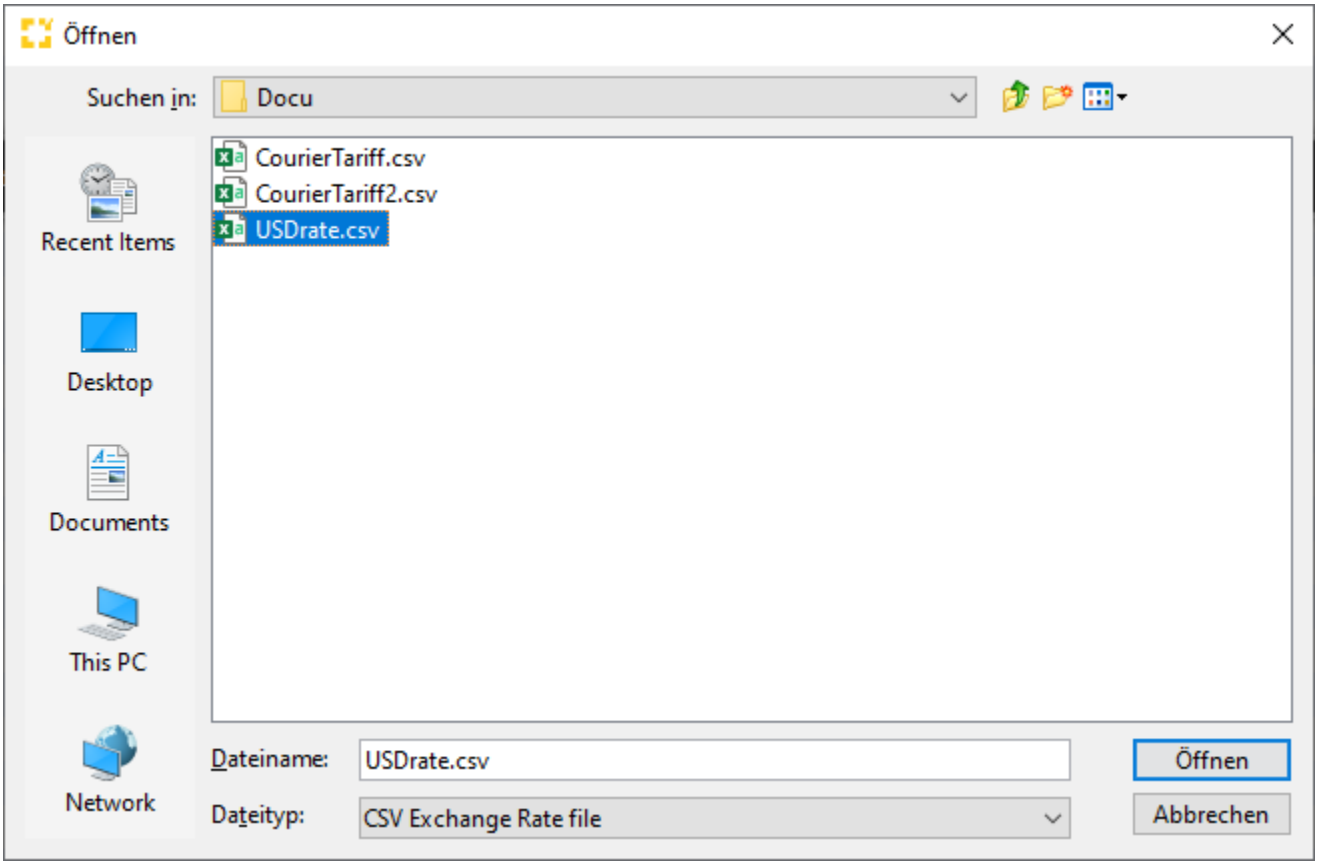


Exchange Rate type

Select the exchange rate type from the drop down.

Data file

Select the file from the directory. Enter the path or use  to open the search dialogue.



Mark the file and select *open*.

Import

Starts the file import and closes the pop-up.

Cancel

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Closes the popup without import.

File format

The import file needs to have the following criteria:

- CSV-Format (Semikolon separated file)
- column names need to match the following list:

Column #	Name	*description*
1	baseCurrency	Three-digit currency code
2	rate	rate using , as a separator
3	unit	unit
4	directQuotation	Indirect quotation = 0 / Direct quotation = 1
5	validFrom	valid from date in format DD.MM.JJJJ

Example:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ECB - Exchange rate download

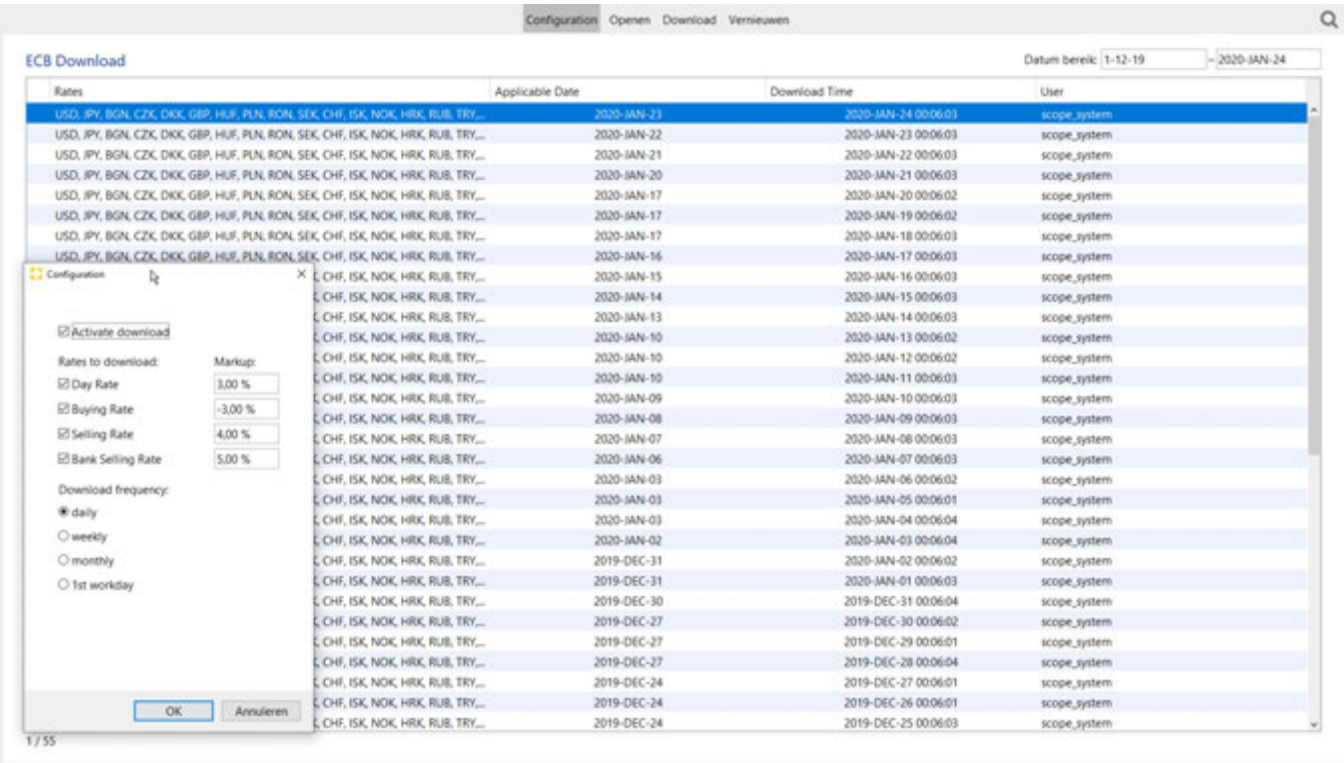
- Introduction
- Description

Introduction

As an additional feature it is possible to download the exchange rates as published by the ECB (European Central Bank) directly into scope.

Description

To review and maintain the download feature start the appliance Maintenance \ Finance \ ECB Download



Configuration

Under the configuration option (available under separate permission) the download is activated and the desired schedule is maintained.

Activate Download

Whether the download is active , yes or no

Rates to download :

Daily Rate	Update the daily rate when downloading the exchange rates, yes or no.
House Rate	Update the house rate when downloading the exchange rates, yes or no
Bankers Rate	Update the bankers rate when downloading the exchange rates, yes or no.

Download Frequency :

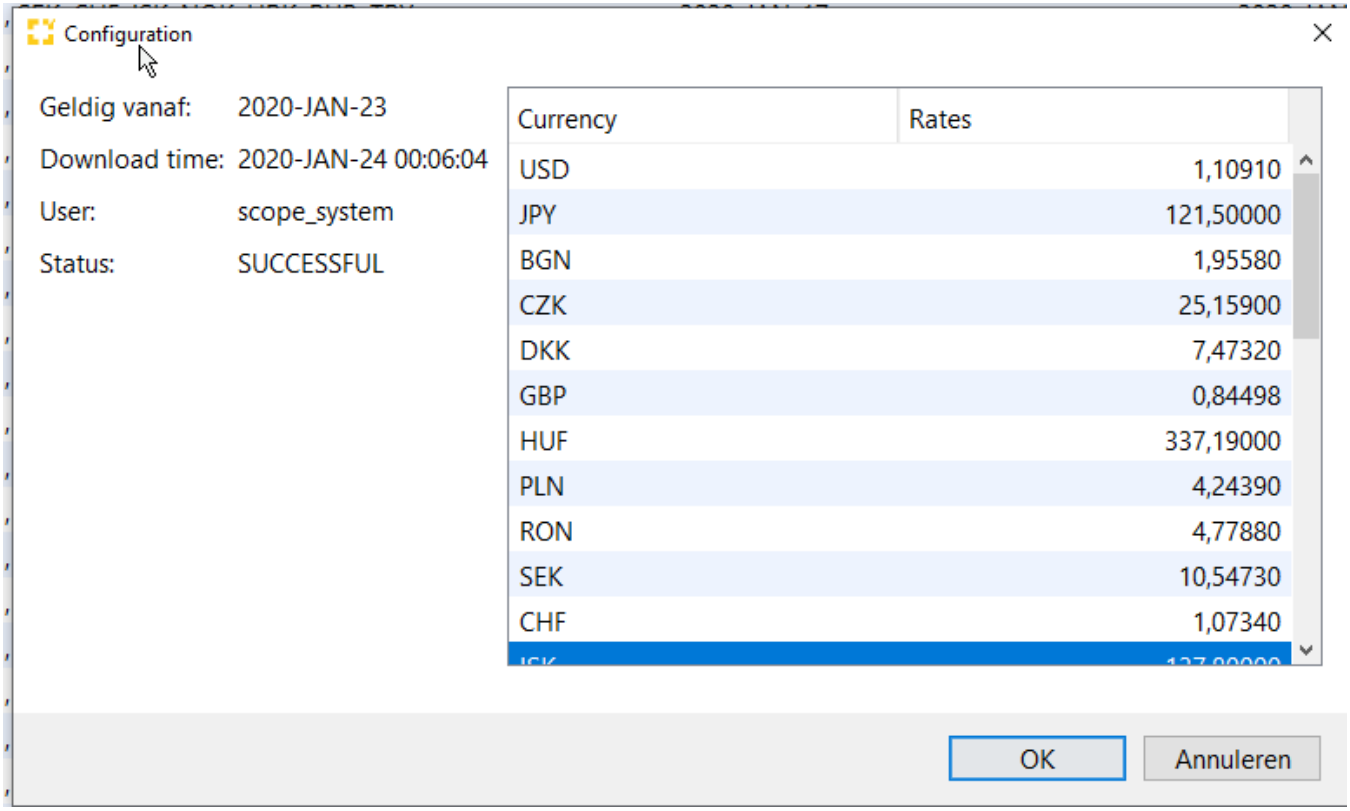
Daily	The exchange rate will be downloaded each day at 23:00 CET	
Weekly	The exchange rate will be downloaded on the selected day of the week at 23:00 CET	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Monthly	The exchange rate will be downloaded on the selected day of the month at 23:00 CET	

Open

Open the selected download to review the retrieved data. a successful download will also update the exchange rate application for the included currencies.



Download

Download the latest version of the ECB rates. (only active when the configuration has been performed)

The following currencies are included in the Download: USD, JPY, BGN, CZK, DKK, GBP, HUF, PLN, RON, SEK, CHF, ISK, NOK, HRK, RUB, TRY, AUD, BRL, CAD, CNY, HKD, IDR, ILS, INR, KRW, MXN, MYR, NZD, PHP, SGD, THB, ZAR
Other currencies should be maintained manually.

Homeview Grid

In the application homeview the displayed downloads can be filtered on basis of a date range, linked to the publication date.

Rates

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The list of currencies downloaded from the ECB

Applicable date

The publication date of the exchange rates by the ECB

Download time

Date / Time the download was retrieved from the ECB

User

The user who actually did the download

Import exchanges rates from CSV

- Introduction
- Description

Introduction

Exchanges rates can be imported from a CSV file.

Description

Import CSV Data

Exchanges rates can be imported from a CSV file. Each type of rate must be imported separately.

Exchange rate type

Select from the drop down list the type of rates that will be imported.

Data file

The location of the data file. The can be used to open a file browser to navigate to the file location.

OK

Starts the import and closes the pop-up window.

Cancel

Closes the pop-up window and cancels the importation of the file.

File Format

The import file must have the following format:

- CSV-Format (Semi-colon delimited file)
- with column headings according to the following description

Column	Column heading	Description
1	baseCurrency	The tree didgit alpha-numeric currency code
2	rate	Exchange rate with a decimal place.
3	unit	Unit size
4	directQuotation	Indirect Quotation = 0 / Direct Quotation = 1
5	validFrom	valid date in the format DD.MM.YYYY

Example:

```
baseCurrency;rate;unit;directQuotation;validFrom
USD;1,2370;1;0;15.11.2010
```

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Finance - Master Data

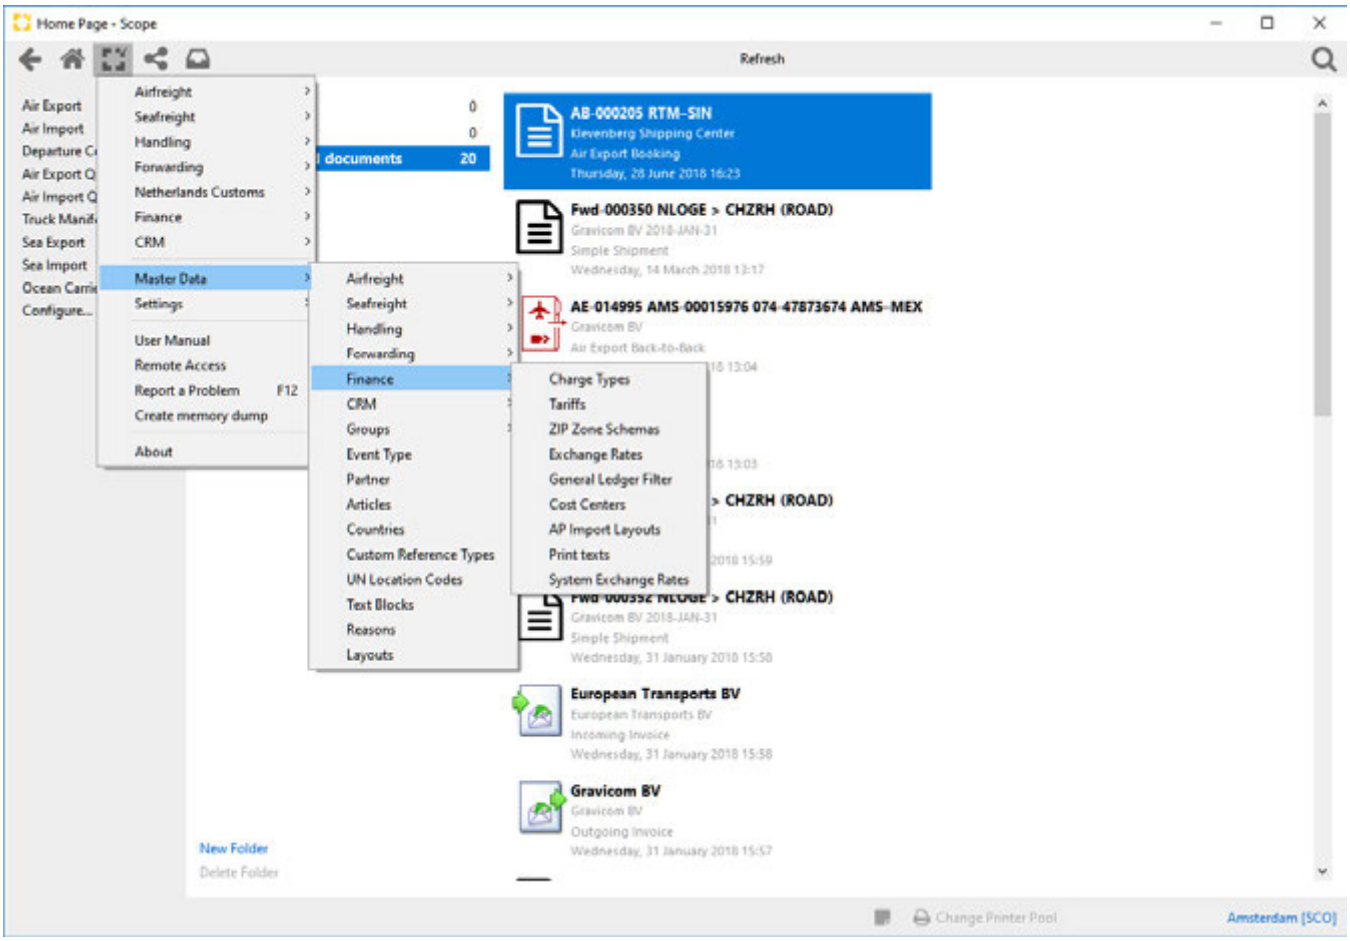
- Introduction
- Description

Introduction

Applications within this section are used to manage master data for financial operations and includes Charge Types and Tariffs.

Description

From the *Master Data* menu, the *Finance* sub-menu can be selected and when the cursor hovers over this option a set of sub-menu items will appear.



The following applications are available.

- AP Import Templates - Finance - Masterdata
- Charge Types - Accounting - Maintenance
- Cost Center Filter - Accounting - Maintenance
- Cost Centers - Accounting - Maintenance
- General Ledger Filter - Accounting - Maintenance
- Rate Imports
- Regions - Accounting - Maintenance
- Tariffs - Accounting - Maintenance
- Zip Zones - Accounting - Maintenance

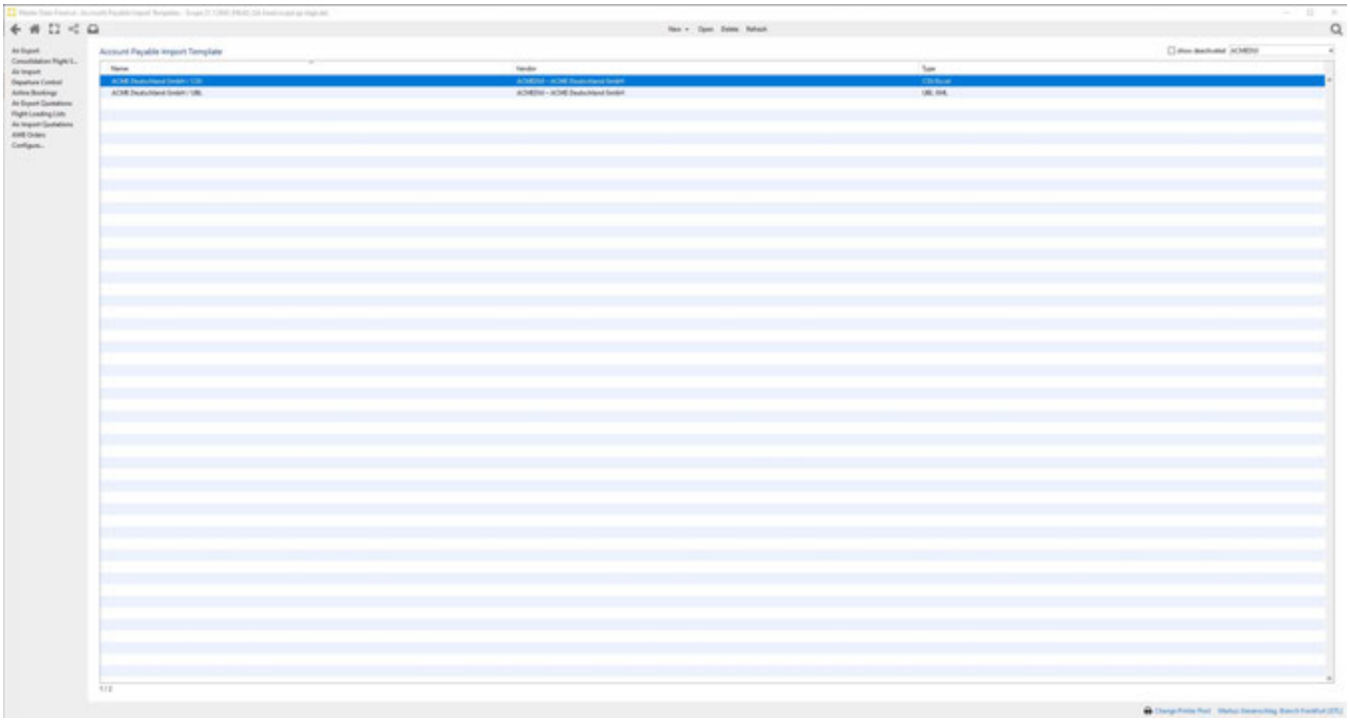
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AP Import Templates - Finance - Masterdata

Introduction

Scope provides a function to create an Account Payable by importing a CSV-file. To properly map the data contained in the CSV-file a template needs to be defined beforehand.

Description



Actions

New

This action will create a new AP Import Template

General Tab

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

General

- Type Determine whether the template is for CSV-files or UBL-files
- Template name Name of the template, in order to select it when processing the actual file

Vendor

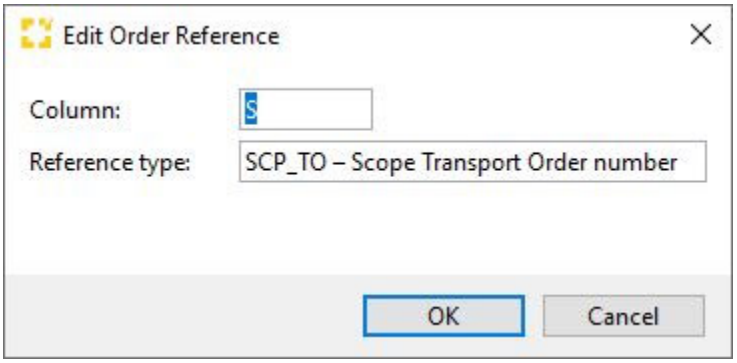
- Fix vendor / Determine Vendor Indicator account number" listed in the csv file Whether the layout definition applies to a fixed vendor or if the vendor is determined on basis "creditor
- Vendor Account number contains the account number In case the previous radio is set to the creditor account number, insert the column letter which

Note: the matching is done on creditor accounting number and not on partner code

Reference Columns

New

Opens a window to register a new AP Import Template



- Column: The respective column in the CSV to read the reference from
- Reference type: The type of reference. The type can be chosen from the list of available references.

Edit

Opens the marked entry for editing.

Delete

Deletes the marked entry

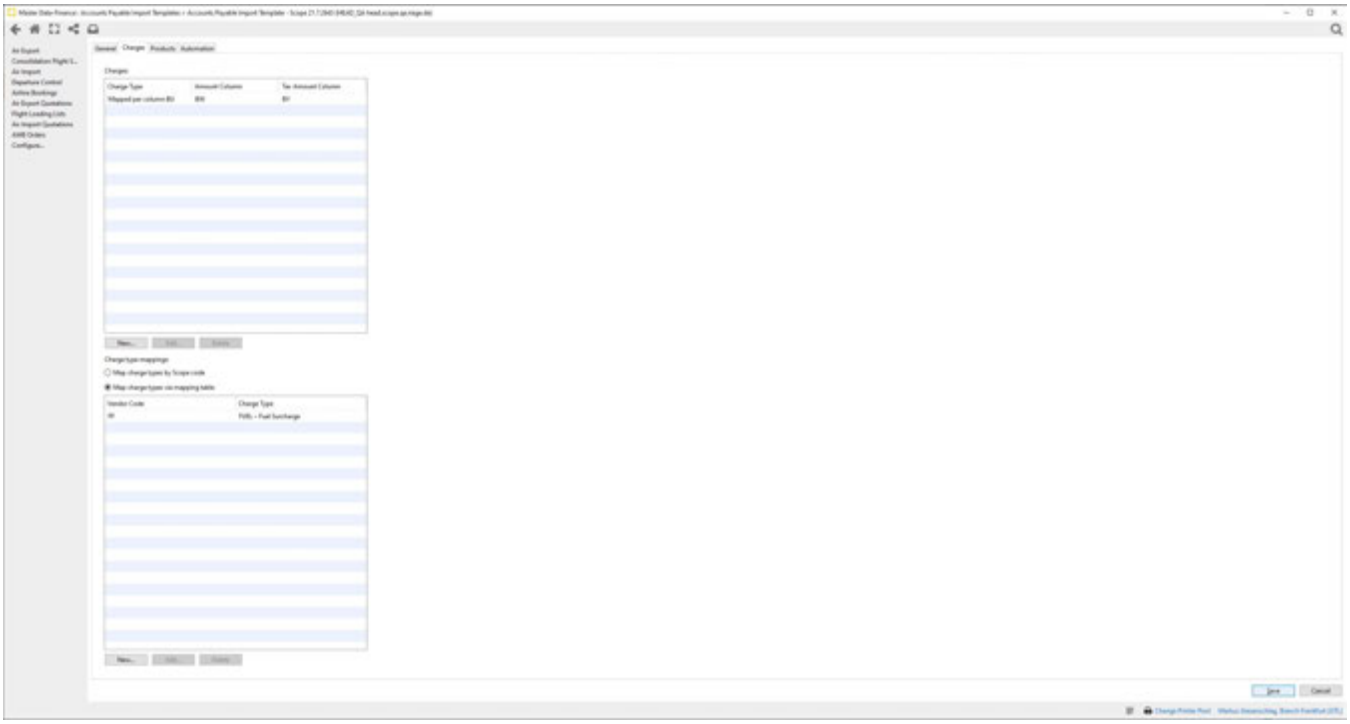
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Additional parsing information
- Skip Header: If active, the first line in the csv file will be interpreted as Header. To skip other lines see 'Lines to Parse'
- Field Seperator: Identifies the character used as field separator
- Decimal point: Indicate which character is used as "decimal"
- Date Format: Indicate the format in which the date fields are populated
- Lines to Parse: Indicate if lines should be skipped during processing (for instance header or file start/end lines)
    - All data lines : All data lines should be processed (all lines are equally formatted)
    - Identify lines by column value: Lines that should be processed are recognized by value (indentifier) in the indicated column
    - Skip lines by column value: Lines that should not be processed are recognized by value (indentifier) in the indicated column

Data

- Invoice number: The invoice number of the supplier,
- Internal number: The booking number assigned to the purchase invoice
- Invoice type: Indication of type of Invoice (normal or credit invoice)
- Credit Note id: If the previous column is used, this additional field is mapping to the column where the credit-invoice number is registered
- Invoice date: Invoice issue date
- Invoice due date: Due date of the invoice when it should be paid
- Currency: The currency of the invoice
- Total Amount Line: Total amount per Taxable type (sum of VAT basis amount per VAT type (taxable / free)
- Total Vat amount line: Total amount TAX per Taxable type (sum of VAT basis amount per VAT type (taxable / free)
- Total Invoice amount: Total invoice amount including VAT
- Total invoice VAT: Amount Total Invoice VAT amount

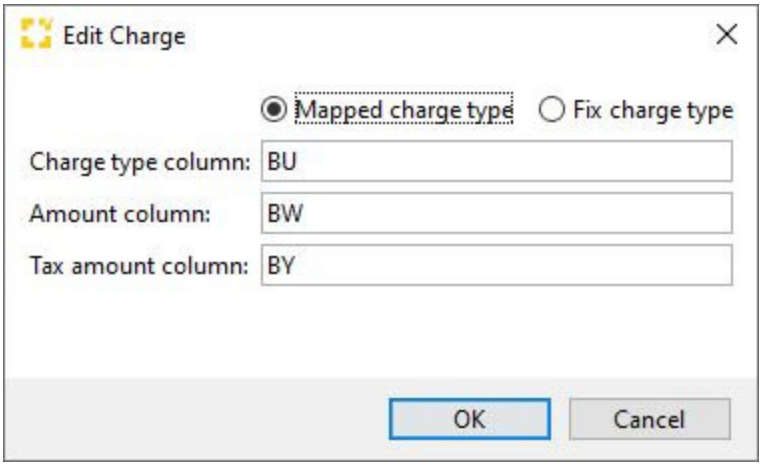
Charges Tab



Charges

New

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Charge type column: The respective column in the CSV to read the charge type from.
- Amount column: The respective column in the CSV to read the charge amount from
- Tax amount column: The respective column in the CSV to read the tax amount from if applicable

Edit

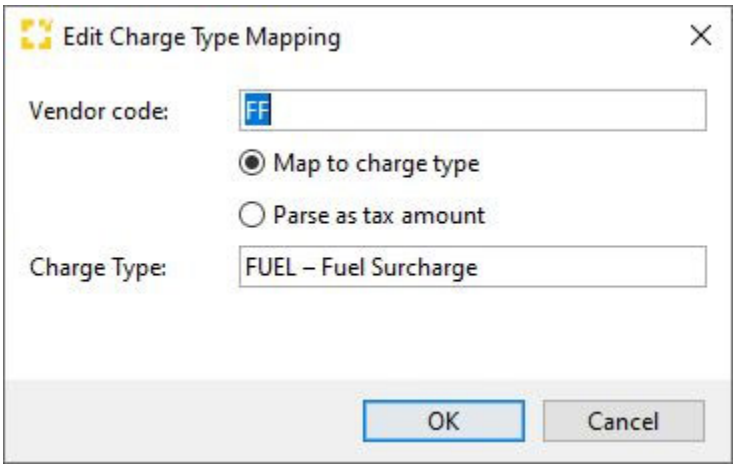
Opens the marked entry for editing.

Delete

Deletes the marked entry

Charge type mapping

New



- Vendor code: The respective column in the CSV to read the charge reference from
- Charge Type: The Scope charge type to map to
- Radio button "Map to charge type": The provided reference is mapped to the Scope charge type provided
- Radio button "Parse as tax amount": A line with the provided reference is treated as a tax amount

Edit

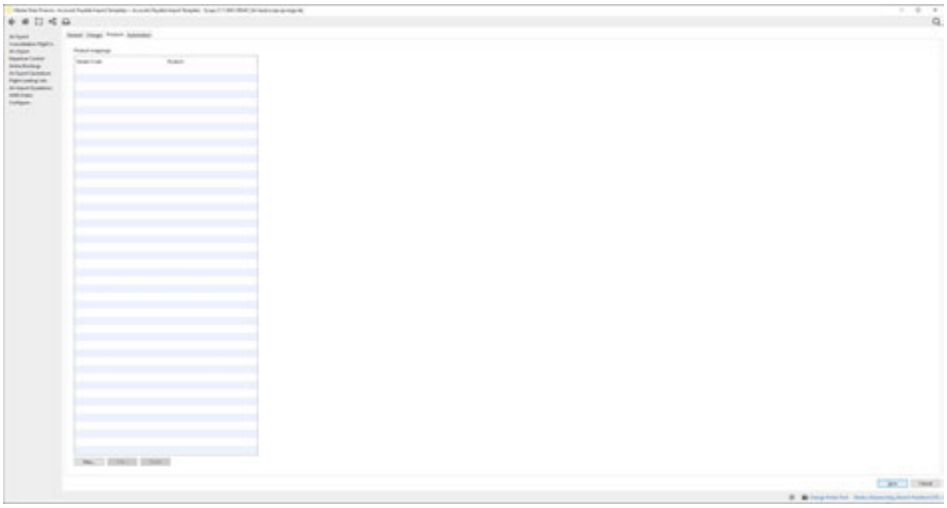
Opens the marked entry for editing.

Delete

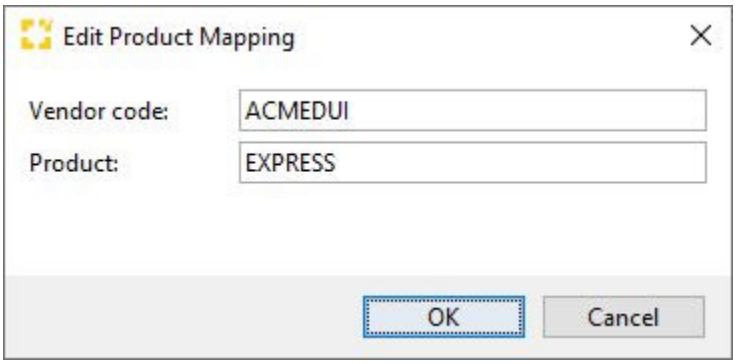
Deletes the marked entry

Product Tab

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



New



- Vendor code: The vendors code for the product involved in the billed service
- Product: Scope code for the product involved in the billed service

Edit

Opens the marked entry for editing.

Delete

Deletes the marked entry

Cancel

Exits from the action without saving

Automation Tab

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Create accounts payable: Tick this box if you want the accounts payable to be created automatically
- Finalize accounts payable: Tick this box if you want to finalize the accounts payable automatically providing the following conditions are met.
- Absolute amount: Maximum deviation of charge amounts between previously registred estimate amounts and amounts charged in the import
- Percentage (%): Percentage deviation of charge amounts between previously registred estimate amounts and amounts charged in the import

Edit

Opens the highlighted AP Import Template for editing. Alternatively the AP Layouts can be opened and edited by double clicking it.

Refresh

Refreshes the index to ensure the latest AP Import Templates are visible.

Show removed

Check this box to include AP Import Templates that may have been removed.

Type to Search

This is a full text search field. Enter the AP Import Template code, name or part thereof to search for the desired AP Import Template

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Charge Types - Accounting - Maintenance

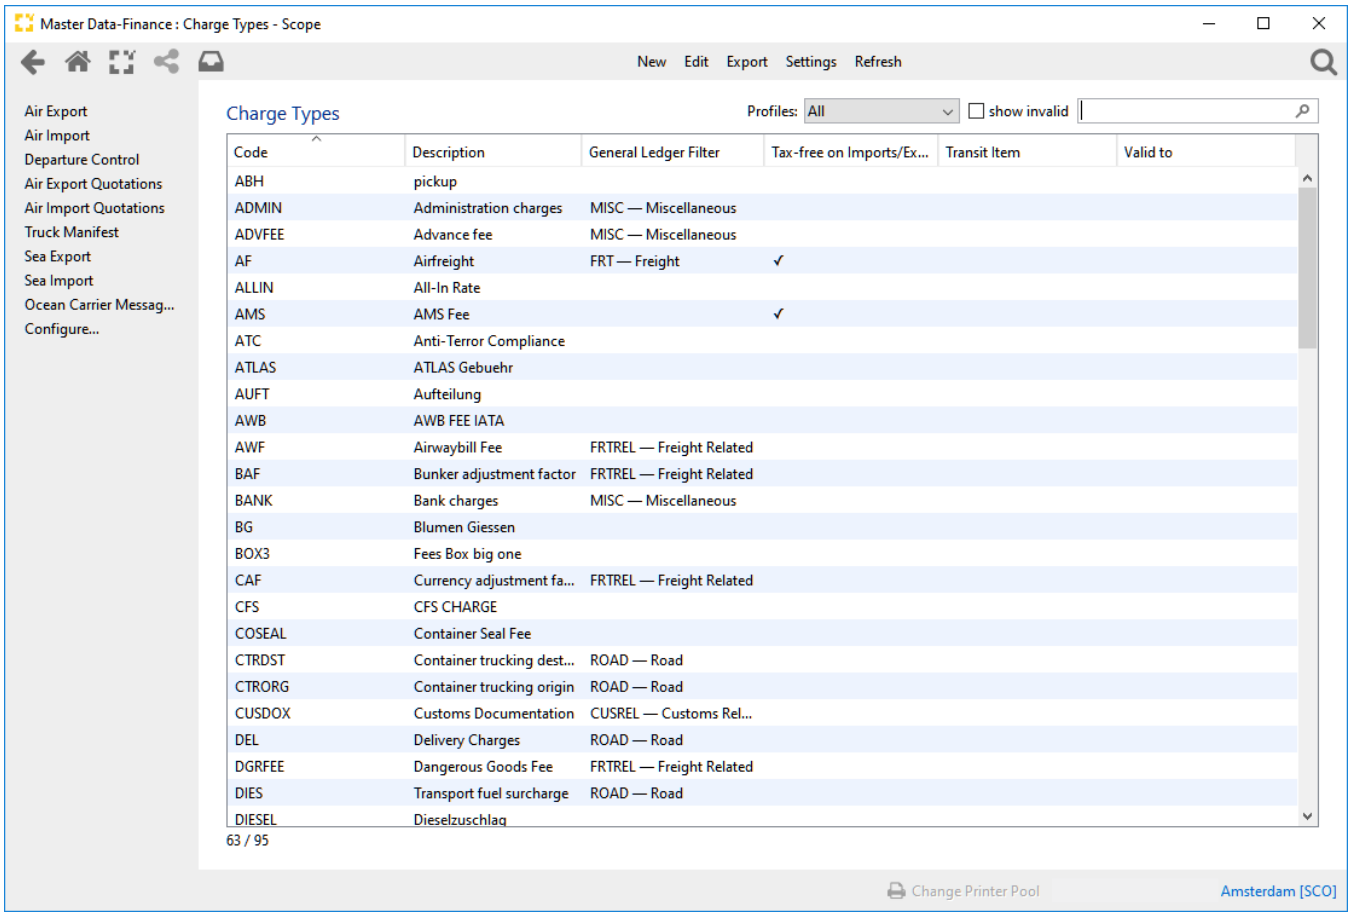
- Introduction
- Description

Introduction

Cost types represent individual services that are billed to the customer or billed by a supplier. There are many elements of a charge type that can be defined which enables advanced automation of the behavior of the charge type during accounting operations such as issuing invoices or calculating profit shares. Proper setup of charge types is essential to obtain accurate job-costing from the system.

Charge types are assigned a unique code of up to 6 characters. This code is shown as the reference for the charge during jobcosting operations.

Description



New

Opens the charge type editor where a new charge type can be created.

Edit

Opens the charge type highlighted in the list using the charge type editor in order for adjustments to be made. Alternatively a charge type can be opened for editing by double clicking it.

Export

Exports the listed charge types to a spreadsheet that may be opened on the local computer.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Setting

Customs charge type setting (if any) for the highlighted charge type can be added here

Refresh

Updates the list of displayed charge types to ensure the latest charge type information is visible.

Profiles

Special profiles can be applied to charge types that allow additional information to be appended to them for use in specific applications. For a charge type can be given the profile **AWB Other Charge** which allows special information to be applied to the charge when it is used in an air export shipment. The *Pro files* drop down menu shows a list of currently available profiles and selecting a profile will filter the list of charge types to include only those that possess the selected profile.

Show removed

Includes charge types that have been deleted.

Type to search

Enter keywords in the search field to filter the list of charge types.

Charge Types

Charge types are listed in the table showing:

- **Code** - the code of the charge type
- **Description** - Full description of the charge type
- **General ledger filter** - The general ledge code for the charge type
- Tax free on imports - Tax fee item
- Transit item - Costs identical to charges
- **Valid from - valid to** the validity date range for the charge type

Charges types may be sorted by column if the desired column header is clicked.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

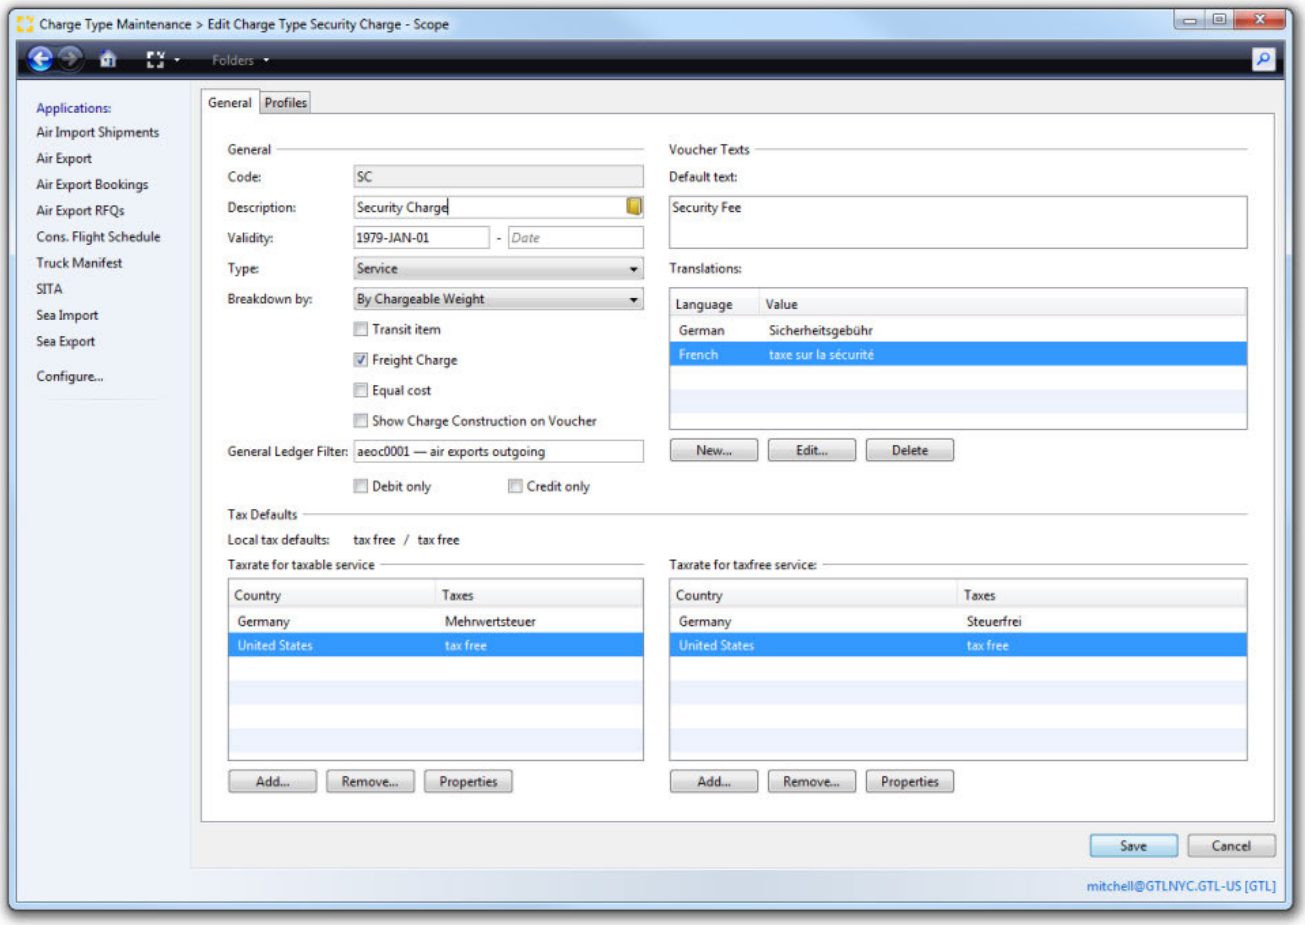
General - Charge Types - Accounting - Maintenance

- Introduction
- Description

Introduction

The **General** tab is where detailed information about the charge type is stored. Careful maintenance of this area is required to ensure accurate and efficient finance operations.

Description



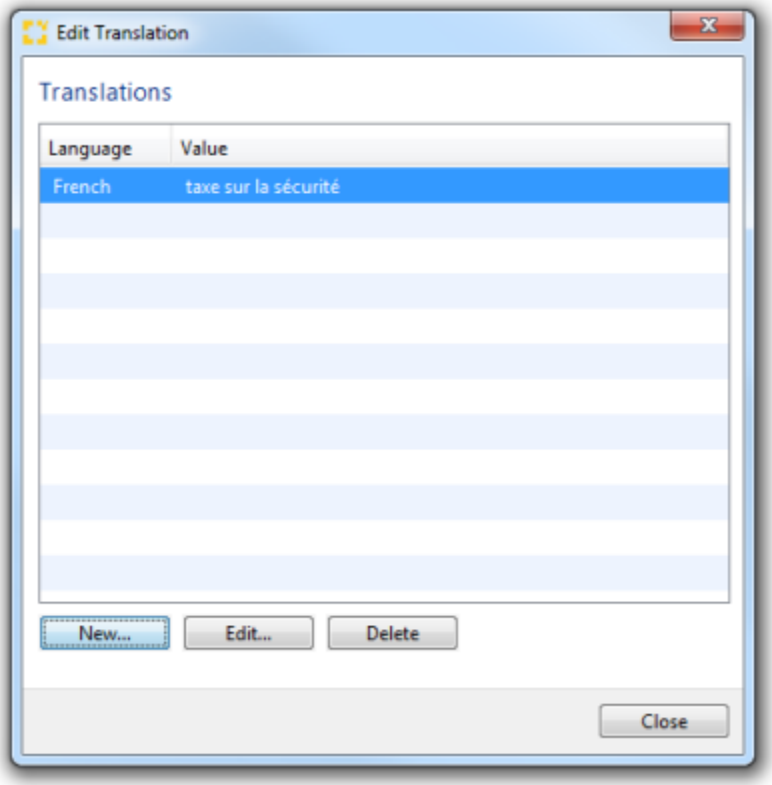
Code

Any code can be chosen to represent the charge type, but it must be unique and up to 6 digits long. Once saved, this code cannot be changed.

Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The description of the charge type. Clicking the  icon will launch the translation editor. This is used to translate the description into different languages. This enables automatic translation of a charge type description to a different language when a foreign language document is produced.



New

Opens the language selection popup where the language and translation may be entered.

Edit

Opens the selected translation in the language selection popup in order for the translation to be changed.

Delete

Deletes the selected translation.

Close

Closes the translation editor.

Validity

The date from which the charge type is valid, to the date on which it expires. If the "to" date is left blank it is assumed the charge type has no expiry date.

Type

It must be defined if the charge type is for:

- Services
- Goods
- Duties

This is important for statistical purposes.

Breakdown by:

When a charge is applied at a master level, in order to obtain jobcosting figures for the houses on that master, the master charges must be apportioned among the house shipments. This drop down menu enables the method of apportioning the charge from master to house to be selected:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **No Breakdown** The charge is never broken down.
- **Equally** The charge will be divided equally amongst all the house shipments.
- **By chargeable weight** The charge will be pro-rated according to the chargeable weight of each house shipment.
- **By gross weight** The charge will be pro-rated according to the gross weight of each house shipment.
- **By volume** The charge will be pro-rated according to the volume of each house shipment.
- **By number of pieces** The charge will be pro-rated according to the number of pieces on each house shipment.
- **By Profit share** The charge will be pro-rated using the Profitshare (CPA) applied to each house shipment.

Costs can only be broken down to house shipments.

Transit Item

The check box is used to exclude a charge code from profit reporting. This may be desirable for some charges whose income and costs are equal and therefore there will be no profit or loss on this charge type. This can simplify profit reports by presenting only charges that positively or negatively impact final profit figures.

Freight Costs

This field is of importance in countries where taxes are charged on freight forwarding operations. In these countries, normally taxes are not charged on freight charges that occurred outside of the country where the shipment will be billed. For example on an air import shipment, any charges that occurred outside of the country where the charges will be billed will be marked as freight charges in order for them to appear as tax free charges when the shipment is billed to the responsible party.

Equal Cost

These are charges whose costs will always be the same as the income amount. Finance applications will automatically create cost reserves for these charges that match the income amount. These charges will also appear on profit reports.

Show Charge Construction on Voucher

The method used to construct the total amount of the charge code will be printed on the voucher.

General Ledger Filter

A general ledger code must be applied to the charge type.
General ledger codes can be found using the Field search function

debit only

The charge type can only be used on outgoing documents

Credit only

The charge type can only be used on incoming documents

Voucher Texts

Texts to be included on documents when the charge type is used.

Translations

Translations of voucher texts used on documents.

New

Opens a pop-up window to create a new translation

Edit

Edits the text highlighted in the translations list.

Deletes

Deletes the selected text

Language

Use the Field search to find the desired language.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Value

The test translation

OK

Saves the translations and exits.

Cancel

Closes the pop-up window without making any changes.

Tax Defaults

Define taxes for the charge type

Add

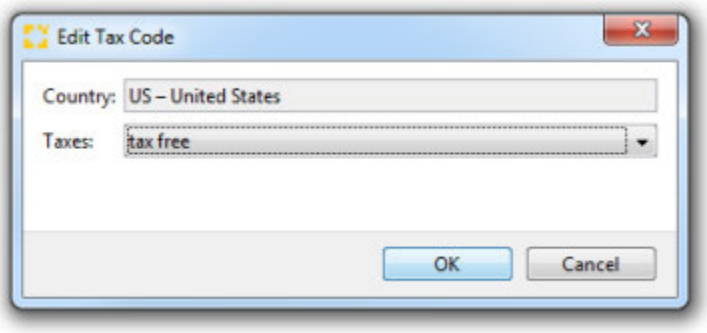
Opens a pop-up window where the taxes applied to this charge type for a specific country can be recorded.

Remove

Removes the highlighted tax entry

Properties

Opens a tax editor to change the tax properties of the charge type.



Country

The country where the taxes apply. Use the field search function to locate the desired country.

Taxes

The drop down list will present tax types for the country selected. These are maintained in the country master data.

OK

Saves the tax entry.

Remove

Removes the tax entry

Properties

Opens the tax entry in an editor.

Save

Saves the general details of the charge type.

Cancel

closes the general tab of the charge type without any changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

More specific charge type details are stored using the profiles tab .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

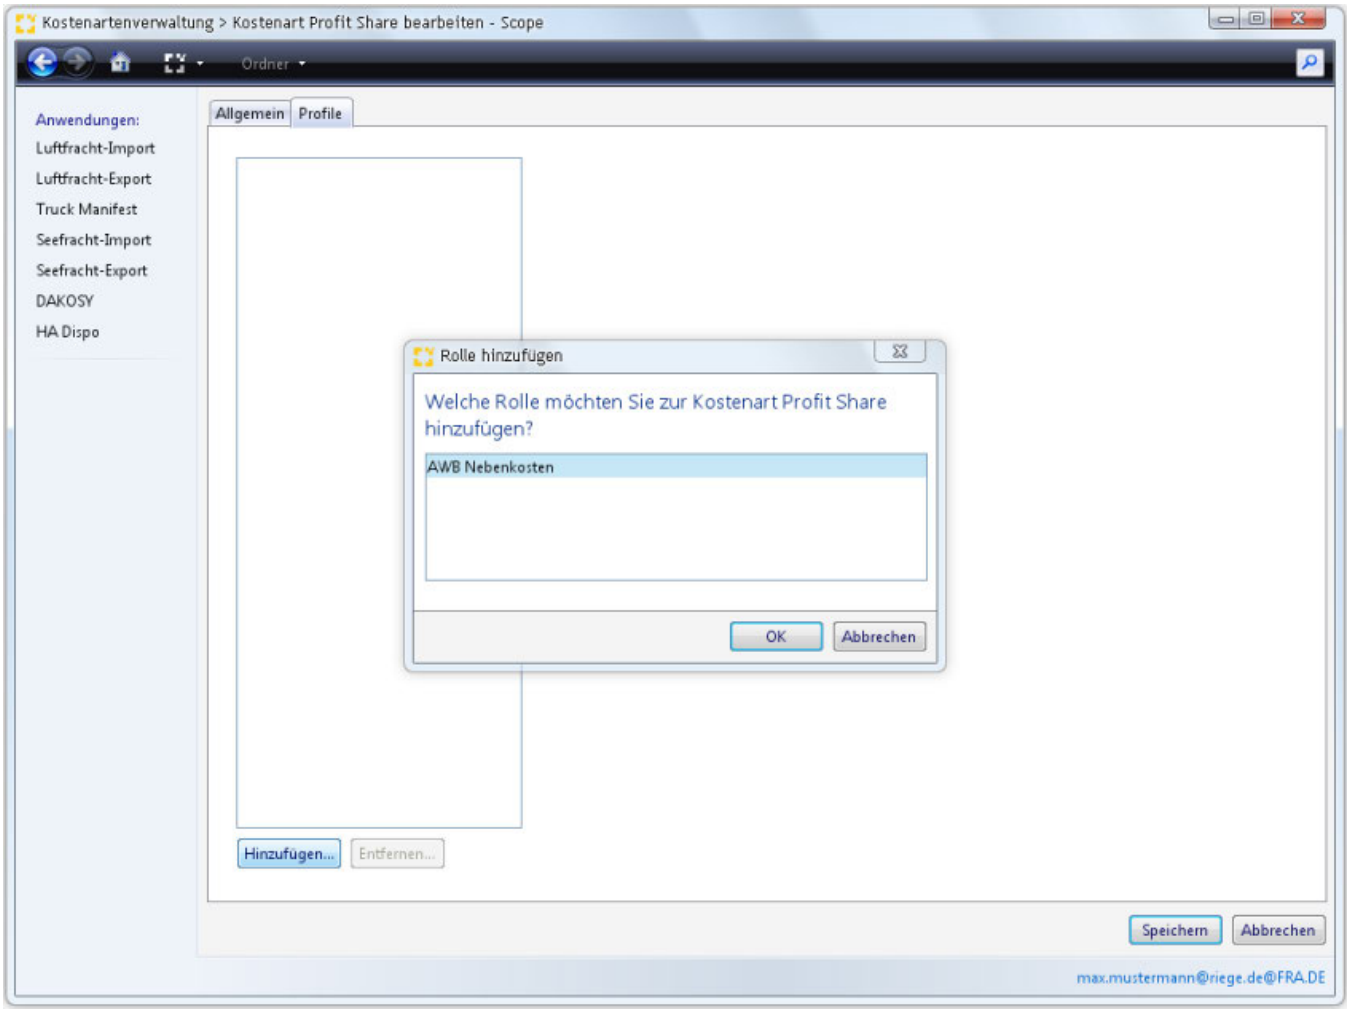
Profile - Charge Types - Accounting - Maintenance

- Introduction
- Description

Introduction

Profiles for charge types are similar to roles for partners in that they contain additional data to be used only in specific activities. This application allows profiles to be added, removed and managed.

Description



Add

Opens a pop-up window from where the desired profile can be selected. By clicking *OK* the selected profile will be added to the charge type. *Cancel* will close the pop-up window without further action.

Currently the following profiles are maintained:

- AWB Other Charges

Remove

Removes the highlighted profile.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Save

Saves the changes to the charge type and exits the editor.

Cancel

Closes the editor without any changes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

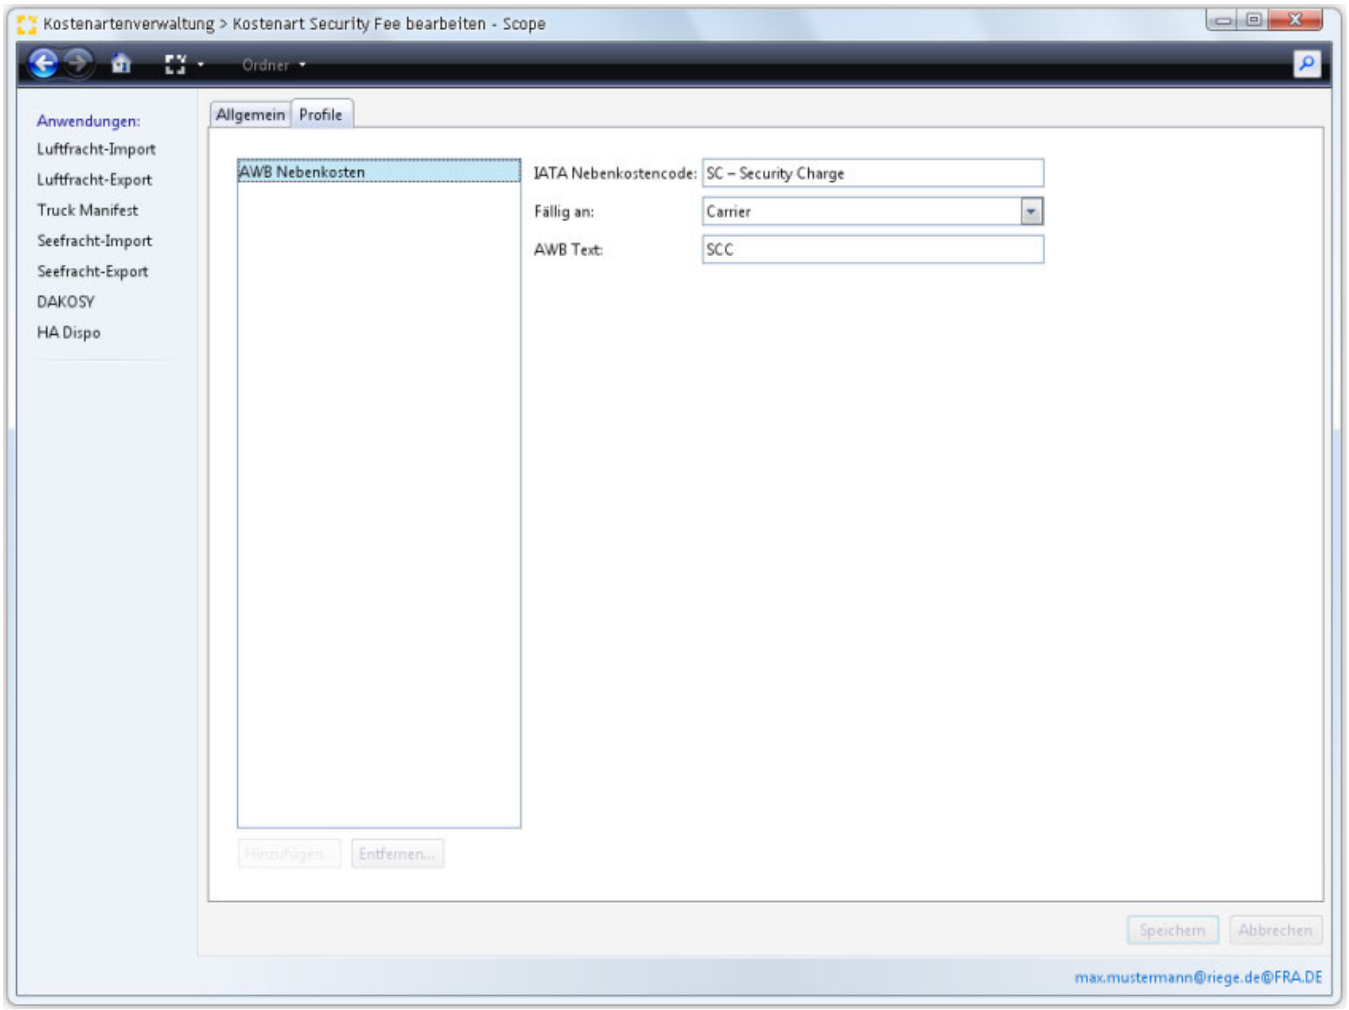
AWB Other Charges - Profile - Charge Types - Accounting - Maintenance

- Introduction
- Description

Introduction

The AWB Other Charges profile is used when the charge code is one that is used in air export shipments and is included in AWB charges. Air export specific information about the charge type is stored.

Description



IATA-Other Charge Code

The corresponding IATA other charge code for the charge type. The field search function can be used to find valid codes.

Payable to:

A drop down menu where the party to whom the charge is payable can be chosen. The options are *due Carrier*, or *due Agent*.

AWB Text

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This field will accept a maximum of 9 characters, and this text will appear on the AWB when the charge is used. If left blank the 2 digit IATA codes is used instead.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

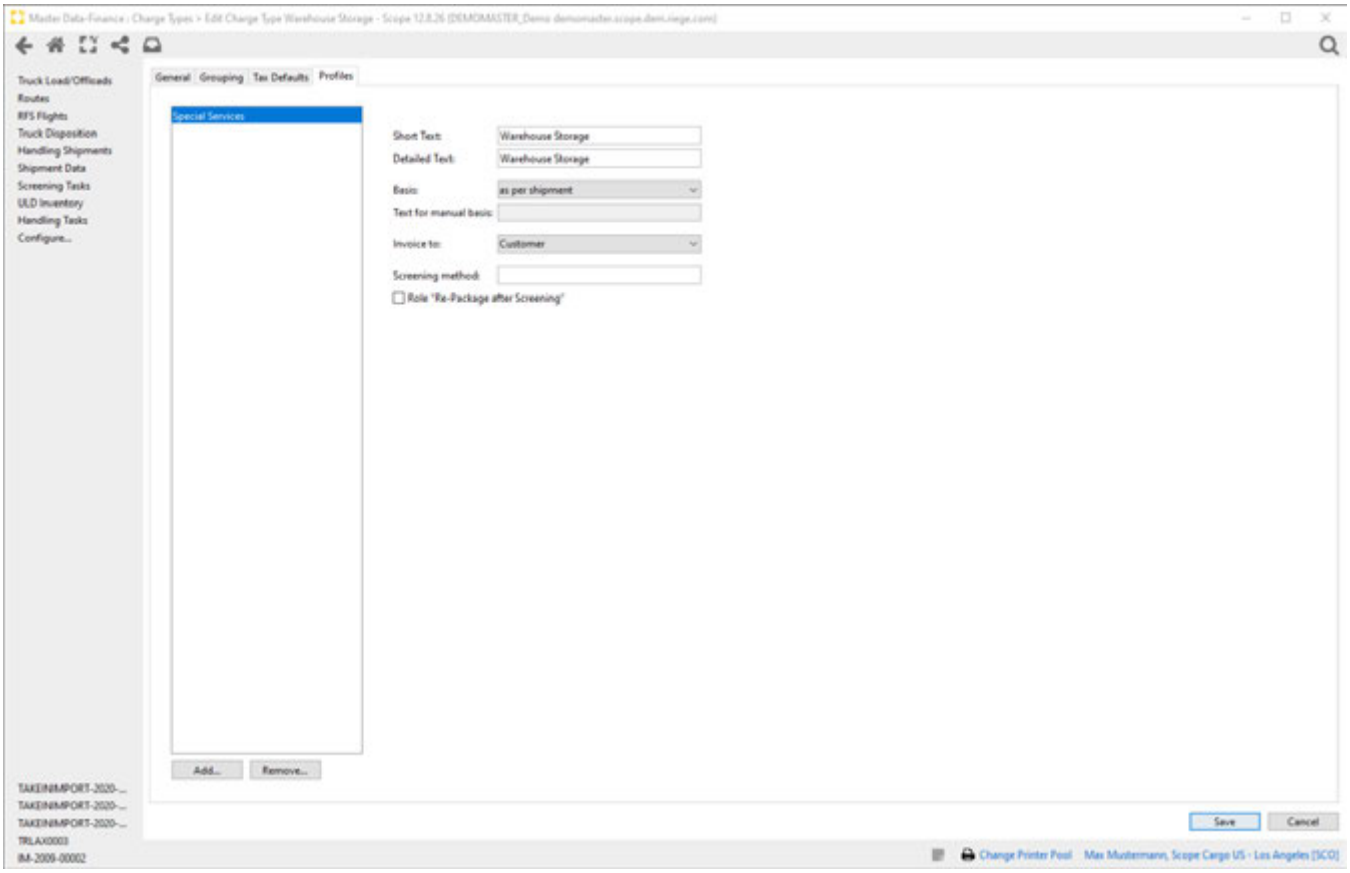
Special treatments - Profile - Charge Types - Accounting - Maintenance

- Introduction
- Description

Introduction

In the charge type profile special treatments, charges can be recorded that need to be recorded in the scope handling product under special services.

Description



Short Text

Name of the special treatment

Detailed Text

A detailed description that will also be displayed as a help, when the profile of the charge type is used.

Basis

The following possible billing bases are available to define.

Type	Description
As per shipment	Calculation based on the shipment data
Number of Pieces	Calculation per package

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Gross Weight	Calculation per kilo of actual weight
Resource Time	Specification in minutes that was required to provide the service
Manual Entry	Entry is done manually by the user

Text for manual basis

Only to be filled if manual entry was entered as the basis. The user fills the field individually as required.

Invoice to

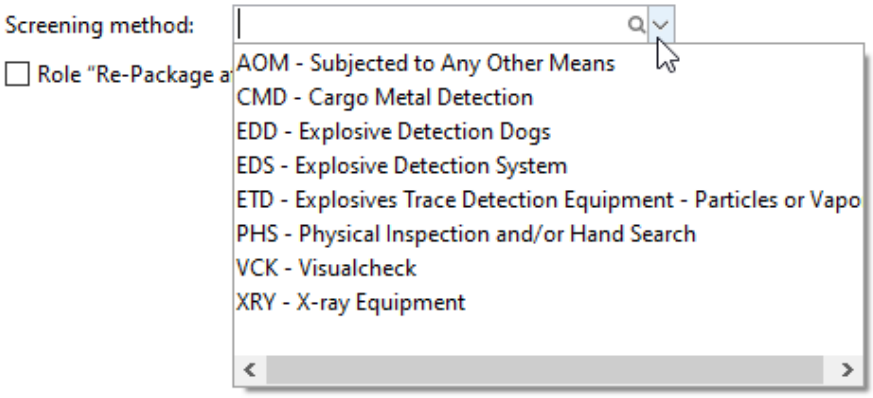
partner to whom the special treatment will be charged

The following possibilities are available:

- Customer
- Consignee
- Collector

Screening method

A screening method can be chosen here.



Role Re-Package after Screening

Re-Package after Screening can be defined here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

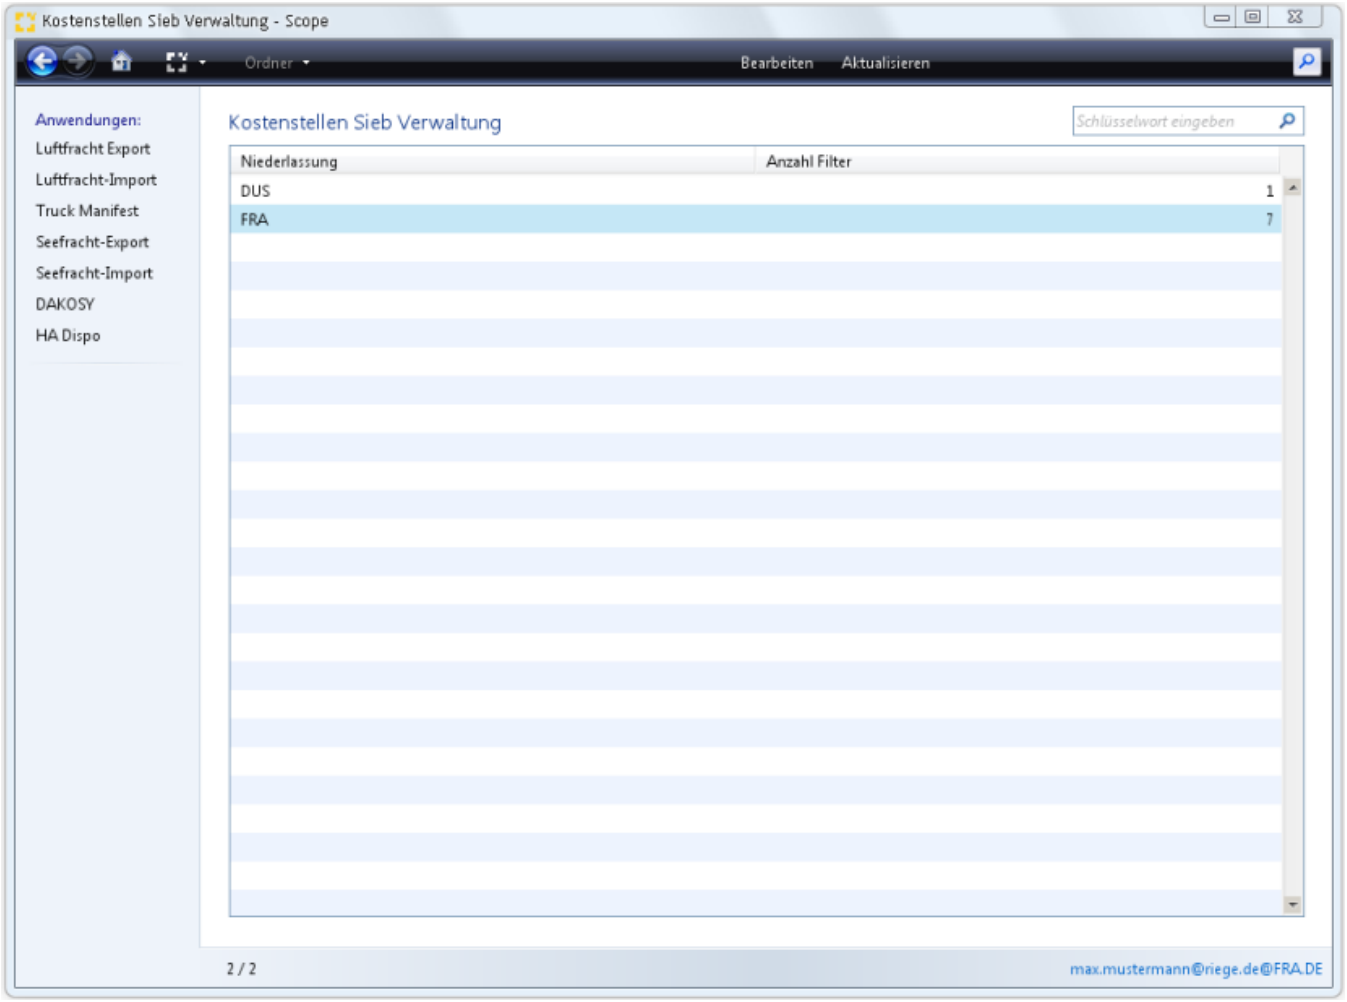
Cost Center Filter - Accounting - Maintenance

- Introduction
- Description

Introduction

This application is used to combine cost centers under branches. Cost centers can be assigned to these branches according to criteria such as type of transport, mode, departure, destination, customer and user.

Description



New

Edit

Opens the branch highlighted in the overview with the filter editor .

Refresh

Refreshes the index to ensure the latest cost center filters are visible.

> ⚠ Only the filter for the branch where the user is logged in will be displayed.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type to search

This is a full text search field.

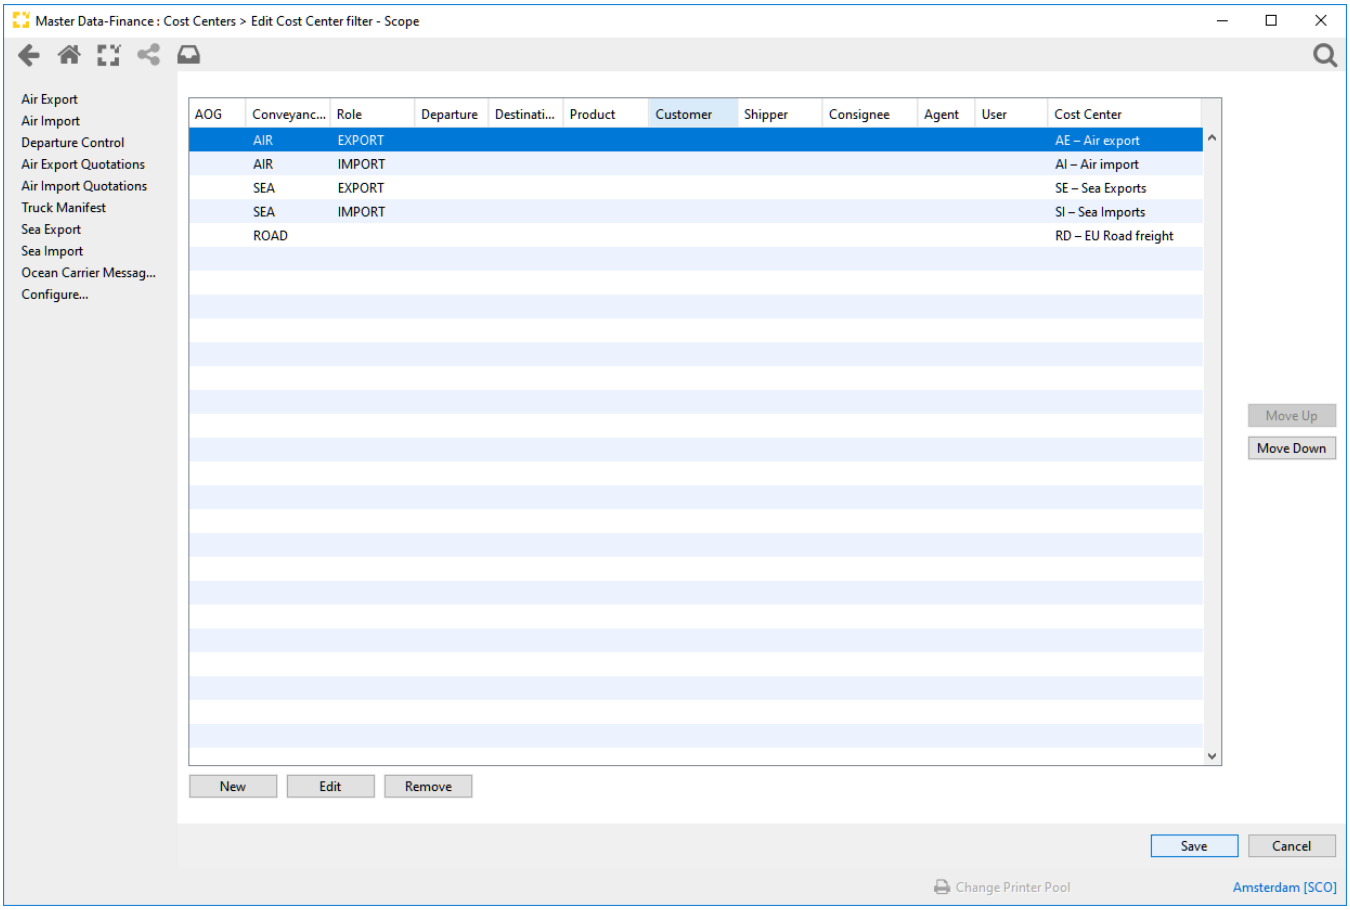
Cost center filter - Summary table

The summary table display the names of the branches and the number of filters applied to each.

Filter

The filter display the individual filters applied to the branch in table format. Each filter is comprised of the elements from which is it constructed:

- AOG - Aircraft on ground
- Conveyance - air, sea or road
- Role - Import or export
- Departure
- Destination
- Product
- Customer
- Shipper
- Consignee
- Agent
- User
- Cost center name



New

Opens the Filter Editor to capture a new filter.

Edit

Opens the filter highlighted in the summary table with the Filter Editor in order to make adjustments to the filter.

Remove

Deletes the filter highlighted in the summary table.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Move up

Moves the filter highlighted up the list of filter.

Move down

Moves the filter highlighted down the list of filter.

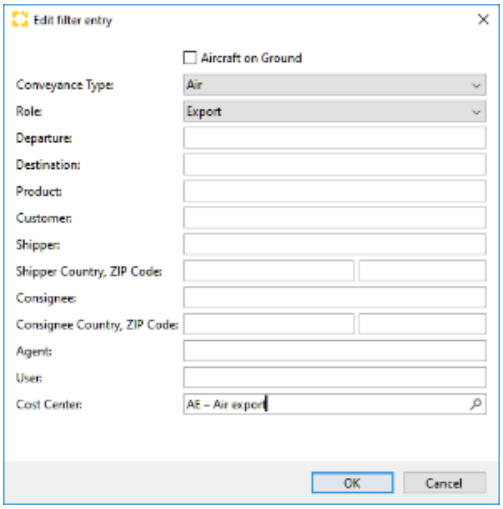
> **Order**
>
> Cost center filters are processed sequentially. This means they are read from top to bottom. The first filter in the branch that matches the financial transaction will be used without reference to other filters. It is therefore important that the most specific cost center filters are at the top of the listing and the most general are at the bottom.

Save

Saves the branch details and exits.

Exits the branch details without saving.

Filter Editor



Aircraft on Ground (AOG)

This check box is used to indicate the this is a cost center specifically for use with AOG shipments which are created using the AOG Module.

Conveyance type

The cost will be determined using the mode by which the shipment is travelling, this can be:

- **All** - (n/a)
- **Air**
- **Sea**
- **Road**

Role

The cost will be determined using the role of the shipment, this can be:

- **All** - (n/a)
- **Import**
- **Export**

Departure

The cost will be determined using the departure region, country or UNLocode. The field is a full text search field, that will search all of these kinds of geographic locations for the correct match.

Destination

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The cost will be determined using the destination region, country or UNLocode. The field is a full text search field, that will search all of these kinds of geographic locations for the correct match.

Product

The cost will be applied only to a specific product. The field is a full text search field, offers search of all products

Customer

The cost will be applied only to a specific customer. The field is a full text search field, offers search of all partners

Shipper

The cost will be applied only to a specific shipper. The field is a full text search field, offers search of all partners

Consignee

The cost will be applied only to a specific consignee. The field is a full text search field, offers search of all partners

Agent

The cost will be applied only to a specific agent. The field is a full text search field, offers search of all partners

User

The cost will be applied only when the transaction is created by a specific user. The field is a full text search field, and offers search of all user names.

Cost Center

The Field search function can be used to search all cost centers and apply the desired cost center.

OK

Save the new filter and closes the editor.

Cancel

Closes the editor without saving.

Cost Centers - Accounting - Maintenance

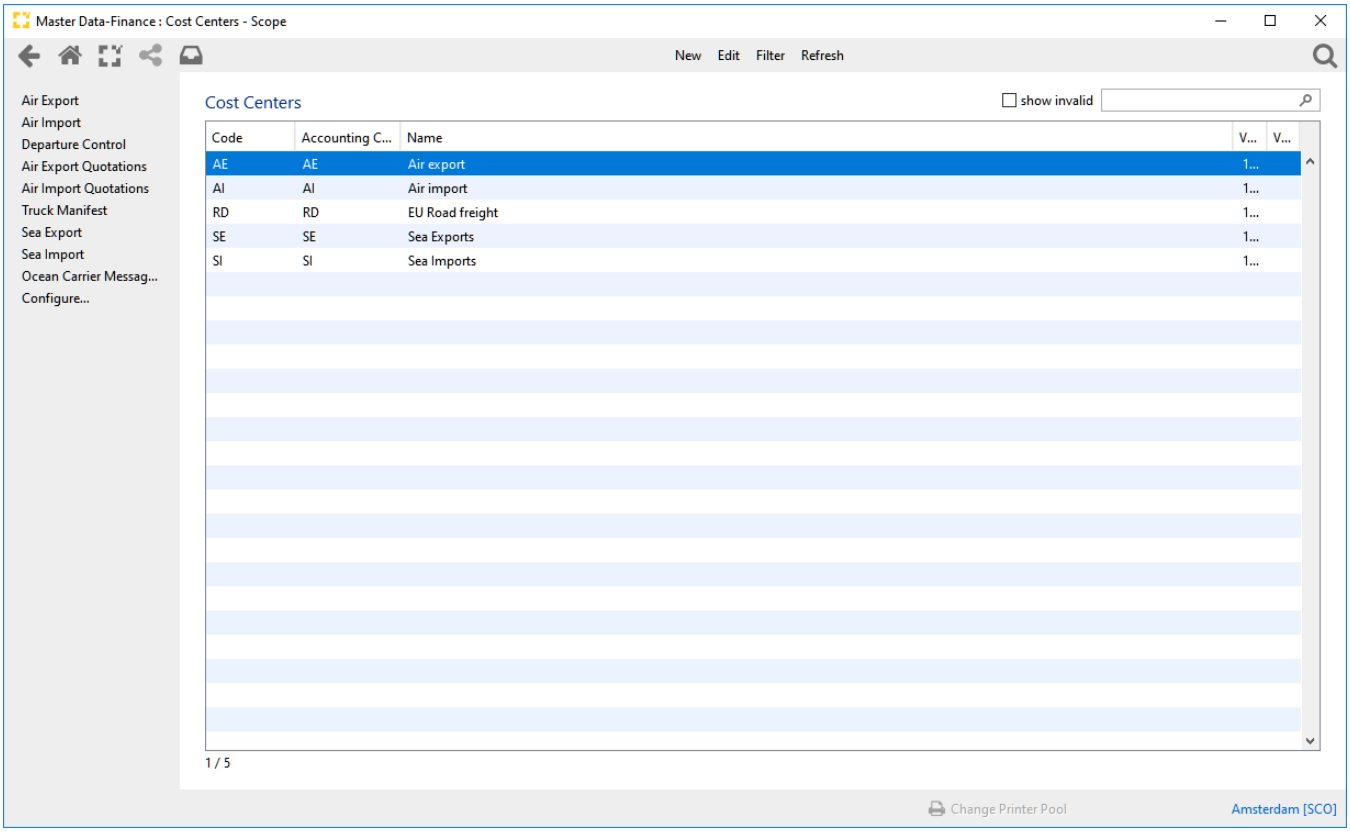
- Introduction
- Description

Introduction

This applications creates and maintains the cost centers required for accounting purposes.

A cost center is where the costs for a service are applied.

Description



New

This action will create a new cost center using the cost center Editor.

Edit

Opens the cost center highlighted in the overview for editing using the cost center editor. Alternatively the cost center can be opened and edited by double clicking it.

Filter

Cost centers are automatically assigned to shipments by the system based on Cost Center Filter settings

Refresh

Refreshes the index to ensure the latest cost centers are visible.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Show removed

Check this box to include cost centers that may have been removed.

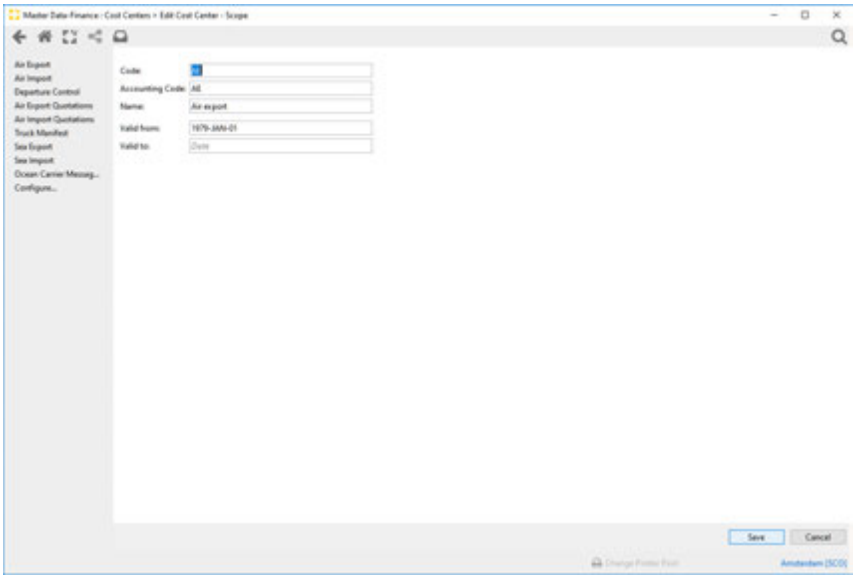
Type to Search

This is a full text search field. Enter the cost center code, name or part thereof to search for the desired cost center.

Summary table - Cost centers

The summary table displays a listing of all cost centers, the code, name and validity dates of the cost centers.

Cost Center Editor



Code

The code for the cost center. This may be freely selected, but must be unique.

Name

The name of the cost center.

Accounting code

The accounting code

Valid from

The Date the cost center is valid from.

Valid to

The Date the cost center is valid to.

> ⚠ Cost centers that have passed their expiry date will not be displayed in the summary table.

Save

Saves the cost center details and exits to the cost center summary table.

Cancel

Exits the cost center editor without saving changes and return to the cost center summary table.

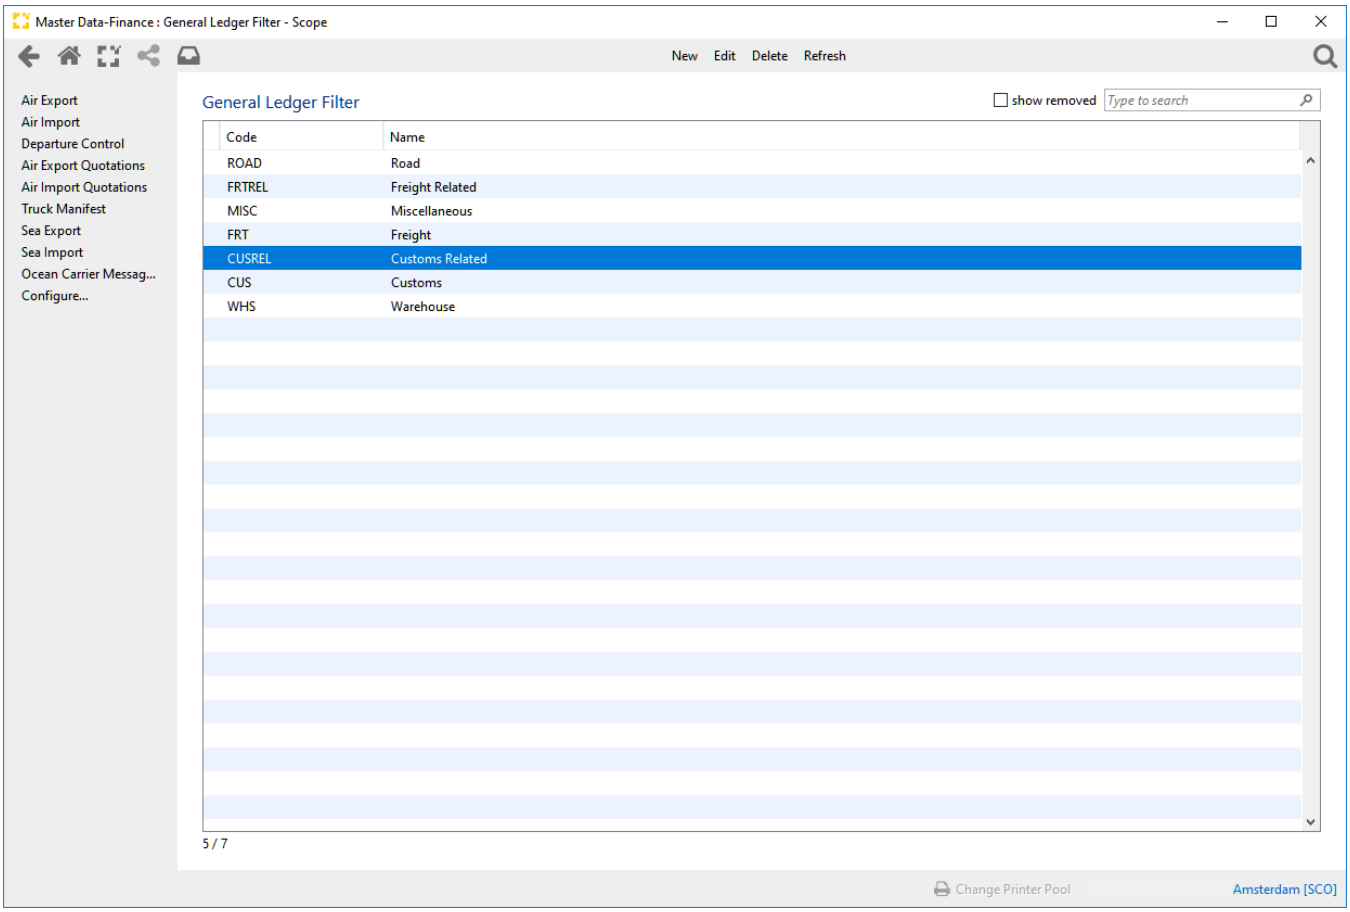
General Ledger Filter - Accounting - Maintenance

- Introduction
- Description

Introduction

This application is used to create and maintain general ledger accounts that are required for accounting purposes.

Description



New

The action creates a new entry in the general ledgers listing.

Edit

Opens the selected record in the overview for editing in the general ledger accounts filter. Alternatively the record can be opened by double clicking it.

Delete

The record highlighted in the overview will be deleted. The entry is not physically deleted and may be restored (see *show removed* below)

Refresh

updates the index to ensure the latest records are visible.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Show removed

When this box is checked, any records that have been previously deleted will be included. These deleted records will have the trash icon in the left hand column. They can be restored by clicking them.

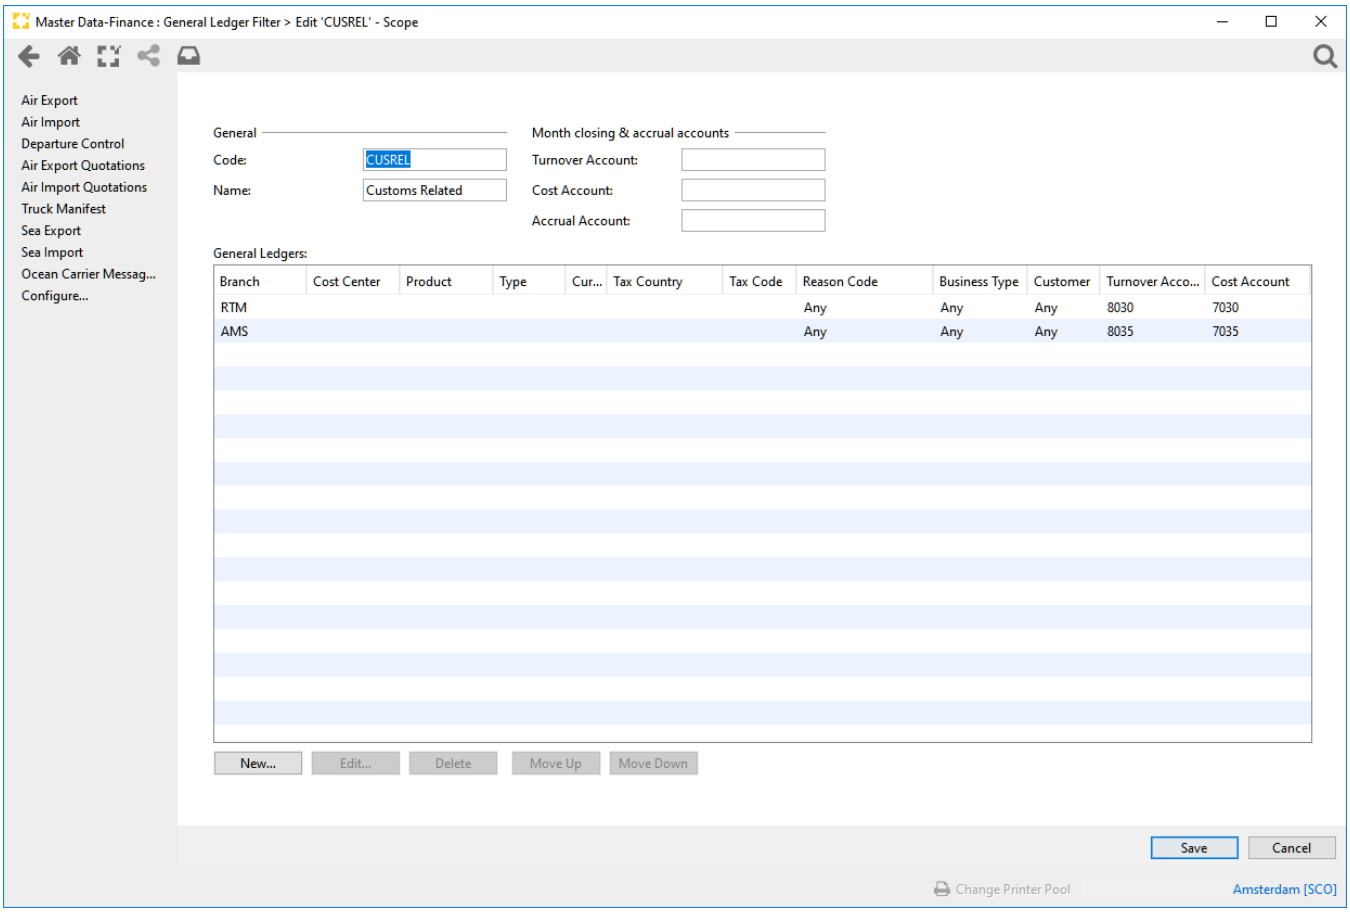
Type to search

This is a full text search field. Any part of the record code or name can be entered to assist locating the record.

Summary table - Accounts filter

The summary table displays all existing general ledger accounts, both the code and name of the account are visible.

Accounts Filter



Code

The code of the account filter, this can be freely selected, but it must be unique.

Name

The name of the general ledger account filter.

Accruals Account

This is the account where any estimates are recorded.

New

Opens the Filter Editor to create a new filter.

Edit

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens the selected filter in the summary table using the Filter Editor. Alternately double-click the record to open it.

Delete

Deletes the filter highlighted in the summary table.

Move up

moves the selected filter up the list in the summary table.

Move down

moves the selected filter down the list in the summary table.

> **Order**
>
> The general ledger accounts are processed sequentially. This means they are read from top to bottom. Once a filter corresponding to the desired ledger is found the ledger will be stored there and no other filters are considered. This means that the most specific filters should be stored at the top an the most general at the bottom.

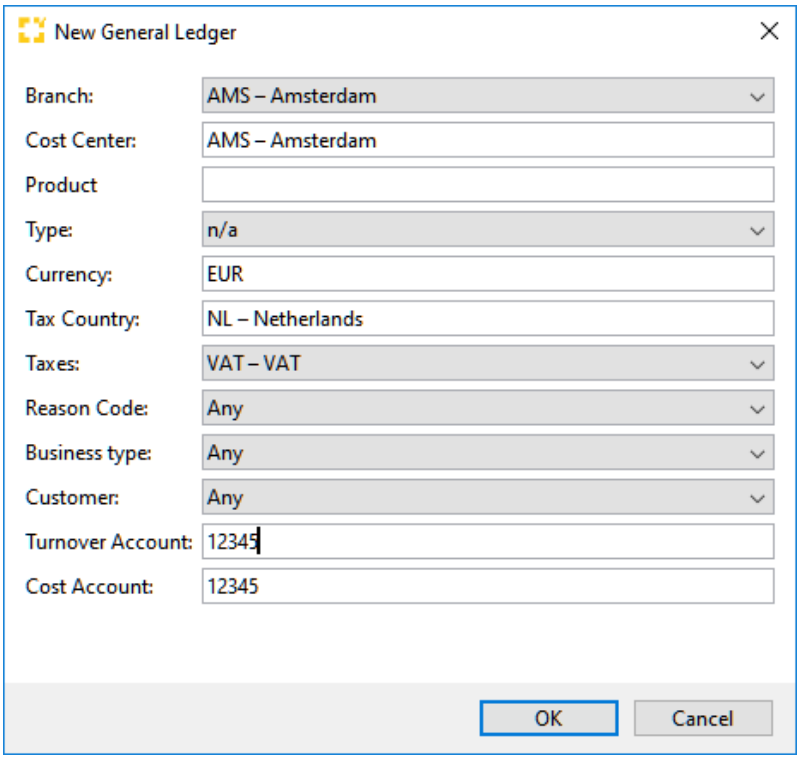
Save

Stores the filter and exits the accounts filter.

Cancel

Exits the accounts filter without saving changes.

General Ledger Editor



Branch

The branch where the general ledger may be used. Branches are defined in the Organizational structure. If no branch is inserted, then the general ledger account is valid for all branches.

Cost Center

The cost center for the general ledger. If no cost center is defined then the general ledger is valid for all cost centers.

Product

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Products (Sales products)for which the general ledger applies. If no product is defined then the general ledger is valid for all products.

Type

The invoice type (invoice or credit note) for which the general ledger applies. If no type is defined then the general ledger is valid for both invoices and creditnotes.

Currency

The currency for which the general ledger applies. If no currency is defined then the general ledger is valid for all currencies

Tax Country

The tax country where the general ledger applies. If no country is selected the the general ledger is valid for all countries. This is a full text search field, type the country name, code or part thereof to find the correct country.

Taxes

This is a drop-down field that will show the availble tax types for the country that has been selected.

Reason Code

This is a drop down menu that will offer reason why the general ledger code is subject to or not subject to taxes:

Taxable

- Any
- RC - Reverse Charge
- RC3 - Reverse Charge (Third country)
- RCI - Reverse Charge India

Tax Free

- Any
- EX - Export
- IM - Import
- 3T - Third country transport
- TR - Export /Import
- DT - Tariffs
- TX - Taxes
- 3C - Third Country
- OS - Offshore
- IN - Internal
- BG - Dutiable goods
- NT - Not taxable
- EMB -Embassy

Business type

This is a drop-down field that will show the types of business. If 'any' is defined then the general ledger is valid for all business types

Customer

This is a drop-down field that will show the types of customers. If 'any' is defined then the general ledger is valid for all customer types

Turnover Account

The account number to be used for outgoing documents.

Cost Account

The account number to be used for incoming documents.

OK

Saves the general ledger details and exits to the filter.

Cancel

Exits without saving.

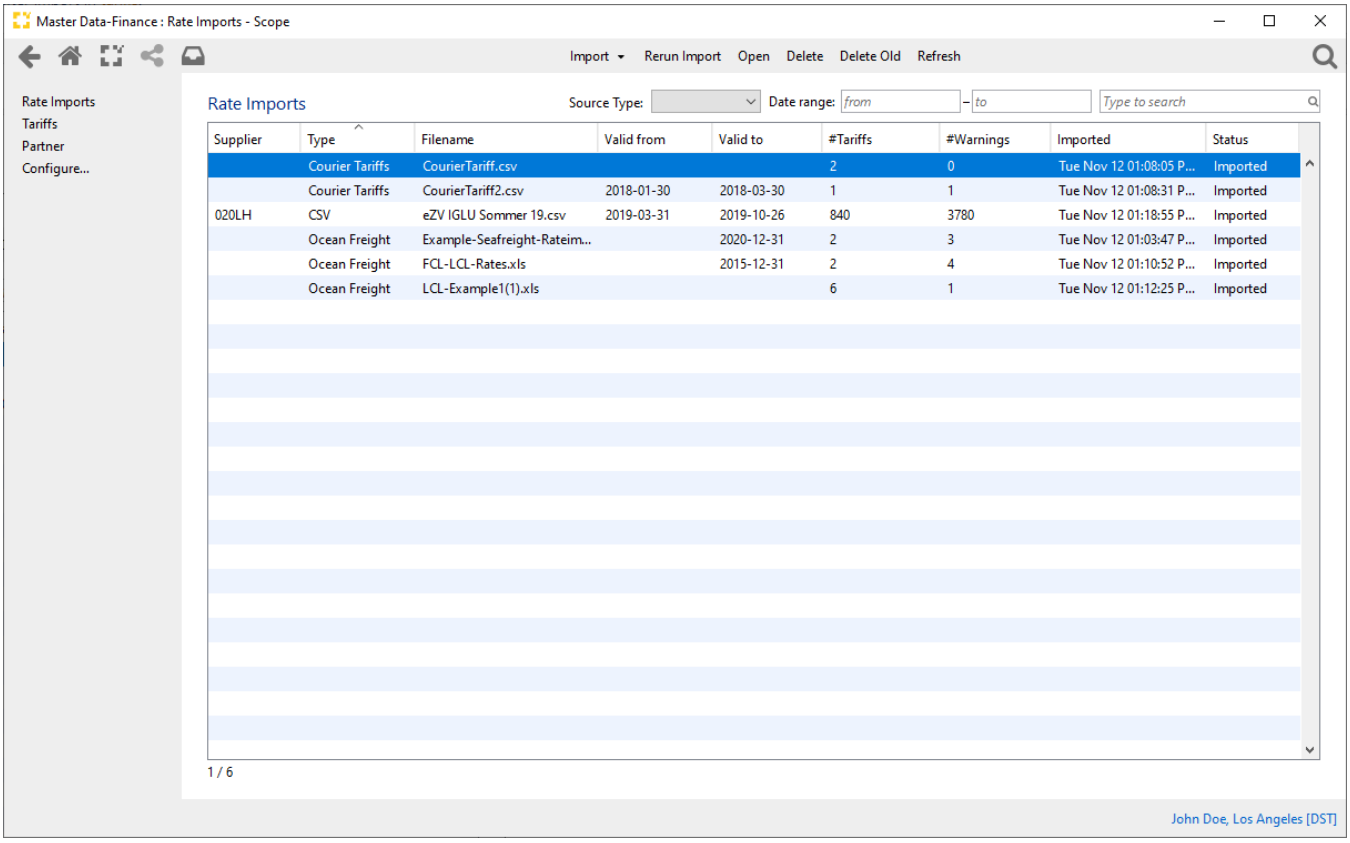
Rate Imports

Introduction

This application allows importing buying and selling tariffs as well as e-rates. The tariffs created can be viewed and changed after import in tariffs.

> Users needs a specific permission to import rates.

Description



Actions

Import

The import function enables importing four different kinds of tariffs. The following options are available:

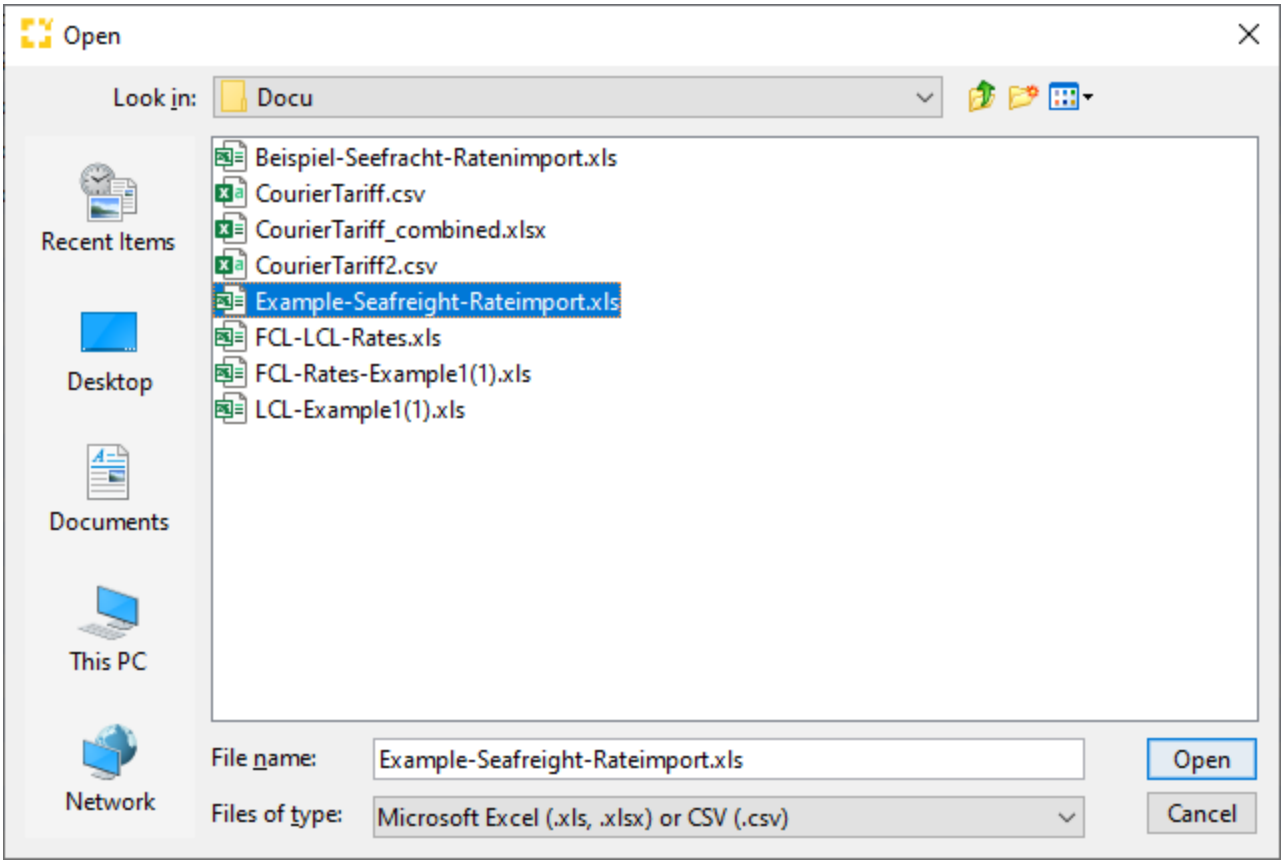
- Ocean Freight
- Courier Tariffs
- CSV (e-rates)

Ocean Freight

Scope uses system charge code "Oceanfreight" to import rates.

Select the file for import:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



To import ocean tariffs, the following format is required:

Example: LCL

type	departure	destination	supplier	product	customer	currency	chargeType	LCL	LCL MIN	shipper*	consignee*	validityStart*	validityE
buying or selling	UNLocode of port of departure	UNLocode of port of destination	Partnercode of supplier	Product	Partnercode of customer	three digit currency	Charge Type	Rate per M/W	Minimum for LCL rate	shipper	consignee	validity start of tariff	validity end tariff

Example: FCL

type	departure	destination	supplier	customer	currency	chargeType	20DC	40G0	shipper*	consignee*	validityStart*	validityEnd*	co
buying or selling	UNLocode of port of departure	UNLocode of port of destination	Partnercode of supplier	Partnercode of customer	three digit currency	Charge Type	Containert ype	Container type	shipper	consignee	validity start of tariff	validity end of tariff	Air, R Barge

Example: TEU

type	departure	destination	supplier	product	customer	currency	chargeType	shipper*	consignee*	basis*	rate	base*	min*	max
buying or selling	UNLocode of port of departure	UNLocode of port of destination	Partnercode of supplier	Product	Partnercode of customer	three digit currency	Charge Type	shipper	consignee	calculation basis • W/M • Volume • Chargeable Weight	rate (for first breakpoint)	base amount	min amount	max amoun

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

											• Gross Weight • Number of containers • TEU					

* these fields are not mandatory and can be left blank.

⚠ W/M (weight or measure) = 1m^3 = 1.000kg = 1 x w/m. LCL assumes chargeable weight is calculated at 1000 kg per volume factor.

ⓘ The columns of the file do not need to be in the order described. As long the the description of the columns matches, Scope can import the tariffs. Additional containertypes can be added in new columns. FCL and LCL tariffs can be imported in a single file or in different files.

ⓘ Please find examples for the files here: LCL / FCL / FCL/LCL / TEU

Courier Tariffs

Enables importing of selling or buying tariffs for any charge type in XLS or CSV format.

Here is an example of a selling tariff, here an example of a buying tariff.

Courier tariffs can be imported with multiple tables in Excel files. Please find an example here.

The format is as follows:

Column name	Optional / Mandatory	Description
Type	Mandatory	Type of tariff. Possible values: *selling*, *buying, internal*
ChargeType	Mandatory	Charge type as maintained in Scope
Currency	Mandatory	3-digit currency code, e.g. USD (ISO 4217)
Product	Optional	Code of the product
Module	Optional	Module, e.g. AE, AI, SE, SI
Branch	Optional	Branch Code
Basis	Optional	Basis (base amount only/gross weight/chargeable weight/volume/loading meter/number of pieces/number of pieces (dgr))
Volume Factor	Optional	Volume Factor
Base Amount	Optional/Mandatory	A base amount (mandatory for basis: Base amount only)
Min	Optional	Minimum Amount
Max	Optional	Maximum Amount
Departure	Optional	UN/Locode, country code or regioncode for tariff *Departure*
Destination	Optional	UN/Locode, country code or regioncode for tariff *Destination*
Supplier	Optional	Partner code or name of partner group of the *supplier*
Customer	Optional	Partner code or name of partner group of the *customer*
Shipper	Optional	Partner code or name of partner group of the *shipper*
Consignee	Optional	Partner code or name of partner group of the *consignee*
Agent	Optional	Partner code or name of partner group of the *agent*
Zip Zone	Optional	Zone from Zip Zone Schema

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Round	Optional	Default is no. When entering *yes* the rates of the breakpoint are rounded according to the setting of the currency.
BP FIX *x*	Mandatory/Optional	Describes a breakpoint with the following properties: • from Breakpoint: *x* kg • Method: FIX
BP STEP *x y*	Mandatory/Optional	Describes a breakpoint with the following properties: • from Breakpoint: *y* kg • Method: STEP • Option *accumulating*: not checked • Unit: x
BP STEP *x* ACC *y*	Mandatory/Optional	Describes a breakpoint with the following properties: • from Breakpoint: *y* kg • Method: STEP • Option *accumulating*: checked • Unit: x
BP PROP x *y*	Mandatory/Optional	Describes a breakpoint with the following properties: • from Breakpoint: *y* kg • Method: PROP • Unit: x
Valid From	Optional	valid from date
Valid To	Optional	valid to date
DGR level	Optional	DGR level of the shipment (DGR/PAX, CAO, limited or exempted Quantity)
Weekdays	Optional	days on which the tariff is applicable (1234567)
Remarks	Optional	Remarks

When the base is "base amount only", the line must not contain a BP-element. Otherwise one of the BP-elements is mandatory

CSV (e-rates)

Scope uses system charge code "Airfreight" to import rates as buying rates.

This option enables importing of e-rates. Scope allows the import of the old version as well as the new version of the official e-rates sheet, which have been defined by the airlines.

The corresponding file needs to be saved as format ".csv" in order to be imported into Scope correctly.

⚠ The first nine lines of the import file are ignored (they usually contain the header data of the e-rates file). When manually creating a file for upload, enter nine emtpy lines. ⚠

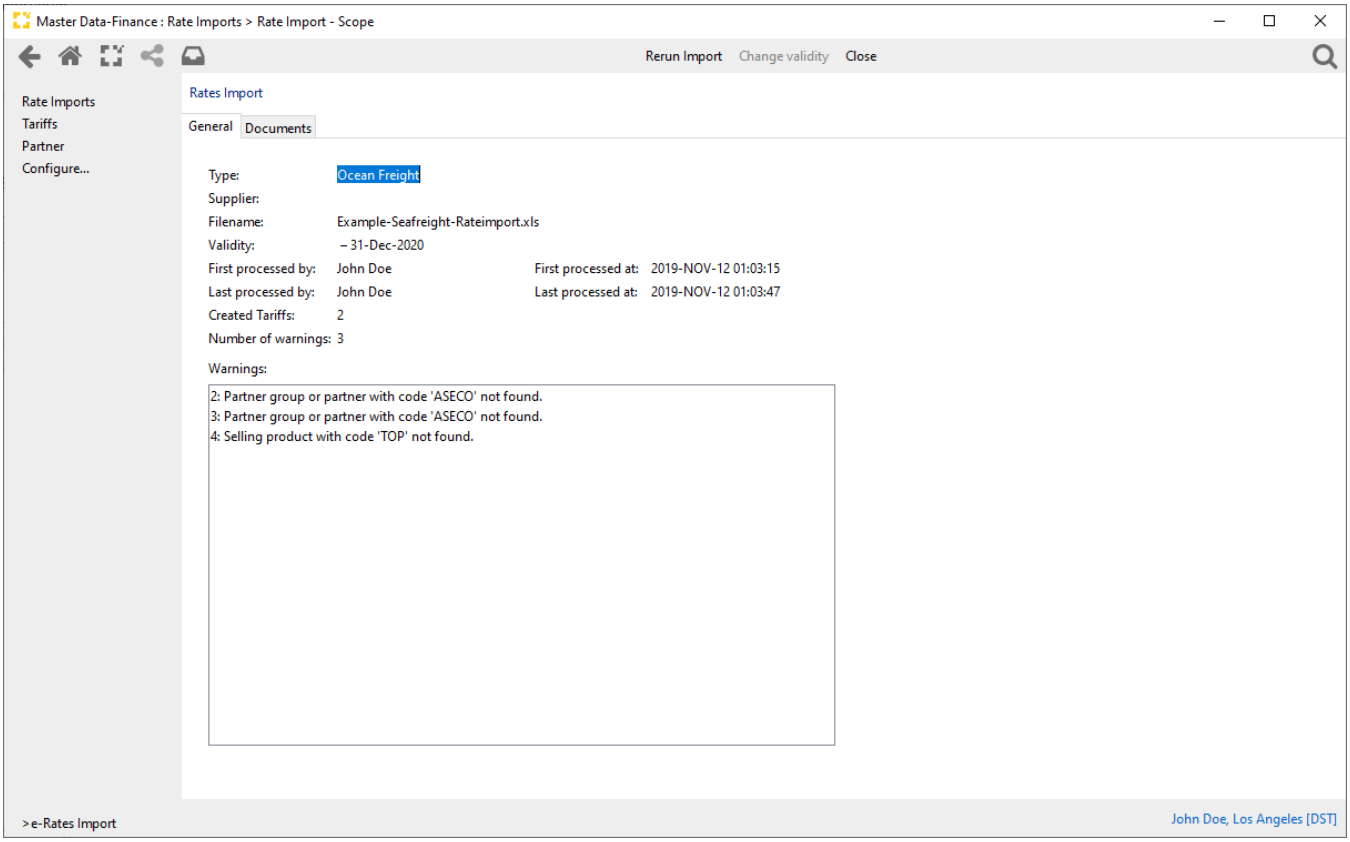
Rerun Import

Runs the import on the selected / marked file again.

Open

Opens the selected / marked entry and displays information of the import, e.g. how many tariffs were created and - in case of errors -why these tariffs were not created (missing data in this example).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Rerun Import

Runs the import of this file again. This is used to add tariffs which could not be imported after master data has been maintained.

Change validity

If the file contains validity dates and the validity to is in the past, the user can change the validity of the tariffs from here without having to upload the file again.

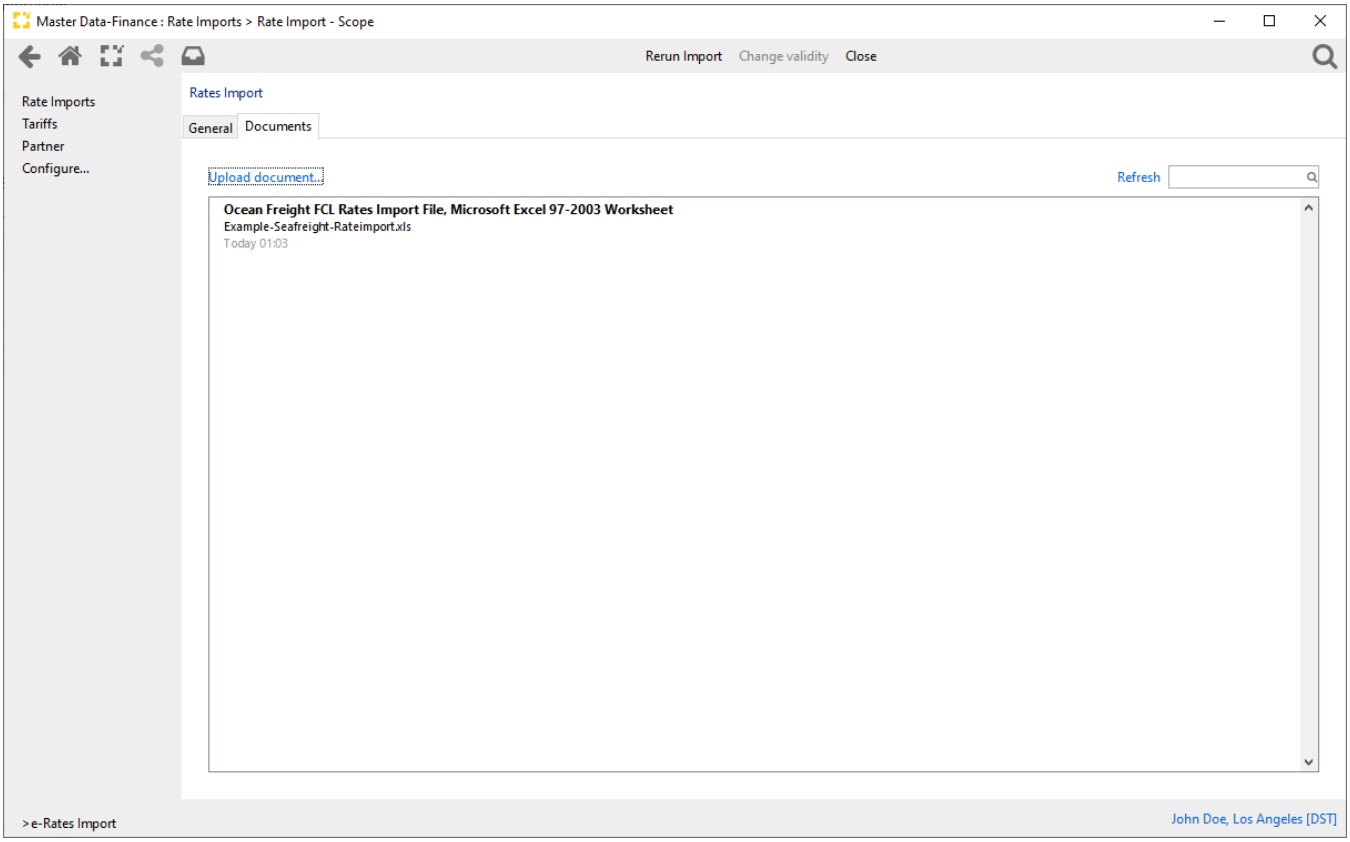
General

Tab "General" displays information about the file imported and warnings.

Documents

Tab *"Documents"* displays the file used and the file can be downloaded from here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



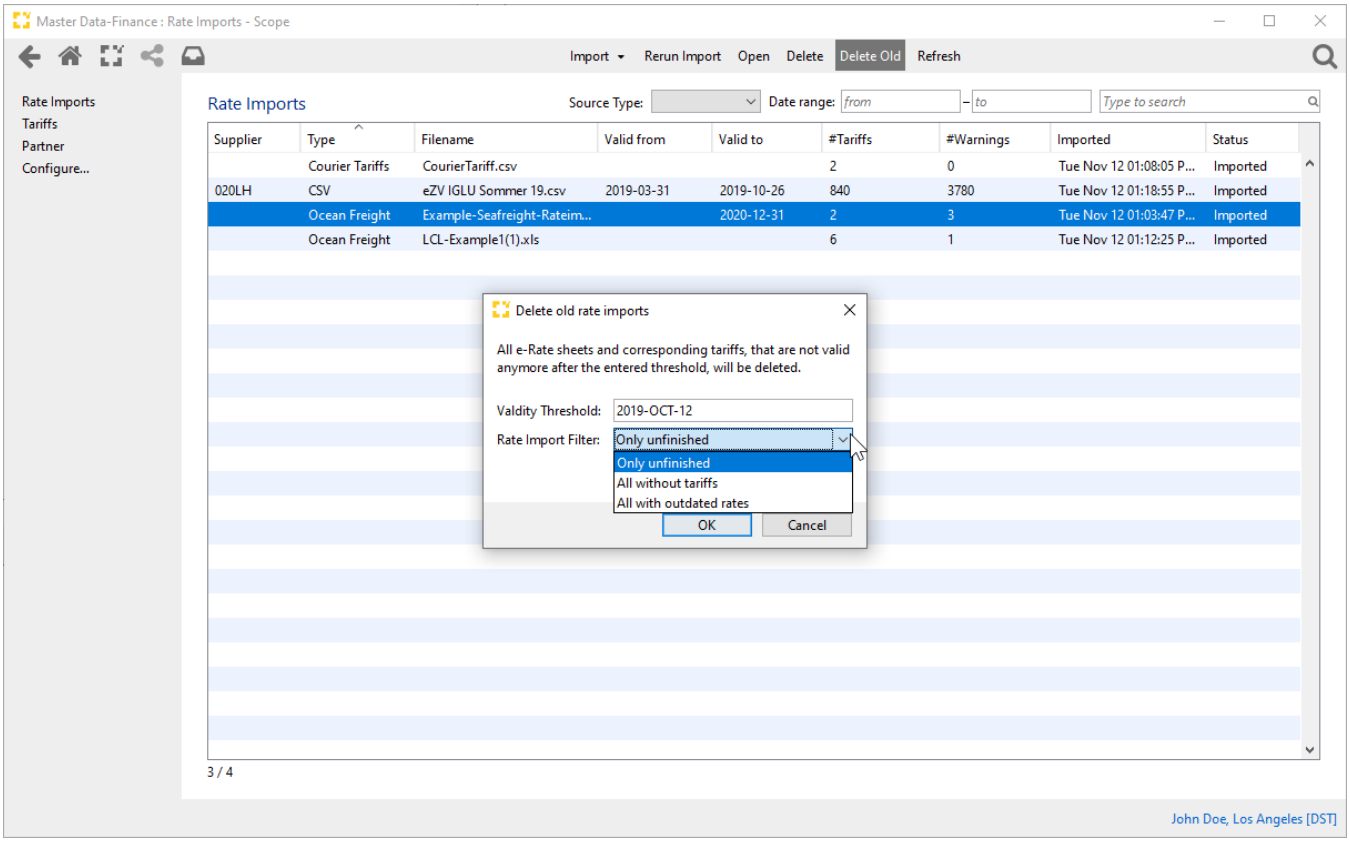
Delete

Deletes the selected file from the overview and the tariffs created from this file.

Delete Old

A new window with options is opened to select criteria for deletion:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Validity Threshold

Date of validity.

Rate Import Filter

Select per Drop-Down which tariffs according to the previously selected validity threshold shall be removed.

- **Only unfinished**: deletes all entries which do not have the status "Imported"
- **All without tariffs:** deletes all entries with 0 tariffs and 1 warning
- **All with oudated tariffs**: deletes all entries where "valid to" is not in range of the entered validity threshold

OK

Confirms the selection and starts deletion of entries.

Cancel

Cancels the action and closes the window.

Refresh

Refreshes the home view.

Overview

The overview displays imported files which can be sorted by *"Supplier, Type, Filename, Valid from, Valid to, #Tariffs, #Warnings, Imported, Status"*.

Source Type

Filter per Drop-Down and type of entry.

Date range "from/ to"

Search for the date of import of certain entries.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type to search

Search for suppliers, types

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Regions - Accounting - Maintenance

- Introduction
- Description

Introduction

This application will group Countries and their UNLocodes into regions. A region may be comprised of Countries or UNLocodes or a combination of both. It is also possible to specifically exclude defined UNLocodes from a region even though such UNLocodes are located in Countries that are included in the region. Once regions have been created, it is then possible to create tariffs that can be applied to these regions and calculate charges for services automatically.

Description

The **regions** application provides a menu bar with standard functions such as *New*, *Edit* and *Delete*. An overview of all existing regions is shown and this can be searched using the search field . As each region is highlighted in the overview, the lower panes of the screen show full details of the region; the Countries in the region, the UNLocodes included in the region and any UNLocodes that are excluded from the region.

? Unbekannter Anhang

New

Opens the Regions Editor to create a new region and add Countries and UNLocodes to the region. UNLocodes may also be specifically excluded from the region.

Edit

Opens the Regions Editor to edit the region highlighted in the overview.

Delete

Deletes the region highlighted in the overview.

Refresh

Updates the index to ensure the latest regions are visible.

Regions

A table listing the existing regions

Type to search

full search text field used to find regions using the name of the region the Countries and UNLocodes in the region.

Region Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The region editor allows new or existing regions to be processed.

Regions

The name of the region

Country

Countries in the region

Add

Use the *Add* function to add a Country to the region. A dialogue will appear with a country search field , to assist locating the country.

Remove

Highlight a Country in the region and use the *Remove* function to delete it from the region.

Included UNLocode(s)

A listing of all the UNLocodes included in the region.

Add

Use the *Add* function to add a UNLocodes to the region. A dialogue will appear with a UNLocode search field , to assist locating the UNLocode.

Remove

Highlight a UNLocodes in the region and use the *Remove* function to delete it from the region.

Excluded UNLocode(s)

A listing of all the UNLocodes excluded from the region.

Add

Use the *Add* function to add a UNLocodes that is to be excluded from the region. A dialogue will appear with a UNLocode search field , to assist locating the UNLocode.

Remove

Highlight a UNLocodes excluded from the region and use the *Remove* function to delete it from the excluded list.

Save

Save the region and exits to the overview of regions

Cancel

Exits the region editor without saving any changes.

Tariffs - Accounting - Maintenance

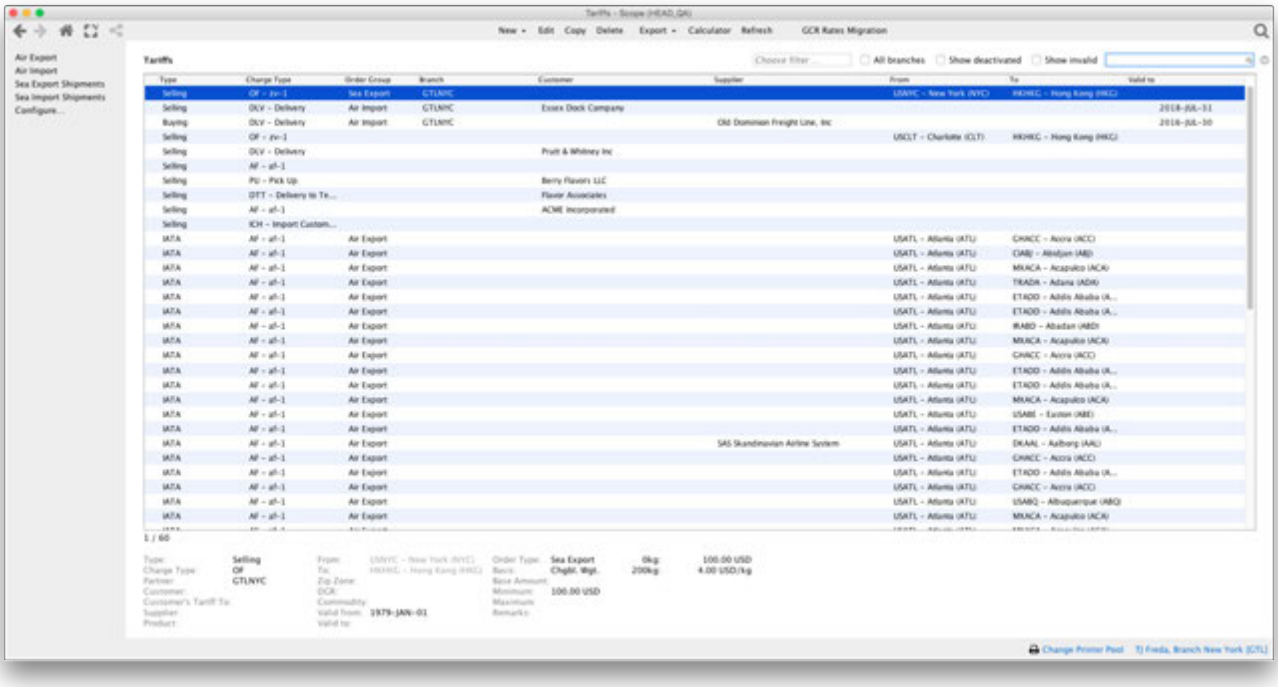
- Introduction
- Description

Introduction

In order to automatically determine charges for services, tariffs are created using the tariff maintenance application. Tariffs can be created to generate rates for both buying and selling activities. 3rd party rates such as IATA rates can be stored and internal rates (intra organization) rates can be created. Tariffs may be both general and customer specific. Maintaining rates, avoids manual entry of charges during invoicing and costing operations. Examples of tariffs are available here .

Description

The tariff maintenance applications presents a menu bar with functions with an overview of existing tariffs that may be searched and filtered using standard functionality.



The following actions are available from the menu bar:

New

A drop-down list appears where the type of new tariff to be created should be selected. Currently types are:

- **Selling**
- **Buying**
- **IATA**
- **Internal**
- **Agent**

Once the type of tariff has been selected, the Tariff Editor opens for the creation of the tariff.

Edit

Opens the tariff highlighted in the overview within the Tariff-Edtior. Changes may then be made to the existing tariff.

Copy

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens the tariff highlighted in the overview within the Tariff-Edtior. Changes may then be made to this tariff, but when saved it will be created as a new tariff while the original tariff that served as the model for the new tariff will remain unchanged. This provides fast duplication and reuse of existing tariffs for new purposes.

Delete

Deletes the tariff highlighted in the overview. This action produces a dialogue window where confirmation is requested that the tariff really should be deleted. Tariffs are not physically deleted but marked as inactive. They may be viewed by checking the *show removed* option described below. Inactive tariffs are displayed with the **trash** icon in the left hand column to indicate their inactive status. The may be restored to active status by highlighting them and then *editing* them as described above. This produces another dialogue requesting confirmation that the tariff is to be restored. On saving the tariff it becomes active again.

Export

Export of Air Freight additional costs - fuel surcharge and security charges - to an excel sheet.

Calculator

In order to test the output of a tariff, locate the tariff in the overview or using the search and filter functions. Once the desired tariff is highlighted in the overview, select the **Calculator** action, this will automatically produce a pop-up window that will request a figure to use for the test calculation, the pop-up window will advise what the basis of the figure should be using the tariff itself, for example if the tariff is based on **Chargeable Weight**, then the figure being entered represents the chargeable weight of the shipment. On selecting *Calculate* the result will be produced using the construction of the tariff. This may then be checked against a manual calculation of the tariff.

Refresh

Updates the index of tariffs shown in the overview to ensure that latest tariff details are visible.

Show Invalid

Tariffs are normally only valid for a period defined within the tariff itself. This is because charges for services are constantly changing and so an expiry date for tariffs must be set to prevent old tariffs from being used indefinitely. The *Show Invalid* check box is used to include display of expired tariffs in the overview. This is useful since these expired tariffs, while not available within shipments, may be edited, updated with new figure and a new validity period to restore them as active tariffs. This avoids the recreation of tariffs from scratch when they expire.

Show deactivated

When deleted, tariffs are not physically deleted but marked as inactive. They may be viewed by checking the *show deactivated* option. Inactive tariffs are displayed with the **trash** icon in the left hand column to indicate their inactive status. The may be restored to active status by highlighting them and then *edit ing* them as described above. This produces another dialogue requesting confirmation that the tariff is to be restored. On saving the tariff it becomes active again.

Charge type

In order to view tariffs that relate to a specific charge type , the charge type description or code may be entered in this search field. Once a specific charge type has been choosen, only tariffs relating to that charge will appear in the overview.

All Tariffs

This is a drop down search option that defaults to *All Tariffs*. This can be changed to any of the following types to restrict the list of tariffs in the overview to:

Tariff type	Description
All tariffs	Include all tariffs
Selling	Tariffs for outgoing documents on house shipments and direct shipments (Except Air freight)
Buying	These are tariffs used for the creation of reserves (Expected costs that will be resolved at a later date via payables processing.) They can also be *Due Carrier* charges for master shipments and appear as such on the master AWB
IATA	These tariffs are used by the activity type *AF - Air Freight* used in direct and master shipments
Internal	Internal rates used between branches

Selling Tariffs:

Activity	HAWB	Direct-AWB	B2B - HAWB	B2B - MAWB	MAWB
Airfreight (AF)	✓	✗	✓	✗	✗

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

due Carrier charges	✓	✓	✓	✗	✗
due Agent charges	✓	✓	✓	✗	✗

Buying Tariffs:

Activity	HAWB	Direct-AWB	B2B - HAWB	B2B - MAWB	MAWB
Airfreight (AF)	✗	✗	✗	✗	✗
due Carrier charges	✗	✗	✗	✓	✓
due Agent charges	✗	✗	✗	✓	✓

IATA Tariffs:

Activity	HAWB	Direct-AWB	B2B - HAWB	B2B - MAWB	MAWB
Airfreight (AF)	✗	✓	✗	✓	✓
due Carrier charges	✗	✗	✗	✗	✗
due Agent charges	✗	✗	✗	✗	✗

Type to search

Keywords can be typed into this general search field and will restrict the list of tariffs to those matching the keywords. Keywords may be:

- Charge code
- Charge Description
- Customer name or address
- Supplier name or address
- Departure
- Destination

Tariffs

The overview of tariffs is presented in table form. The table may be sorted by clicking on the title of each column. The current columns shown are from left to right:

- **Trash** - If the trash icon appears in this column, the tariff has been removed. This column is blank for active tariffs.
- **Type** - The tariff type may be **Selling, Buying, IATA,** or **Internal**
- **Charge type** The charge code of the charge type .
- **Module** - The module for which the tariff is valid.
- **Basis** - The basis on which the calculation is being made.
- **Branch** - The Branch (if any) where the tariff is valid.
- **Customer** - The customer (if any) to whom the tariff applies
- **Supplier** - The supplier (if any) to whom the tariff applies
- **From** - The departure point (if any) to which the tariff applies
- **To** - The destination point (if any) to which the tariff applies
- **Zone** - The zone (if any) to which the tariff applies
- **Valid from** - The date (if any) from which the tariff is valid.
- **Valid to** - The date (if any) up to which the tariff is valid.

When a tariff is highlighted in the overview, full details of the tariff appear in the lower section of the screen.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Automatic Calculation - Tariffs - Accounting - Maintenance

- Introduction
- Description

Introduction

In various applications, income and costs are calculated automatically and documents prepared and issued as a result of these calculations. The user may if necessary, adjust figures that are automatically calculated. The ideal setup is for charges to be automatically calculated wherever possible. Below, the types of data that are used to automate costs are described followed by an explanation of the logic and realtionships used in automatic charge calculation.

Description

Relevant master data

The following master data is used in the creation of tariffs and automatic calculation of charges:

- Tarffs
- Charge Types
- Business Partners
- Countries
- UNLocodes
- Exchange Rates
- Activity Types
- Airfreight Carrier
- Seafreight Carrier
- Organizational Structure
- Movement type and Incoterms

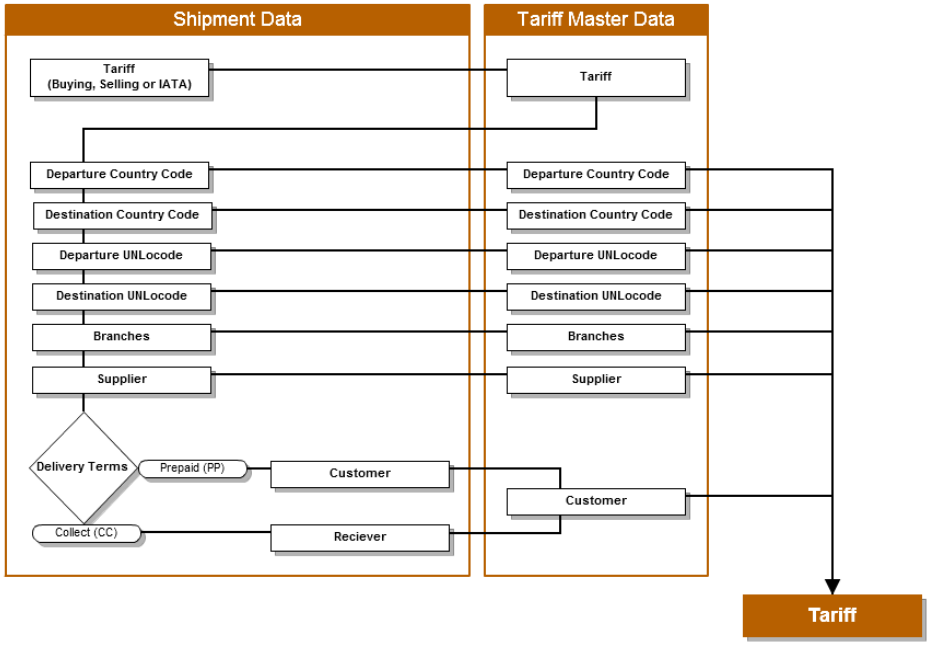
Determining the charges for the shipment

The system tries to determine the correct charges for the shipment using the the maintained charge types together with the Activity types that have been maintained. Certain charge will be associated with a particular Activity, for example if a pickup order is created for an export item charges types will be associated with this Activity and on generation of the pickup note the system uses these setting to calculate charges to be added to invoices or stored as estimate costs.

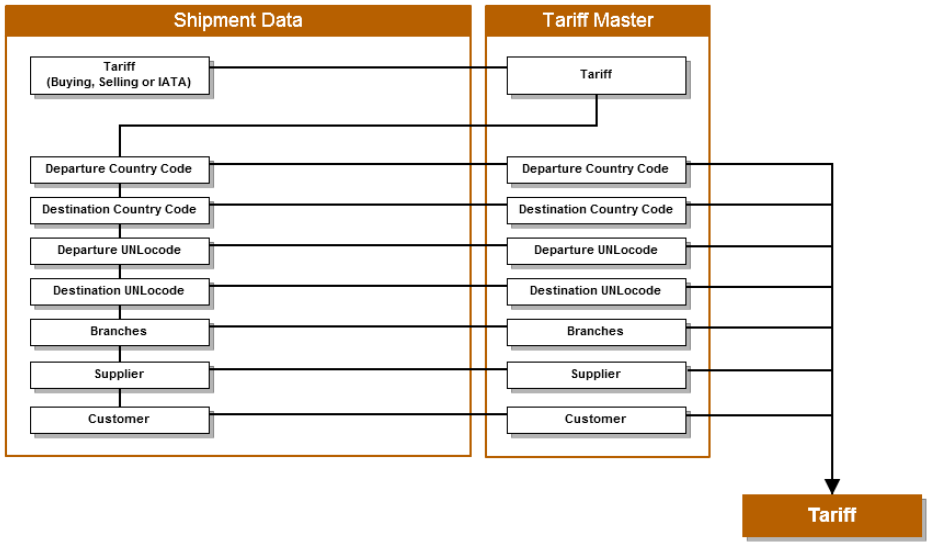
Determination of Tariffs

Airfreight and Seafreight Export

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Airfreight and Seafreight Import



- If and item in the tariff base has not been maintained, it is assumed that the tariff is **generally valid**. For example if the country code is not maintained it is assumed the tariff is valid for all countries.
- If a part of the order / shipment data does not match the data entered in tariff, the tariff is not taken
- If a tariff is maintained without specific criteria (from, to, branch, customer etc) this tariff will be used as a default

⚠ Only one tariff with the same data may be stored at any time.

Tariff Weighting

When multiple tariffs are found containing combinations of elements that match a shipment, the application uses the most accurate combination. A weighting system is used to arrive at the most accurate tariff:

Element	Weighting (Point)
Country of Departure	1

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Country of Destination	1
Departure	2
Destination	2
Branch	5
Supplier	10
Customer	10

The tafiff with the most points according to the above table will be used to calculate the charge for the voucher.

Element exists in a consol master and is consistent with the house shipment data.

Dep. Country	Pts.	From Dep.	Pts.	Dest. Country	Pts.	Dest.	Pts.	Branch.	Pts.	Supplier	Pts.	Customer	Pts.	Total

Examples - Tariffs - Accounting - Maintenance

- Introduction

Introduction

The following are examples of tariffs together with a description of their construction and use.

Example 1:

For manual input of 0 - 8, the following values are used:

0 -> 50
1 -> 50
2 -> 75
3 -> 100
4 -> 125
5 -> 150
6 -> 170
7 -> 190
8 -> 210

The breakdown is as follows:

1 -> 25 (base amount) + 1x25 = 50
2 -> 25 (base amount) + 2x25 = 75
3 -> 25 (base amount) + 3x25 = 100
4 -> 25 (base amount) + 4x25 = 125
5 -> 25 (base amount) + 5x25 = 150

A value of "6" or higher shall be used, a rate of 20 EUR (in addition to the previously calculated x 25 EUR):

6 -> 25 (base amount) + 5x25 + 1x20 (additional) = 170
7 -> 25 (base amount) + 5x25 + 2x20 (additional) = 190
8 -> 25 (base amount) + 5x25 + 3x20 (additional) = 210

Automatische berekening van Fuel - Security

Introductie

Naar aanleiding van recente veranderingen in de berekening van Fuel & Security charges, waarbij sommige airlines deze surcharges berekening omzetten van bruto (gross) gewicht naar belastbaar (chargeable) gewicht, maakten we deze Scope tip.

Met deze tip laten we zien hoe dit efficiënt in Scope ingericht kan worden.

Beschrijving

Deze Scope tip werkt voor directe en back to back airwaybills. Voor masters kunnen de kosten correct uitgerekend worden. De moeilijkheid zit hem nog in het chargeable weight van de houses. Hier is het totaal chargeable weight van de houses niet per definitie gelijk aan dat van de master. We kunnen dus niet de regel verkoop=(prorated) inkoop toepassen. Voor een oplossing hiervoor zijn we nog in overleg.

Voor deze uitleg baseren wij ons op het volgende voorbeeld.

Inkoop :

Airline : KLM

Regio US-W) USA - West coast (LAX, SFO, STL)	Fuel surcharge € 1,15 p/kgs Chargeable weight
Regio N-AM) North America (Canada, USA) - All except (LAX, SFO, STL)	Fuel surcharge € 1,00 p/kgs Chargeable weight
Regio EU) Europe	Fuel surcharge € 0,65 p/kgs Chargeable weight
Overige bestemmingen	Fuel surcharge € 1.25 p/kgs Chargeable weight

Verkoop :

De verkoop is gelijk aan de inkoop.

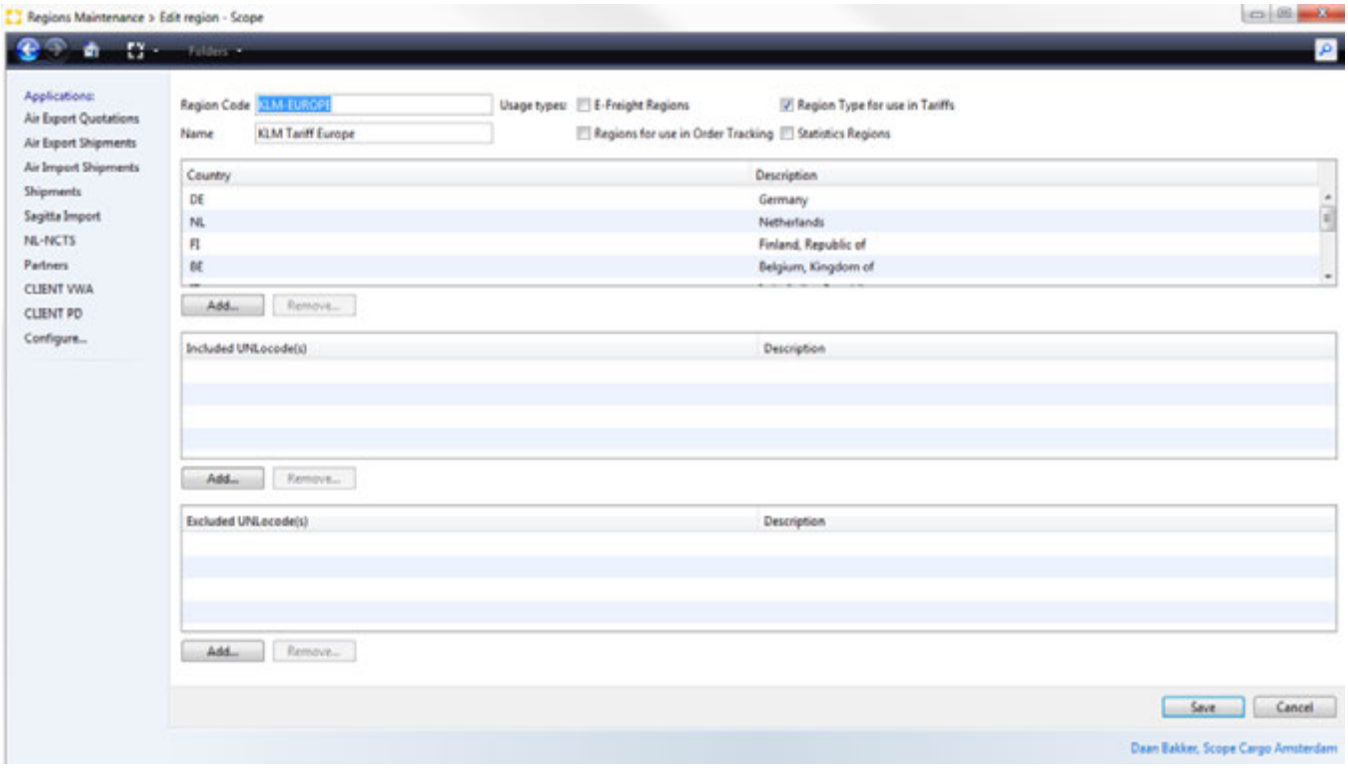
Set-Up

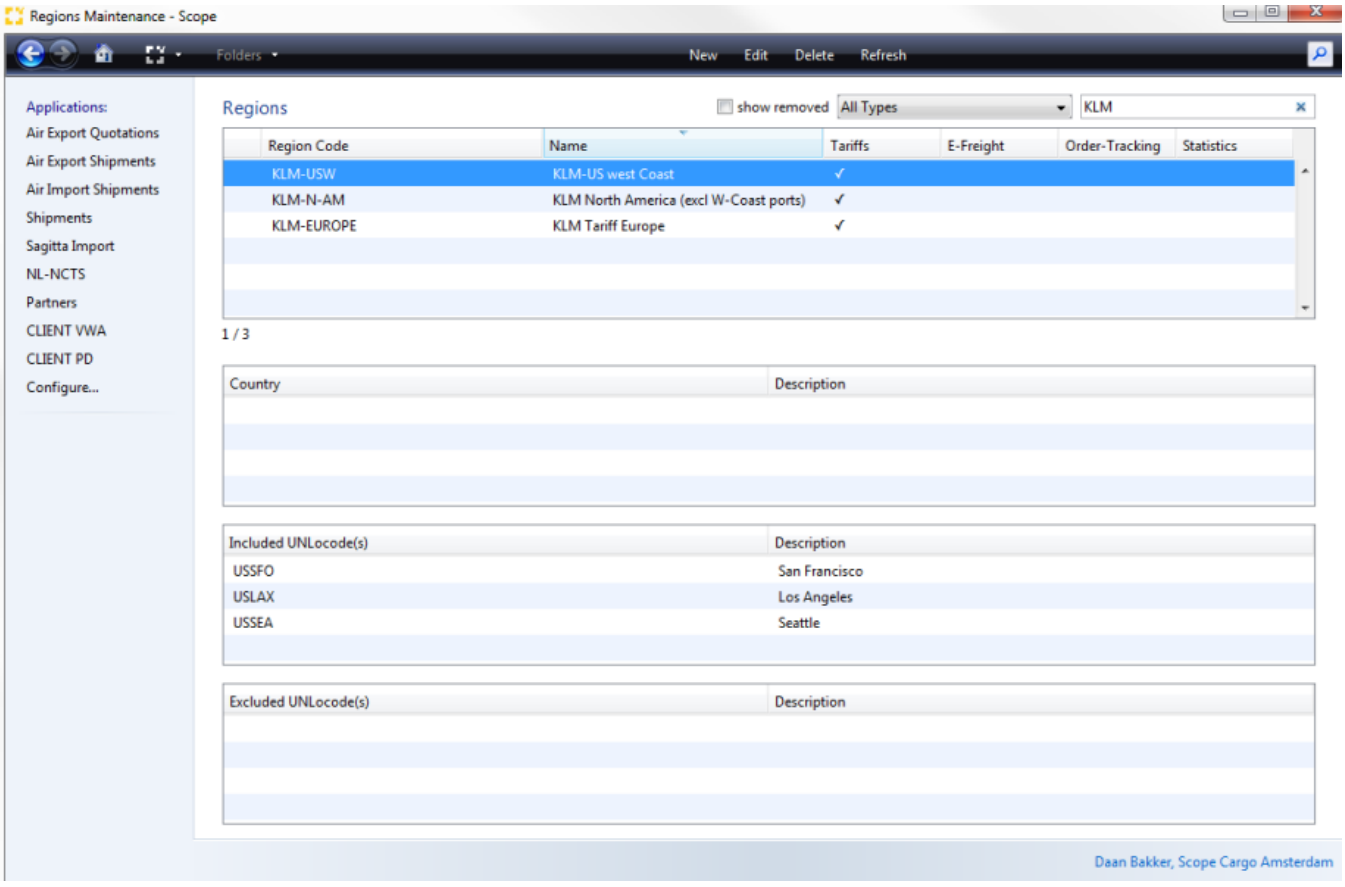
De setup wordt gedaan in de volgende functies

1. Regions, voor het vastleggen van de verschillende regio's
2. Activity Types, voor het registreren van de charge types, Trigger voor het defaulten op de AWB
3. Tariffs, voor het vastleggen van de inkoop en verkoop tarieven.

Regions

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





Activity types

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

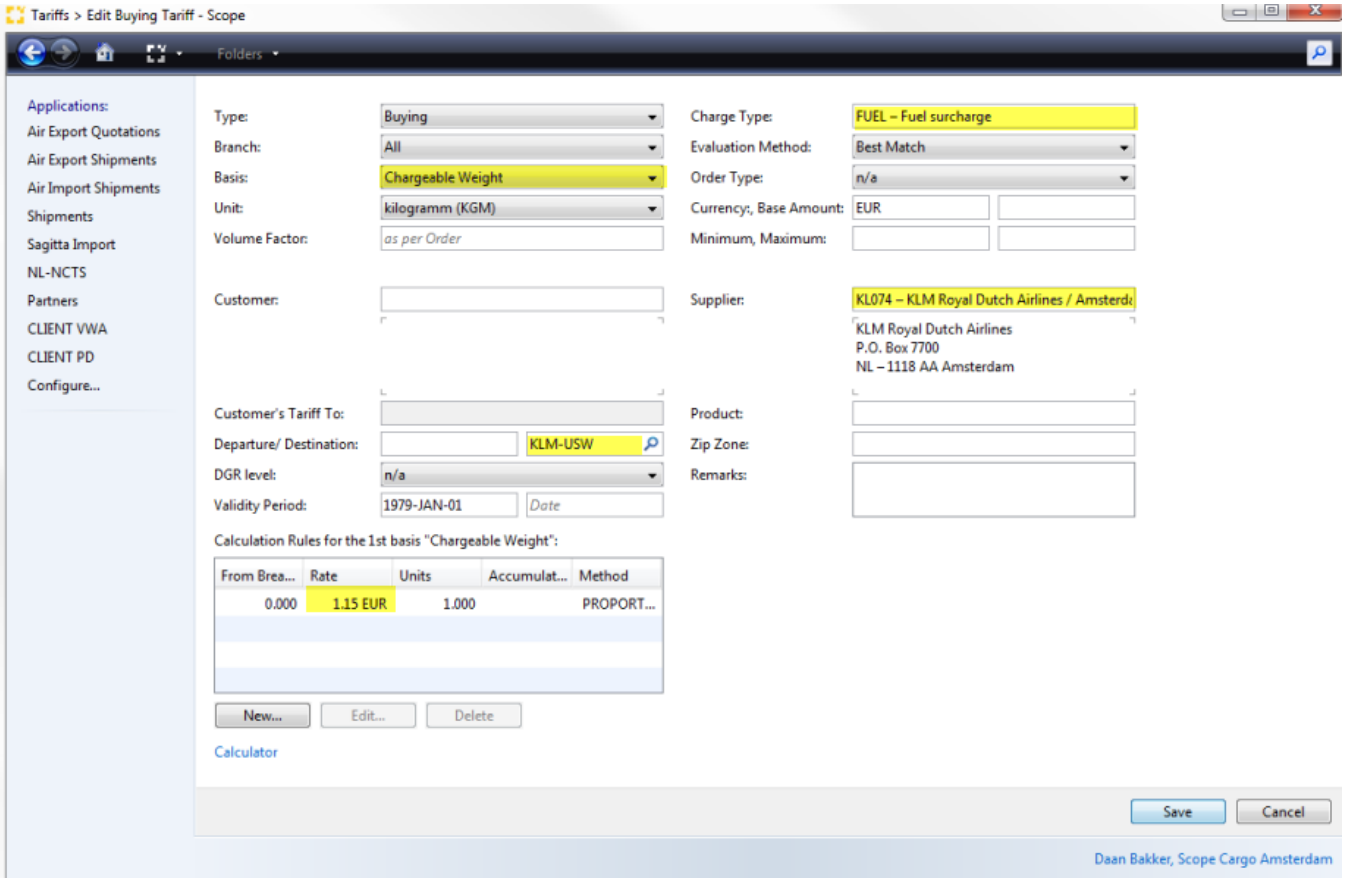
Indien er nu al automatisch Fuel Surcharge, eventueel zonder bedragen, worden gedefault op de AWB dan kan deze stap worden overgeslagen. Indien er nog geen charges types automatisch
op de AWB verschijnen, controleer dan de setup van activity types in Scope. De inrichting van activity types wordt verder uitgelegd in de handleiding.

Tariffs

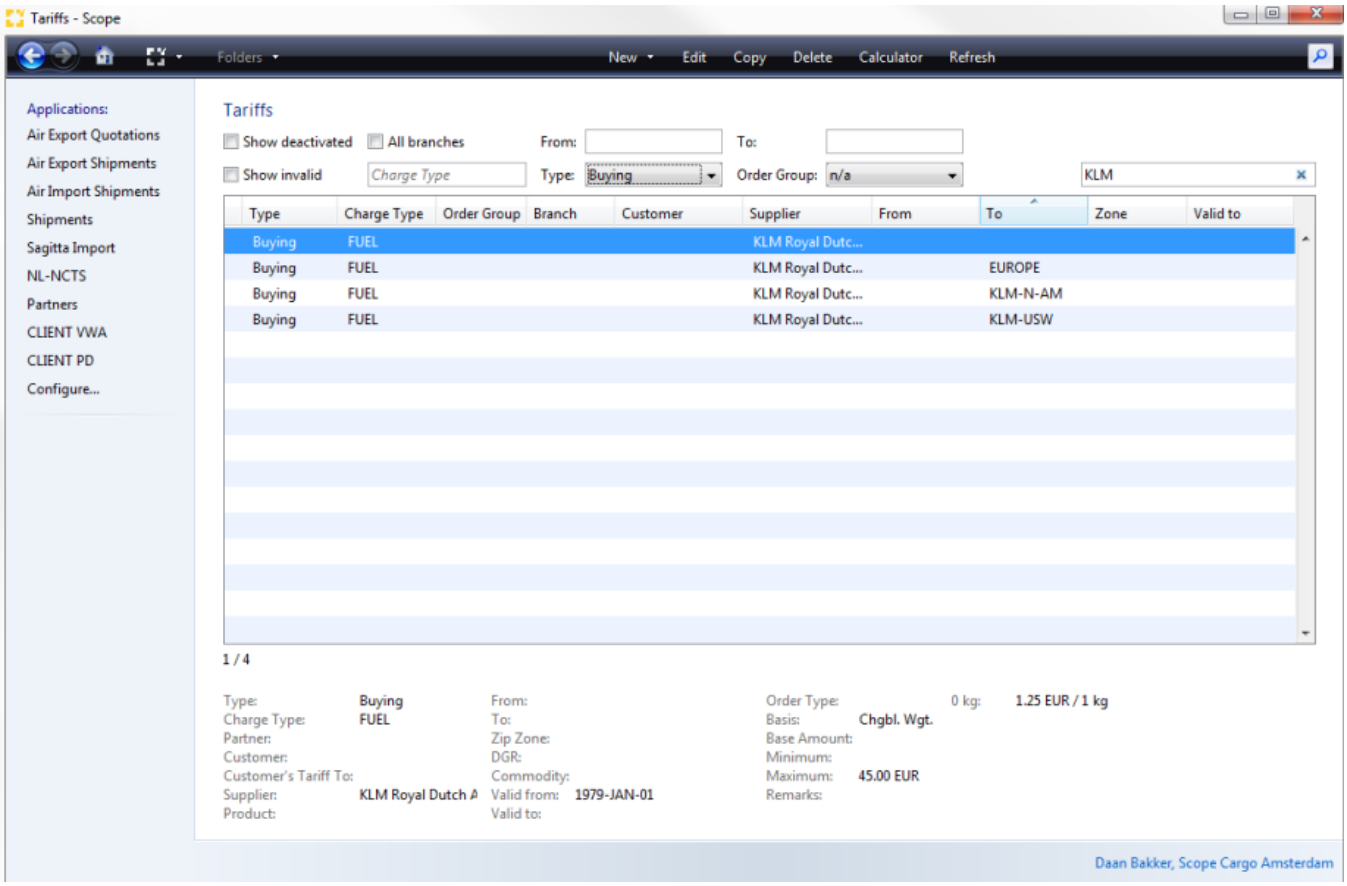
In de Functie Tariffs worden nu de volgende zaken vastgelegd.

Inkoop

Voor inkoop komen er nu 4 regels voor de Supplier KL074 bij te weten één inkoop tarief per regio en één zonder regio voor de overige bestemmingen.



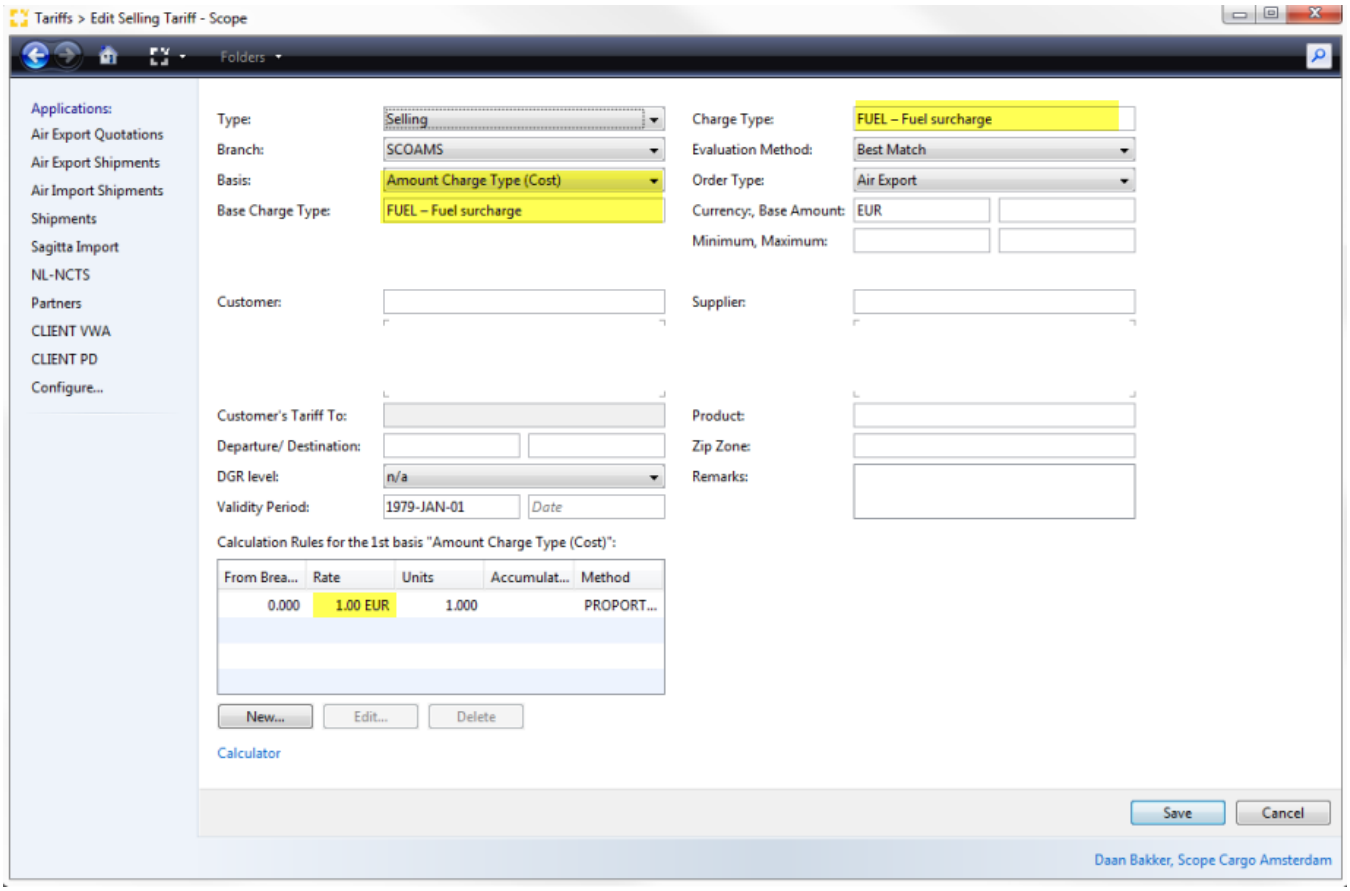
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Verkoop

Voor verkoop is er slechts een regel nodig omdat er gebruik gemaakt wordt van de berekende inkoop, deze regel wordt opgemaakt zoals in onderstaand voorbeeld.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



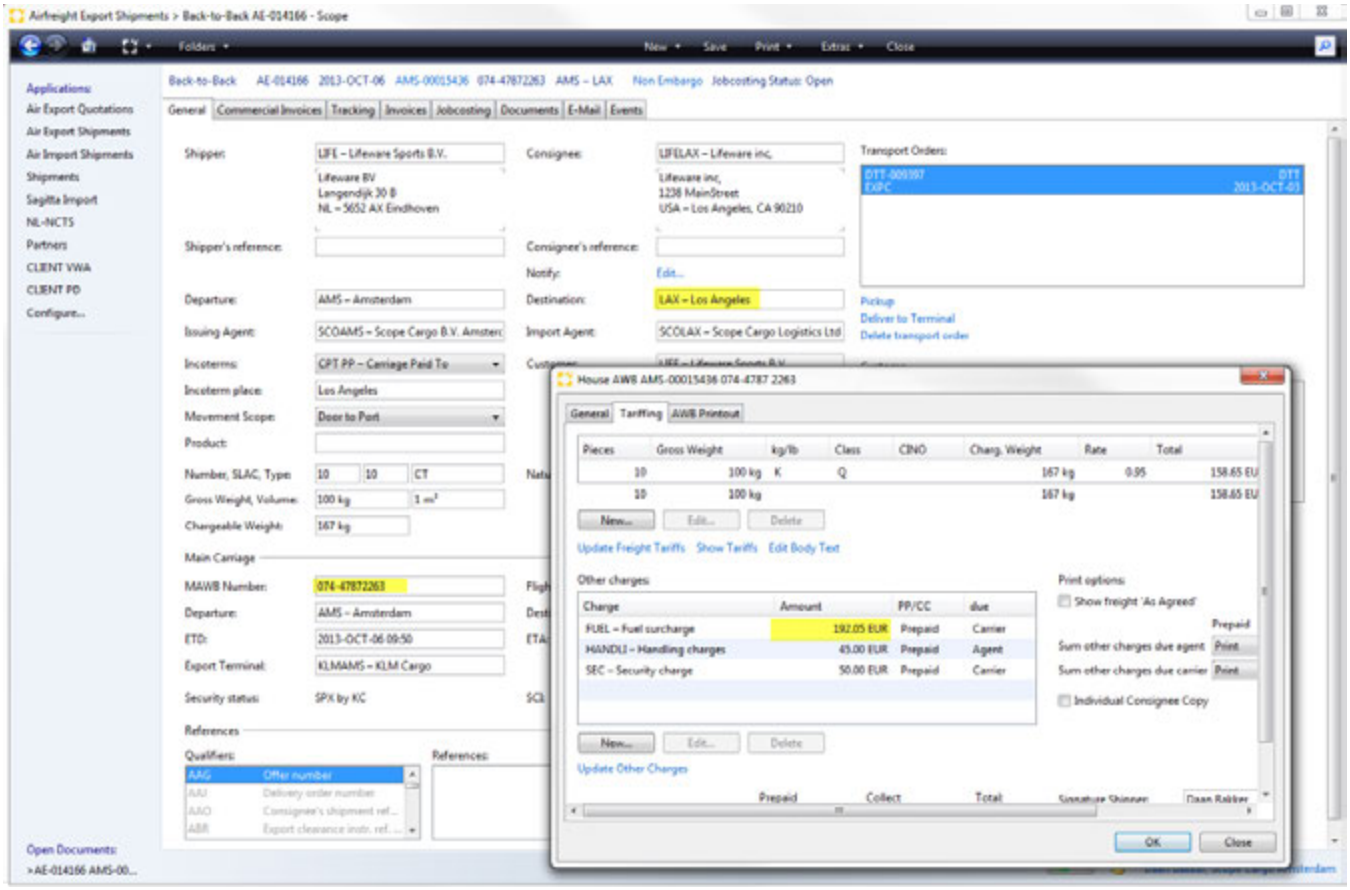
Veld	Waarde
Charge Type	De chargetype code van de te belaste verkoop
Basis	Amount Charge Type (Cost)
Rate	1 EUR indien de kosten één op één worden doorbelast (indien er een marge is dan wordt de 1 verhoogd met de gewenste marge-5% wordt dan 1,05 EUR)

Uitvoering

Dus wanneer er nu een directe of back to back zending wordt aangemaakt welke aan de gestelde criteria voldoet worden de bedragen op de IATA-AWB en de B2B HAWB en op het TAB Job costing van de air export entries automatisch berekend.

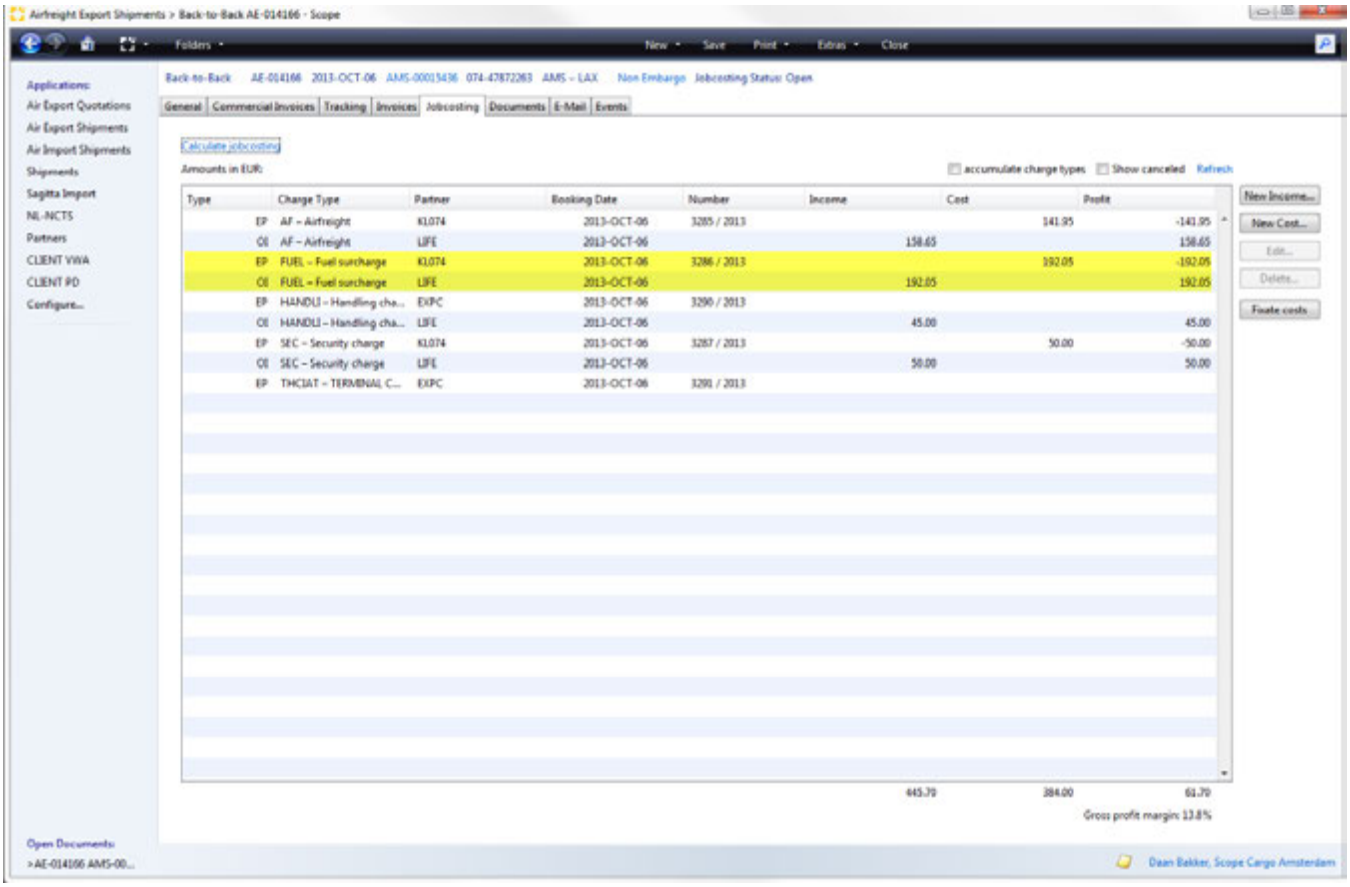
Back-to-Back

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Job Costing

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Tariff Editor - Tariff - Accounting - Maintenance

- Introduction
- Description

Introduction

This application creates new, or edits existing tariffs.

Description

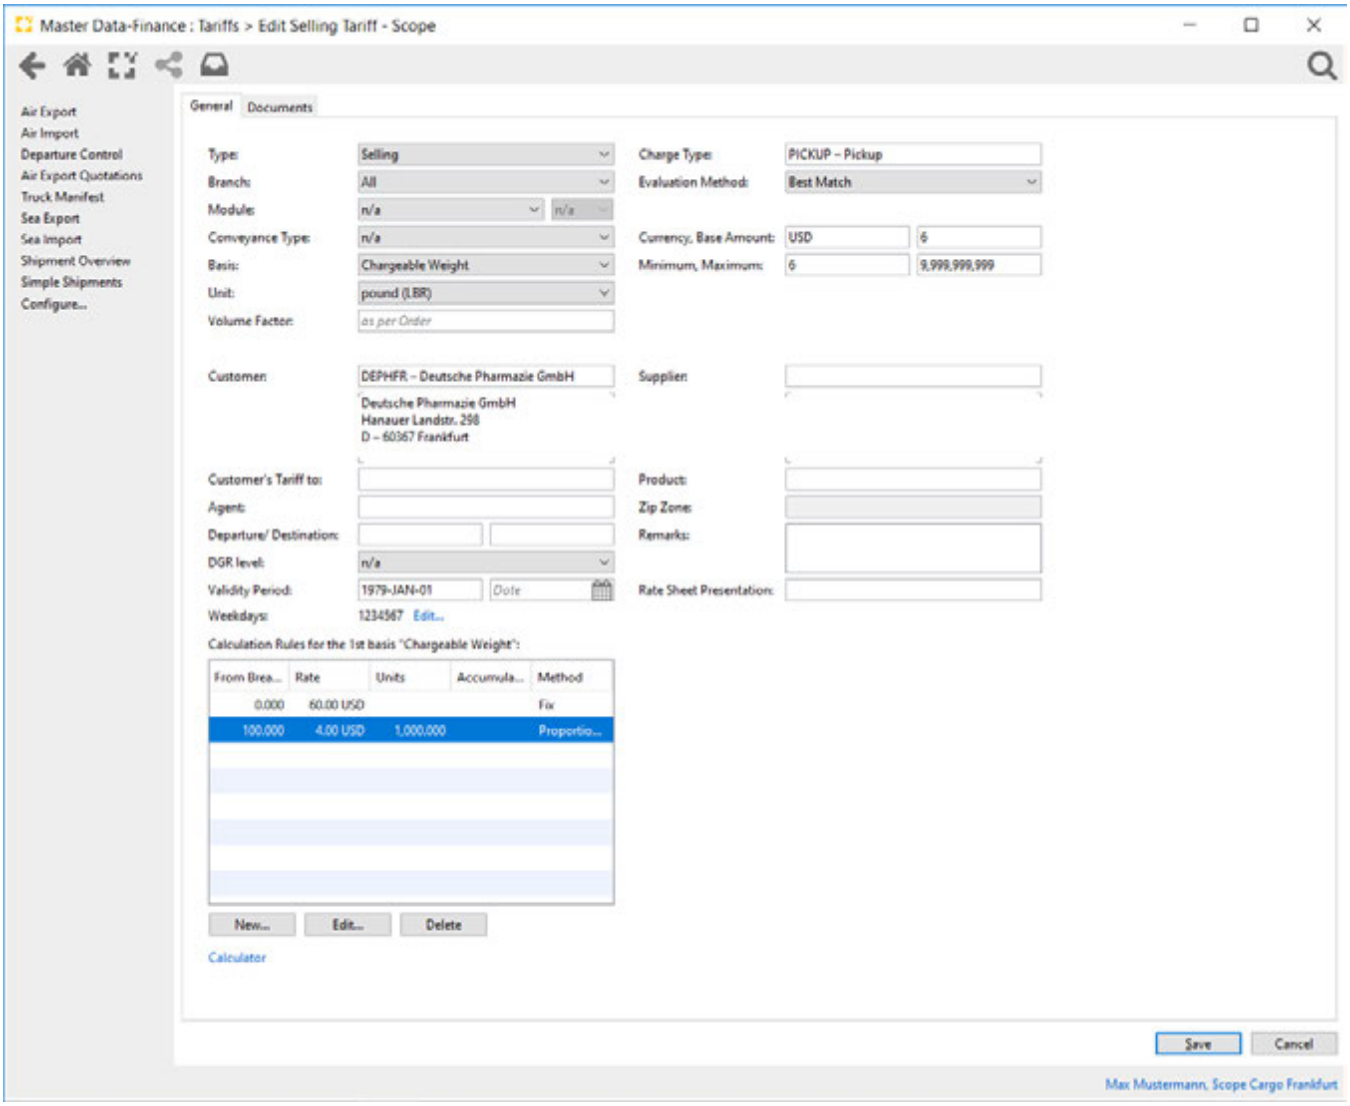
When creating a new tariff, the type of tariff must first be selected. Current tariff types are:

Tariff type	Description
Selling	This tariff type is for outgoing documents associated with House shipments and Direct shipments
Buying	These tariffs will be used to determine expected costs, also known as reserves which are later resolved when the real costs are billed by the vendor of the service. If these are airfreight charges billed by airlines then the air export applications will assume they are *Net Rates*.
IATA Tariffs	These tariffs are used by the activity type *AF - Air Freight* used in direct and master shipments
Internal Tariffs	This tariffs are used internally between branches and are used for Consol Profit Analysis

Criteria for Internal Tariffs

- Master shipment (MAWB): Criteria *Customer* and *supplier* will not be considered.
- House shipment (HAWB): Principle Criterion = Export Agent
- House shipment (HAWB: Criterion *supplier* is not considered.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Charge Type

The field search function can be used to locate the charge type to which the tariff will apply.

Branch

The drop down list will display a complete list of branches to which the tariff may apply. Select a single branch to which the tariff should apply. When the tariff applies to all branches, the field may be left as *N/A*.

Evaluation Method

This is a drop-down option that provides three methods of applying the rate table:

Best Match

The system uses one rate line to calculate the total figure:

Example:

1. Shipments up to 100 Kg is a flat fee of EUR 150.00
2. Shipments over 100Kg and up to 200Kg are EUR 2.50 per Kg
3. Shipment over 200Kg and up to 300Kg are EUR 2.30 per Kg.

The actual shipment is 190 Kg. Therefore line 2 will be used exclusively to calculate the rate by dividing 190Kg by 1 and multiplying the result by EUR 2.50 for a figure of EUR 475.00.

Next Minimum

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This method can be used when more than 1 breakpoints are present in the rate table. In this calculation the application will calculate the rate using the appropriate breakpoint, however it will compare this breakpoint figure against the lowest figure that could be obtained from the next breakpoint and the lower of the 2 figures will be used as the final figure.

Example:

1. Shipments up to 100 Kg is a flat fee of EUR 150.00
2. Shipments over 100Kg and up to 200Kg are Eur 2.50 per Kg
3. Shipment over 200Kg and up to 300Kg are Eur 2.30 per Kg.

The actual shipment is 190 Kg. Therefore line 2 will be used to calculate the rate by dividing 190Kg by 1 and multiplying the result by EUR 2.50 for a figure of EUR 475.00. Because the evaluation method *Next Minimum* is being used, the application will evaluate the next breakpoint after line 2 which is line 3 and it will determine if a minimum shipment qualifying for line 3 will cost less than the actual shipment which is using line 2. In this case for line 3 a minimum shipment will be 200Kg divided by 1 and multiplied by EUR 2.30 for a final figure of EUR 460.00. Since this 2nd figure is lower than the EUR 475.00 derived from line 2, the minimum from line 3 of EUR 460.00 will be used.

Previous maximum

This method can be used when more than 1 breakpoints are present in the rate table. In this calculation the application will calculate the rate using the appropriate breakpoint, however it will compare this breakpoint figure against the highest figure that could be obtained for a shipment using the previous breakpoint and the higher of the 2 figures will be used as the final figure.

Example:

1. Shipments up to 100 Kg is a flat fee of EUR 150.00
2. Shipments over 100Kg and up to 200Kg are EUR 2.50 per Kg
3. Shipment over 200Kg and up to 300Kg are EUR 2.30 per Kg.

The actual shipment is 210 Kg which means that line 3 is used as the rate calculation, the sum being 210Kg divided by 1 and multiplied by 2.30. This produces a total of EUR 483.00. This figure is compared against the maximum cargo weight that would qualify for the previous line being line 2. This would be a shipment of 199 kg which would be charged at EUR 2.50 per kg resulting in a figure of EUR 497.50. In this case the higher of the figures, EUR 497.50 would be used.

Basis

Tariffs that use a rate table require a basis on which to calculate the rates, this basis may be the chargeable weight of the shipment, or it may be the the number of pieces on the shipment. The basis field is a drop-down field that allows selection from a list of available basis types:

- Only base amount
- Manual Entry
- Number of Pieces
- Chargeable Weight
- Gross Weight
- Amount Charge Type
- Amount all Charges
- Other Tariff
- Volume
- Container Type

When the *Manual Entry* basis is selected, the **Prompt** field is used to store the message that will appear in a pop-up window requesting the number of units for the custom basis. As an example if the charge is calculated based on the number of commodity items in a customs clearance, then the **Prompt** text area could be used to store the prompt text; *"Number of commodity items in customs entry?"*.

The basis *Only base amount* assumes a single fixed charge for the service, therefore the rate table is not available.

Unit / Base Charge Type / Tariff / Container type

Once the *Basis* has been determined, the type of units for the basis should be chosen. For example if *volume* is chosen as the basis, then volume units may be *cubic meters, cubic feet* etc. Because the units for each basis may differ considerably, the **Unit** field is flexible and will be labeled in accordance with the basis chosen with the complete listing of basis', units and their types shown in the table below:

Basis	Unit/Charge Type/Tariff/Container	Units
Only base amount	Not Active	None
Manual Entry	Not Active	Specified by *prompt*
Number of Pieces	Not Active	From shipment
Chargeable Weight	Unit	Gram, Kilogram, Metric Ton or Pound
Gross Weight	Unit	Gram, Kilogram, Metric Ton or Pound
Amount Charge Type	Base charge type	Selected from available charge types
Amount all Charges	Not Active	Rate table based on invoice total

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Other Tariff	Tariff	Selected from list of existing tariffs
Volume	Unit	Cubic centimeter, cubic decimeter, litre, millilitre, cubic meter, cubic inch or cubic foot
Container Type	Container type (code)	From standard container ISO codes

Prompt

When the **Basis** is *manual entry* the **Prompt** field is active and is used to describe the kind of units that should be entered when the tariff is in use.

Order Type

The tariff can be restricted to particular types of shipments using the **Order Type** field*. This is a drop down menu providing a list of possible order types:

- **N/A** - Not applicable and valid for any type of shipment
- **Air Export** - Only for use with air export shipments
- **Air Import** - Only for use with air import shipments
- **Sea Export** - Only for use with sea export shipments
- **Sea Import** - Only for use with sea import shipments
- **AOG Order** - Only for use with AOG shipments
- **Simple Shipment** - Only for use with simple shipments

Currency

The code of the currency for the tariff

Base Amount

If a base amount is present it will always be used in the tariff calculation as the basic charge for the shipment. If there are further figures maintained in the rates table, these will be added to the base amount. To calculate exclusively using the rate table, the **Base Amount** should be left empty.

Minimum / Maximum

The minimum figure that may be charged for this tariff. This ensures the charge billed is never less than the minimum. The Maximum figure sets a maximum amount that may be billed when using this tariff.

Customer

This is a full search text field , where the name of the invoice to party can be stored. This will restrict the tariff for use with only the specified invoice to party. If a general tariffs exists that matches a tariff which is specific to an invoice to party, then the tariff for the invoice to part will be used as a priority.

Supplier

When a tariff is specific to a supplier (vendor of services), this full search text field can be used to find and store the supplier.

Customer's Tariff To

This allows you to involve the shipper or consignee in the tariff. The system first checks the existence of a tariff and activity type with the corresponding customer and "tariff to" partner, in second priority it will check for a customer tariff without a "tariff to" partner and in third priority it will check for general tariffs and activity types.

Product

The product to which the tariff applies.

Agent

When a tariff is specific to a agent (export or import agent), this full search text field can be used to find and store the agent.

Departure

The departure field may be left blank to indicate the tariff is valid for departures from any location, or the the departure field can be used to indicate that the tariff is specific to:

- A UNLOCODE
- A country code
- Region code

Destination

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The destination field may be left blank to indicate the tariff is valid for destinations in any location, or the the destination field can be used to indicate that the tariff is specific to:

- A UNLOCODE
- A country code
- Region code

DGR-Level

In the case of a tariff for DGR shipments different options can be selected:

Options:

- n/a = not applicable (recommended for general tariffs)
- no DGR = the tariff is only valid for no DGR goods
- DGR/PAX = the tariff is valid for DGR and PAX goods
- CAO = the tariff is valid for DGR goods, which only can shipped out by cargo aircraft only (CAO)
- limited or excepted Quantity = the tariff is valid for DGR goods which applies under the regulations for limited or excepted quantities

Note: The tariffs for dangerous goods is specified for airfreight. Regarding a tariff for other modules like SEA you can use n/a, no DGR, DGR/PAX (shipments with dangerous goods)

Validity Period

These date and time fields are used to determine the period for which the tariff is valid. In the case of sea imports, the date used in the shipment's economic date.

Zip Zone

A specified zip zone may be applied to the tariff. This is a full search text field that will search for valid zip zones.

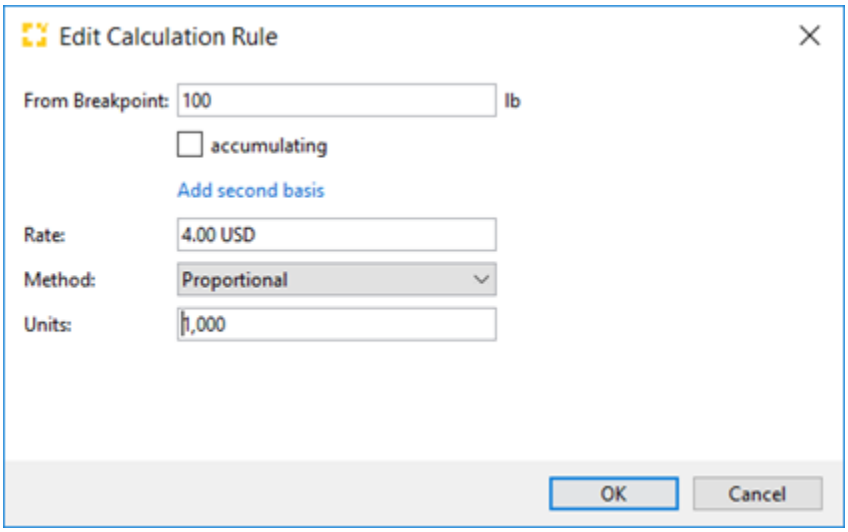
> The Zip Zone cannot be used in the following types of tariffs:
>
> - Tariffs that apply to more than 1 branch
> - Tariffs where a departure or destination are specified.

Remarks

This field allows you to fill in remarks for this tariff.

Calculation Rules (Rate Table)

Where a tariff is based on breakpoints (not a fixed fee), the rate table is used to build the calculation rules for the tariff



There are 3 functions available to manage a rate table:

New

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This function will add a new breakpoint to a rate table using the new calculation rule editor.

Edit

Highlight a breakpoint in the table and select this function to edit the rule using the new calculation rule editor.

Delete

Highlight a breakpoint in the table and select this function to delete the rule.

New Calculation Rule Editor

The **New Calculation Rule** editor appears when the *New* or *Edit* functions for the calculation rules are selected. This popup editor provides a set of features to define a new rule:

From Breakpoint

The breakpoint indicates the quantity at which a new rate is offered. For example when a rate is based on the chargeable weight of a shipment, breakpoints should be present to calculate rates for chargeable weights from 1 to the maximum possible number of chargeable Kgs (or Lbs). This means that a breakpoint representing the minimum figure must always be present and therefore this breakpoint is "0.000". This "0.000" breakpoint cannot be deleted since it must exist for the rate table to function correctly. There is no limit in the number of Breakpoints that may be created, but each Breakpoints must be unique.

Accumulating

This checkbox is used to indicate if the previous lines of the rate table should be used to calculate the rate.

Example

The rate table is based on chargeable weight (Kgs) and comprised of 3 rate lines:

1. 0.000 Kgs to 99.999 Kgs = Flat fee of EUR 50.00
2. 100.000 Kgs to 199.999 Kgs = Rate per kilo (proportional) of EUR 4.000 (accumulating)
3. 200.000 Kgs to 99999.999 Kgs = Rate per kilo (proportional) of EUR 3.800 (accumulating)

The example shipment has a chargeable weight of 220.000 Kgs. Using the **accumulating** method the total will be calculated as follows:

The first 100 Kgs = EUR 50.00
The next 100 Kgs = EUR 4.00 per Kg = EUR 400.00
The final 20 Kgs = EUR 3.80 per Kg = EUR 76.00

Total Rate for 220.00 Kgs using an accumulating rate table is EUR 526.00

Add second basis

When the calculation of the tariff is based on 2 different units, for example a rate for storing cargo in a warehouse may be based on both the volume of the cargo and the number of days stored. The **Add second basis** option allows this 2nd basis to be created and used during calculation of the total charge. Once created, this 2nd basis will appear in a table to the right of the 1st rate table.

Rate

the actual rate to be charged for the number of units on the shipment.

Method

This is a drop-down menu offering 3 methods to apply a rate:

- Fixed
- Step
- Proportional

Type	Description
Fix	This is a flat fee and does not depend on the number of units. If a fixed rate of EUR 15.00 is offered on chargeable weights between 0.000 Kgs and 100.00 Kgs, the fee for shipments in this size range will always be EUR 15.00
Step	In a step calculation, the number of units are always rounded to a full figure. Example: At the Breakpoint of "100 kgs" a figure of "20.00" EUR will be charged per 10 kgs of chargeable weight. The shipment has a chargeable weight of 118,0 kgs. The calculation will be 118 Kgs : 10 = 11.8 (rounded to the nearest whole unit = 12), 12 x 20.00 EUR = 240.00 EUR
Proportional	The rate is calculated by the units. Example: At the breakpoint "100 kgs" a figure of "20.00" EUR per 10 kgs is charged. The shipment has a weight of 118,0 kgs. Calculation: 118 : 10 = 11,8 x 20,00 EUR = 236,00 EUR

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Units

If the calculation rule is a *step* or *proportional* rule, then the number of units that the rate applies to must be provided.

OK

Saves the rule and exits the **Calculation Rule** editor.

Cancel

Exits the **Calculation Rule** editor without saving any changes.

Calculator

This action launches an application that allows the tariff to be tested. The calculator will request the number of units to be calculated and then produce a result, allowing the tariff to be checked.

Save

The tariff will be saved and the application will exit to the overview of all tariffs.

Cancel

Any changes to the tariff will not be saved and the application will exit to the overview of all tariffs.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Quay Charges Calculator - Tariffs - Accounting - Maintenance

- Introduction
- Description

Introduction

Since Scope Release 10.8 a calculator for quay charges is included the Tariff-Editor.

Description

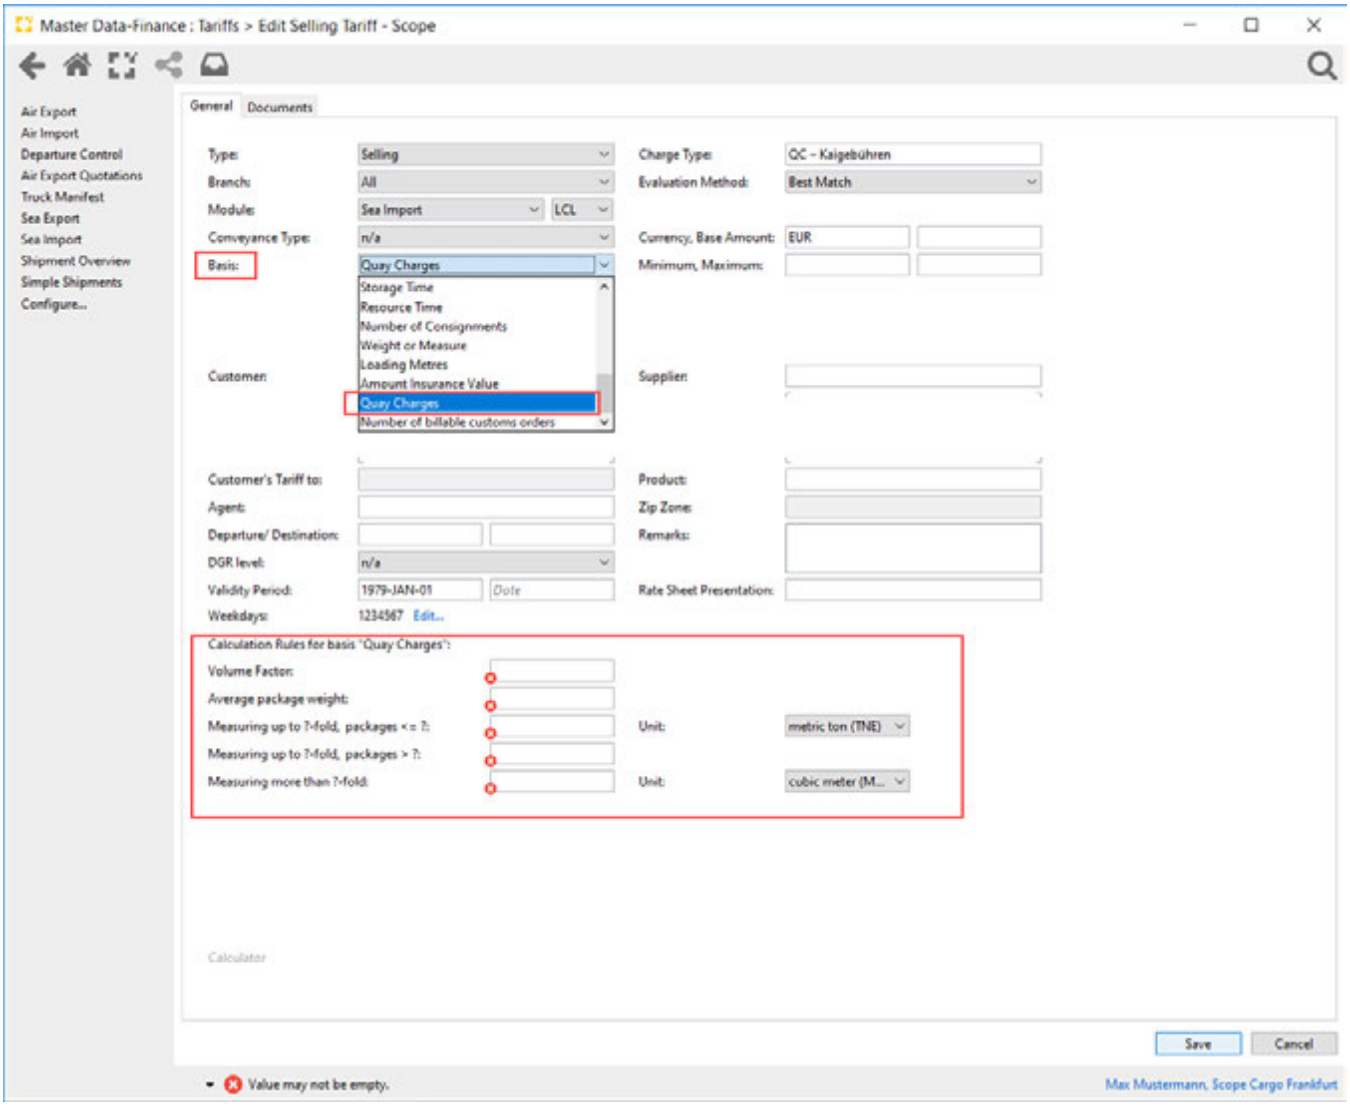
Normally quay charges are applicable for seafreight import shipments which arrive at port of Hamburg. The Hamburg Port Authorities published an official quay tariff which divides the calculation in different parts:

- Quay charges for packages greater than 20 kgs (measuring up to 5-fold) / Base: metric tons
- Quay charges for packages less than 20 kgs (measuring up to 5-fold) / Base: metric tons
- Quay charges for packages more than 5-fold measuring / Base: cubic meter
- Minimum

For calculation of quay charges Scope is checking if weight per package is greater or less than 20 kgs/Package and if the packages are measuring goods (x-fold measuring = cubic meter : metric tons).

Calculation of quay charges is available at Tariff-Editor (Master Data-Finance-Tariffs) at checkbox Basis (Quay Charges).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Calculation Rules for basis "Quay Charges"

Building up the quay tariff by different parameters.

Volume Factor

Selection of measuring-factor, e.g. quay tariff port of Hamburg = 5

Average package weight

Selection oof package weight, e.g. quay tariff port of Hamburg = 20 kgs

Measuring up to ?-fold, packages <= ?

By fullfilling the above mentioned fields it can called: Measuring up to 5-fold, packages <= 20 kgs. Adding amount for accounting. Unit normally "metric ton"

Measuring up to ?-fold, packages >?

By fullfilling the above mentioned fields it can called: Measuring up to 5-fold, packages > 20 kgs. Adding amount for accounting. Unit normally "metric ton"

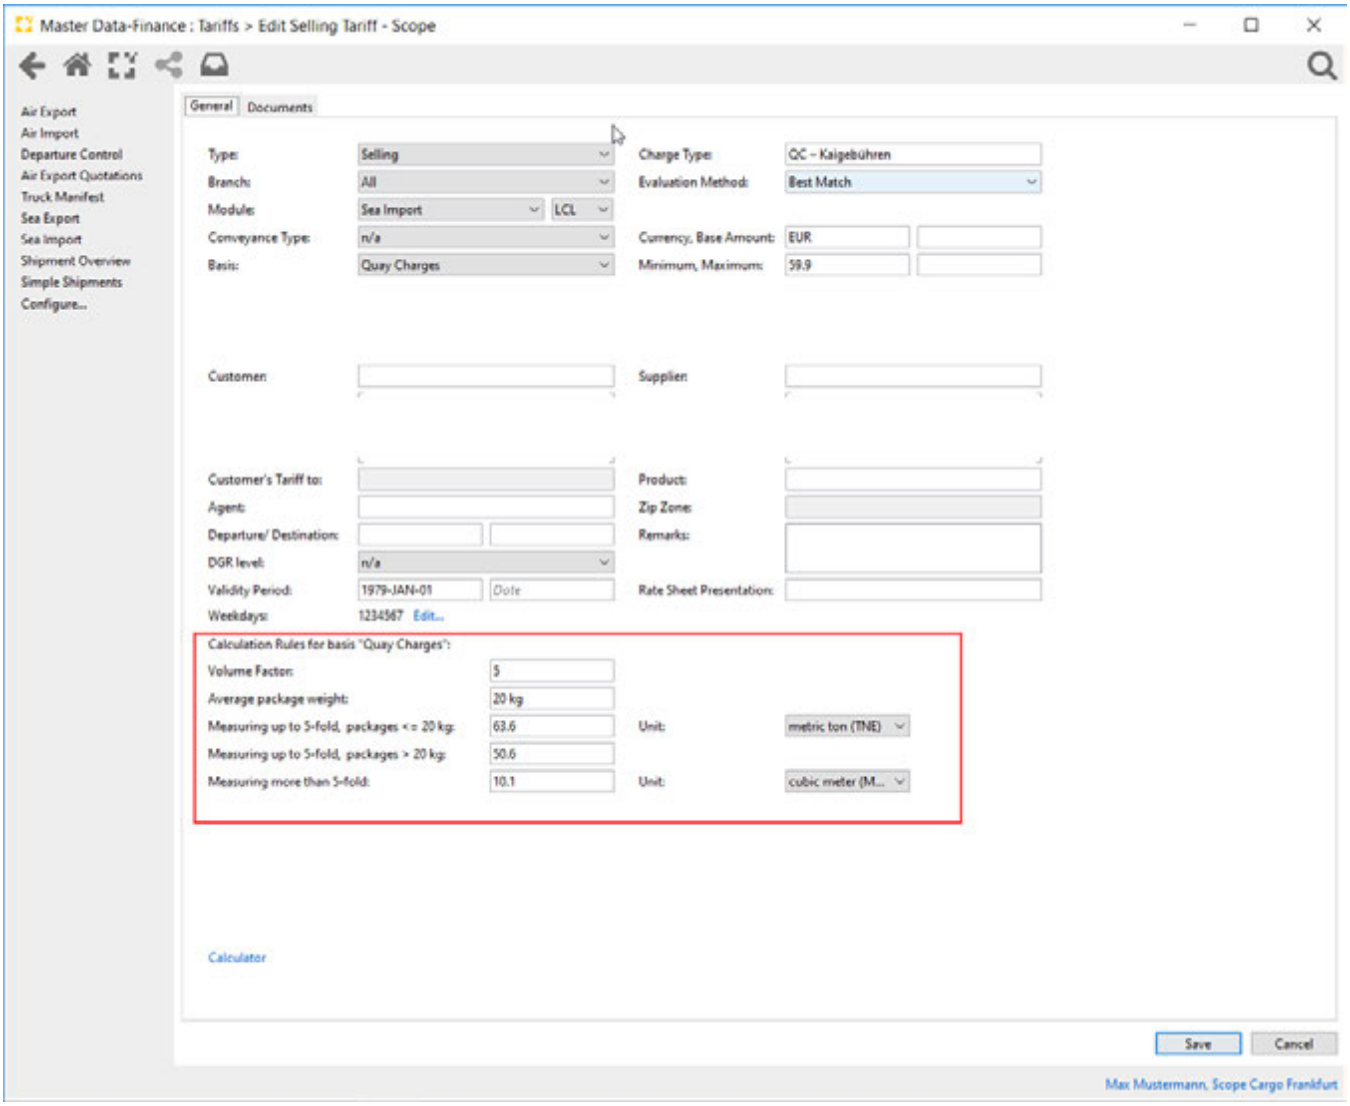
Measuring more than ?-fold

By fullfilling the above mentioned fields it can called: Measuring more than 5-fold. Adding amount for accounting. Unit normally "cubic meter"

Unit

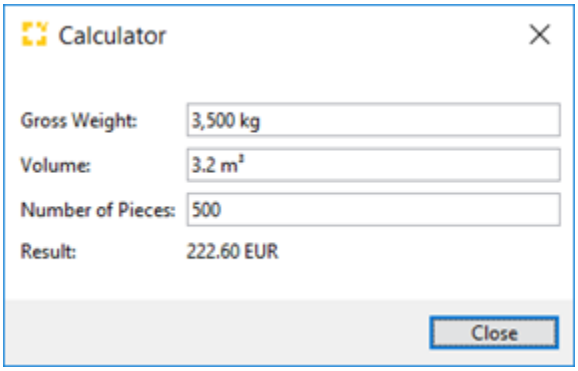
Selection of Unit for calcultion for different accounting types (measuring up to / measuring more than)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Calculator

This action launches an application that allows the tariff to be tested. The calculator will request the number of units to be calculated and then produce a result, allowing the tariff to be checked.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Zip Zones - Accounting - Maintenance

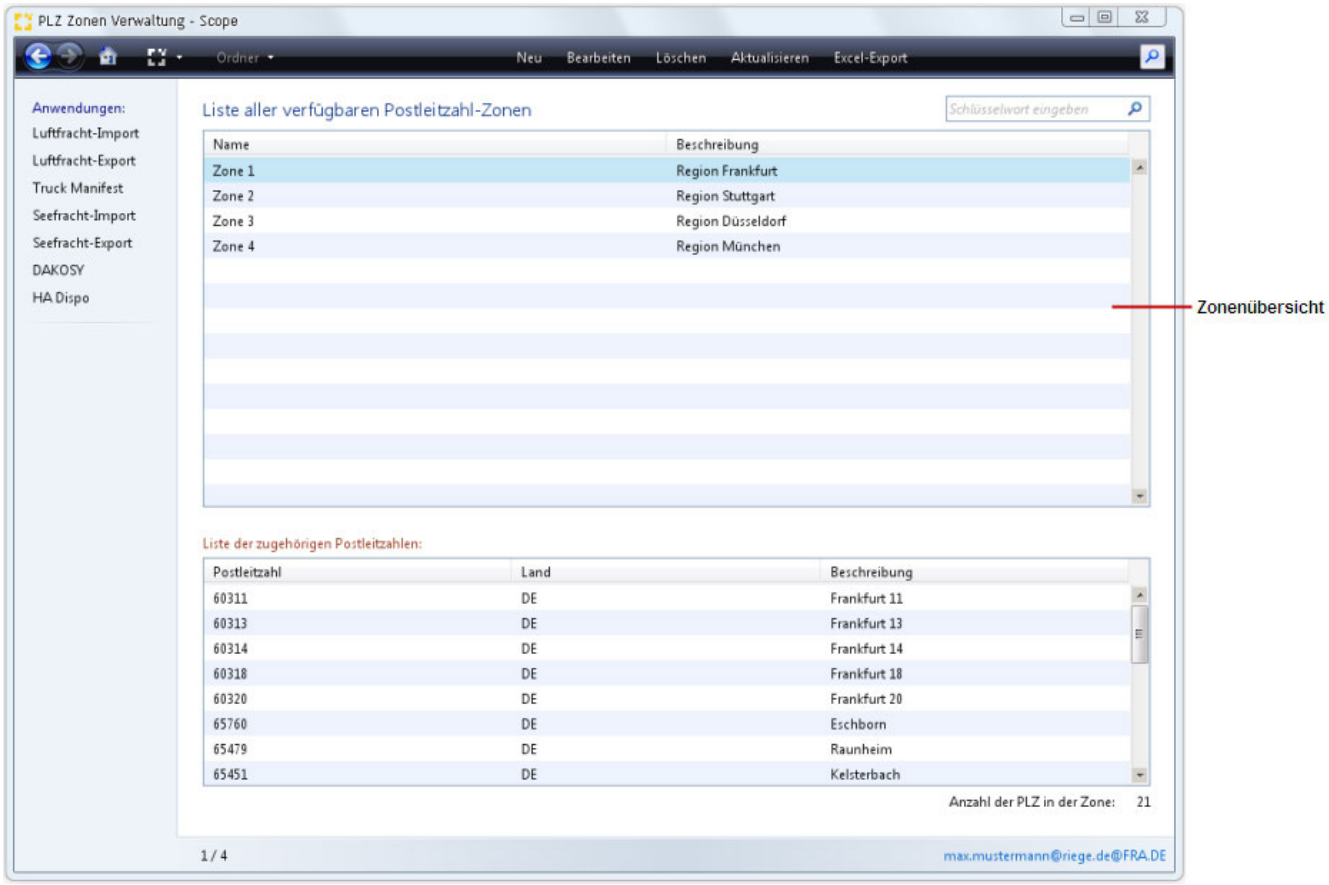
- Introduction
- Description

Introduction

Tariffs and their charge types may be based on zip codes. For example pickups and deliveries could be billed according to the the zip code of the pickup /delivery address. The **zip zones** application allows multiple zip/postal codes to be be grouped into zones and these **zip zones** may then be used when building a tariff to automatically calculate pickup/delivery charges for particular zip codes.

Description

The application provides a menu bar with action such as new, open, delete etc. There is an overview of all existing zip zones and a search field to locate zip zones.



New

Opens the Zone Editor in order to create a new zip zone.

Open

Opens the Zone Editor in order to edit the zip zone highlighted in the overview.

Delete

Deletes the zip zone highlighted in the overview.

Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Updates the index to ensure the latest zip zones are visible.

Export to Excel

Exports the zip zone highlighted in the overview to a spreadsheet and opens it on the local computer.

List of all available ZIP-Zones

A complete listing of all zip zones is shown in the overview, showing the name of the zip zone, the partner and the product. If the search field is used, the listing of zip zones will be restricted to those matching the search terms.

Type to search

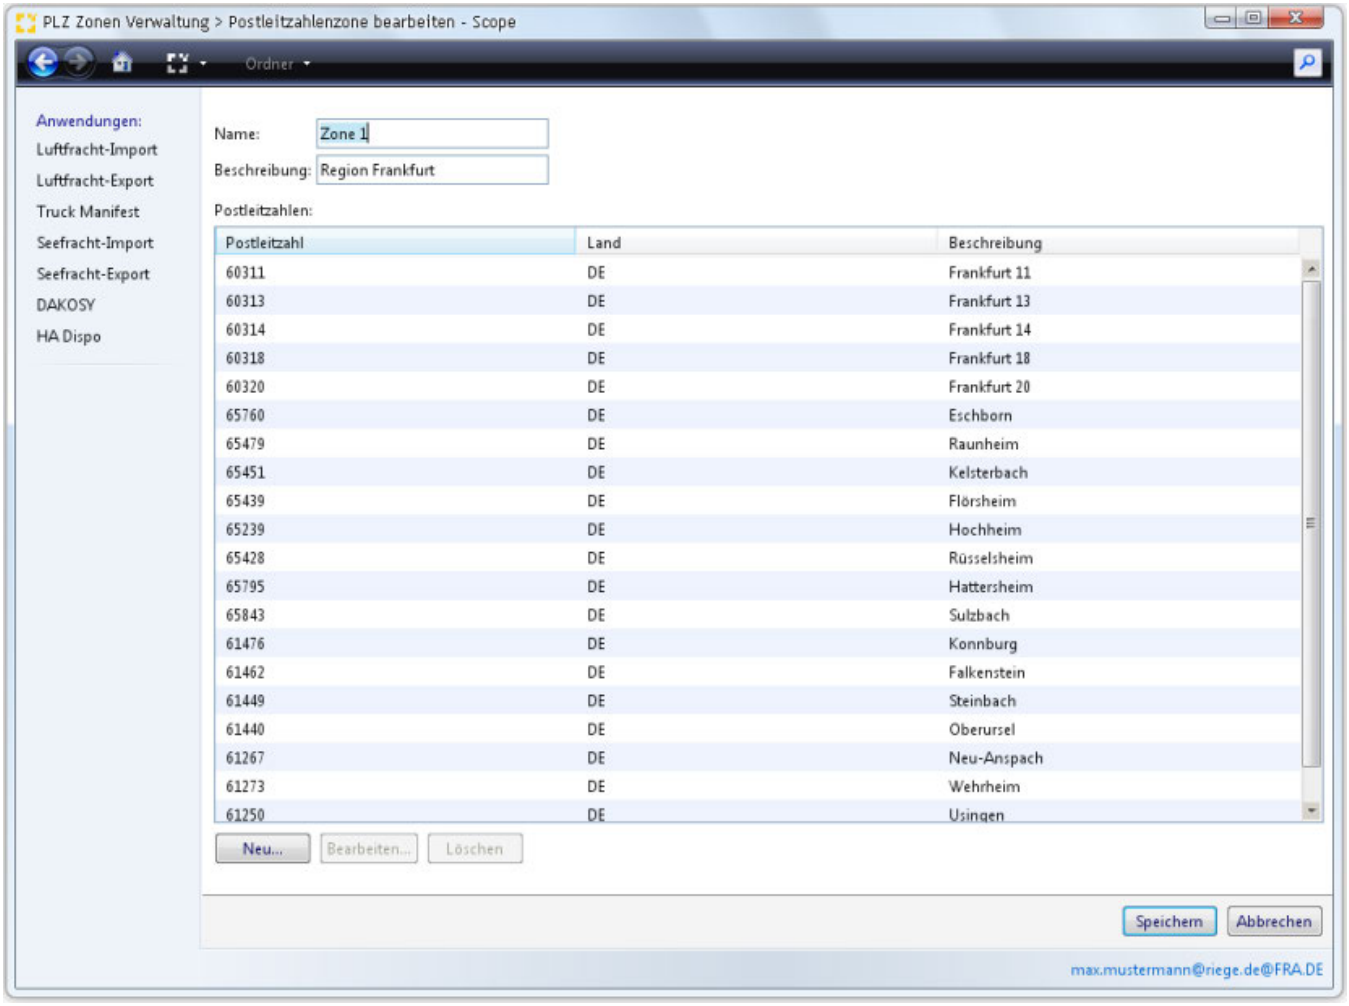
This is a full search text field . Keywords can be entered to locate ZIP zones. For example to find out which zip zones the zip code "07416" belongs to, simply type "07416" in the search field.

List of belonging ZIPS

Detail of the zip zone highlighted in the overview, showing the ZIP code, Country and description of the ZIP code. A total of all the ZIP code in the the ZIP zone is shown at the bottom right.

Zone Editor

When the *New* or *Edit* function are selected in the overview, the **Zip Zone Maintenance** application appears.



Name

The name of the ZIP zone. This may be freely choosen or can use generally established regions and example being "New York Tristate" which encompasses the greater New York metropolitan area.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Description

A complete description of the ZIP zone.

ZIP codes

A list of ZIP codes in the ZIP zone, together with the country where the zip code is located and a full description of the ZIP code. Additional ZIP codes are added to the listing with the **New** function described below. Existing zip codes can be changed by highlighting then and selecting the **Edit** function or deleted with the **Delete** function.

New

Opens the New ZIP Code Editor to create a new ZIP code for the zone.

Edit

Opens the New ZIP Code Editor to edit a zip code highlighted in the list of ZIP codes.

Delete

Removes the zip code highlighted in the list of ZIP codes.

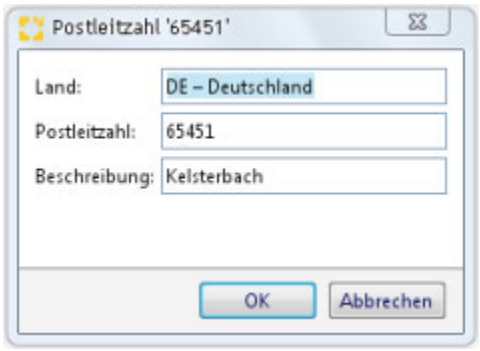
Save

Saves the ZIP zone and exits back to the overview of ZIP zones.

Cancel

Exits the ZIP zone editor without saving changes.

New ZIP Code Editor



Country

The country where the ZIP code is located. This is a search field and can be used to find valid countries and their country codes.

ZIP code

The actual ZIP or Postal code. The code used must be in the valid format of the country where the zip or postal code is located.

Description

A full description of the ZIP code.

OK

Saves the ZIP code details and returns to the ZIP zone application.

Cancel

Exits without saving any changes to the zip codes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Forwarding - Maintenance

- Introduction
- Description

Introduction

This sub-menu item contains all applications that maintain master data which is specific to forwarding operations.

Description

The forwarding master data sub-menu item can be accessed using the main menu and following the links, master data, forwarding. Selection can then be made from a sub-menu of forwarding master data applications.

The following chapters are available and describe master data maintenance applications for forwarding:

- Activity Types - Forwarding - Maintenance
- Carrier Handling Agents - Forwarding - Maintenance
- Code Lists for Order Tracking Approvals - Codelists - Forwarding - Maintenance
- Damage Code - Forwarding - Maintenance
- Equipment - Forwarding - Maintenance
- Handling Agents - Forwarding - Maintenance
- Products - Forwarding - Maintenance
- Tracking Templates - Forwarding - Maintenance

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Activity Types - Forwarding - Maintenance

- Introduction
- Description

Introduction

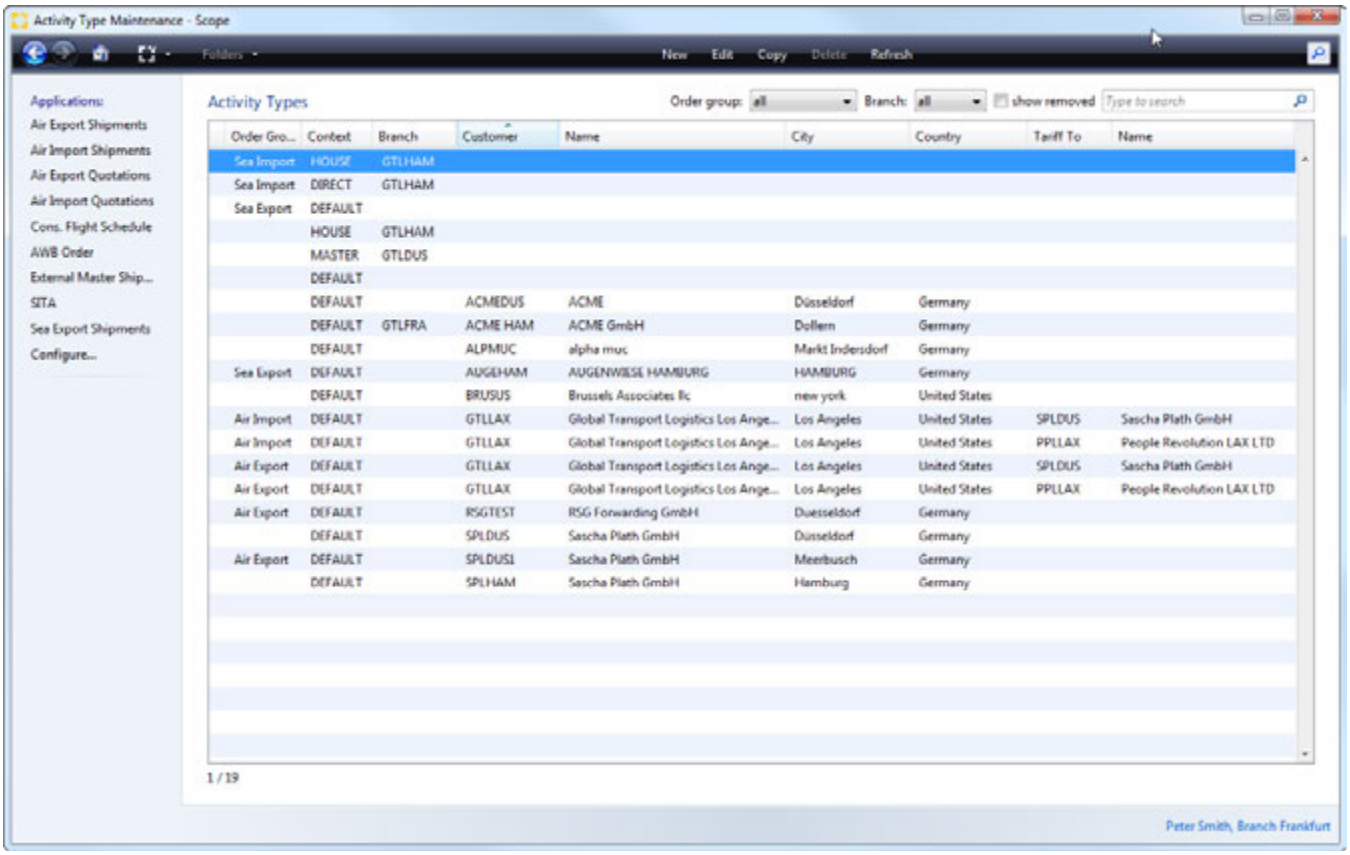
The purpose of the activity types maintenance application is to enable the automatic calculation of income and costs on shipments. These incomes and costs will automatically appear when invoices are created for shipment and as AWB charges when the AWB is printed. This process helps to ensure that all income and costs are accounted for and appear in the job costing records of shipments, leading to accurate profit figures. In order to achieve this automation, an order type exists for every step in the life of a cargo shipment from dispatch to final delivery. Income and cost charges can then be applied to each of these order types as soon as the order is executed such as the generation of a pickup note, the income and costs associated with that order will be automatically added to the shipment record.

Description

The application has a menu bar providing standard actions such as *new, edit* and *delete*. An overview of existing activity types is presented showing:

- **Order Group** (The activity takes place in the context of *Air Export, Air Import, Sea Export, Sea Import or Simple shipments* or if the activity occurs for all shipments and is therefore a default activity.)
- **Context** (The activity takes place in the context of *master, direct, house* shipments or if the activity occurs for all shipments and is therefore a default activity.)
- **Branch** (The branch to which the activity must occur)
- **Customer** (The specific customer code to which the activity must apply)
- **Name** (The full name of the customer to which the activity must apply)
- **City** (The city where the customer is located)
- **Country** (The country where the customer is located.)
- **Tariff to** (The specific customer code to which the activity must apply in combination with the original customer - also see documentation regarding customer in General --> User Interface --> Field types)

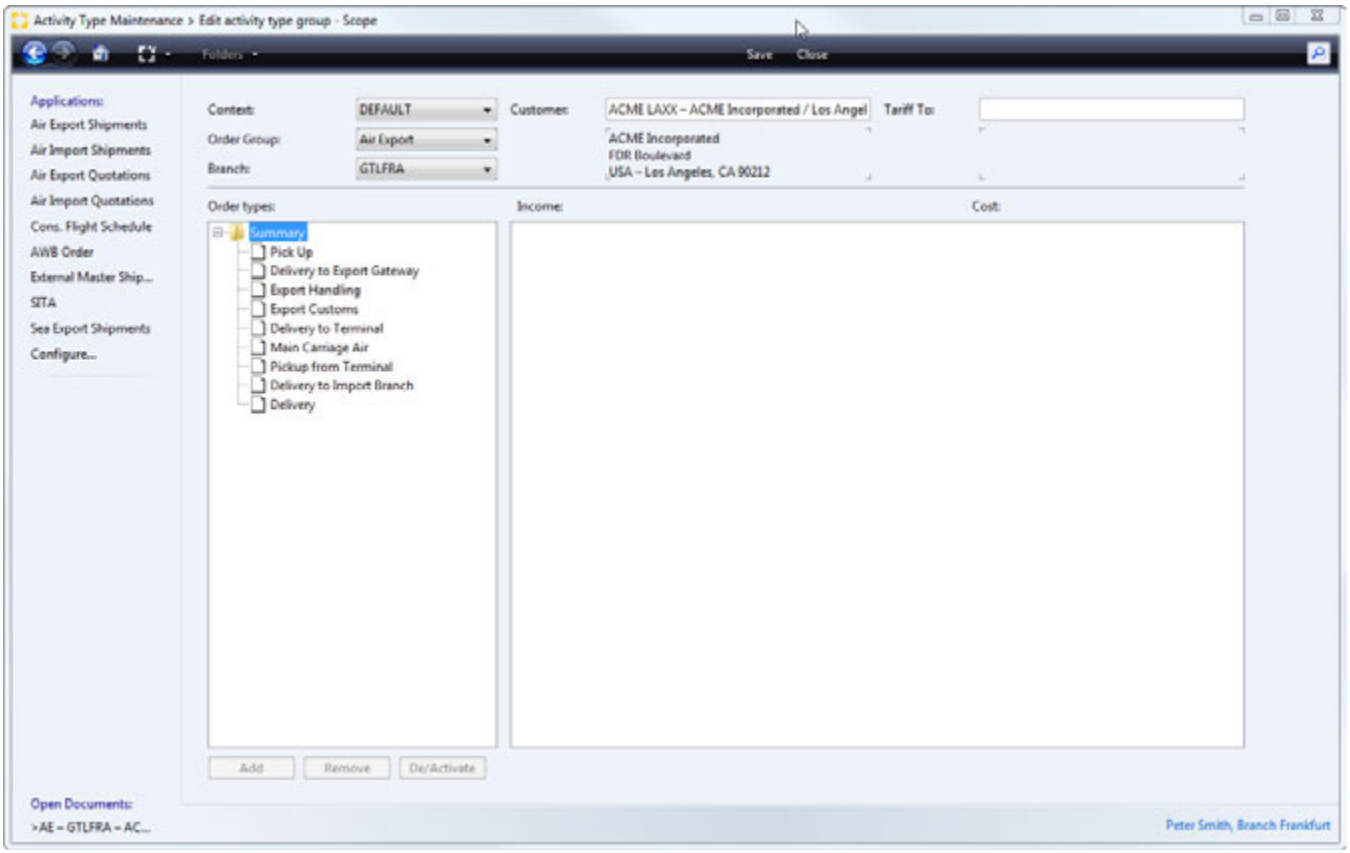
There are also filter/search options to limit the list of results shown in the overview.



New

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Starts the process of registering a new activity type.



Context

Define the context within which the activity should occur. This is a drop-down menu option that will offer the following contexts:

Context	Explanation
Master*	All consolidations
Direct	All direct shipments
House	All house shipments
Default	All shipments

* Back-to-Back shipments correspond to consolidations.

Order Group

Define the context within which the activity should occur. This is a drop-down menu option that will offer the following contexts:

Context	Explanation
Air Export	All Air Export shipments
Air Import	All Air Import shipments
Sea Export	All Sea Export shipments
Sea Import	All Sea Import shipments
AOG Order	All AOG shipments (from the module **NEW AOG**)
Simple shipment	All simple shipments (from the module **Simple shipments**)
n/a	All shipments

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Branch

If the activity is to apply exclusively to a particular branch , this field can be used to search for and store the appropriate branch code.

Customer

If the activity is to apply exclusively to a particular customer , this field can be used to search for and store the appropriate customer. When left blank the activity will apply regardless of the customer.

Tariff to

If the activity is to apply exclusively to a partner in combination to a particular customer , this field can be used to search for and store the appropriate partner. When left blank the activity will apply regardless of the partner. Also see documentation regarding "customer" in General --> User Interface --> Field types

Save

Saves the basic definition of the activity type and proceeds to the definition of income and costs to be applied to order types.

Close

Exits the new activity type definition without saving any data and returns to the overview.

Edit

Opens the activity type highlighted in the overview for editing.

Copy

Copies the activity type highlighted in the overview for a new activity type.

Delete

Deletes the activity type highlighted in the overview. Activity types are not physically deleted, but marked as removed. These removed items can be restored using the *show removed* option described below.

Refresh

Updates the index to ensure the latest activity type data is visible.

Show removed

Check this box to include any activity types that may have been deleted. These will appear in the list with the *Trash* icon to the left. The activity type can be restored by highlighting it and then choosing to edit it. This will generate a dialogue window that will ask to confirm the activity type should be restored.

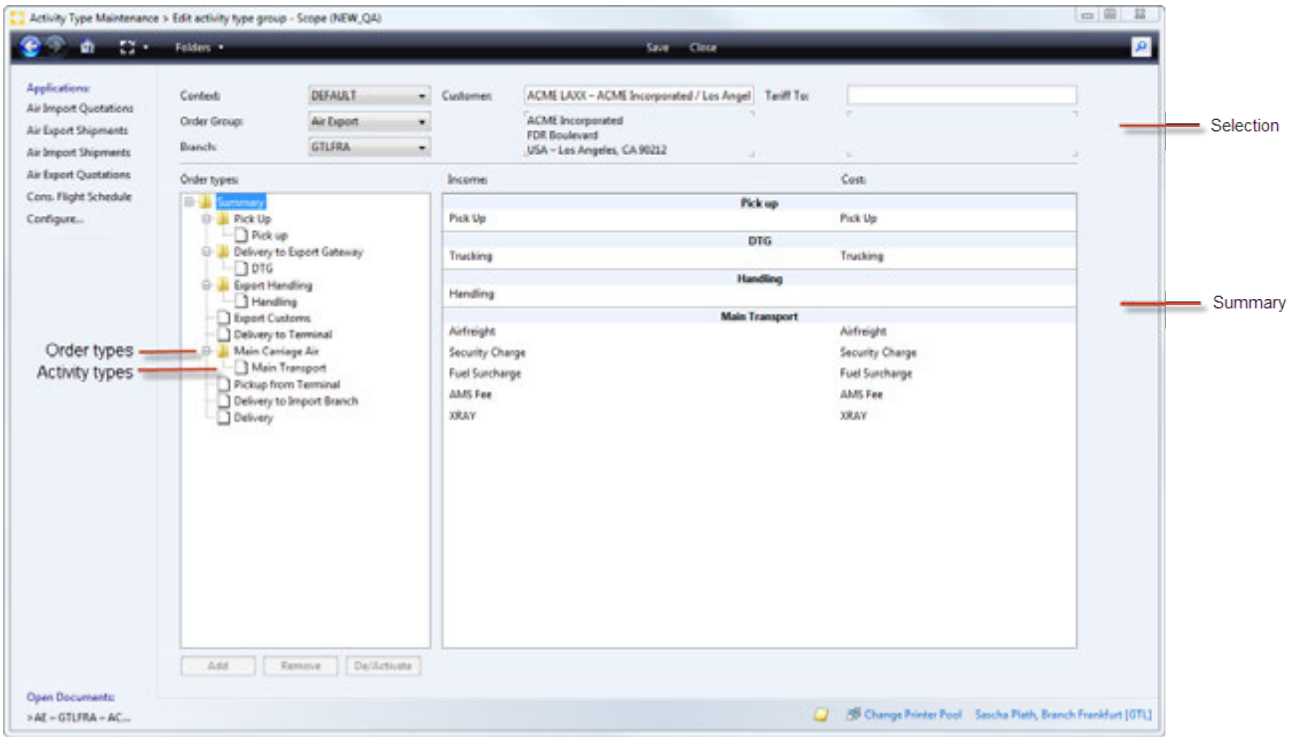
Type to search

This is a search field. Enter one or more keywords to restrict the display of activity types to those containing the keywords.

Order Types Editor

The editor displays two panels, side by side. The Left hand displays the individual events in the life of the shipment as folders and these correspond to actions within Scope, for example *Pickup* corresponds to the generation of a pickup note and will generate the associated default income and costs accordingly. When income or costs are added to any of the events shown in the left hand column, the event in the left hand column will be presented with the *folder* icon and the income and costs will appear beneath the folder with the *document* icon. This enables multiple sets of income and costs to be associated with each event. Click the "+" sign to the left of a folder icon to see it's documents, or click "-" to hide them. When a folder is highlighted and opened in the left-hand pane, all the document sets and their charges associated with that event will appear in the right hand pane. Click on a *document* to view the full details of the document and to make changes in the right-hand pane.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Order types and their triggers

Depending on the Order Group you may have the following Order types:

Order Type	Description	Trigger
Pickup	Pickup from the shipper	Creation of a pickup note for Airfreight Export or Seafreight Export Shipment
Delivery to Export Gateway	Delivery of the export goods from a satellite office to the gateway	Creation of a delivery to gateway transport order for an Air Export or Sea Master Export Shipment
Security Measure	Security Check	Creation of an Airfreight Export air export shipment and creation of a Screening Order
Export Handling	Export Handling	Creation of an Air Export or Sea Export Shipment
Export Customs	Export customs clearance	Creation of an export declaration for an Air Export or Sea Export Shipment
Delivery to Terminal	Delivery of cargo to the export terminal	*not yet implemented*
Main Carriage Air	main flight details	Finalization of master, back to back or direct flight details for Air Freight Export Shipments
Main Carriage Sea	main voyage details	Finalization of transport details for Seafreight Export Shipments
Main Carriage Road	main carriage simple shipment	Creation of a Simple Shipment
Pick up from Terminal	Collection from the arrival terminal	Creation of Air Export or Sea Export Shipment if these shipments are a prepaid (PP) shipments.
Import Customs	Import customs clearance	Creation of an import entry for an Air or Sea Import shipment. In addition if an Air shipment is Incoterm DDP, it will use this activity.
Import Handling	Import procedures	Creation of an air or Sea Import shipment, in addition Air Freight Export shipments will use this activity of they are "Prepaid" (PP).
	Import storage	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Import Warehouse		Creation of an Air Freight Import or Seafreight Import shipment . Air Freight Export shipments will also use this activity type if they are "Prepaid" (PP).
Delivery to Import Branch	delivery of goods to the import branch	Creation of a "Delivery to Branch" transport order within an import shipment, or within Air Freight Export shipments if the shipment is "Prepaid(PP)" and the import agent and gateway are different.
Delivery	Delivery to the consignee	Creation of an air or sea delivery order for a shipment. In addition if an Air shipment is Incoterm DDP, it will use this activity.

Add

Adds a new activity type to the order type highlighted in the hierarchy of order types in the left-hand pane.

Remove

If an order type has been created and charges created, then if the order type is highlighted in the left-hand pane, the *Remove* function button will be active and can be used to remove the order type.

De/Activate

If an order type has been created and charges created, then if the order type is highlighted in the left-hand pane, the *De/Activate* function button will be active and can be used to activate and deactivate the marked order type. However this order type will only be enabled/disabled, but not removed from this activity type.

Save

Saves any changes and exits the editor.

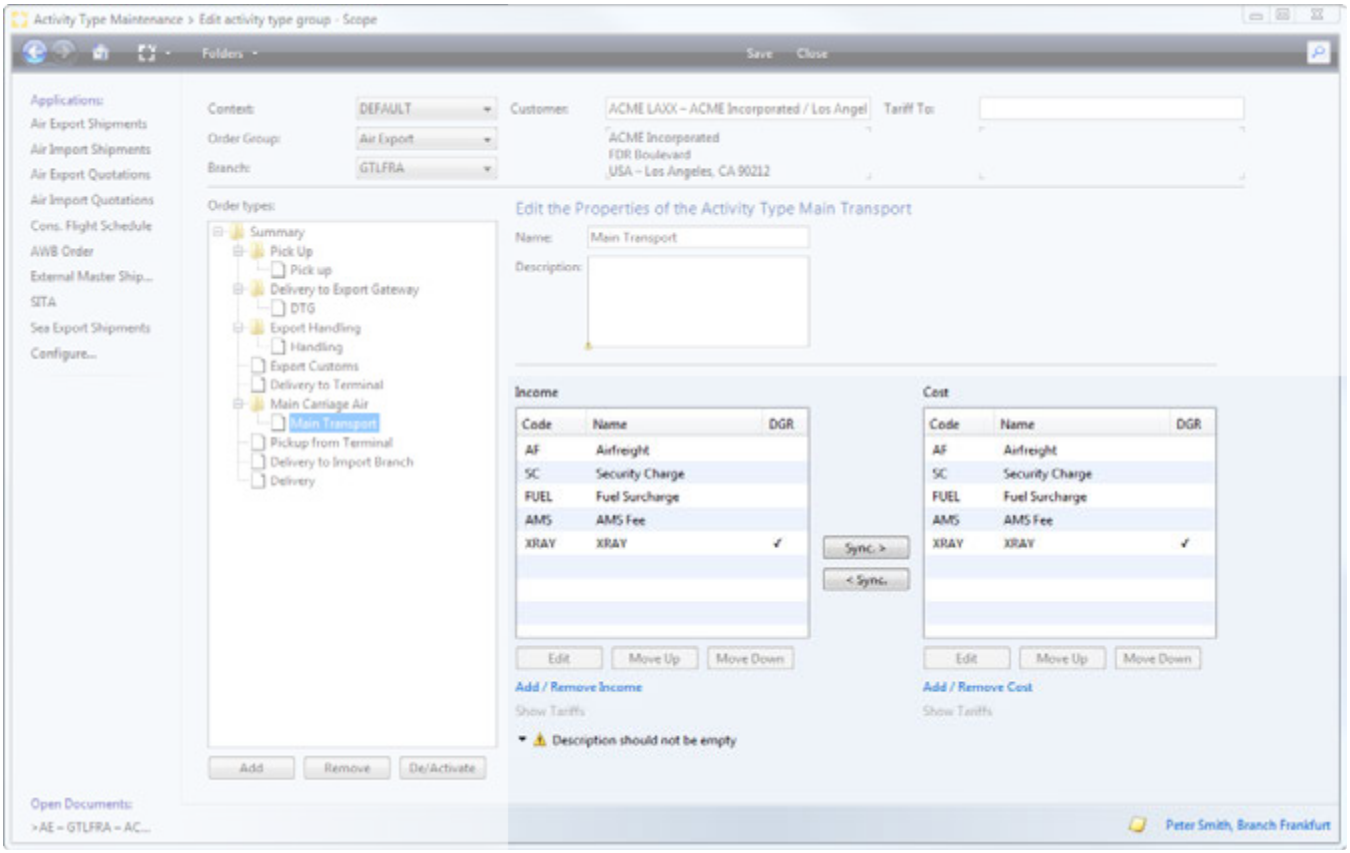
Close

Any changes will not be save and the editor will be closed.

Activity types editor

When an activity type has been defined and selected in the left-hand pane, the details are displayed in the right-hand pane. The editor is used to define the name, description and under what circumstances the costs and incomes defined should be applied to the bills of lading, invoices and cost control for the shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Name

The name of the highlighted activity type. This can be user defined.

Description

A complete description of the activity type.

Income / Cost

These two tables display income or cost charges that may have already been applied to the activity type. The columns of the tables show:

- **Code** - The Charge code
- **Name** - The full Charge code name
- **DGR** - Only for DGR shipments

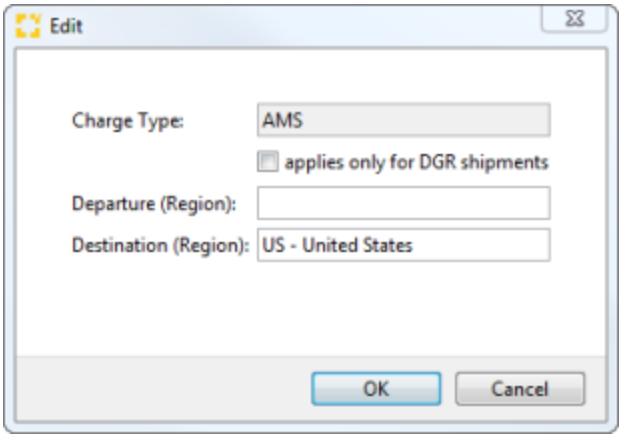
Sync. > / < Sync.

Synchronizes all income charges with those in the cost table, or synchronizes all cost charges with those in the income table.

Edit

Opens a pop-up window for the highlighted charge where a check-box can be used to indicate if the charge is to be applied only to dangerous goods and /or for which Departure and/or Destination, if applicable (eg AMS fee).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Move Up

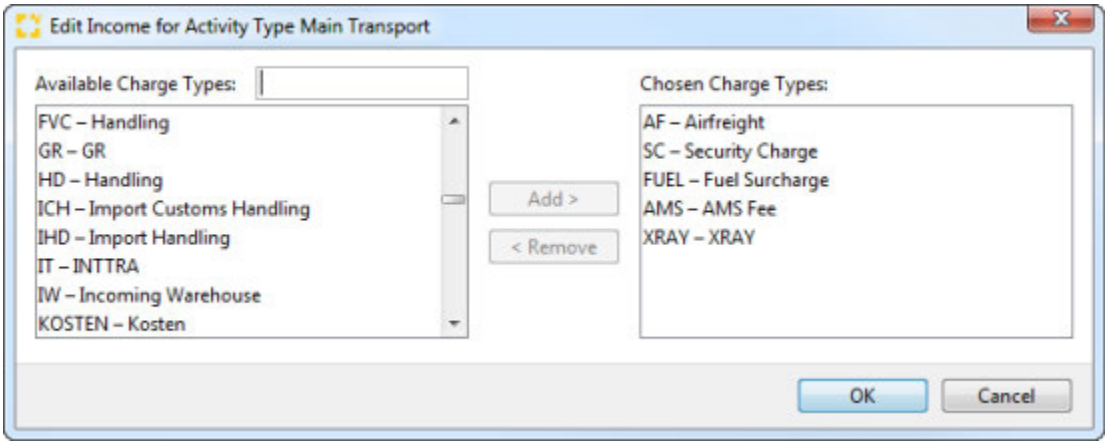
moves the highlighted charge up the list of charges.

Move Down

moves the highlighted charge down the list of charges.

Add / Remove Income / Costs

This action is used to search and select the charges that are to be included in the income or cost table for the activity type. Existing charges may also be removed from the income or cost tables.



Available Charge Types

This is a search field to find the desired charges using a keyword or code for the charge. If left bank, all available charges appear in the view below, but as search terms are added the list of charges will be filtered and display only those matching the search term.

Chosen Charge Types

All the currently selected charges appear in this display.

Add

Add the selected charge in the *available charges* view to the list of *Chosen Charge Types*

Remove

Remove the selected charge from the *Chosen Charge Types* list.

OK

Saves the list of *Chosen Charge Types* and exits.

Cancel

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Cancels selection of charges without saving changes.

Save

Saves any changes to the activity type and exits.

Close

Cancels any changes to the activity type and exits without saving.

Carrier Handling Agents - Forwarding - Maintenance

- Introduction
- Description

Introduction

This application is used to define the ground handling agent for each airline at each airport. It is mainly used by the Scope handing agent module.

> This data is managed by **Riege Software International** via the SDS-master system. This application is not normally available to regular users and this data should not be changed in any way without the supervision of **Riege Software International**.

Description

The application provides a menu bar with actions such as *New* and *Edit*. Below this is a table showing an overview of existing ground handling agents and a search function to locate agents.

? Unbekannter Anhang

Refresh

Updates the index of agents to ensure the latest ground handling agent details are visible.

New

Opens a pop-up window for input of the following new ground handling agent information

Handling Agent

The code and name of the handling agent to be applied to this ground handling agent record. This is a full search text field , however only existing handling agents can be used.

Airline

The airline whom the ground handling agent serves. This is a full search text field , type the name or code of the airline to locate the correct airline.

Airport

The airport which the ground handling agent serves. This is a full search text field , type the name, code or country code of the airport to select the correct available airport.

Import

use this checkbox to indicate this agent is only for air import ground handling.

Export

use this checkbox to indicate this agent is only for air export ground handling.

Save

Save the new Carrier Handling Agent and returns to the overview.

Cancel

Exits the new Carrier Handling Agent application and returns to the overview without saving any changes.

Edit

Opens the Carrier Handling Agent highlighted in the overview in order to make changes to the party.

RSIXML2-Export

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Export the displayed list of carrier handling agents to an RSIXML2 format file on the local system. A pop-up window will appear asking if Procars compatible codes should be used for the nadId element.

Overview Carrier Handling Agents

The table displaying carrier handling agents lists:

- Airline (Code and name)
- Airport (Three letter code)
- Handles Import Cargo
- Handles Export Cargo
- Handling Agent (Name)

Type to search.

This is a search field . Enter one or more keywords to filter the list of matching agents shown in the table of agents.

Code Lists for Order Tracking Approvals - Codelists - Forwarding - Maintenance

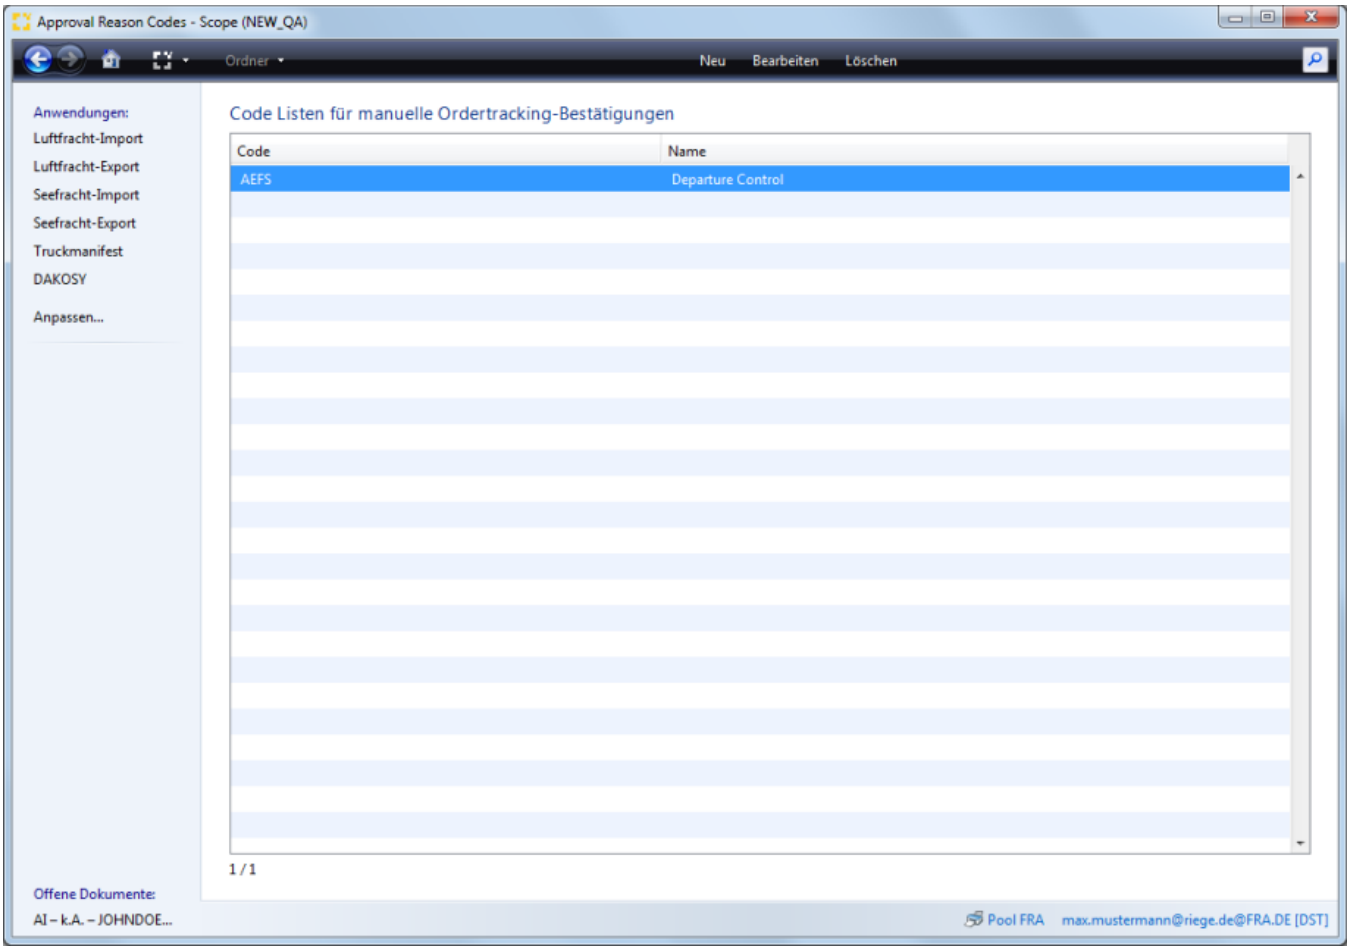
- Introduction

Introduction

This applications maintains codes that enable authorized confirmation of failed milestones (See Authorize failed milestones). The codes lists in the tracking templates application are used to define milestone templates.

Description

Verification code lists that are maintained here refer to either No or exactly one event type in Scope.



New

This action creates a new verification code list.

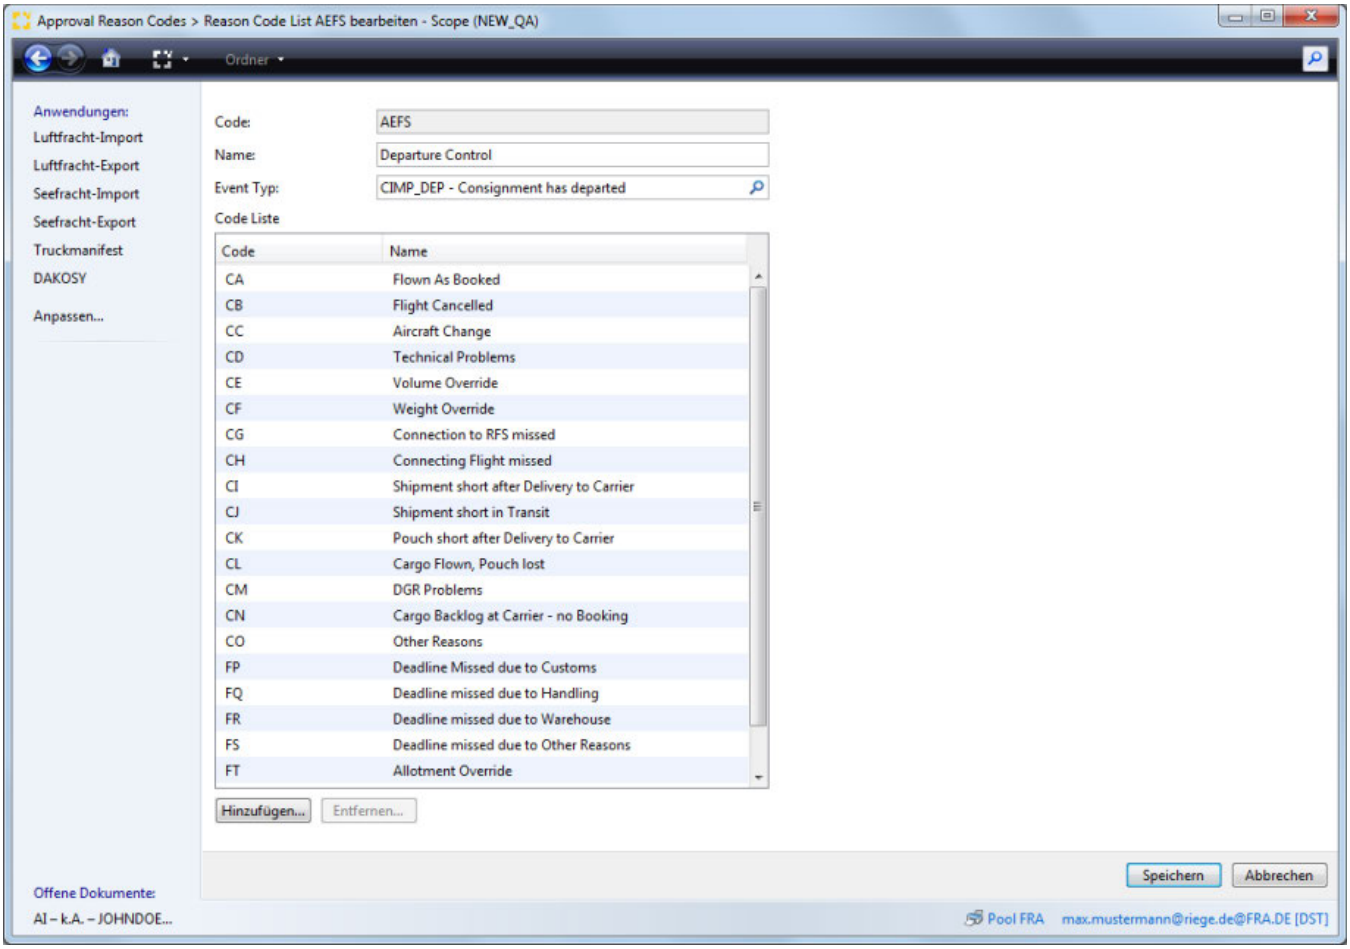
Edit

Opens the selected code for editing. Alternatively the code can be double-clicked in the table to open it.

Delete

Removes the highlighted record from the listing.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code

The code, created by the user.

Name

The name given to the code list.

Event Type

If the code applies only to a specific type of event, then this event type can be inserted here. This field offers a search function to locate the desired event from the complete list of available events.

Code List

The code list window shows the complete list of authorizations codes that are available for the selected codelist. Codes can be added or removed using the *Add* and *Remove* functions.

Introduction

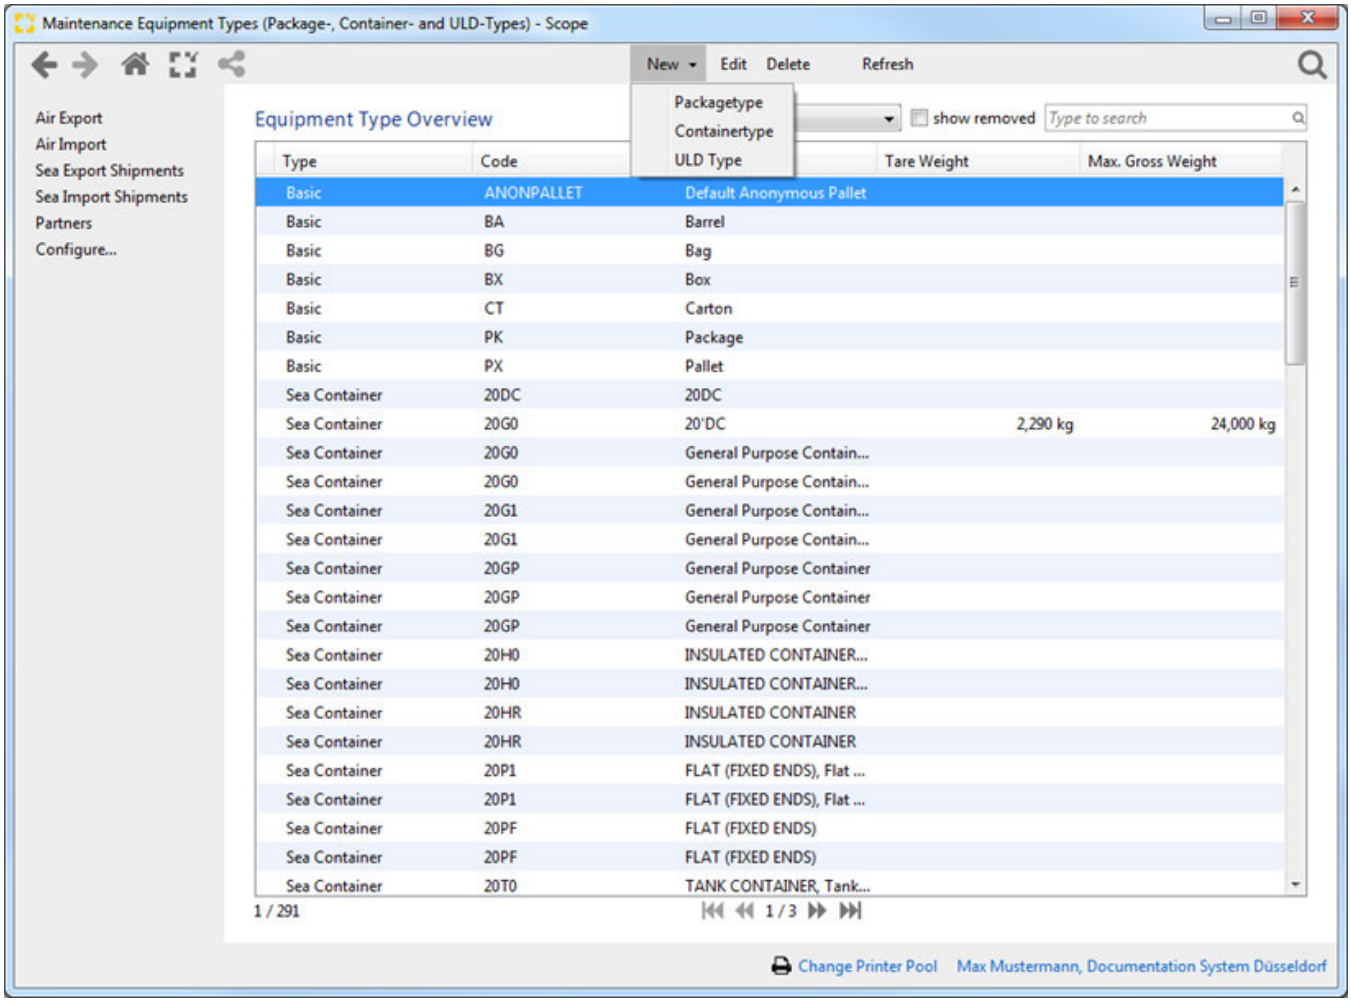
Packing types for air and seafreight can be created using this application.

Description

The application presents a list of all existing items, options for adjusting these and search and filter options.



New

The *New* function key offers a list of types of container that may be created:

- New Package Type (These are "Basic" Packing types such as cartons, Pallets, crates etc. These Basic types are not standardized or subject to precise specifications.)
- New Container Type (Seafreight container types in accord with ISO6346.)
- New ULD Type (Airfreight containers in accord with IATA regulations.)

Edit

Opens the container type highlighted in the overview for editing. A previously deleted container can be restored to active status by editing it.

Delete

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Deletes the container type highlighted in the overview. Containers are not physically removed but marked as inactive and can be restored.

Refresh

Updates the index of container types to ensure the complete list of container types is present.

Equipment Type Overview

The overview displays all current container types or those matching the filter and search terms. The overview table will show:

- **Type** - Sea Container, ULD or Basic
- **Code** - Container code
- **Description** - Full description of container
- **Tare Weight** - Weight of the container
- **Max Gross Weight** - Maximum weight that can be stowed in the container.

Filter

The drop down filer allows the list of container to be restricted to:

- All
- Basic
- ULDs
- Sea Containers

Show removed

Check this box to include any previously deleted containers and then *edit* the container to restore it to active status.

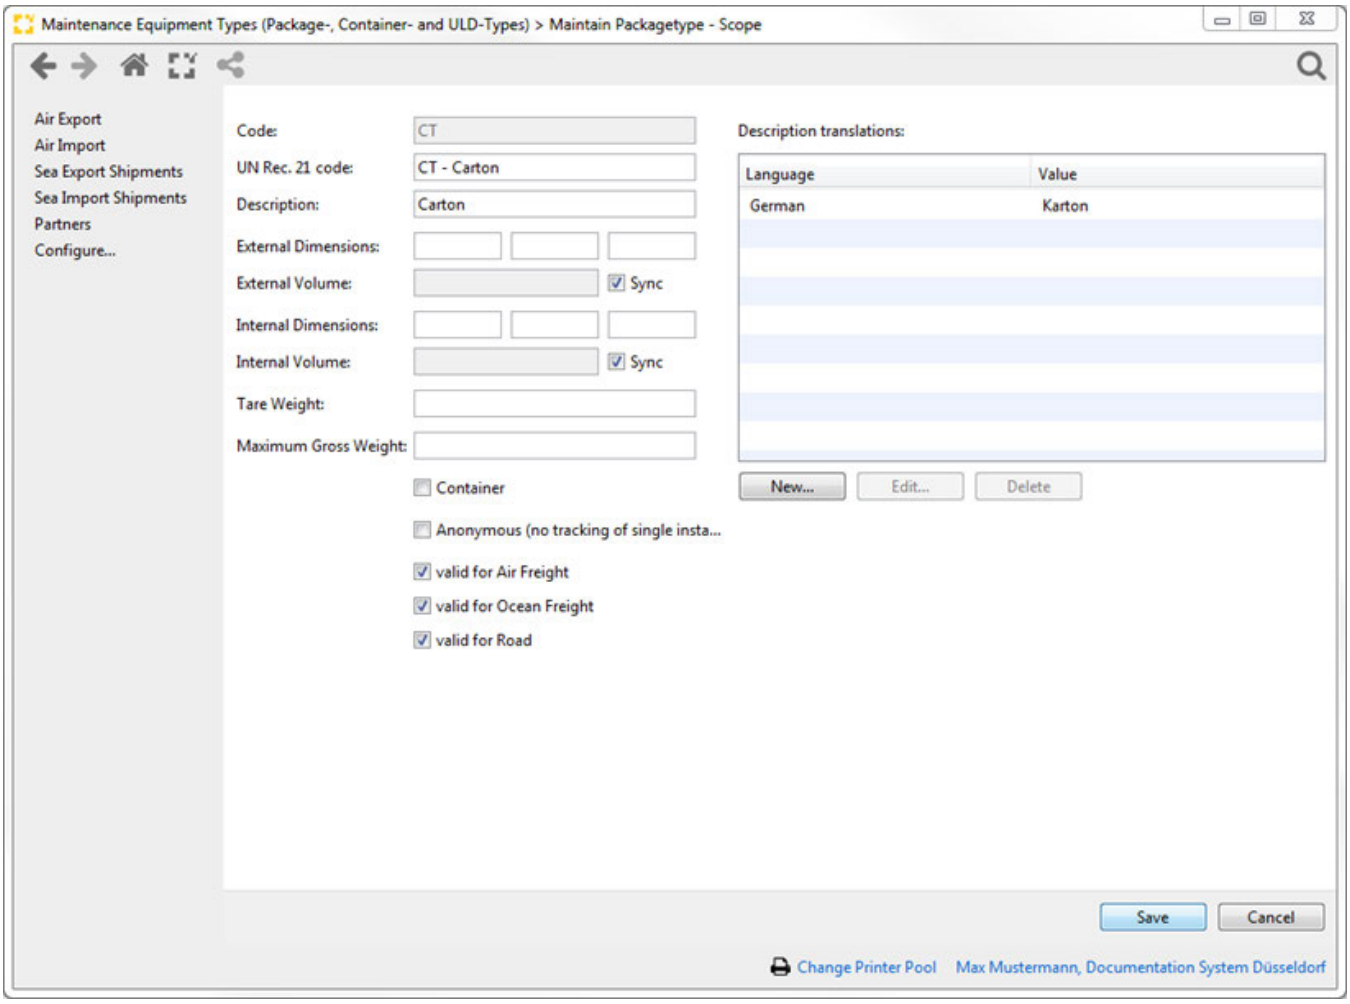
Type to search

This is a search field enter keyword or codes, to search and filter the desired container types.

Basic Container types

When creating new "Basic" container types, only the code and description of the container type are required. The remainder of the container information is optional because "basic" container types are not standardized.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code

Any code can be used for the basic container type but it must be unique. Duplicate codes are not permitted.

Un Rec. 21-Code

The UN assigned code (used by most customs organisations and other communication networks) for the packaging, Selected UN Rec. 21-Code can only be assigned to one packaging code.

Description

A description of the packing type.

External Dimensions / External Volume

External measurements of the container. If the "sync" option is checked, the external volume will be calculated automatically. If the "Sync" is unchecked, the external volume can be entered manually.

Internal Dimensions / Internal Volume

Internal measurements of the container. If the "sync" option is checked, the internal volume will be calculated automatically. If the "Sync" is unchecked, the internal volume can be entered manually.

Tare Weight

The weight of the container

Maximum Gross Weight

The maximum allowable weight of the container and it's contents.

Container

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Container-Flag.

Anonymous (no tracking of single instances)

When checked, this flag indicates it is not possible to track single instance of these Packages.

Valid for: Airfreight, Seafreight, Road Freight

These check boxes are used to determine if the packages type may be used in the various type of transportation.

Description translations

This section is used to create translations of the packing type description. This can then be used on foreign language documents. The function keys *new*, *e dit* and *delete* are used to manage these translations.

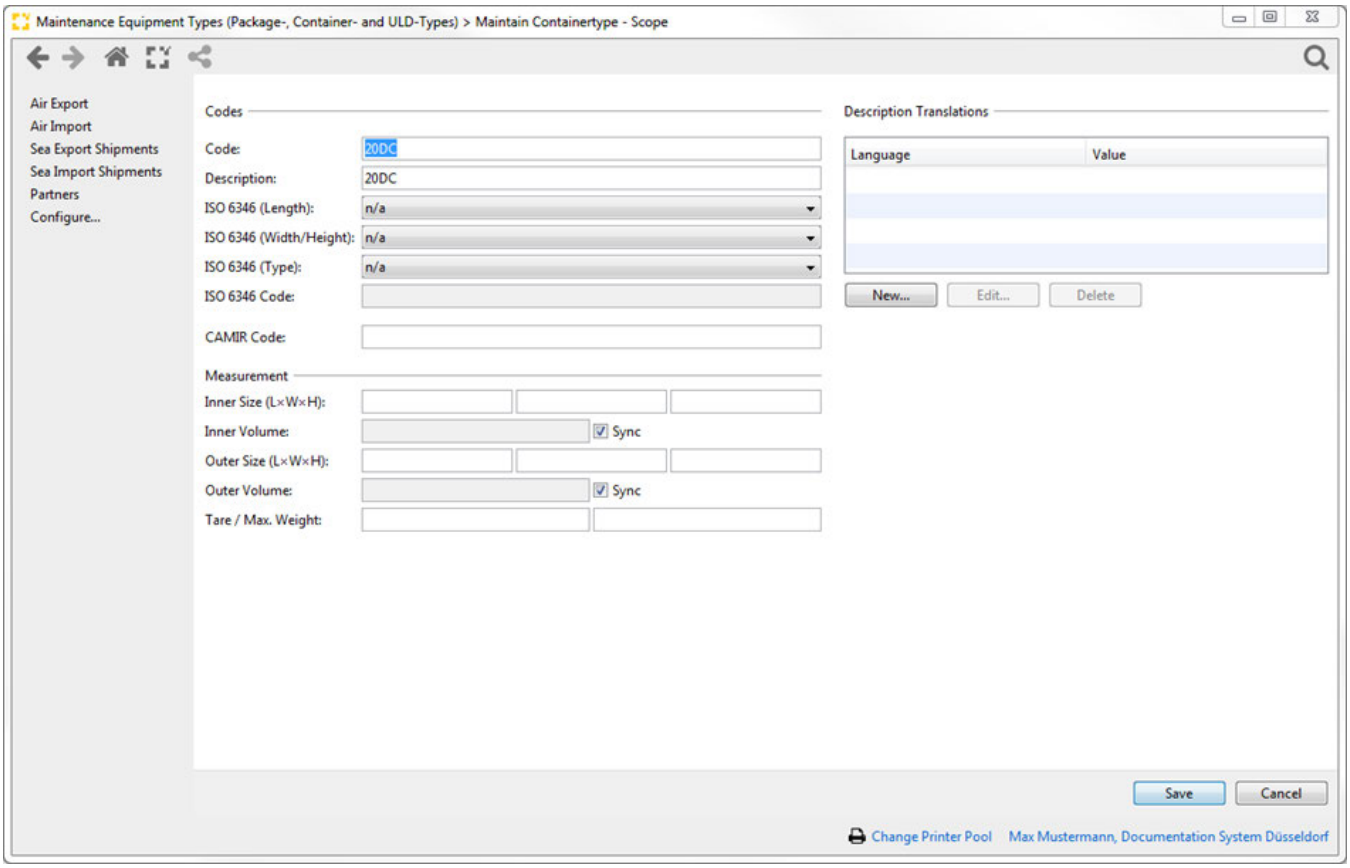
Save

Saves the package type and exits.

Cancel

Exits the package type without saving.

Container Types



If the package type is a seafreight container, the information show above should be entered

Code

Any code can be used for the basic container type but it must be unique. Duplicate codes are not permitted.

Name

The name or designation of the container. This field is mandatory and will be the printed information on Documents and bills of lading.

ISO6346 (Length)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The length of the container, 20', 40' or 45' or other available length

ISO6346 (Width , Height)

The width and height of the container,in the possible combinations, such as 8' x 8', 8.6' x 8' etc.

ISO6346 (Type)

The type of the container, GP -(No ventilation), G0 - (openings at on or both ends), H0 - (Refrigerated with removable equipment..) ect.,

ISO6346 Code

The container code according to ISO6346. This code is used in communication with Inttra and other sea-freight portals, the ISO6346 code will be "calculated" on basis of the previous steps.

Inner Size (LxWxH) / Inner Volume

The internal dimensions of the container. If the "Sync" box is checked, the inner volume will be calculated automatically. Uncheck this box to manually enter the inner volume.

Outer Size (LxWxH) / Outer Volume

The external dimensions of the container. If the "Sync" box is checked, the external volume will be calculated automatically. Uncheck this box to manually enter the external volume volume.

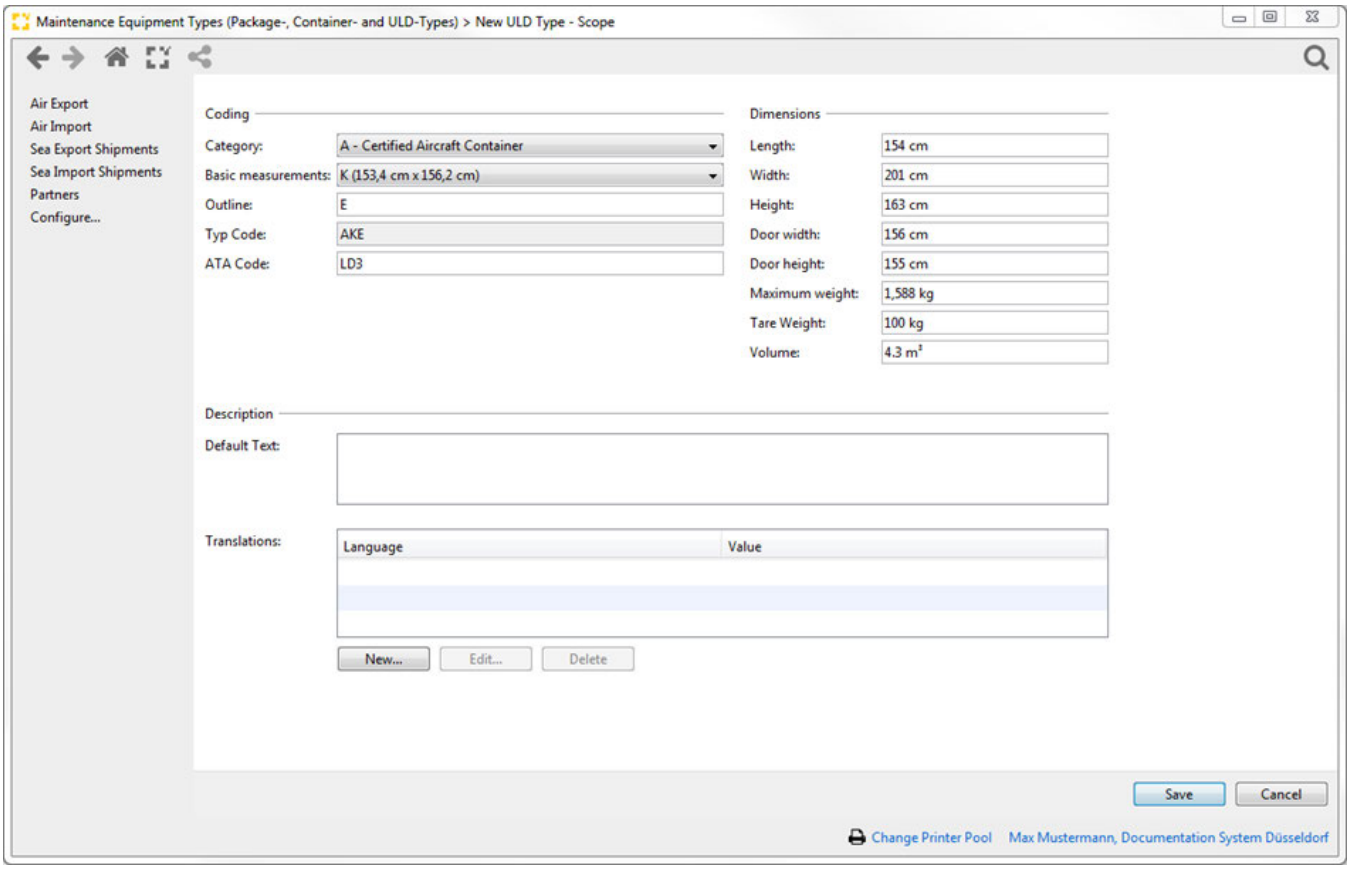
Tare Weight

The weight of the empty container.

Maximum Weight

The maximum allowed weight of the container and cargo.

ULD Types



Category

A drop-down list presents a complete listing of possible ULD categories.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Basic Measurements

A drop-down list present a complete listing of possible basic ULD measurements for selection.

Outline

Description of the ULD contours

Type Code

The 3 digit code comprising the first digit of the category code, the basic measurement code and the outline code, plus the ATA code.

ATA Code

The standard ATA Code of the ULD Container.

Description

A full description of the ULD container.

Length / Width / Height

The dimensions of the ULD container.

Door Width / Door Height

The dimensions of the ULD loading door.

Maximum weight

Total allowed weight of the ULD and it's cargo.

Tare weight (KG)

Total empty weight of the ULD container.

Volume

Total volume of the ULD in cubic meters.

Description

Default text for the ULD.

Edit translations

The *Edit translations* action can be used to enter descriptions of the ULD container in different languages. These translations can then be printed on foreign language forms.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Handling Agents - Forwarding - Maintenance

- Introduction
- Description

Introduction

The Handling Agents maintenance application is used to define for all airports the agents who handle freight at those airports. This information is used principally in the Scope Handling Agent module.

> ⚠ Handling agent data is managed by **Riege Software International** and this application is not normally available to the regular user.

Description

The application presents a menu bar of import functions such as *editing* or adding *new* handling agents. A complete listing of existing handling agents is shown which comprises the agent code, agent name and the airport they serve. There are search and filter functions to limit the list of agents shown.

? Unbekannter Anhang

New

Opens a pop-up window where a new handling agent may be created. This pop-up window comprises two tabs:

General

Enter the following information

Place of Loading

Airport

This is an airport search field, enter the airport code or name.

Procars-Export

Information related to Procars export operations

Procars-ID

Procars Name

Partner (Template)

The full address details of the new handling agent

Code

The code of the new agent.

Name

The new agents operating name

Country

The country where the agent is located. This is a search field. The country is identified ahead of the other address data since address data and the format of that data will depend on the country of the agent. For example the format of the postal code will differ by country.

Name

The full name of the partner. Any part of this name can later be used to search for the company.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

C/O

Care of. To be used where the partner uses another entities postal address.

P.O. Box

Check this box if the partner uses a post box number and enter the box number to the right.

Street

Street address

City

The city or town where the partner is located.

Save

Saves the new agent data and exits

Cancel

Cancels any changes and exits.

Edit

Opens the agent highlighted in the overview using the agent editor. Agent details may then be adjusted and saved.

Refresh

Updates the index to ensure that latest handling agents are present.

RSIXML2-Export

Export the displayed list of handling agents to an RSIXML2 format file on the local system. A pop-up window will appear asking if Procars compatible codes should be used for the nadId element.

Show removed

If agents have been removed, this box can be checked to ensure they are included in the listing of agents.

Type to search

This is a search field . Enter one or more keywords to filter the list of matching agents shown in the table of agents.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

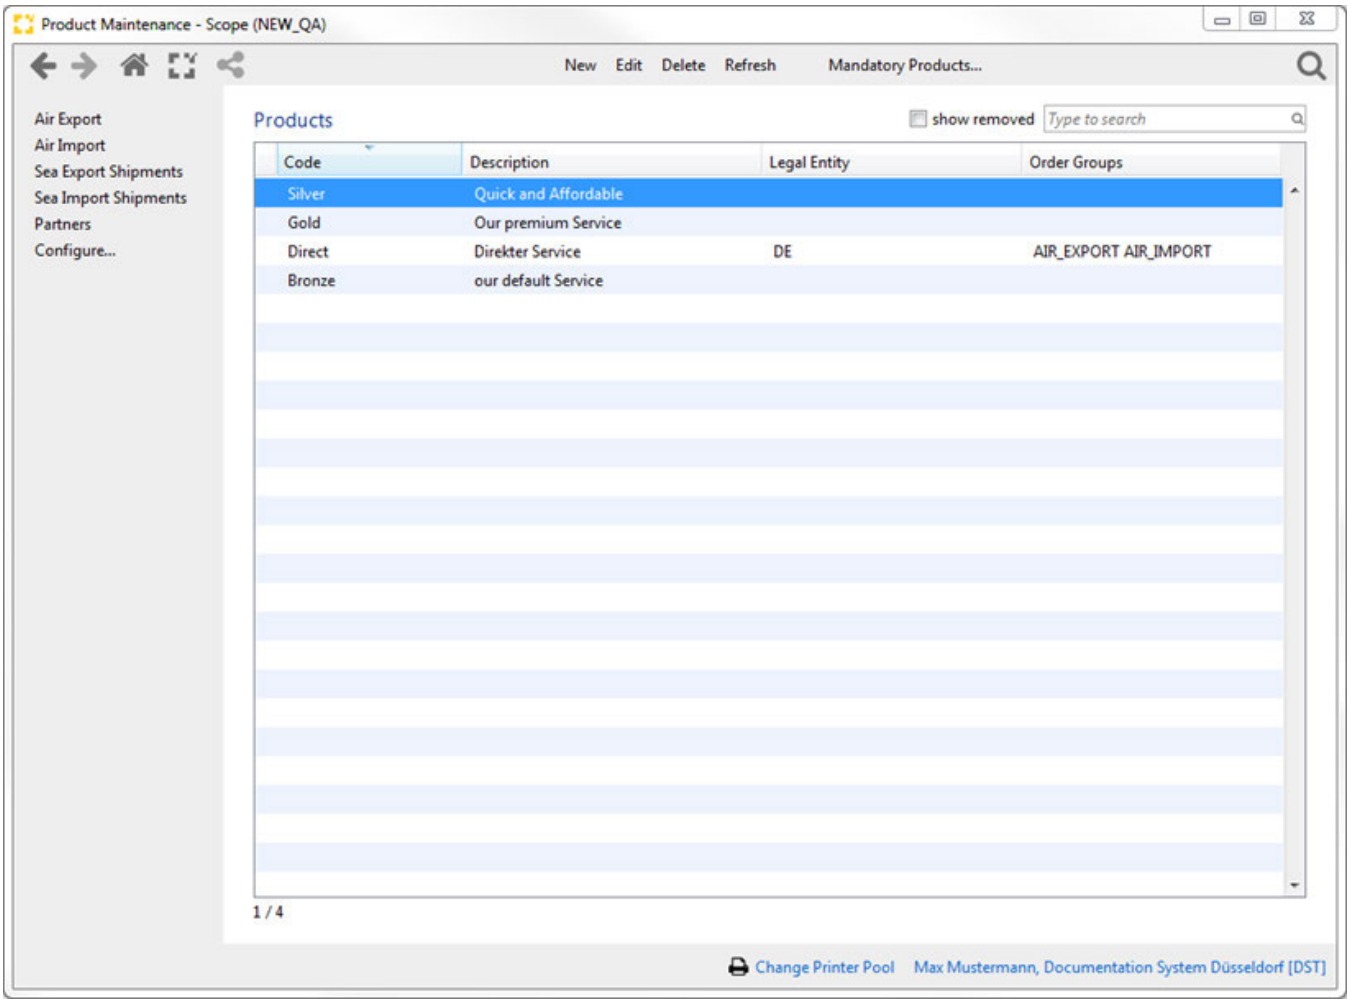
Products - Forwarding - Maintenance

Introduction

Products (Sales products) for all shipment types can be created for use within shipments.

Description

The application presents a list of all existing products, options for adjusting these, a search function and filter options.



New

Opens the product editor to add a new product.

Edit

Opens the marked product in the Product Editor to make changes on it. Alternatively it is possible to open the editor by double clicking the left mouse button.

Delete

Delete the marked Product from the overview.The product will not be completely deleted. By ticking the checkbox "show removed" any deleted Products will be displayed again.

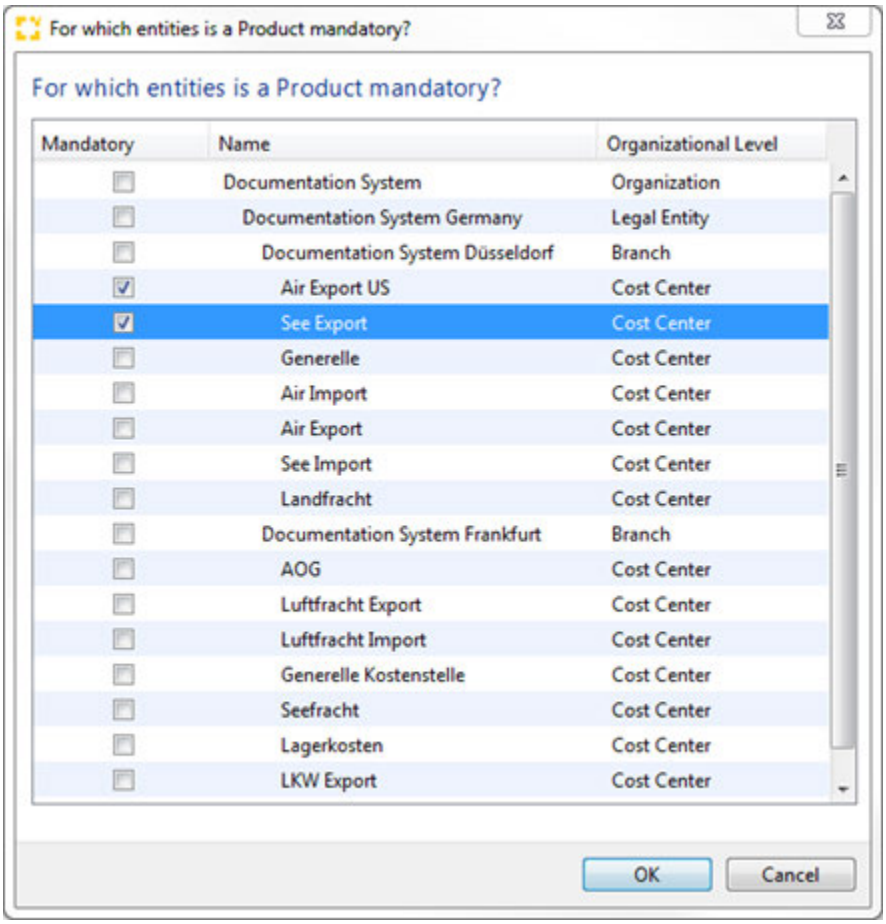
Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

By clicking the Refresh-Button, the overview will be refreshed and changes will be displayed.

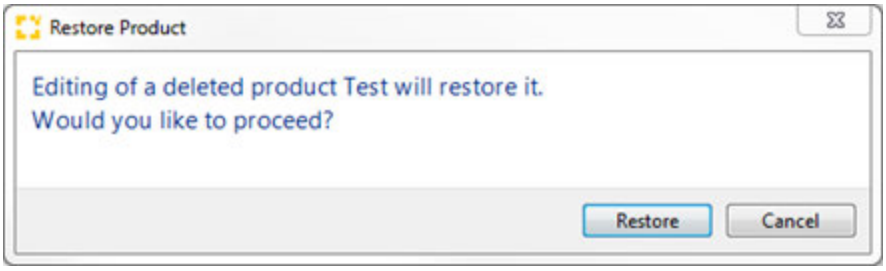
Mandatory Products...

By clicking the Button, a new window opens. In this window the settings will be set for which order types require a mandatory product entry in the shipment. The settings can be made at organization level, legal entity level, country level or branch level.



Show removed

On activating the checkbox, all removed (inactive) products will be displayed again. The inactive products can be recognize by a trashcan on the left side. By double clicking on the product a new window appears to restore the product or cancel the action.



Type to search

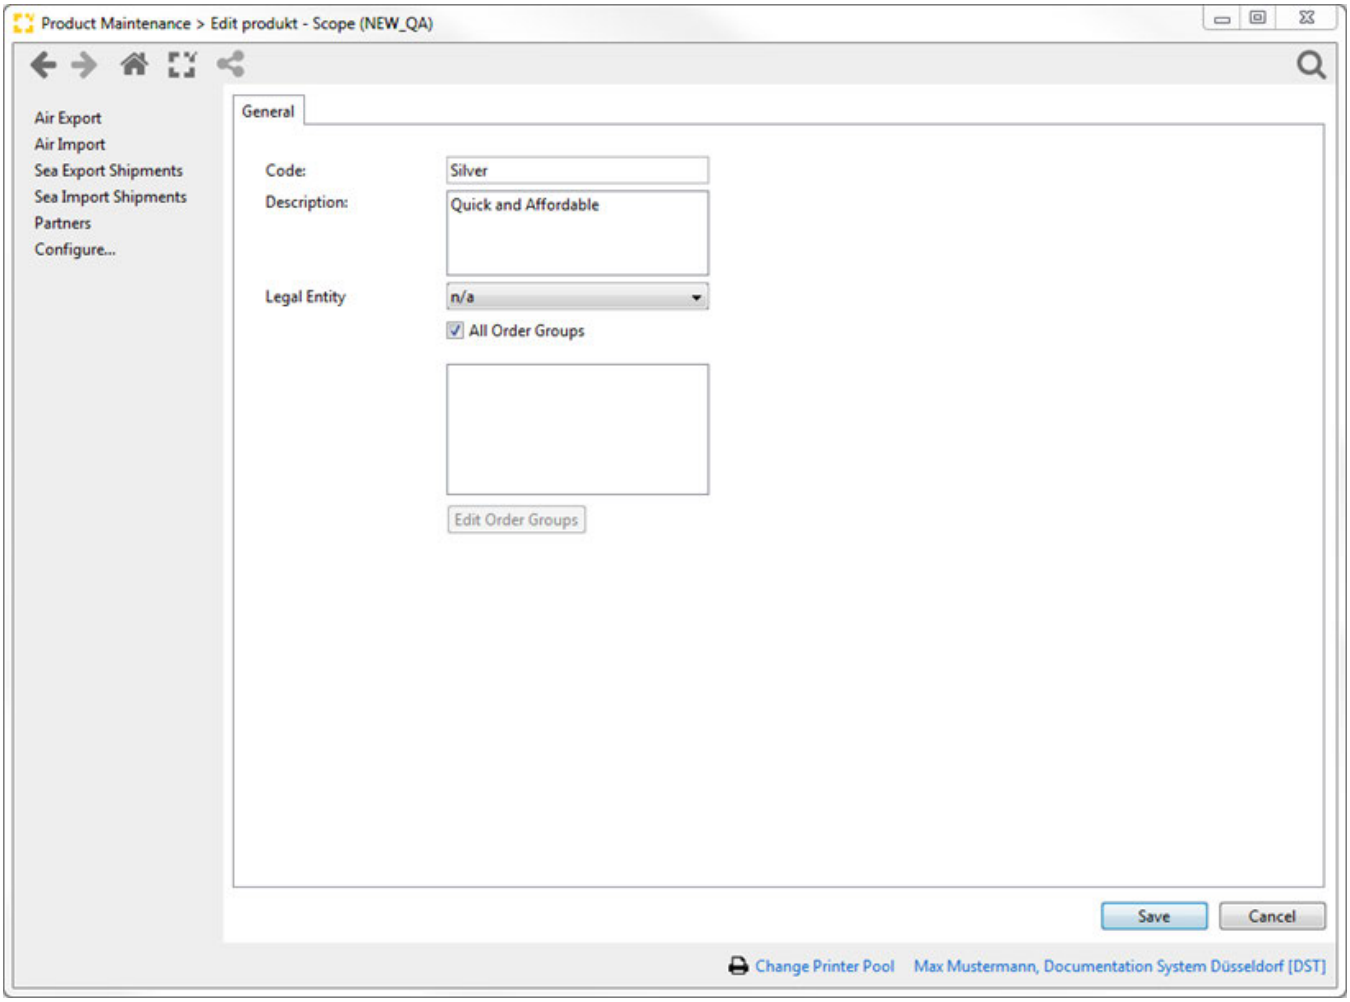
Enter a search term. Products corresponding to the search criteria are shown.

Product Overview

The product overview displays all products with their code, description, legal entity and order groups (when these are defined).

Product Editor

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code

Create a code for the product. There is no restriction on the structure of the code.

Description

This field is for the description of the product.

Legal entity

The product can be select for one legal entity. The legal entity can be selected using the drop-down menu

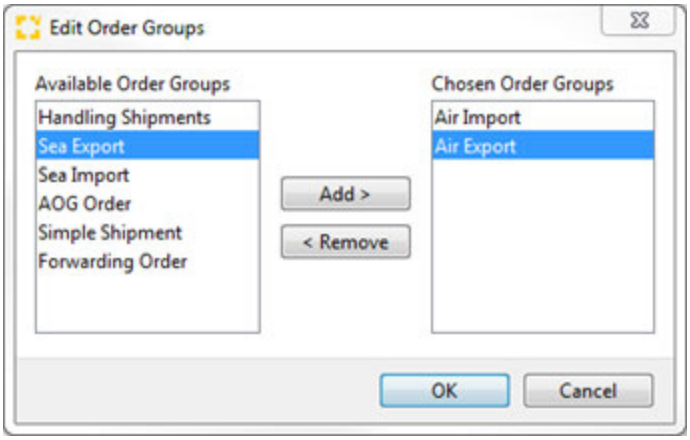
Checkbox "All Order Groups"

Generally a product is available for all shipment types. To restrict the product to selected shipment types, the checkbox must be deactivated.

Edit Order Groups

If the checkbox "All Order Groups" is deactivated, the "Edit Order Groups" button is active. By clicking this button, a new window appears.The product is only available for the selected order groups. For all other order groups, the product is not available in the shipment entry. Click OK to save changes and by clicking cancel, the window will be closed without any actions.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Save

Save the product and close the window.

Cancel

Close the window without any actions. The product is not stored and will not shown in the overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Tracking Templates - Forwarding - Maintenance

- Introduction
- Overview
- Tracking Template Editor

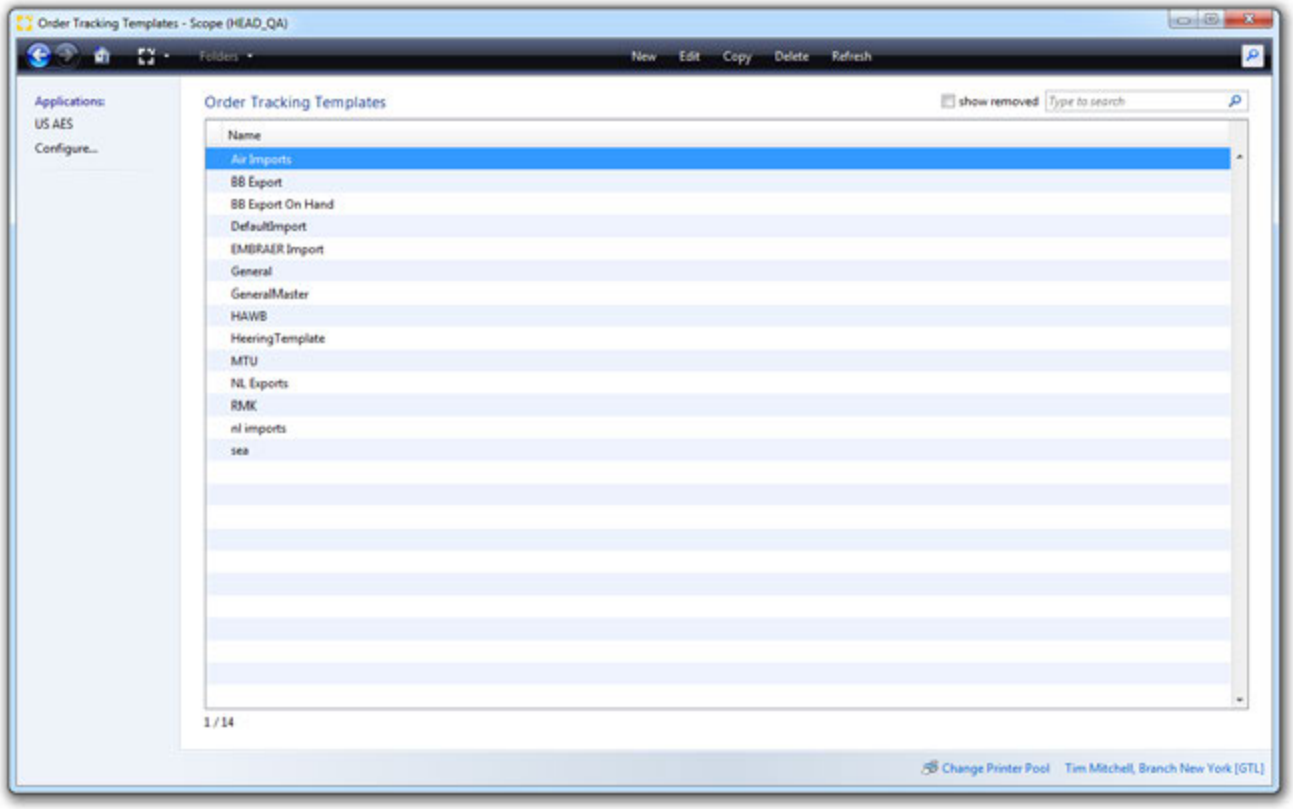
Introduction

The *Tracking Templates* Appliance enables users to maintain Tracking Templates. These templates define

1. To which shipments a tracking plan should be applied
2. The milestones a tracking plan should contain,
3. Under what conditions these milestones are considered "completed",
4. Which actions to execute for a milestones to reach completion.
5. Alerts to be issued when unexpected events occurs in a tracking plan.

> **Warning**
>
> This application is intended for experienced users who are acquainted with tracking events and EDI communication in Scope

Overview



The overview displays the names of all available tracking templates.

Program Actions

The task bar provides a set of actions and beneath this are search and filter options:

New

The *New* function launches the template editor and a new tracking template can be created.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Edit

To modify an existing tracking template, highlight the desired template in the overview and either *double click* it or select *Edit* from the task bar. This will open the template and modifications can be made.

Copy

Tracking templates may contain an extensive set of information; attributes, milestones, schedules actions and alarms. Rather than creating a tracking template from scratch it may be easier to simply *Copy* and existing template and use it as the basis for a new template. Highlight the template to be copied and then select the *Copy* function from the task bar. The template editor will open showing the existing template, but it will require that a new name is given to the template to distinguish it from the existing template.

Delete

A tracking template can be removed by highlighting it in the overview of templates and selecting the *Delete* function from the task bar. A pop-up will appear asking for confirmation that the template should really be deleted. Confirm by selecting *Delete* in the pop-up or choose *Cancel* to cancel the delete operation. Templates are not permanently deleted and all templates including those removed can be seen by using the *show removed* filter described below.

Refresh

The *Refresh* command loads all available tracking templates from the database and updates the overview.

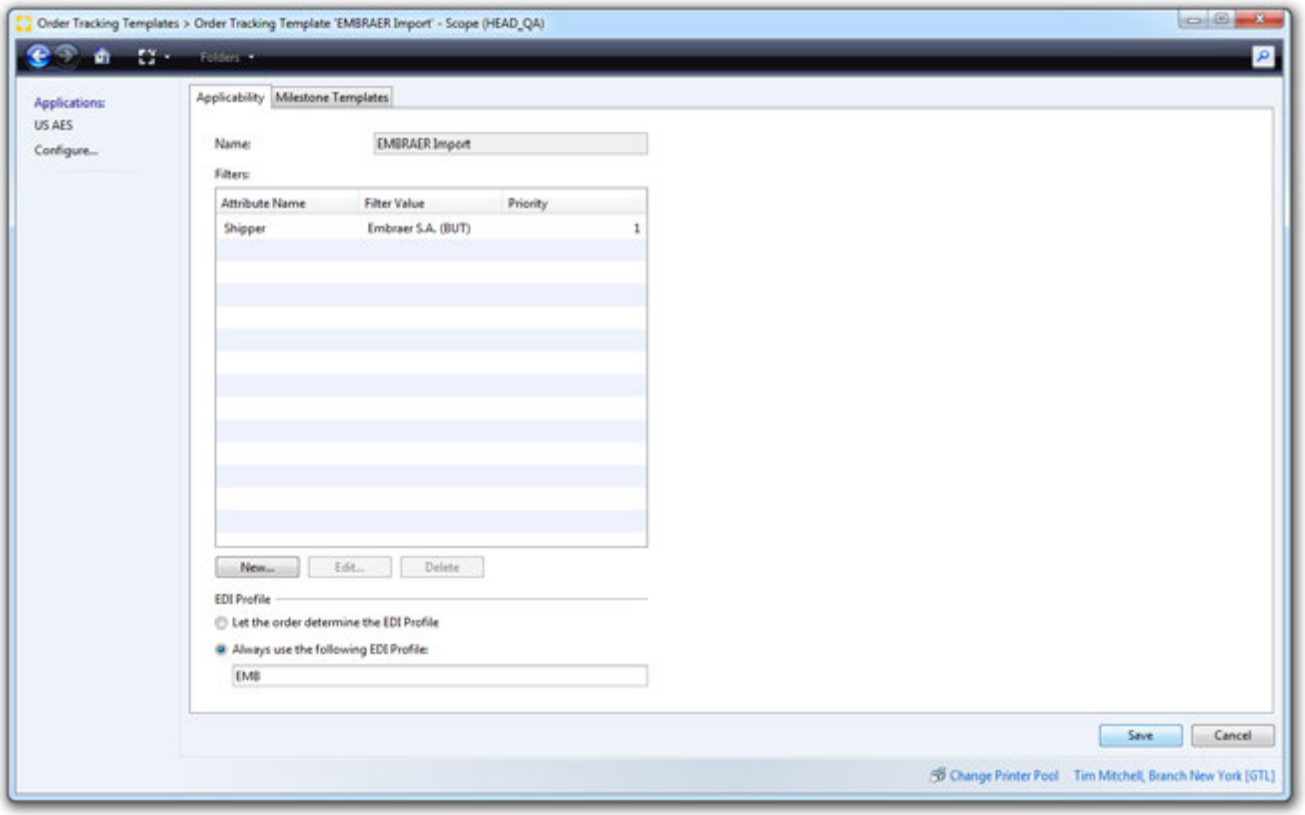
show removed

Below the task bar is the filter option *show removed*. When a tracking template is deleted, it is simply removed from view in the overview of templates. By checking the *show removed* option, all deleted templates will appear in the overview, but a *trash can* icon will appear in the column to the left indicating they are not active. A deleted template can be restored by highlighting it in the overview and then editing it. This will produce a pop-up window with a prompt to confirm the template is to be restored.

Type to search

To locate a particular template or filter the list of templates, enter the template name or part of the name in the *Type to search* field.

Tracking Template Editor



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The tracking template editor contains two tabs: *Applicability* and *Milestone Templates*

Applicability

Name

The text-field *Name* contains the unique name of the current tracking template.

EDI Profile

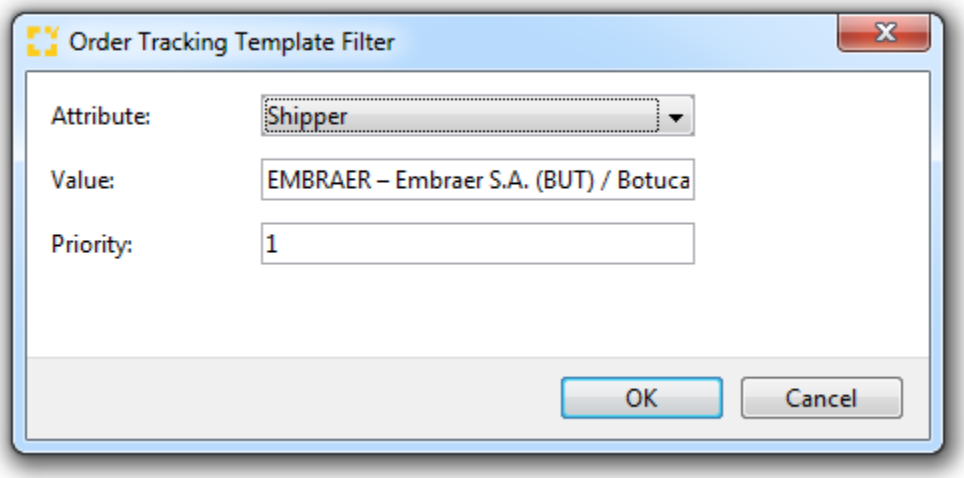
The order tracking module uses EDI Profiles for outgoing EDI communication. The EDI profiles determine how Scope partner addresses should be identified when communicating with external systems. The *EDI Profile* section provides 2 ways to select the appropriate EDI Profile:

1. *Let the order determine the EDI Profile*: Choose this alternative if Scope should try to determine the appropriate EDI Profile automatically by inspecting the order data (shipment data).
2. *Always use the following EDI Profile*: Choose this alternative to specify a static EDI Profile for all outgoing EDI communication from order tracking plans generated using this template. The search field will refer to all available EDI profiles.

Filters

Filters are created to help Scope determine the correct matching tracking template for a given order (shipment). The *New...* button brings up a pop-up dialogue box for creating a new filter. Depending on the order attribute selected on the first row of the dialogue box, the field on the second line is either a text, or a special field (e.g. a field specifically designed for entering weights) and a built-in search feature will automatically apply the correct format to the value. For example if the attribute is *Gross Weight* then the value entered will be assumed to be a figure in *Kgs*.

In the example displayed below, a new filter is being created that limits the current template's applicability to shipments for the customer "SHPFRA".



When a tracking template has a single filter, then the filter must match the shipment in order for the tracking template to be applied to that shipment. It is possible for a tracking template to have multiple filters. When multiple filters exist in a template they may utilize the same attributes (Import Agent, Export Agent, Consignee etc.) or they may utilize different attributes. When multiple filters have the same attribute, if any of these filters match the shipment, then the template is considered a match. Where multiple filters are present but have different attributes, then at least 1 of each attribute must match the shipment. This is best described in the example shown below:

The priority setting for the filter can be used to give a weighting to to the filter. This is used by the system to apply the most suitable tracking template to a shipment:

When the branch *DSTDUS* has an export consignment for the customer *MyCustomer* and going to *USLAX*, the tracking template 2 will be selected from the 2 templates shown above. Both templates are applicable to this shipment, but tracking template 2 has the greater weighting according to the priority settings.

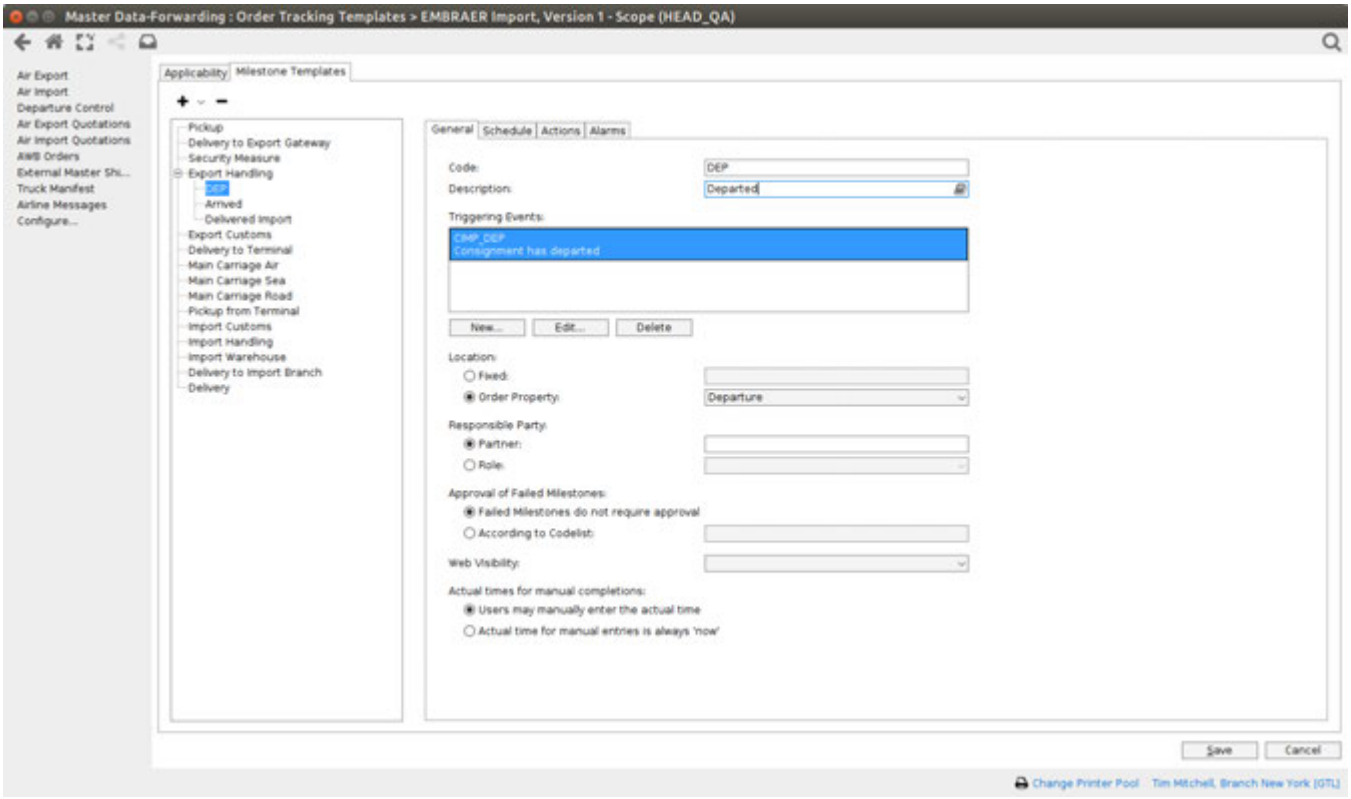
Should several tracking templates apply to a particular shipment but the total weighting be the same for each of the possible templates, then Scope will arbitrarily apply a template until such time as a milestone may be applied to a shipment at which point the system may apply the most appropriate template for the shipment.

Milestone Templates

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The Milestone Templates tab is divided into two sections: a list of all milestone (left) and the properties of each of these milestones is shown on the right when the milestone is selected. Using the buttons in the left-hand-side upper area, users can create new milestone templates (green cross symbol), delete the selected milestone template (red "X") or change the position of the selected milestone template in the list (arrow symbols).

> **Movement Scope and sections**
>
> In order for milestones within the "Delivery" section of a plan to be visible, the shipment itself must be "to door"



The following segments are available:

Pickup: This segment is active, if the shipment is Door2Port or Door2Door or if a pickup order is on the shipment
Delivery to Export Gateway: This segment is active, if the shipment can be consolidated and Exportgateway and Agent are filled in the shipment.
Security Measure: This segment is active, if the shipment is air.
Export Handling: This segment is always active.
Export Customs: This segment is always active.
Delivery to Terminal:This Segment is active if the shipment is a Master, Direct, B2B or all shipments which cannot be consolidated.
Main Carriage Air: This segment is active if the shipment is air.
Main Carriage Sea: This segment is active if the shipment is sea.
Main Carriage Road: This segment is active if the shipment is road.
Pickup from Terminal: This Segment is active if the shipment is a Master, Direct, B2B or all shipments which cannot be consolidated.
Import Customs: This segment is always active.
Import Handling: This segment is always active.
Import Warehouse: This segment is always active.
Delivery to Import Branch: This Segment is active, if the shipment can be consolidated and Importgateway and Importagent are filled in the shipment.
Delivery: This Segment is active, if the shipment is Port2Door or Door2Door ist or if a delivery order is on the shipment

The properties of milestone templates are grouped into four sections (tabs):

General

- Use Milestone-template-block
- Code
- Description
- Event Type
- Criteria
- Location
- Responsible Party
- Approval of Failed Milestones
- Web Visibility

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Actual times for manual completion

Use Milestone-template-block

A standard set of milestones are maintained by Riege. This check-box is used to limit the milestones to only the standard set.

Code

The text-field *Code* sets the short name of the milestone template that will be used for all milestone instances on a shipment. The example used in the screenshots uses codes according to conventional air freight nomenclature, e.g. *PUP* for "Pick up at shipper", *REW* for "Received at Export Warehouse" and so forth.

⚠ When synchronising milestones from master to house level and shipments use different tracking plans, the Code needs to be the same on both plans. ⚠

Description

A longer description of the code may be stored in the description field to assist identifying the milestone. In some cases it may prove useful to store the description in a different language.

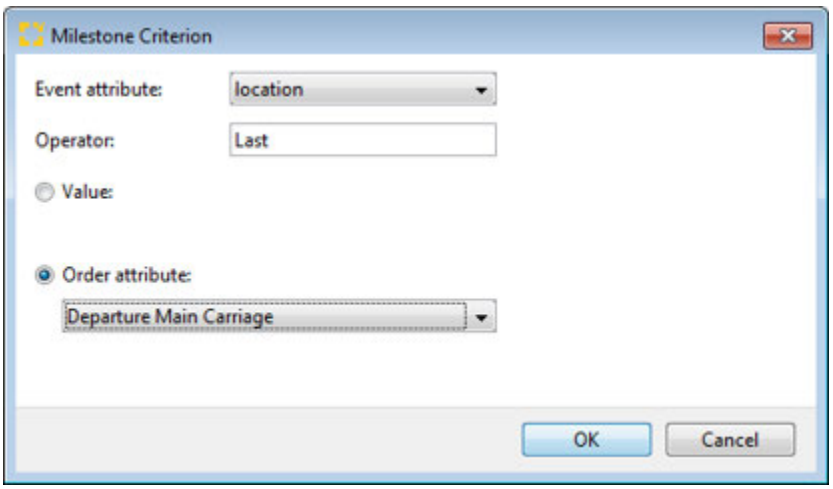
Event Type

The *Event Type* field is used to map Scope events to the milestone: whenever a Scope event of the selected type is registered for the shipment, the event properties it will be interpreted in order to meet the milestones. In this example the milestone is *DEP* and is enabled upon arrival of the airline message *CIMP_DEP*.

> **Reference**
>
> The list of possible event types is extensive. In deference to the general scope performance, not all places where an event may be created are trigger points. Top priority events are:
>
> - received via an interface (for example, all event types which start with `CIMP_`)
> - Workflow events are (eg "shipment completed", "invoice cancelled")
> - important communication between modules (eg all customs events)

Criteria

The *Criteria* table contains all event criteria that have to match in order to fulfill the milestone. Criteria can be added or deleted using the *New...* and *Delete* buttons.



An event-criteria-definition comprises the selection of an *Event attribute* (list of available attributes dependent on Scope Event Type selected above), the *Operator*, a static criterion value or, alternatively, an order property (drop-down-field containing suitable order properties). The operator determines whether Scope should use the first or the last Scope event's attribute value to determine milestone completion (comparison according to event time), or whether Scope should use the sum of all Scope events' attribute values for this purpose.

The example pictured above can be phrased as: The location attribute of the last *DEP* Scope event must match the main carriage port of departure property of the corresponding order to fulfill the milestone.

Location

A milestone's location (UN Location Code) can be determined statically (*Fixed Location*), or it can be derived from the shipment (*Location as per shipment Property*).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Responsible Party

For each milestone, it should be determined who is responsible for completing this milestone. This can be specified with 2 methods

- Partner - here and existing partner is specified as the party responsible for completing the milestone
- Role - This is a dynamic assignment of the responsible party. Use the drop-down menu to see the possible parties from the shipment who can be set as responsible for the milestone.

Approval of Failed Milestones

There are 2 options offered in the event that a milestone fails to be completed and these appear as the check boxes:

- Failed Milestones require approval
- Failed Milestones do not require approval

When a failed milestone requires approval, the first option above should be checked. An Approval code will be required that can be applied to this event type.

For failed milestones that do not require approval, the second option above can be selected.

Web Visibility

The options here determin if a milestone will be made visible in Scope Connect. The options are:

- Invisible - cannot be seen in Scope Connect
- Visible - can be seen in Scope Connect, but not completable.
- Visible & Completable - Can be seen in Scope Connect and can be completed by anyone
- Visible & Completeable by Relevant Party - Can be seen in Scope Connect but can only be completed by the responsible party

Actual times for manual completion

There are two possibilities for determining the actual time:

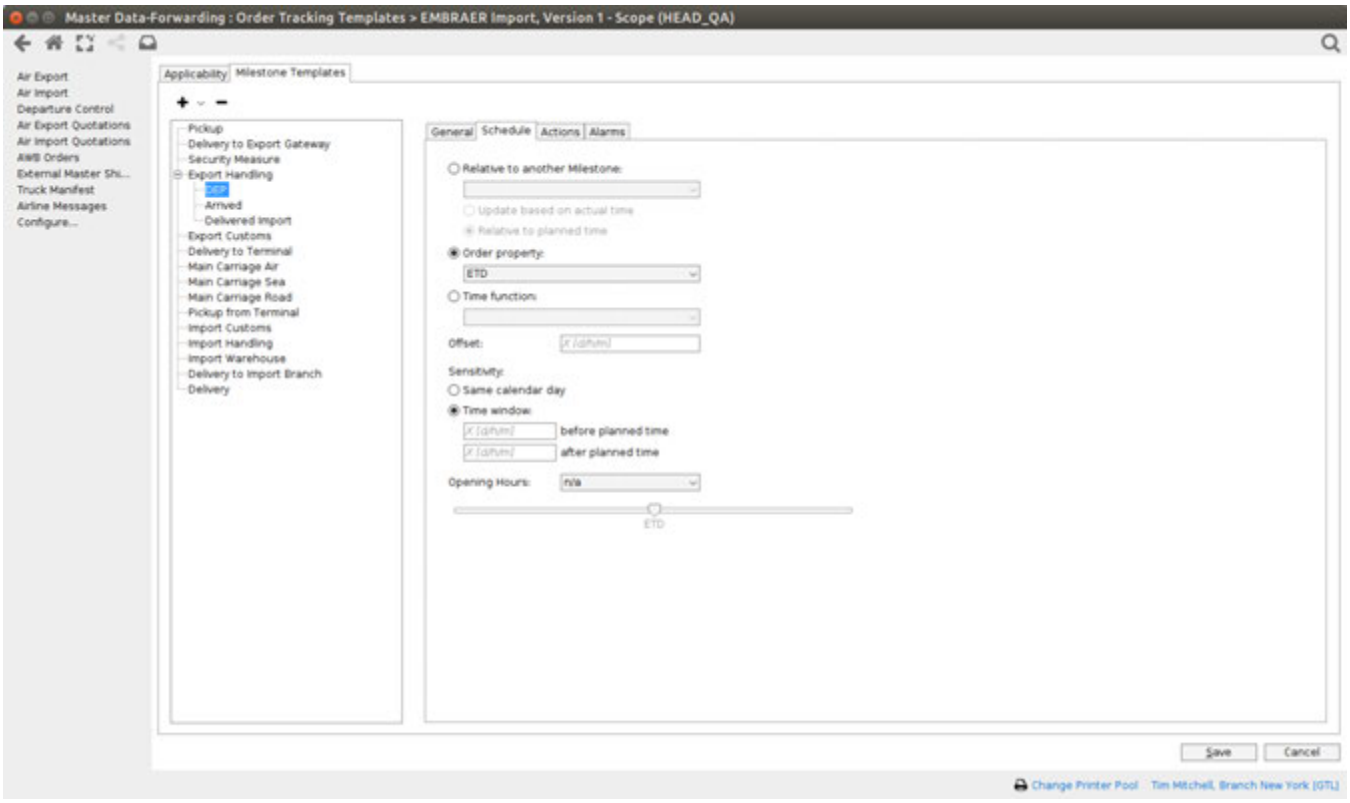
Users may manually enter the actual time.

Actaul time for manual entries is always now - Where a milestone may be manually completed, the completion time will always be "Now".

Schedule

The milestone schedule is used to determine how a milestone is to be initiated and the sensitivity of the milestone to deviations from the specified timeframe for completion of the milestone.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Milestone initiation
  - Relative to another Milestone
  - Order Property
  - Time Function
  - Offset
- Sensitivity
  - Same calendar day
  - Time window (hours)
- Example Milestone "RCF"

Opening hours
- n/a
- Forward (Cutoff)
- Forward (Flex)
- Backward (Flex)
- Example

Milestone initiation

There are 3 methods to indicate how a milestone is to be initiated

Relative to another Milestone

The planned fulfillment time of milestone *A* is derived from the planned fulfillment time of milestone *B*. The offset is added using local time and therefore may vary, for example: schedule time M1 (DEFRA): 1.6.2012 22:00 Offset: +2 h -> Time Schedule M2 (GBLHR) 1.6.2012 23:00.

If the planned period is calculated using another Milestone, then further milestones can be calculated from the planned or actual time of these other milestones, for example:

	ARR	RCF	NFD	DLV
Schedule time	12:00	14:20	15:20	02:00
Adjustment	Order property ETD	Relative to ARR (actual) + 2h	Relativel to RCF (actual) + 1h	Relativel to ARR (plan) + 12h
Actual Time	12:20			

Order Property

The planned fulfillment time of a milestone is derived from a specific order property. The dropdown-field contains all suitable order properties.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the example pictured above, the planned fulfillment time of the *DEP* milestone is initialized from the *ETD* property of the corresponding order. Here is a list of all availalbe time fields.

Time Function

The planned fulfillment time of the milestone is initialized using a special built-in function. Currently, only the "Creation Time" function is available. Choosing this function will use the creation time of the tracking plan to initialize the planned fulfillment time.

Offset

the offset can be used to offset the panned time from the previous settings. For example, entering "2 H" will offest the planned time by 2 hours after the ETD. Using the minus symbol will cause the offset to be before the planned time.

Sensitivity

The *sensitivity* section is used to specify the time frame in which a milestone fulfillment counts as "according to plan" (marked *OK* in the shipment monitor). This time frame is given relative to the planned fulfillment time.

Same calendar day

Milestone fulfillment is OK, if it's on the same calendar day as planned. Scope uses the milestone location's timezone to compare these dates (see location above).

Time window (hours)

Users may specify allowed time deviations on either side of the planned fulfillment time. These allowed deviations may be specified in days, hours an minutes. The abbreviations "d", "h" and "m" may be used to specify the time unit, so for example if "1h30m" is entered, this will be interpreted as "1 hour and 30 minutes". Negative values are not allowed.

Example Milestone "RCF"

Schedule:

Order property	Estimated Time of Arrival (ETA)
Offset	+4 H
Time slot	-4 H +12 H

Shipment:

Destination	USLAX
ETA	2012-06-01 13:37

Result planed time window

lower limit	2016-06-01 11:37 (Pacific Time)
upper limit	20162-06-02 05:37 (Pacific Time)

Opening hours

This field can be used to define a strategy for considering the opening hours of the responsible party. The opening hours of the responsible party are taken from the delivery address used. These can be maintained for the partner on the Delivery/pickup address tab. The opening hours during holidays (see Holiday Appliance) are treated like Sundays. If the responsible party cannot be determined or at the responsible party has no opening times maintained, the plan time ascertained by Scope in the accompanying time function are used.

The user can choose between the following strategies:

- n/a
- Forward (Cutoff)
- Forward (Flex)
- Backward (Flex)

n/a

The opening hours will not be considered. Plan time and time window are used as they are determined by Scope. This can lead to the situation where an action is expected outside of the opening times and suitable alarms are generated.

Forward (Cutoff)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If the plan time occurs within an opening hours interval, then this interval is used. If the responsible party has not opened at the planned time, the following opening hours interval is used. Plan time and time window are moved in the certain opening hours interval and the latest time stays the same and is shortened if necessary on the limit of the Intervals.

Forward (Flex)

If the plan time falls occurs within an opening hours interval, this interval is used. If the responsible party is not open at the planned time, the following opening hours interval is used. Plan time and time window are moved in the certain opening hours interval and the latest time is laid relatively at the new plan time (in the limit of the opening hours interval).

Backward (Flex)

If the plan time occurs during an opening hours interval, this interval is used. If the responsible party is not open at the planned time, the prior opening hours interval will be used. Plan time and time window are moved in this opening hours interval and the earliest time is laid relatively at the new plan time (in the limit of the opening hours interval).

Example

Opening hours of the responsible party: Monday - Friday 8 to 12 and 13 to 17 hundred hours

Planned time 4:00am, Time window - 3 hours / + 5 hours

Strategy	Adapted plan time	lower limit	upper limit
n/a	4:00am	1:00am	9:00am
Forward (cutoff)	8:00am	8:00am	9:00am
Forward (flex)	8:00am	8:00am	12:00pm
Backward (flex)	-1 5:00pm	-1 2:00pm	-1 5:00pm

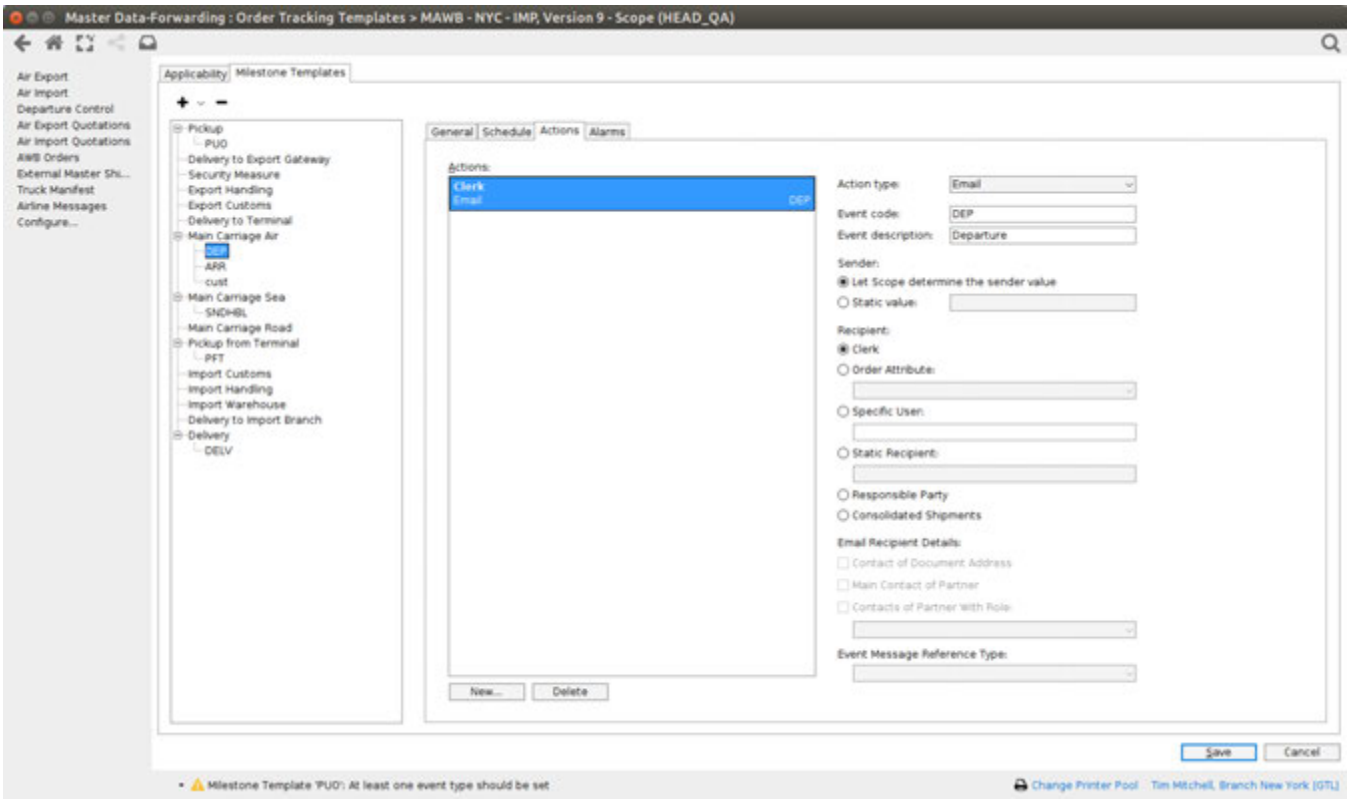
Planned time 10:00am, Time window - 3 hours / + 5 hours

Strategy	Adapted plan time	lower limit	upper limit
n/a	10:00am	07:00am	3:00pm
Forward (cutoff)	10:00am	8:00am	12:00pm
Forward (flex)	8:00am	8:00am	12:00pm
Backward (flex)	10:00am	8:00am	12:00pm

The opening hours are always interpreted in the time zone of the milestone.

Actions

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The actions tab is used to specify actions to perform upon milestone fulfillment. On the left hand side of the tab, all actions are listed, the right hand side of the tab contains an editor for the selected action. The *New...* button is used to add further actions and *Delete* is used to remove the highlighted existing action.

- Action Type
- Event Code
- Event Description
- Sender
- Recipient
- Email Recipient Details
- Event Message Reference Type
- Alarms
- Alarm Time
- Alarm Type
- Recipient
- Email Recipient Details

Action Type

Users can specify the *Action type* using the dropdown-field. The following action types are available:

- Event Message: Generate EDI event messages
- Email: Send a simple email notification
- Cargo 2000 Message: Send a Cargo 2000 message
- Move to Inbox: The associated shipment is stored in the Inbox folder of the responsible user.
- User Notification: The user will get a pop-up alert
- Synchronize Milestone: The synchronize function is used to "break down" an event from Master to House level. For example a departure event on a master shipment will automatically breakdown to any houses on the master.

Event Code

Particularly for EDI communication, it can be useful to use a special, client-specific code identifying milestone fulfillment. these special "mappings" can be maintained in the *Event code* field.

Event Description

Users may supply a specific description to be used for milestone fulfillment while performing the action. This can be entered into the *Event description* text-field.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Sender

- Let Scope determine the sender value - for an alert like an email, Scope will determine who the sender of the alert should be shown as
- Static Value - for an alert like an email, the email address of the sender of the alert can be entered here.

Recipient

Recipients can be defined either statically or dynamically, corresponding to the options:

- Clerk - meaning the user who created or owns the shipment
- Order Attribute - use the drop-down menu to view the parties from the shipment who can be set as the recipient of the alert, for example the "Shipper" or "Condsignee".
- Specific User - enter the user name of the Scope user who should receive the alert.
- Static Recipient - enter the email address of anybody as the receipient of the alert
- Responsible party - the recipient of the alert is the same as the party resonsible for completing the milestone
- Consolidated shipments - simply complete the milestone for any house shipments on a master.

Email Recipient Details

When the alert is an email, and the email address is to be found stored with the partner, use these check-boxes to determine which email addresses from the partner should be used:

- Contact of Document Address - A contact stored againsed a document address in the shipment
- Main Contact of a Partner - this is the email address shown on the "General" tab of a partner
- Contacts of Partner with Role - Contacts can have roles. Select the role the contact must have in order to receive the alert
    - Dunning recipient
    - Export Clerk
    - Import Clerk
    - Invoice recipient
    - Rate sheet recipient
    - Warehouse Clerk

Event Message Reference Type

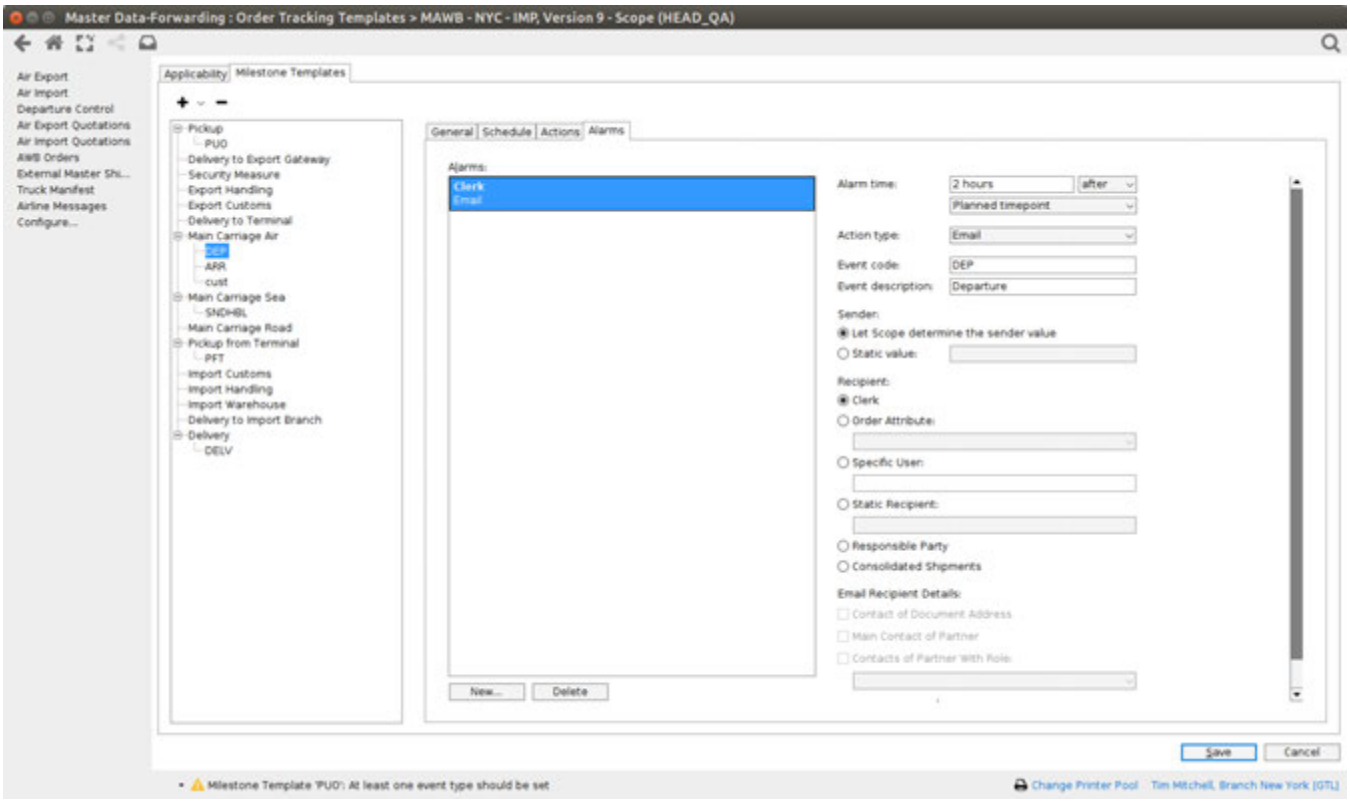
This is used when connected to 3rd party tracking systems. Only use as advised by Riege Software.

Attention!

Static recipient values are neither validated nor subjected to any other kinds of plausibility checks.

Alarms

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The tab Alarms is used to create automatic notifications when milestones fail to be achieved within the allowed period of time. The *New...* button can be used to add new alarms and the *Delete* button is used to remove the highlighted alarm. On creating an alarm, the name given to the alarm will initially be "Clerk", however, as the alarm is constructed this will change to automatically describe the alarm more accurately.

- Alarm Time
- Alarm Type
- Recipient
- Email Recipient Details

Alarm Time

The alarm time field is used to record the number of days, hours or minutes that an alarm should be issued before or after the beginning or end of a specified time period or relative to a specific time-point. The alarm time should be entered in days, hours or minutes. 2 options then exist to indicate how this alarm time is to be applied:

- before
- after

There are then 3 actual time-points that the alarm may be applied to, and therefore the alarm time may be *before* or *after* any of the following:

- Beginning of planned time window
- Planned time-point
- End of planned time window

The desired option should be checked.

Alarm Type

There are 6 possible types of alarms:

Alarm Type	Description
User notification	When the alarm time is reached, the alarm receiver will get a Scope "Growl" notification. The user can click this alert to open the relevant tracking plan
Move to inbox	When the alarm time is reached, the alarm is sent to the Scope inbox folder (see inbox folder in the User Interface section)
Email	Send an email to the specified email address with the alarm time is reached

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Event Message	This is used when connected to 3rd party tracking systems. Only use as advised by Riege Software.
Cargo 200 Message	Send a cargo 2000 message
Synchronize	The same tracking template must be used for all shipments so that milestone synchronization can be applied to all shipments. Here is an example: If a master shipment is created, all house shipments must have the same tracking template so that the synchronization can be carried out successfully. The milestones are then automatically transferred to the house mailings by the master program.

Recipient

Recipients can be defined either statically or dynamically, corresponding to the options:

- Clerk - meaning the user who created or owns the shipment
- Order Attribute - use the drop-down menu to view the parties from the shipment who can be set as the recipient of the alert, for example the "Shipper" or "Condsignee".
- Specific User - enter the user name of the Scope user who should receive the alert.
- Static Recipient - enter the email address of anybody as the receipient of the alert
- Responsible party - the recipient of the alert is the same as the party resonsible for completing the milestone
- Consolidated shipments - simply complete the milestone for any house shipments on a master.

Email Recipient Details

When the alert is an email, and the email address is to be found stored with the partner, use these check-boxes to determine which email addresses from the partner should be used:

- Contact of Document Address - A contact stored againsed a document address in the shipment
- Main Contact of a Partner - this is the email address shown on the "General" tab of a partner
- Contacts of Partner with Role - Contacts can have roles. Select the role the contact must have in order to receive the alert
    - Dunning recipient
    - Export Clerk
    - Import Clerk
    - Invoice recipient
    - Rate sheet recipient
    - Warehouse Clerk

Holiday Maintenance - Maintenance

- Introduction
- Description

Introduction

Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Organizational Structure - Maintenance

- Introduction
- Description

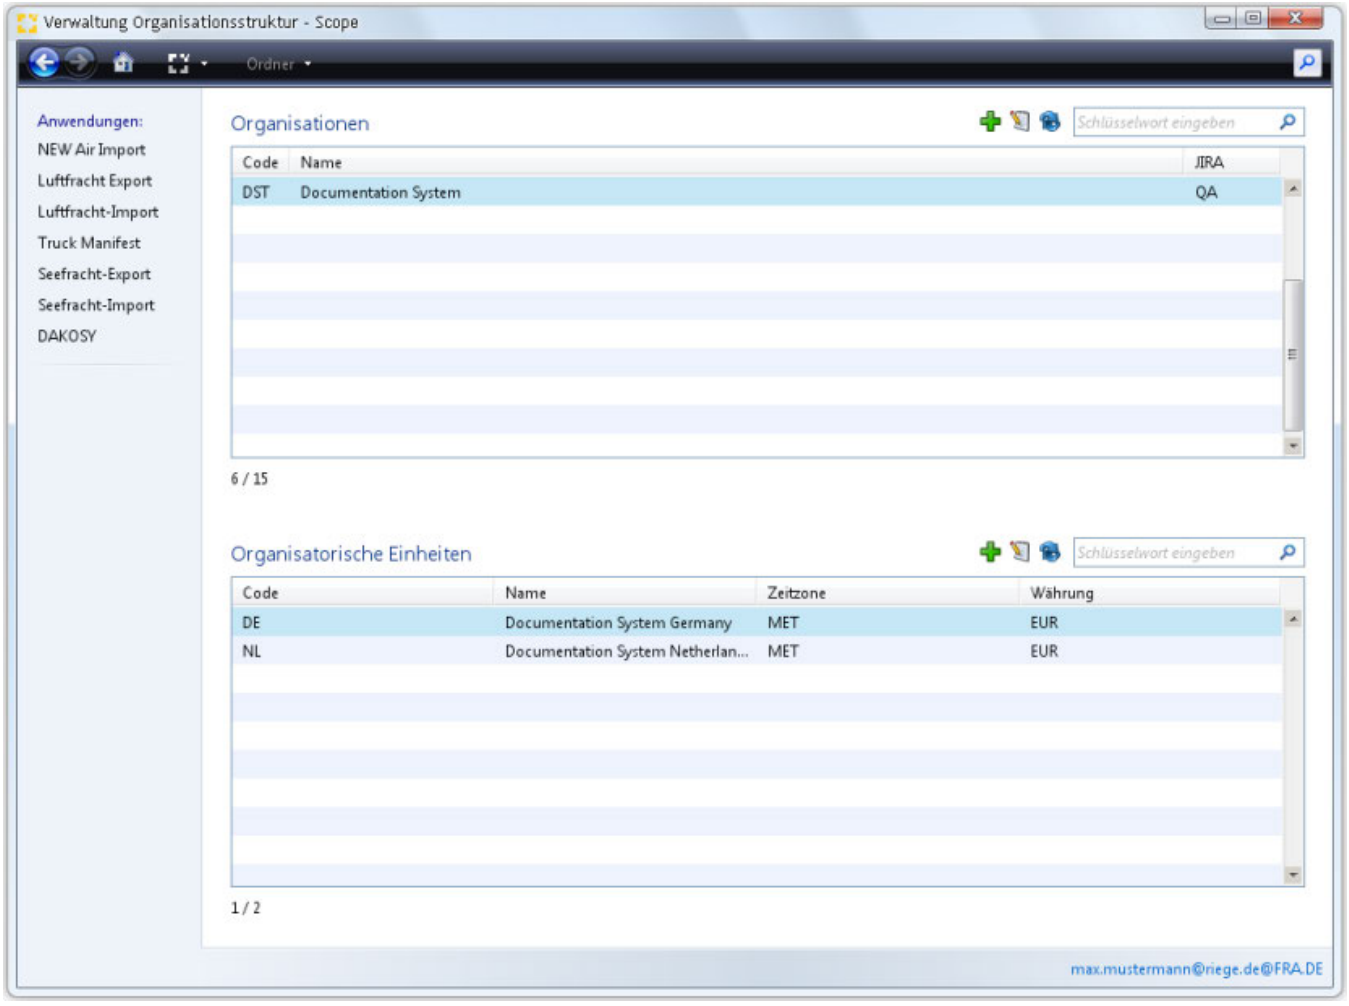
Introduction

Organizational units may be any of the following:

- A permanent branch office
- A company
- A group of companies
- A country where a company has multiple branches (unit=country)

The management of the data in this application can have a significant impact on the overall system configuration. Access to this application is very limited and should be adjusted exclusively by the **Riege Software International** support team.

Description



Organisations

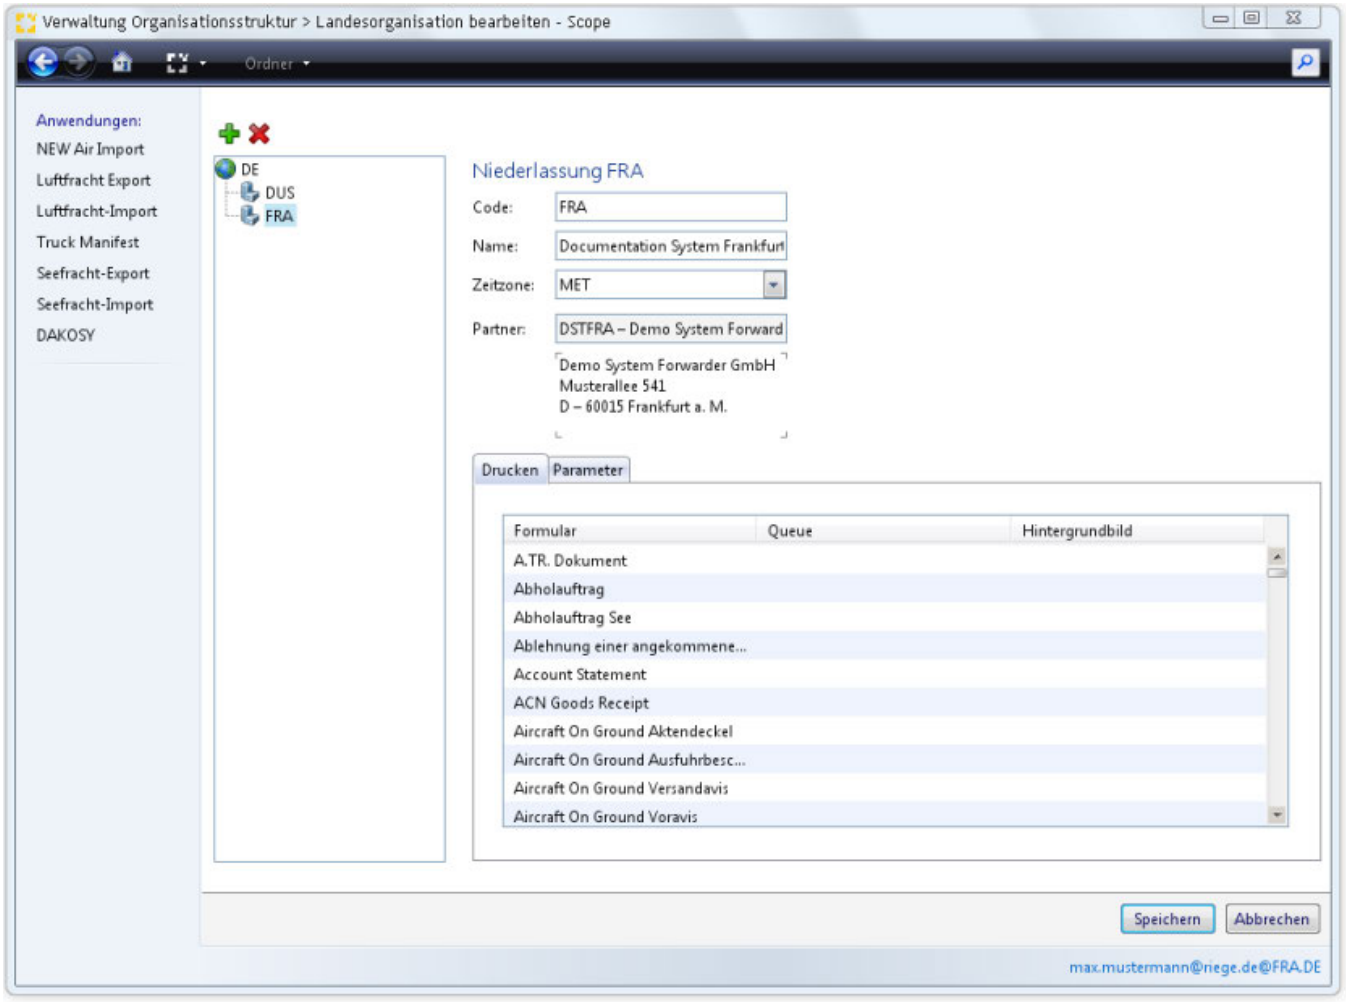
A list of existing organizations.

Legal Entities

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The legal entities that exist within the Organization highlighted in the overview. Typically these are countries. Legal entities can be opened in the Editor by double clicking them or using the "edit" icon. New legal entities can be created in the Editor by using the "Plus" icon.

Editor



The editor is used to maintain the individual offices of the national organizations. The following maintenance functions are also available:

- Parameter (at country and branch level)
- Printers (at branch level)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Partners - Maintenance

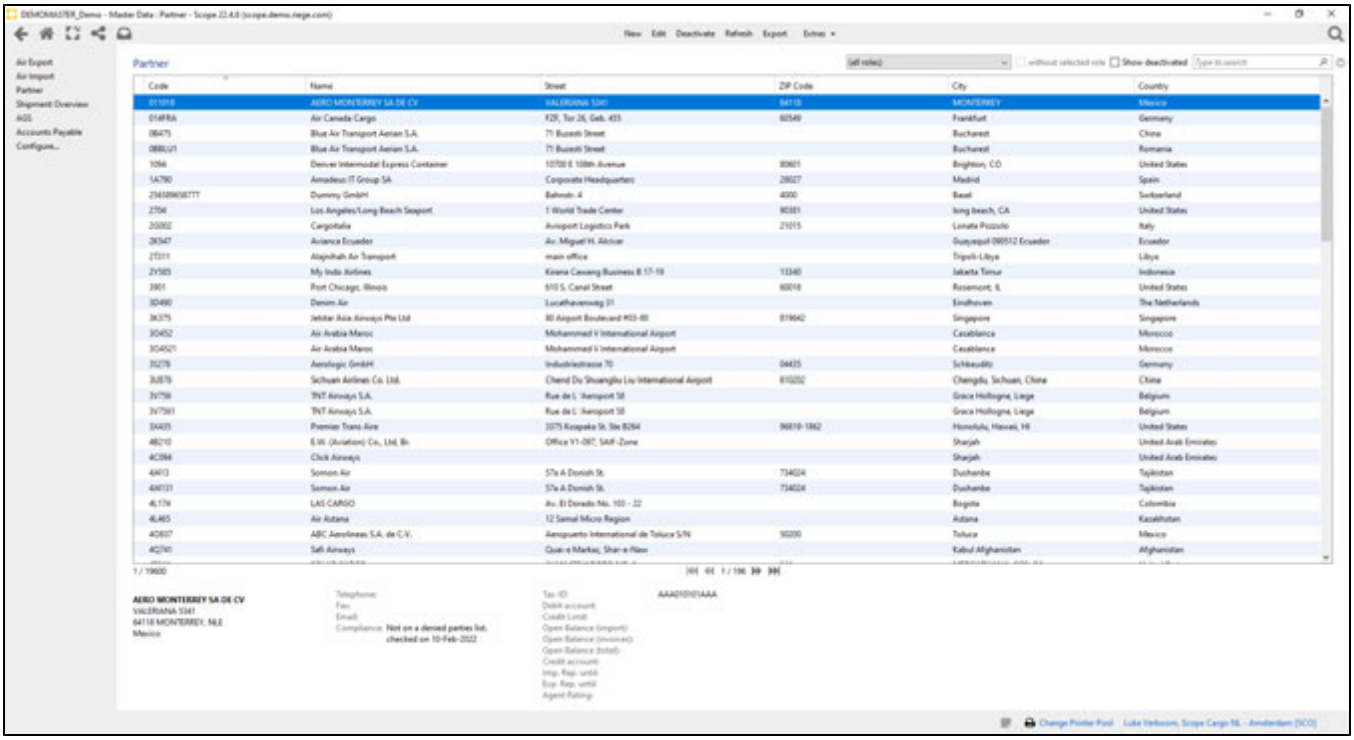
- Introduction
- Description

Introduction

All firms or individuals with whom the organization has business dealings are referred to in Scope as a business partners, regardless of whether these partners are a consignors, consignees, suppliers, agents or carriers, etc.

New business partners enetered in Scope using thee **Partner** application and are then available for business transactions within other Scope applications. Every new partner is given a code that uniquely identifies them

Description



New

Create a new business partner.

Edit

Open an existing business partner highlighted in the list of partners, or click a partner to open the partner in the partner editor application.

Deactivate

Deactivate the business partner highlighted in the list of partners. The partner will not be deleted, but set as "inactive" and removed from the field of view.

Refresh

refresh the list of business partners to ensure the latest data is visible.

Export

Export the list of business partners to a spread-sheet for external processing on the users PC.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Role

From the drop down list select the role to use as a filter for the list of partners.

Show deactivated

Include partners who have been deactivated.

Type to search

Enter one or more keywords to use as search terms, these can be any element of a partner such as a postal code, or labels used when creating the partner or accounting information such as an account number.

Partner table

The partner maintenance home screen presents a list of partners in table format. Column headings are:

Column	Description
Code	Adress Code
Name	Adress Name
Street	Street/Road address
ZIP	Postlal code
City	City or town
Country	Country name

The address data can be sorted by column if the column title is clicked.

Detail Section

If a partner is highlighted in the overview, greater details about that partner will appear in the detail section of the lower part of the screen:

- Full name
- Complete address
- general contact details
- Tax ID
- Debit account
- Credit Limit
- Open Balance (import)
- Open Balance (invoices)
- Open Balance (total)
- Credit account
- Imp.Rep. until
- Exp.Rep. until
- Agent Rating

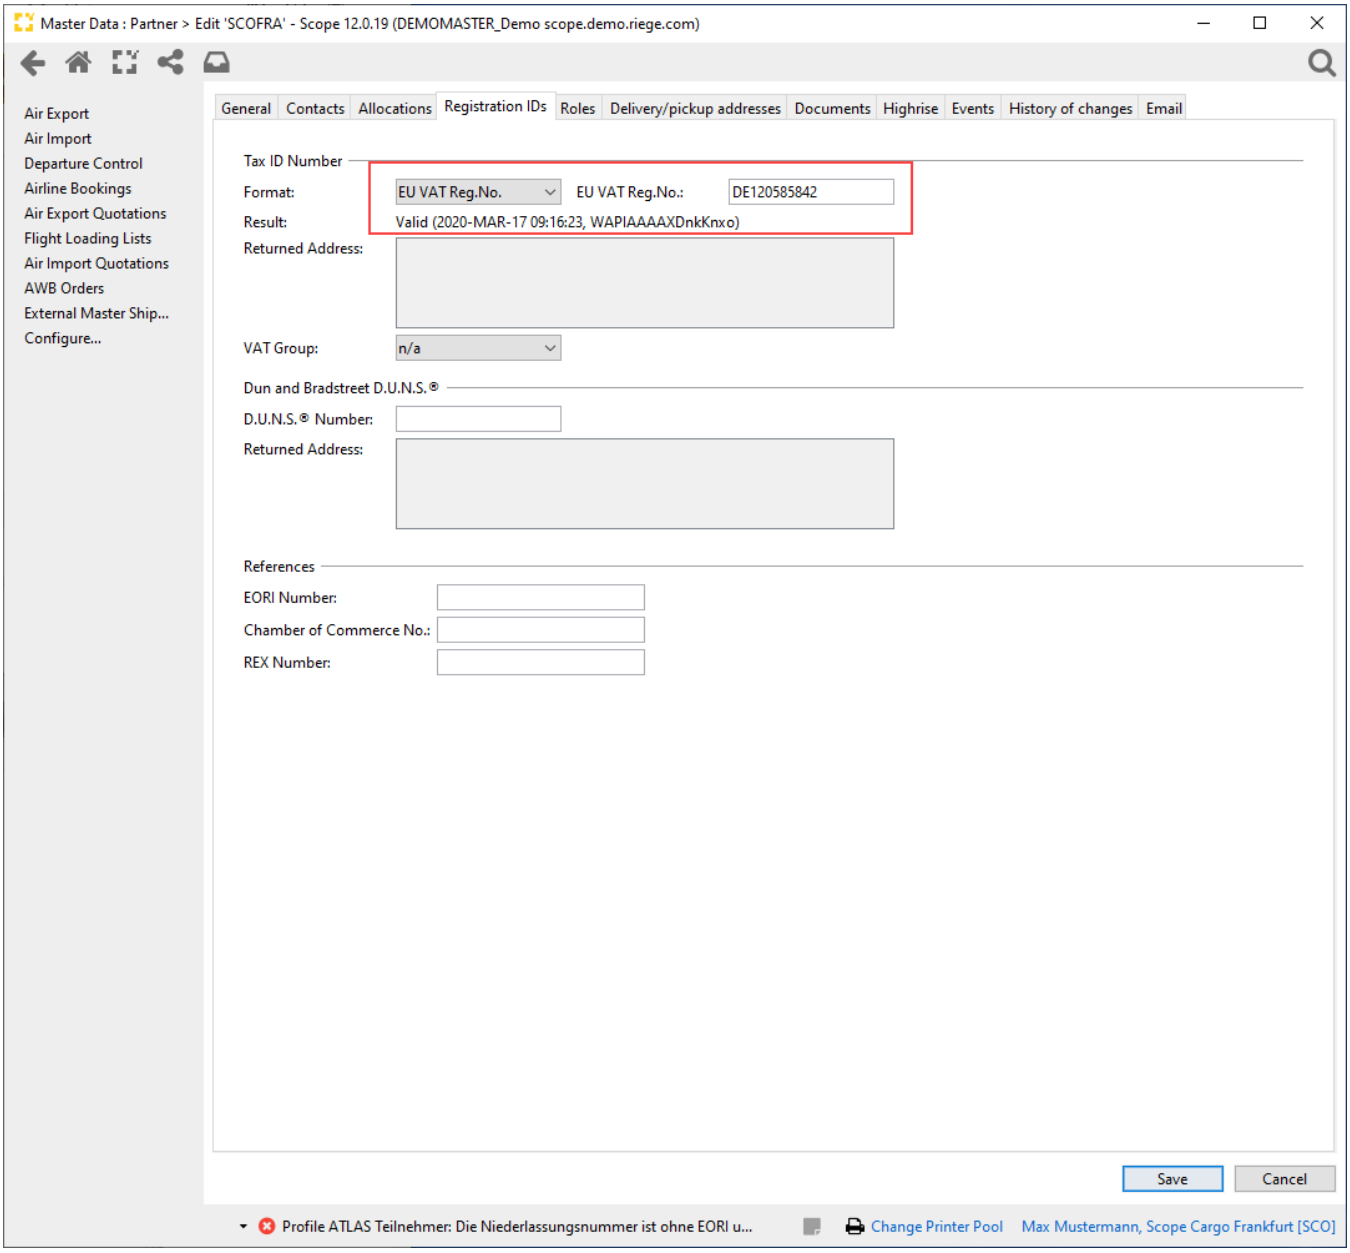
Accounting - Business Partner - Maintenance

- Introduction
- Description

Introduction

The Registration ID tab stores the tax details of the partner.

Description



Tax ID Number

The id to be used for official tax purposes. This is not required for a private individual

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Format

Tax ID

The tax id number. This is required for the preparation of financial documents and to confirm the partner is a business. After Tax ID is filled in this field it has to be verified by clicking on drop down button. If Tax ID is not valid Scope will inform you accordingly.

Dun and Bradstreet D.U.N.S.

Next to Tax ID the D.U.N.S. Number can be filled in

References

At Registraton tab all other IDs of partner can be listed as an overview, like

- EORI Number
- Chamber of Commerce No.
- REX Number

Remarks:

In prior releases all accounting information was listed here. Actual it can be edited at Roles tab

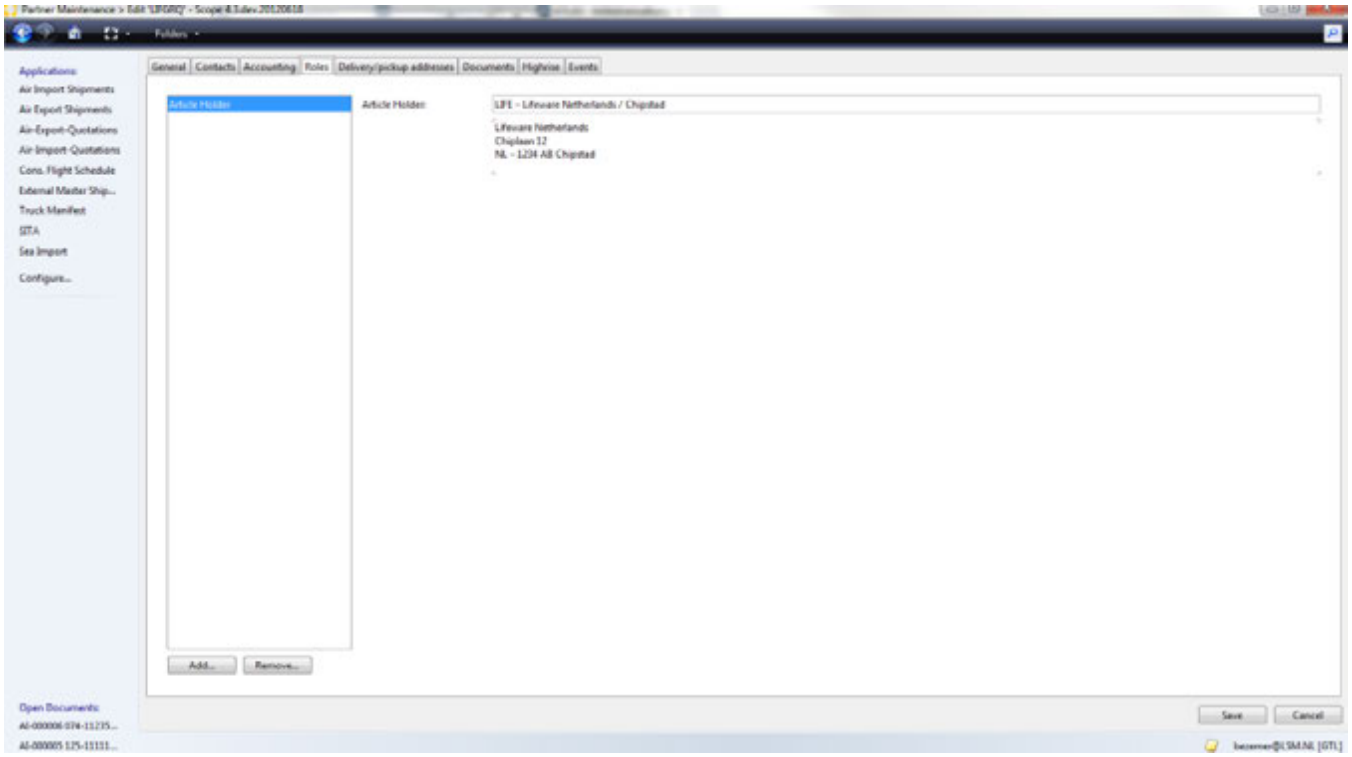
Article Holder - Roles - Business Partner - Maintenance

- Introduction
- Description
- FAQ

Introduction

As described in the Article Maintenance, any article can be assigned to a certain Partner, in order to avoid duplication of articles it, a link from any partner to a Partner with articles registered to them, can be set up using the role "Article Holder".

Description



When adding the role Article holder to any partner the partner, too which the article have been assigned, is to be selected as article holder.
After saving all articles registered on the article holder partner are available to the updated partner.

FAQ

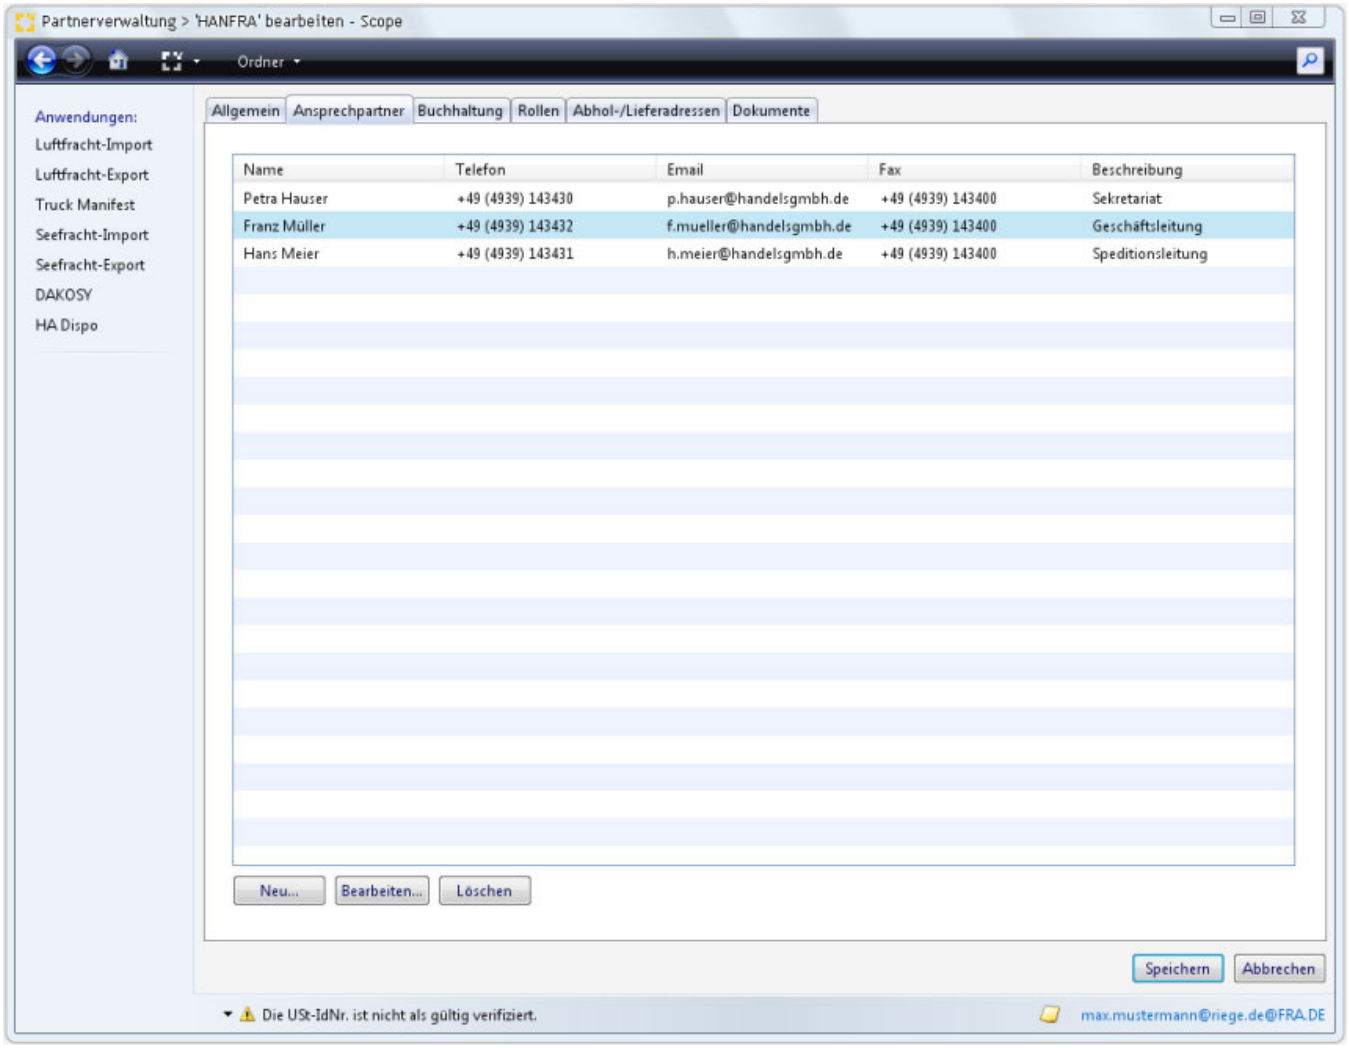
Contact - Business Partner - Maintenance

- Introduction
- Description

Introduction

The **Contact** tab is where various contact names and details for the partner can be stored.

Description

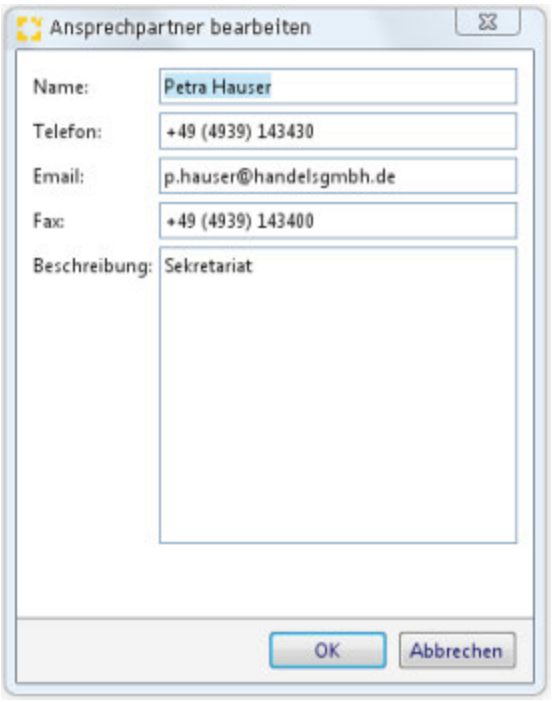


Contact

All contacts or contacts relevant to the address can be stored with name, phone, email, fax and description (for example, the department or the title). This data, especially name and e-mail address can then be used in the Air export application and automatically applied to shipping advices for example.

The following input fields are available on creating a new contact person:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Name

The full name of the contact.

Telephone

The complete phone number for the contact including any extension.

Email

The Email-Address of the contact person.

Fax

The fax number of the contact person

Description

A description of the contact person, for example an indication of the role they play in the transport process.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delivery and Pickup Address - Business Partner - Maintenance

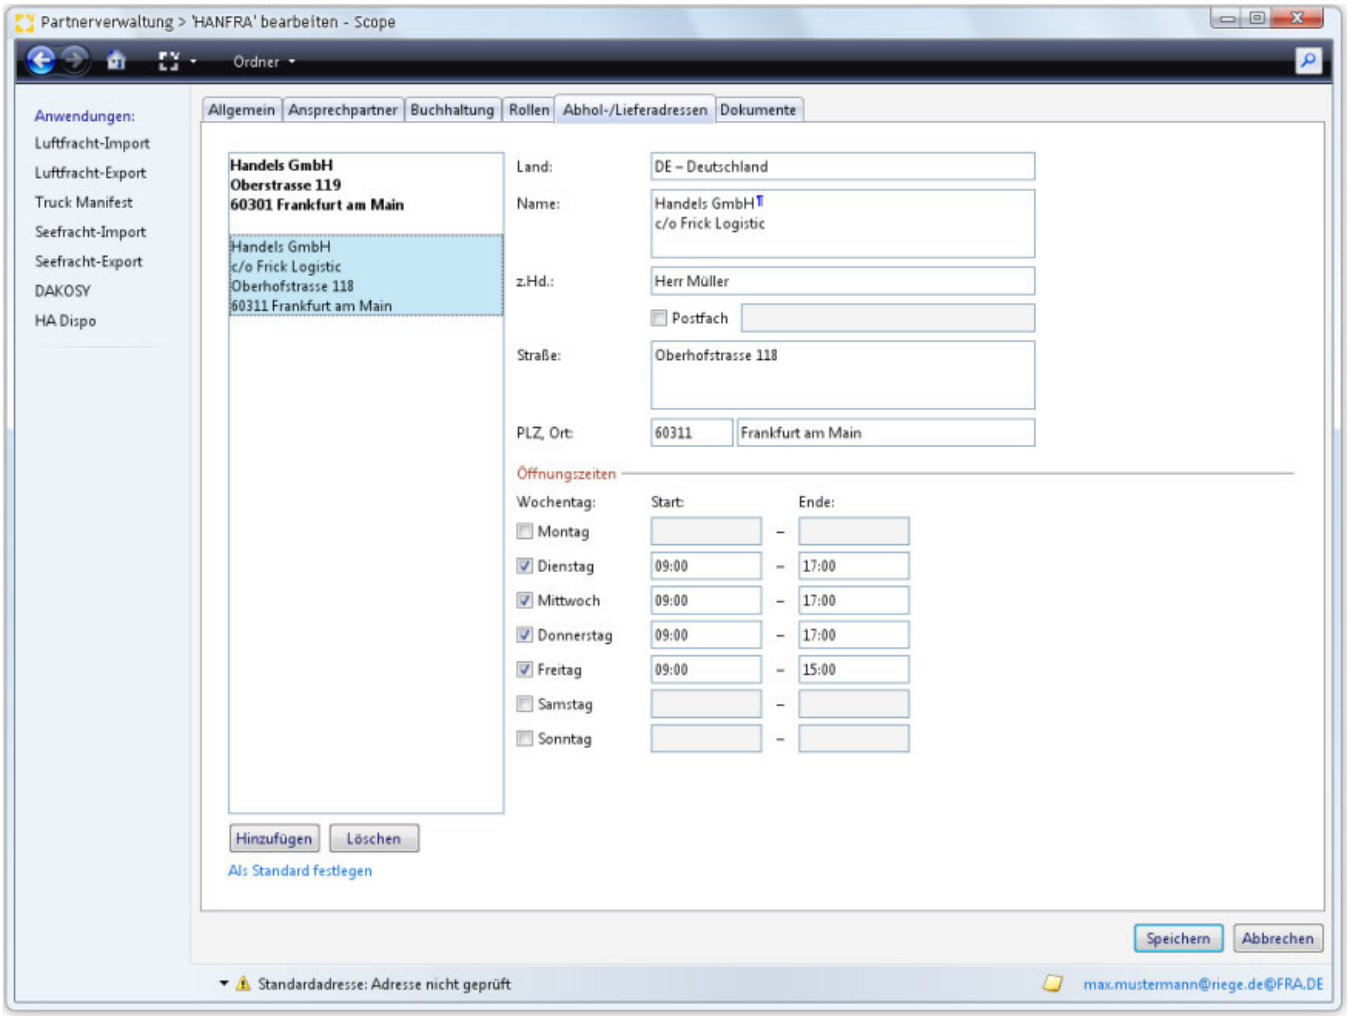
- Introduction
- Description

Introduction

The tab _Delivery/Pickup Address allows for the entry of pickup or delivery addresses that are different to the main partner address. This means that when a transport order is created for a partner, the transport order application will automatically apply the correct delivery or pickup address to the order. Opening hours for these addresses may also be stored.

Description

Address Area



Country

The country where the partner is located. This is a search field. The country is identified ahead of the other address data since address data and the format of that data will depend on the country of the partner. For example the format of the postal code will differ by country.

Name

The name of the company or individual

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

C/O

Care of. To be used where the partner uses another entities postal address.

P.O. Box

Check this box if the partner uses a post box number and enter the box number to the right.

Street

Street address

Postal Code

the postal code of the partner.

City

The city or town where the partner is located.

Compliance Check

Checks the voucher address is not on the anti-terror list.

Opening hours area

the opening hours of the address may be recorded. The day of the week and the hours of operation may be entered. If not completed the applications assumes the location operates continuously.

Add

Add a new pickup or delivery address.

> ⚠ Additional addresses can only be added if the partner has been saved.

Delete

Delete the selected pickup or delivery address from the list.

Set as Default

This action link will set the selected address as the default address for pickup/delivery. This is only required when multiple addresses are possible. The default address is the first address in the list.

Questions

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

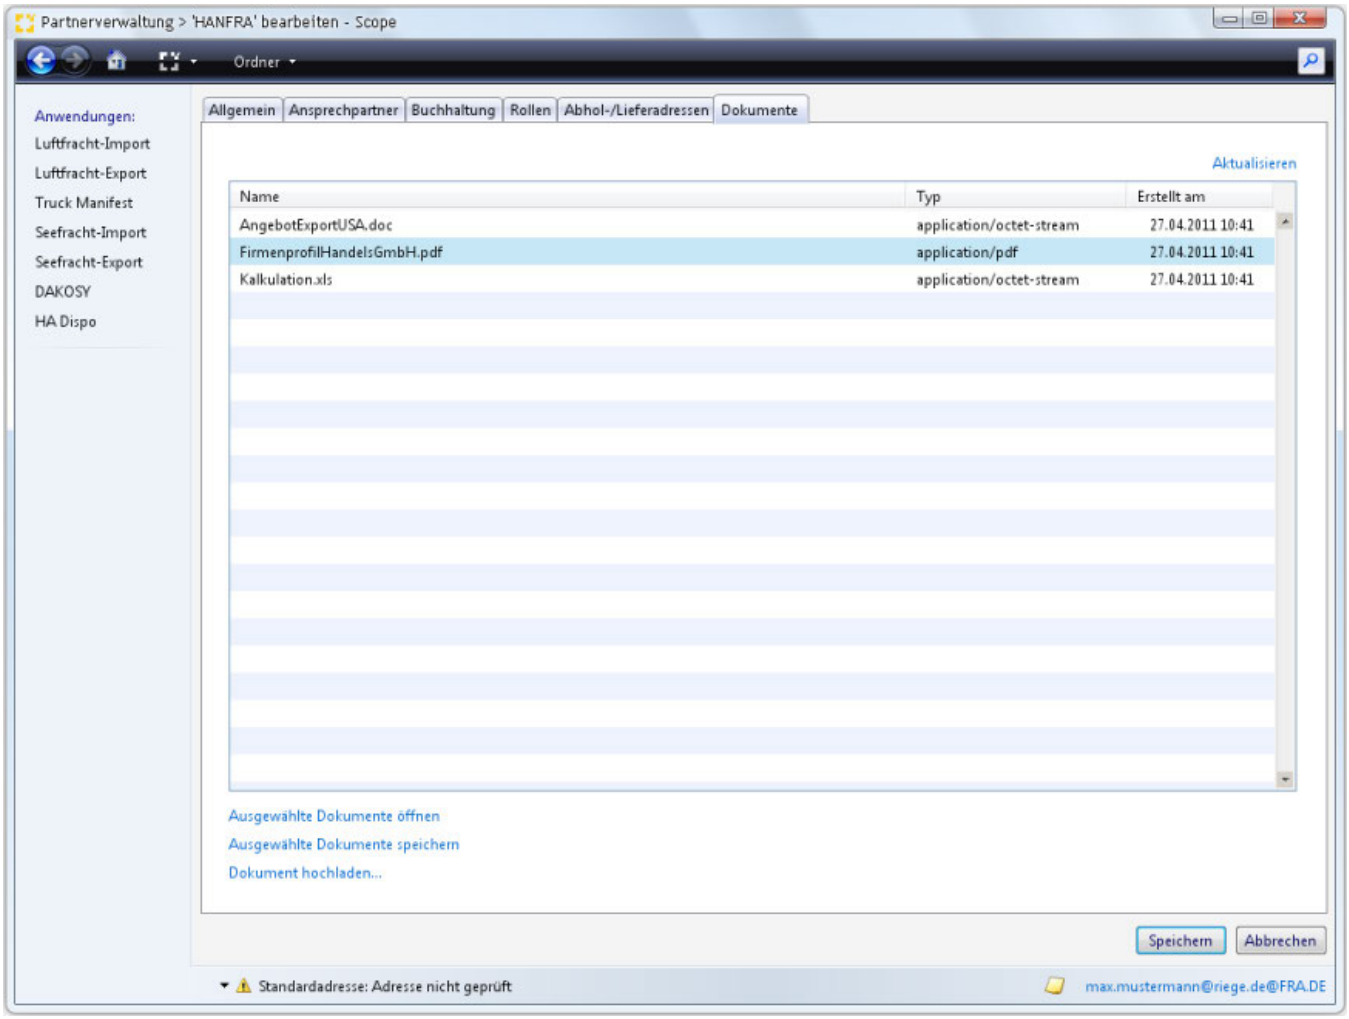
Documents - Business Partner - Maintenance

- Introduction
- Description

Introduction

Important documents for the partner can be uploaded to Scope and stored with the partner details in the *Documents* tab. These documents can be opened or downloaded to the local PC and new documents may be uploaded.

Description



The following cuntions are available:

Show removed

Check this box to view any documents that may have been removed.

Refresh

Refresh the list of documents to ensure the latest documents are visible.

Summary Table

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

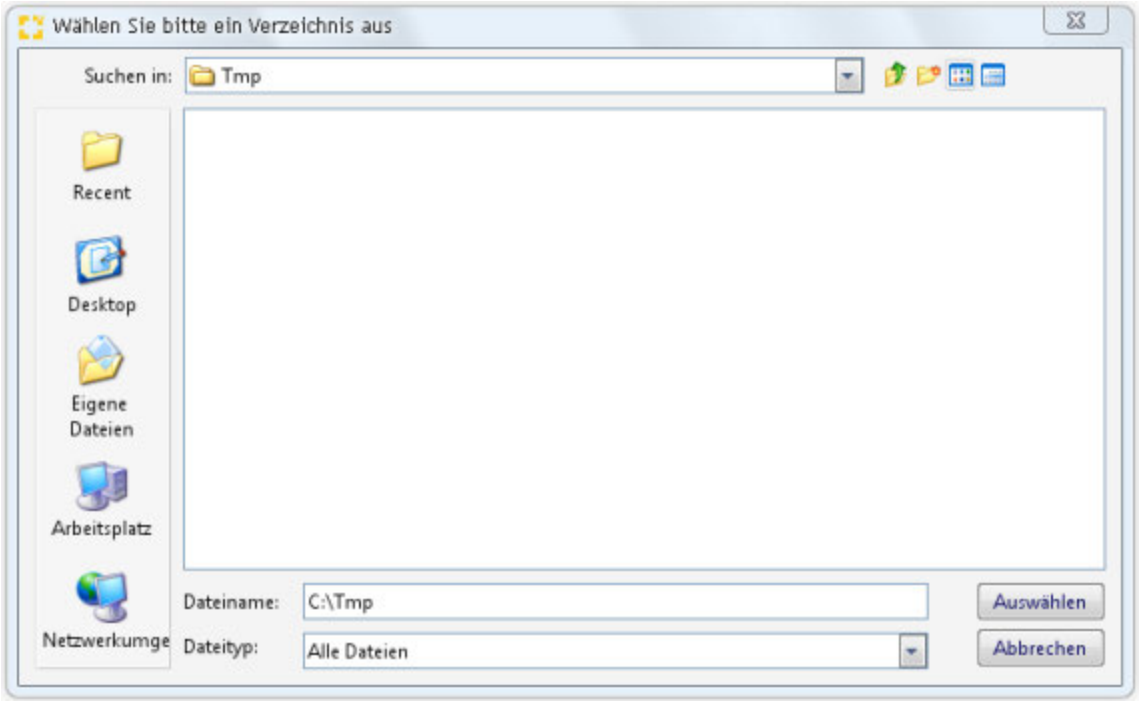
The summary table shows all the documents currently upload for the partner. The type of file, the name of the document and the date uploaded are all present.

Open selected documents

Open the document highlighted in the summary list. The Application opens the document using the associated program on the local PC. Clicking a document will also open it.

Save selected documents

This action downloads the selected document to the local PC. A dialogue box appears in order to choose the folder where the document should be saved.



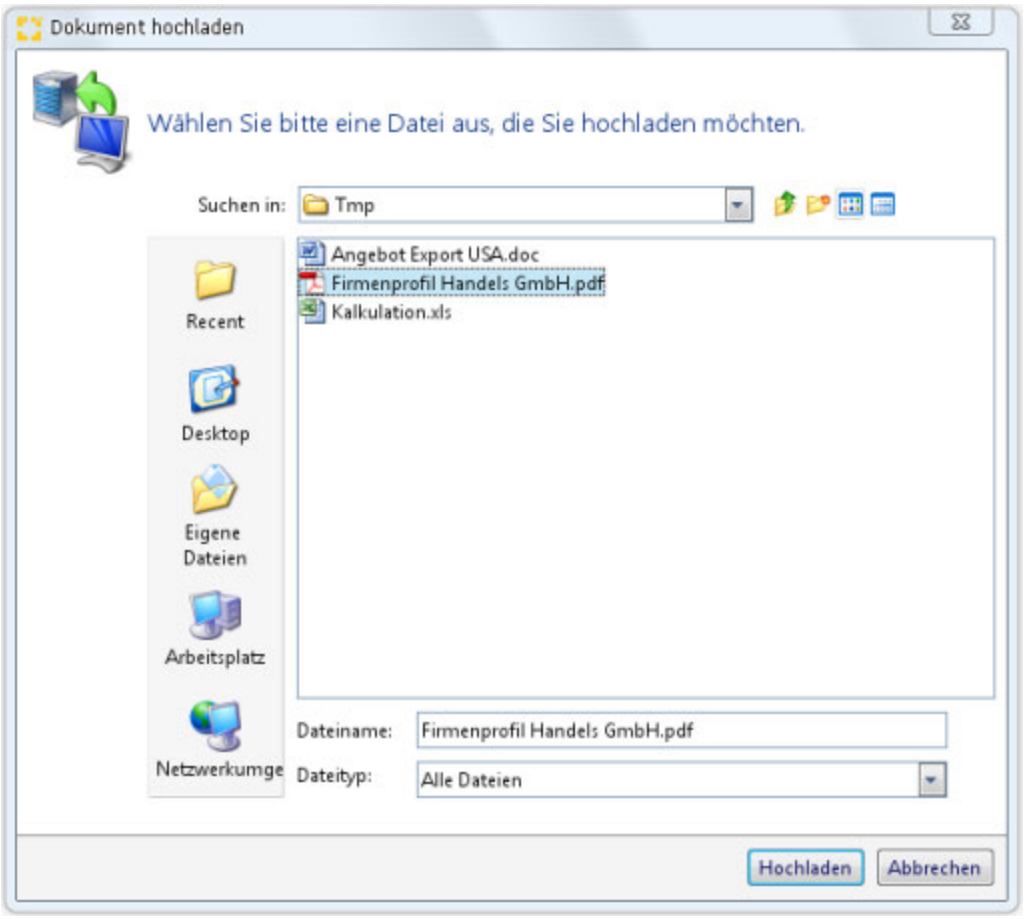
Delete selected documents

The selected documents will be removed. These are not permanently deleted and only removed from view. If the *show removed* option is checked, they will reappear with ~~strikethrough~~ title text to indicate they have been deleted.

Upload document....

Launches a dialogue that allows documents to be selected from the local PC for upload to the *Documents* tab of the partner.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the desired document is found with the dialogue, select "Upload" to upload the item or "Cancel" to exit without upload.

Questions

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Partner

Code

A unique and human readable code to identify the partner. This can also be used to search for the address. The code can be alpha-numeric and up to 30 characters.
It is suggested that a 6 digit code be issued; the first 3 digits represent the company name and the last 3 represent the location of the company, example, Test Company LLC in New York would be --> TSTNYC.

Name

The full name of the partner. Any part of this name can later be used to search for the company.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Labels

A label us used to define a partner and can later be used to find the partner or a group of partners with the same label. A partner could have the label "Consignee" or "Supplier". More than one label can be inserted by using a space between labels.

Language

This field offers a drop-down menu showing a list of possible languages. The language chosen will be the default language used when documentation is produced for this partner.

Business / Private Individual

This check-box indicates if the partner is a business entity or a private individual. This will ensure Tax identification is captured for business entities but is not required for private individuals.

Show Track and Trace ID

When a partner is created, the Scope application issues a unique ID for the new partner in order to identify them within the tracking application. This ID is not required for day-to-day operations but can be viewed by clicking this action link.

Default Address

This area records the standard address details for this partner that should always appear when the partner is used in other Scope applications. If a partner has been changed as a one-off edit in a Scope application, the context menu for the address will offer the option "Use default address" (or press F6) in which case the address will be restored the the default address of the master data.

Country

The country where the partner is located. This is a search field. The country is identified ahead of the other address data since address data and the format of that data will depend on the country of the partner. For example the format of the postal code will differ by country.

Name

The name of the company or individual

C/O

Care of. To be used where the partner uses another entities postal address.

P.O. Box

Check this box if the partner uses a post box number and enter the box number to the right.

Street

Street address

Postal Code

the postal code of the partner.

City

The city or town where the partner is located.

Contact Details

These are the general contact details for the partner. Further specific contact names can be entered in the Contacts tab.

Telephone

The general telephone number for the partner.

Fax

The general fax number for the partner.

E-Mail

The e-mail address for the partner.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Web

The Web Address of the partner. (Internet)

Notes

Notes may be created and applied to partners. More information on notes is available here.

Questions

Fehler beim Ausführen des Makros 'contentbylabel'

parameters should not be empty

Roles - Business Partner - Maintenance

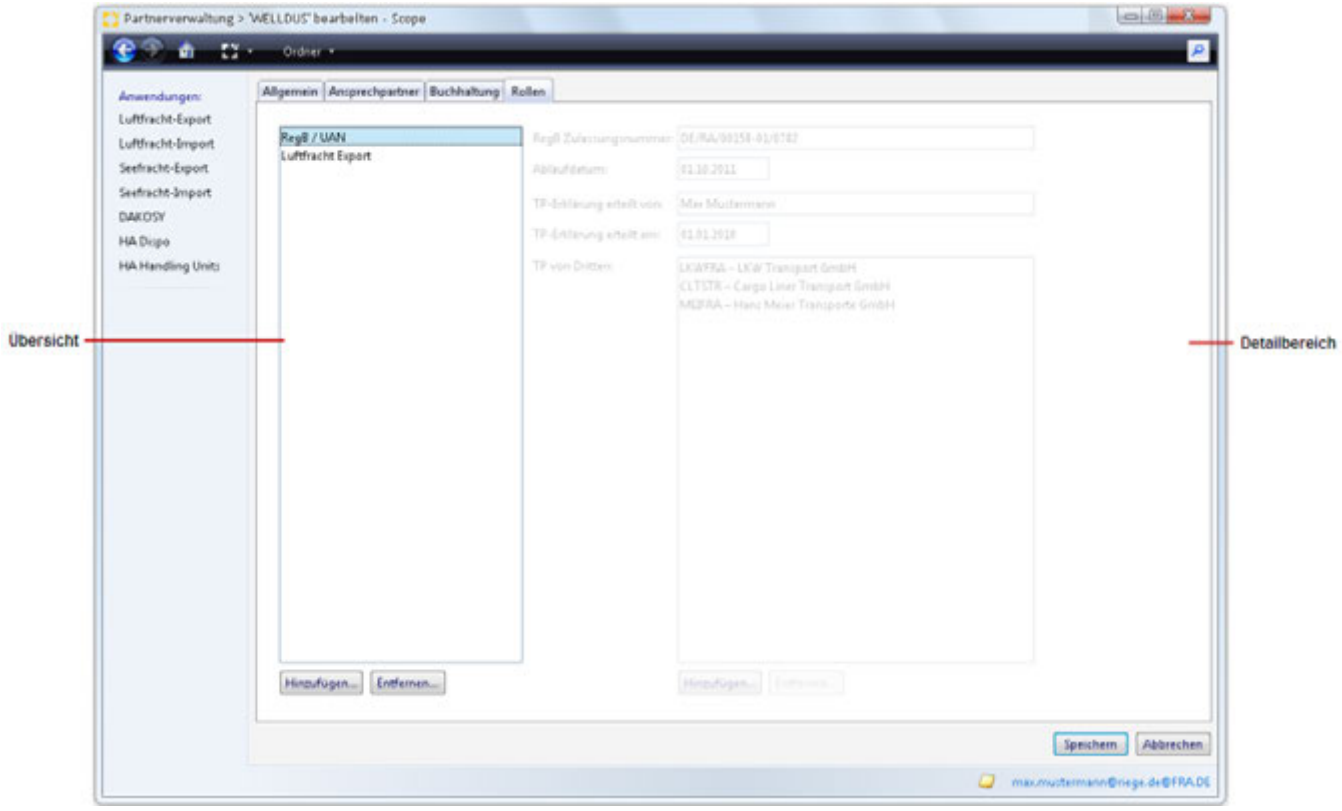
- Introduction
- Description

Introduction

The tab "Roles" allows various attributed to be applied to a partner. These attributes are then used in other Scope applications to improve and automate the process of creating new shipments. An example of this would be to apply the role "Secure shipper" to a partner. On adding this role to the partner, the full secure shipper details can then be included with the partner such as their AEO certificate number and the date their secure status expires. When an air export is subsequently created using this partner, the Scope application uses this secure shipper information to check the party is still a secure shipper and mark the shipment as secure. This removes the need for the user to constantly check the secure status of shippers.

There are a variety of roles available and this chapter describes each in detail.
These other roles include partners such as a haulage contractor or special functions that are used in other applications. In this chapter, the individual roles are described in detail.

Description

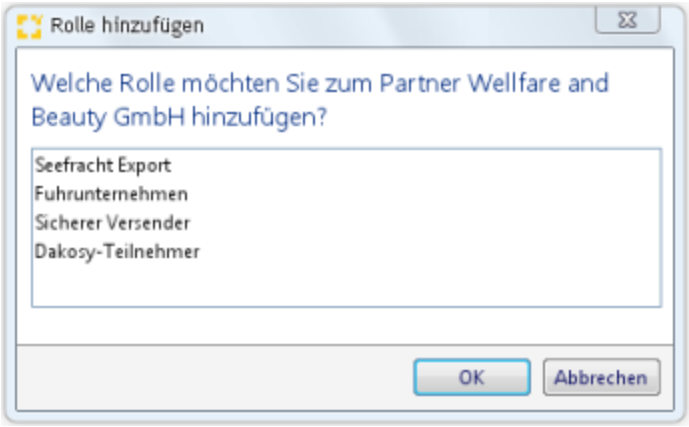


The overview screen shows a list of any roles currently applied to the partner. Clicking role in the role window will present a roles details area to the right where information specific to each role can be entered.

Add

Opens a pop-up window that displays a list of available roles:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



OK

Adds the role selected from the list to the partner and closes the pop-up window.

Cancel

Closes the pop-up window without further action.

Remove

Removes the selected role from the list of roles active for the partner.

> When a role is removed from a partner, it is not physically deleted but simply marked as inactive. If the same role is selected again at a later date, the original settings for the role will be restored.

Save

Saves any new role data and closes the editor.

Cancel

Closes the editor without saving any changes.

- The roles that a user may assign to a partner vary according to the permissions applied to the user. For example special permissions must be applied to a user in order for the user to add the role *Secure Shipper* to a partner. Not all users can see all roles.
- A user without permission to apply a role cannot see any information relating to that role in the *role* tab even if it has been applied by another user.
- A role may only be applied once.

Currently partners may be assigned the following roles:

- Agents - Roles - Business Partner - Maintenance
- Airline - Roles - Business Partner - Maintenance
- ATLAS Participants - Roles - Business Partner - Maintenance
- Creditor - Roles - Business Partner - Maintenance
- Dakosy User - Roles - Business Partner - Maintenance
- Debtor - Roles - Business Partner - Maintenance
- EZV Declarant - Roles - Business Partner - Maintenance
- EZV Participant - Roles - Business Partner - Maintenance
- Forwarding Customer - Roles - Business Partners - Maintenance
- ICS Declarant - Roles - Business Partners - Maintenance
- Liner Agent - Roles - Business Partner - Maintenance
- Netherland Customs Partner - Roles - Business Partner - Maintenance
- Netherlands Customs Goods Location - Roles - Business Partner - Maintenance
- Netherlands Customs License Holder- Roles - Business Partner - Maintenance
- Portbase Participant - Roles - Business Partner - Maintenance
- Regulated Agent - Roles - Business Partner - Maintenance
- Road Carrier - Roles - Business Partner - Maintenance
- Secure Shipper - Roles - Business Partner - Maintenance
- US Partner Profile - Roles - Business Partners - Maintenance
- US Principle Party In Interest - Roles - Business Partners - v

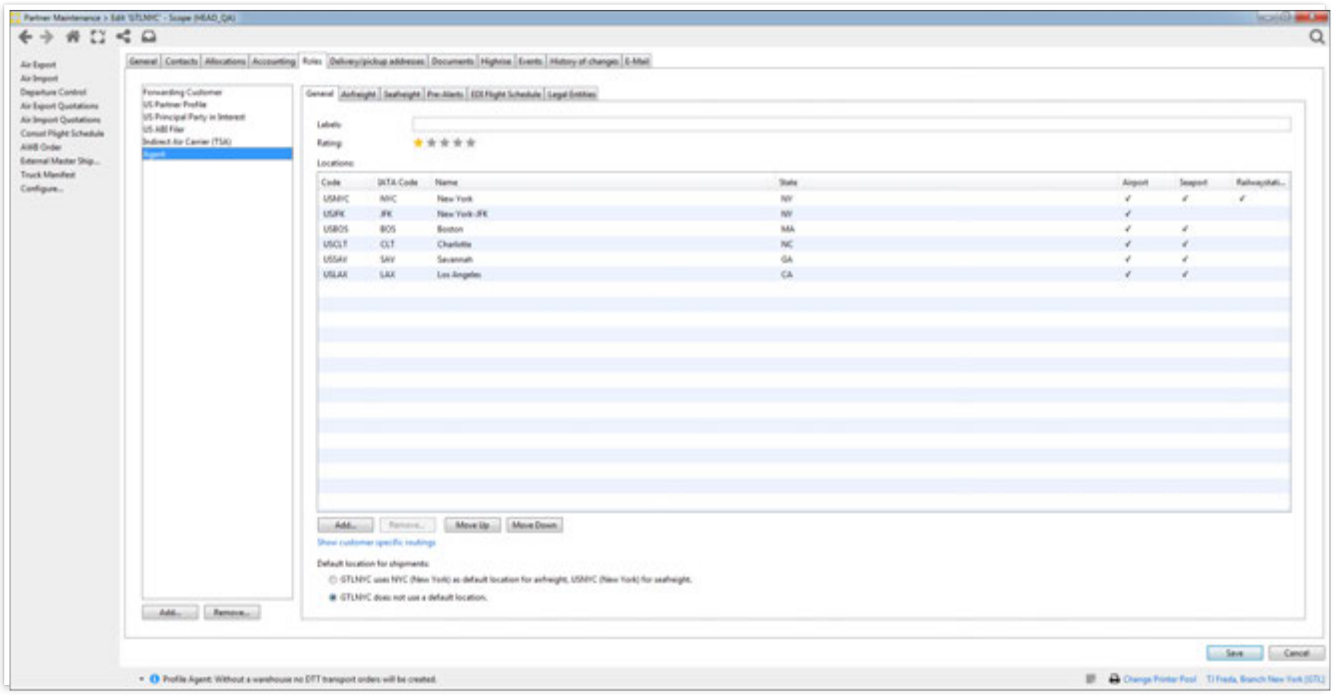
Agents - Roles - Business Partner - Maintenance

- Introduction
- Locations

Introduction

The role Agent is assigned to business partners who are engaged in the general management of freight. An agent can be a subsidiary, a freight forwarder or other logistics company. For each agent, one or more departure and destination locations can be assigned using UN Location Codes. These are set as locations where the agent operates. This information is then used by various applications to determine the correct agent to use for any point of arrival or departure.

Locations



Overview

An overview of all locations that have already been assigned to this agent.

Add

Opens a pop-up window in which a new location code can be inserted. The desired location can be found using the search function in the field.

Remove

Removes the location highlighted in the overview.

Move up

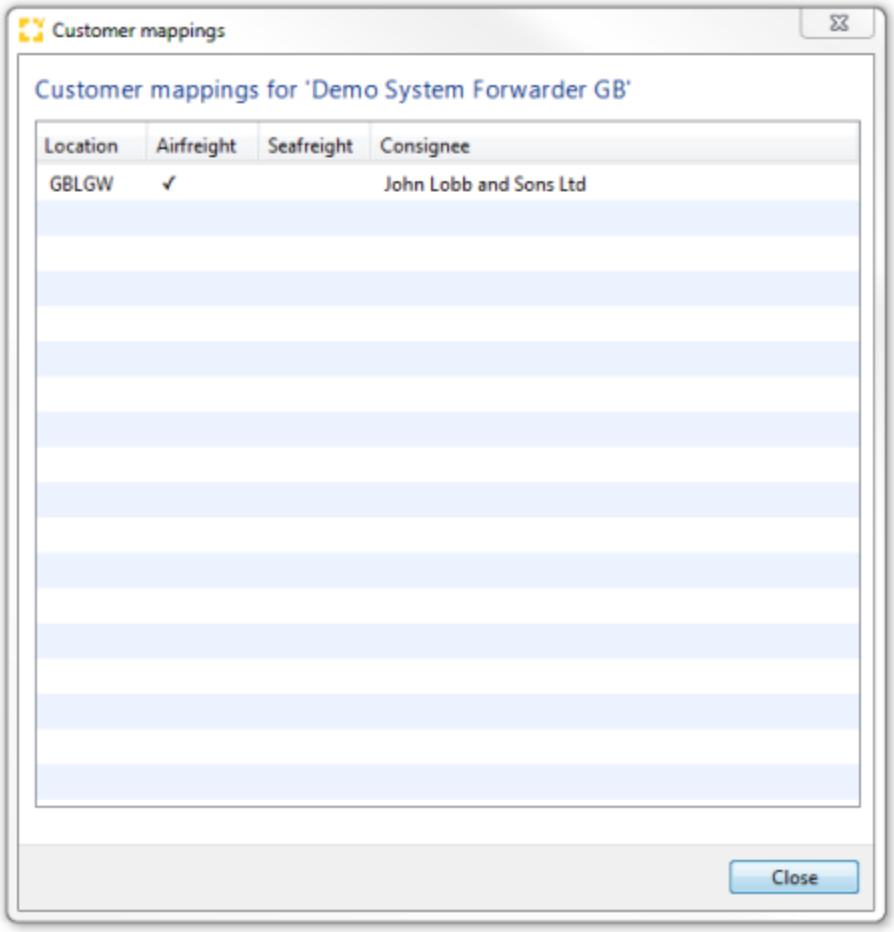
Moves the highlighted location code up the list.

Move down

Moves the highlighted location code down the list.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Show Customers



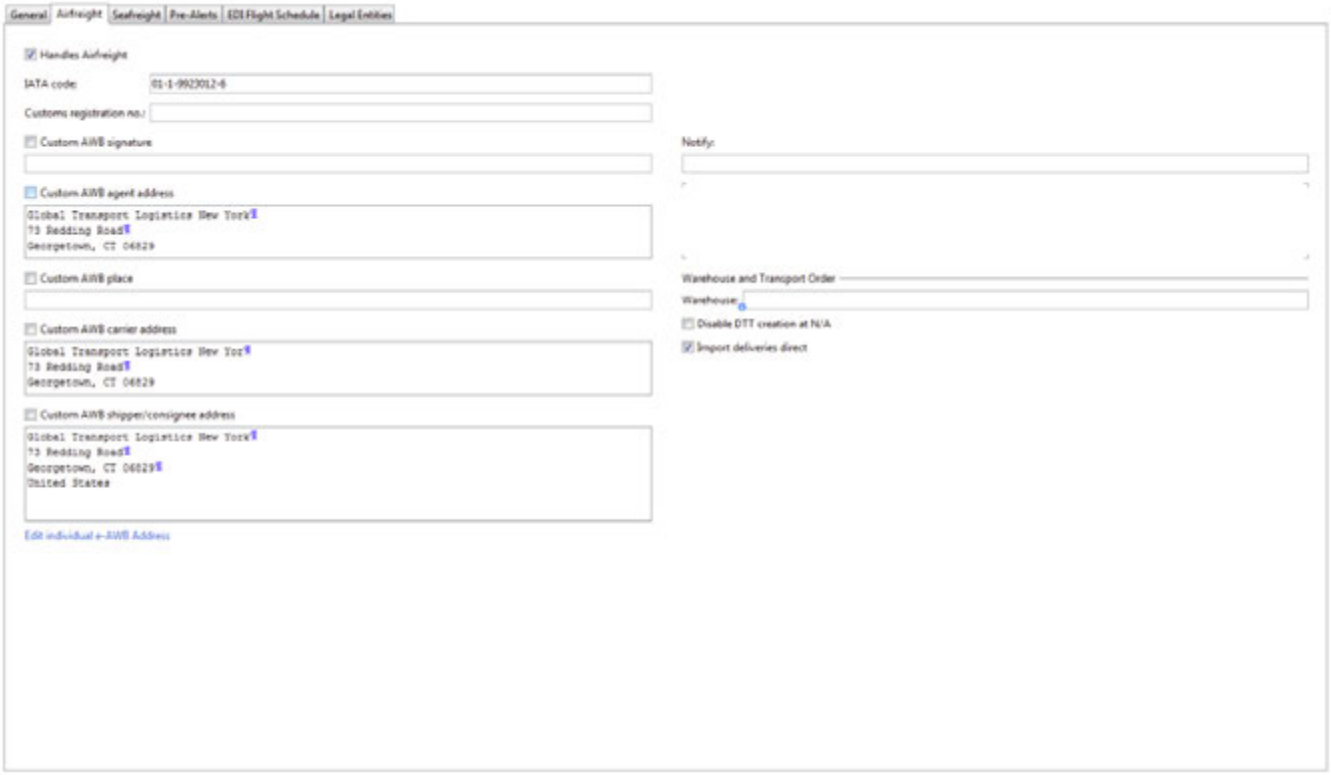
Opens a pop-up window that displays all the customers of this agent. In order to assign the agent to customer, the customer in question must be assigned the role Forwarding Customer and this agent must be applied to the customer using this role.

Close

Closes the pop-up window that displays customers.

Airfreight

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Handles airfreight

This field should be checked by default.

IATA Code

The IATA code of the agent using the format *nn-n-nnnnnnn-c*

Customs registration number

The customs registration number of the agent.

Custom AWB signature

The signature to be printed on airway bills that are produced on behalf of this agent.

Custom AWB agent address

The agents address that should print on the airway bill.

Custom AWB carriers address

The Carrier address to be printed on airway bills for this agent.

Custom AWB shipper/consignee address

The address to be used on airway bills when this agent is shown as a shipper or consignee.

Edit individual e-AWB Address

This blue link opens a sub-window where the agent's address for e-AWBs can be entered.

Notify

The default notify party to be used when creating airway bills for this agent. This is a partner address search field

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Warehouse and Transport Order

This section defines warehouse and transport order details for this agent

Warehouse

The default warehouse address for this agent. When creating delivery orders and transfer to or from terminal orders, this is the address that will be used as the pickup or delivery address. This is a partner address search field , locate the correct partner address by typing the name or part of the address of the partner.

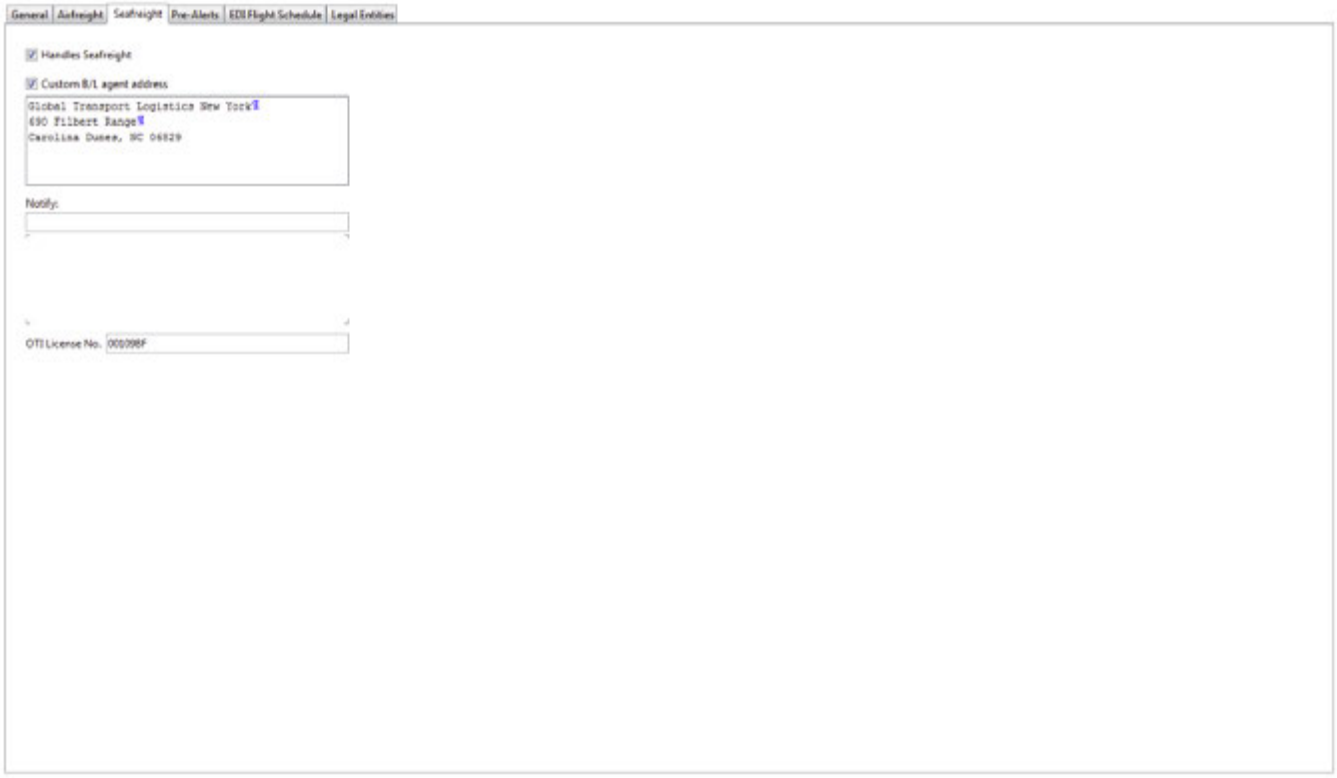
Disable DTT creation at N/A

When a warehouse address is entered for the agent, but deliveries to terminal should not be created with this warehouse as the pickup location, then this box should be checked.

Import deliveries direct

When the agent delivers arriving air imports directly from the import terminal, this box should be checked. This will ensure the import terminal in the shipment is used as the pickup address on the delivery note and not the location of the agent.

Seafreight



Handles Seafreight

This box should be checked if the agent handles seafreight cargo.

Custom B/L agent address

The address of the agent to be printed on any B/L's produced on behalf of the agent.

> On assigning the role *agent* to a partner, the check boxes for individual address to print on documents are not enabled and the address details themselves are the partner's address details from the general tab. If the individual address checkboxes are activated, this general address may be replaced with whatever alternate details are desired. However, if the checkbox is once again deactivated, any existing alternate address data in the custom address fields will be lost and replaced by the general address.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Notify

The default notify party to be used when creating bills of lading for this agent. This is a partner address search field

OTI License number

This is a USA specific field where the FMC OTI number of the seafreight agent can be stored.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airline - Roles - Business Partner - Maintenance

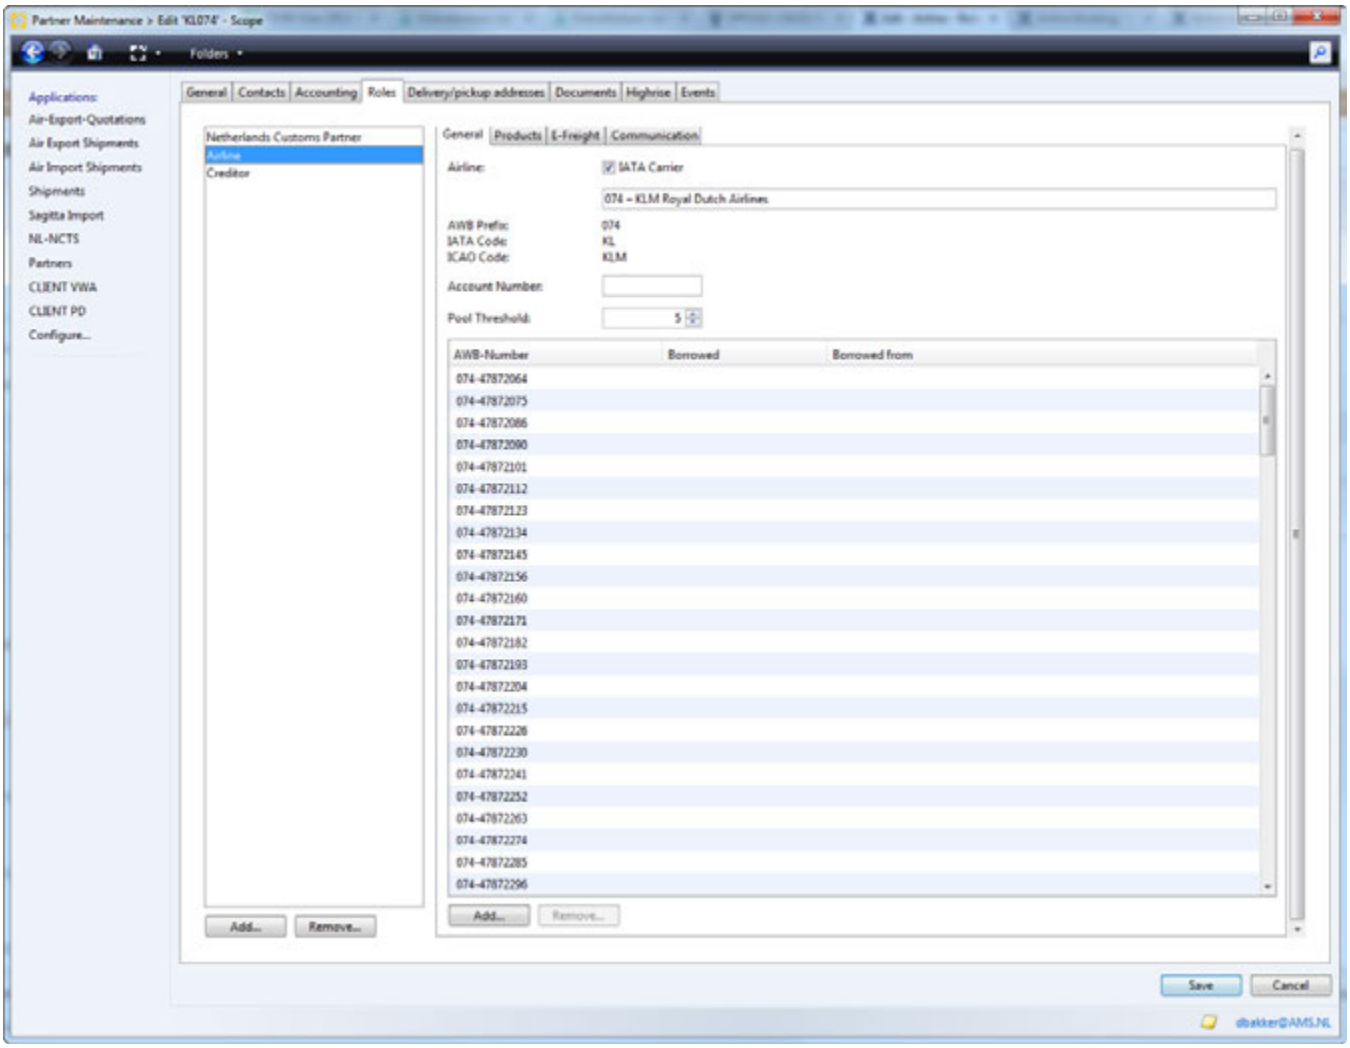
- Introduction
- Description

Introduction

Partners who are airlines agents will have various airline identity codes, and account numbers that may be stored in using the role *Airline*. In addition, the airline may issue a pool of master airway bill numbers to the forwarder and these should also be stored within the role.

During creation of air export and import shipments the applications will refer to this master data for the airline.

Description



Airline

Locate the correct airline using the search function. The name of the airline or the 3 digit prefix can be entered. All airlines should be present and are automatically stored in system data.

AWB-Prefix

The 3 digit numeric carrier prefix as issued by IATA.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

IATA Code

The 2 digit alpha-numeric carrier code as issued by IATA.

ICAO Code

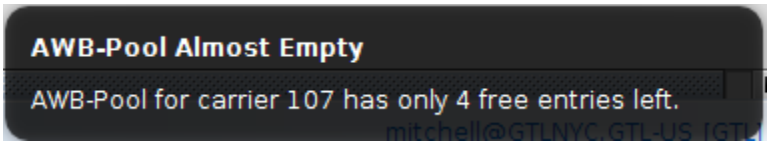
The 2 digit alpha-numeric carrier code as issued by ICAO (International Civil Aviation Organization).

Account Number

The CASS account number issued by CASS (IATA - Cargo Accounts Settlement Systems).

Pool Threshold

Enter the lowest number of remaining master air waybill numbers that may be available before a warning is triggered that there is a shortage of airway bills:



Pools

The table displays a list of master air waybill numbers that are currently available.

AWB-Number

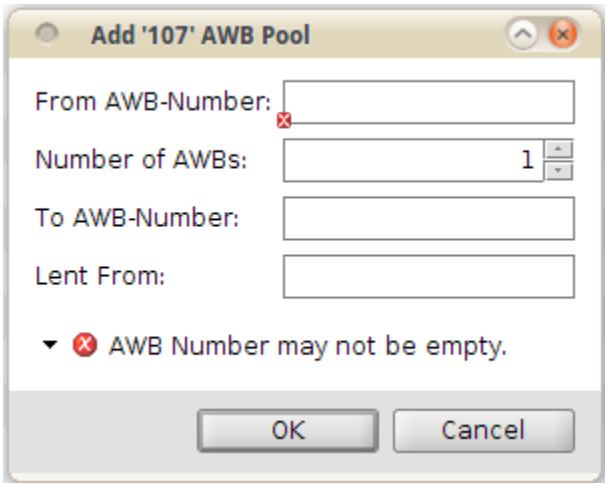
The number of the air waybill

Borrowed

Indicates if the air waybill has been borrowed from another forwarder.

Add

The add button is used to add new air waybill numbers to the pool of available air waybill numbers for the airline. The *Add* button will cause a pop-up window to appear where new the new air waybills can be defined.



From AWB-Number

Enter the new master air waybill number or the lowest master air waybill number if a range of numbers is to be created.

Number of AWB's

The *Up* / *down* arrows can be used to increase or decrease the number of master air waybills to be created starting with the first one entered in the previous field. Alternately the total number of master air waybill numbers can be entered directly into the field.

To AWB-Number

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If a a range of master air waybill numbers has been provided for example **107-00000022** to **107-00000055**, then the last number in the range is entered in this field. If a figure has been inserted in the *Number of AWB's* field, then this field may be left blank since the application will automatically calculate the correct final master air waybill number.

Lent From

If the master air waybill numbers have been lent from another forwarder, use the search field to locate the forwarding partner from whom the stock was borrowed.

OK

Saves the new master air waybill number details. If a range of number are to be generated, this will be calculated and will now appear in the overview.

Cancel

Exits the *add AWB application* with saving any changes.

Remove

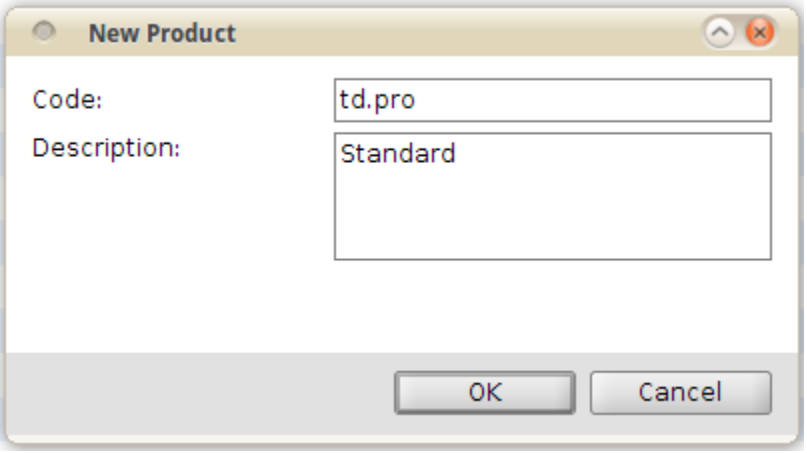
In the overview screen the *Remove* button will remove from the pool the master air waybill highlighted in the overview.

Products Tab

The products and service levels of the airline are stored in this tab. Airfreight tariffs can then be created which used these product codes to determine the correct rates for the service types offered by the airline.

Add

The add function opens a editor where a new product may be entered



Code

The code used to identify the airline product

Description

The description of the airline product.

Ok

Save the new product details and exits back the product overview

Cancel

Exits the new product editor without further action.

Properties

Opens the product highlighted in the overview in order to edit the product details

Remove

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Removes the product highlighted in the overview.

> ⚠ The product codes are also maintained by RSI in the master data server, Product code populated by the SDS updates can not be deleted by users.
> If the EDI airline bookings are implemented for an airline, the product codes used in the airline booking function are not maintained in on the airline but in a codelist, any changes to this code list should requested from RSI Support

E-Freight Tab

On the E-Freight tab defaults for agreed E-Freight origin / destination can be pre-configured, for each active E-Freight Trade lane a record can be added

Departure

The origin airport where the shipment departures under e-freight

Destination

The destination airport where the shipment destined to go to under e-freight

E-freight type

The type of E-freight agreed with the airline for the entered trade-lane.

Type	Explanation
e-freight consignment with Accompanying Paper documents	an pouch is accompanying the consignment containing documentation of the freight, such as Commercial invoice, certificates etc..
e-freight consignment with No Accompanying Paper documents	all documentation is provided to the appropriate parties in a digital manner, no physical documents are sent with the shipment

Ok

Save the new trade lane

Cancel

Exits the new trade lane without saving the details.

Communication Tab

The communications tab of the airline maintenance application stores the details required to exchange electronic details with the airline.

E-Booking

Check the E-booking box if it is possible to send electronic bookings to this carrier.

Email Booking

If electronic bookings are sent via email, then the correct carrier email for e-bookings should be inserted in this field,
When the PDF Booking form is to be emailed automatically to the airline (consol Flight template) then the email address should also be populated here.

Sita Address

The SITA address of the carrier. This address is used when SITA messages are created. the address will be 7 uppercase alpha characters.

SITA CC Recipients

This table lists SITA parties who are to be copied in to the SITA messages sent for this airline.

Add

This button will allow a new SITA CC recipient to be inserted.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Remove

This button will remove the SITA CC recipient highlighted in the overview.

Save

Saves the airline details

Cancel

Exits the airline editor without saving any details.

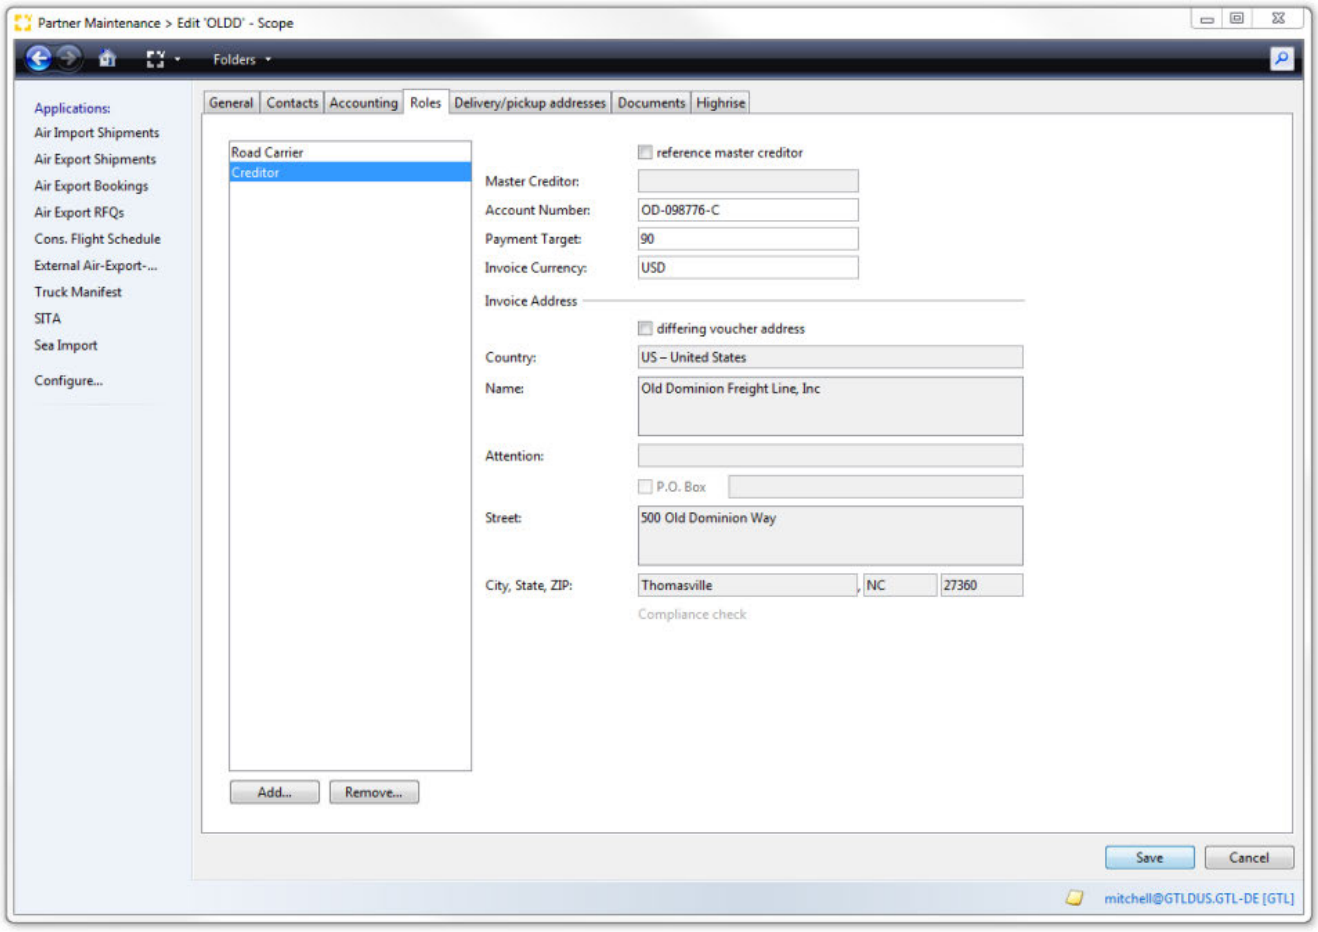
Creditor - Roles - Business Partner - Maintenance

- Introduction
- Description

Introduction

When invoices are to be received from a partner, the role *creditor* should be added to the partner. This role records all relevant creditor information that is used automatically when registering incoming invoices or credit notes.

Description



reference master creditor

In some instances a master creditor may be created. If a master creditor is responsible for charges levied by this partner, then this box should be checked and the master creditor details may then be entered in the field described below. The box is left unchecked by default and this indicates that financial applications should apply finance details stored within this role to all creditor activities for this partner.

Master Creditor

When the *reference master creditor* box is checked, this means another partners creditor details should be used for all charges levied by the current partner. The master creditor field is only available when the *reference master creditor* box is checked. This is a search field, start typing the master creditor's details to find the correct master creditor.

Account Number

The account number issued by the accounting department for the creditor.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Payment target

The number of days allowed by the creditor to make payment of invoices. The days are calculated from the date of the invoice issue.

Invoice Currency

The default currency used when registering vouchers from this creditor. This is a search field, start typing the 3 digit currency code to locate the correct currency. If left blank the local currency will be used as a default.

differing voucher address

If an address different to the partners general address is to be used, then this box should be checked.

Country

The country of the voucher address

Name

The name to be used on the voucher

C/O

Any "care of" details for the voucher address

P.O.

The P.O. Box number for the voucher address, if any.

Street

The Street details for the voucher address.

City

The City for the voucher address

State

The state code for the voucher address

ZIP

The zip code for the voucher address

Compliance check

This action link will activate a compliance check of the partner.

Save

Stores the data and closes the creditor role.

Cancel

Closes the creditor role without further action.

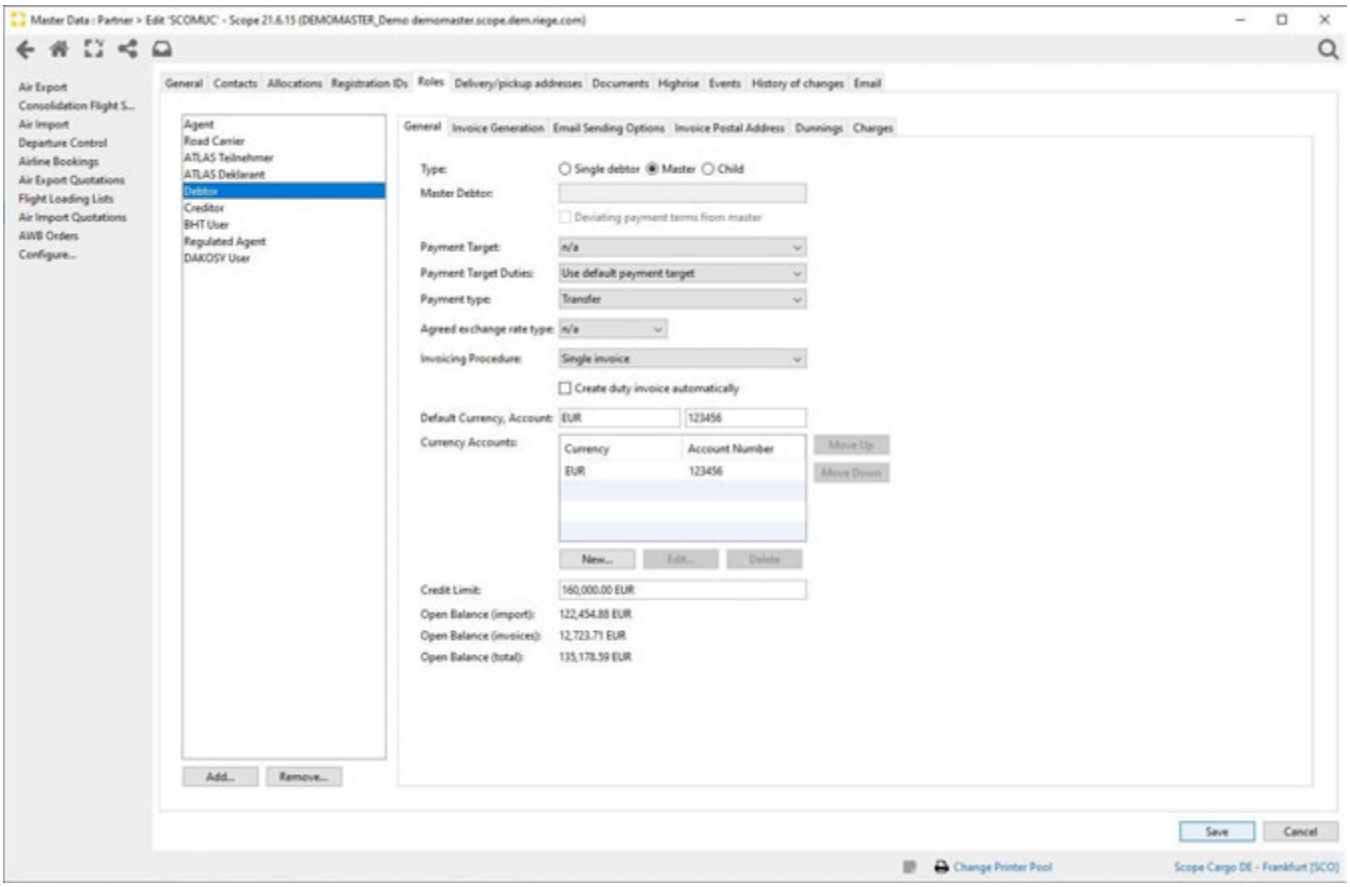
- Debtor - Roles - Partner - Maintenance - (6) Charges

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Debtor - Roles - Partner - Maintenance - (1) General

Description



Type

Select the debtor type

- **Single Debtor:**

  Information is registred as a single, independant debtor
- **Master-Debtor:**

  Information is registred as a master-debtor
- **Child-Debtor:**

  Selecting this option allows to select a correspondened master debtor in the box below.

Payment Target

The payment term is used to calculate the due date of an invoice. The due date is calculated upon invoice finalisation. The available payment targets are maintained in the accounting settings

> ⚠ In case no payment target is selected, Scope assumes the partner to be cash payer.

Payment Target Duties

A separate payment term for duty invoices is available. Functionality is the same as for the general payment term.

Payment type

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Select the payment type:

- Transfer
- Cash
- Cheque
- Direct debit
- Credit card
- Debit card
- Unknown
- Correction

Agreed exchange rate

Select the desired exchange rate type:

- Buying Rate
- Selling Rate
- Day Rate
- Bank Selling Rate
- IATA-Rate

Payment procedure

Select the desired payment procedure:

- Single invoice
- Aggregated invoice
- Self-billing credit note
- Aggregated invoice by charge type

Create duty invoice automatically

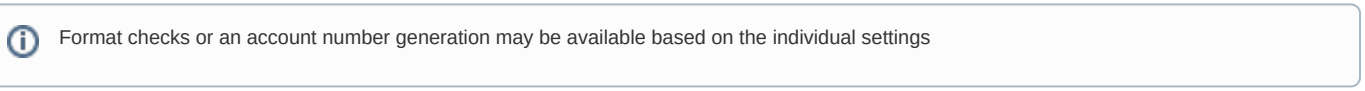
By activating this checkbox, Scope automatically creates receivable from incoming tax receipts.

Default currency

Default currency to be used when creating recevables to this partner. The currency can be changed manually for each invoice if desired. If no currency is selected, the local currency will be used instead.

Account

Debtor account number in accounting.



Currency Accounts

In case the debtor uses different currencies and these need to be reported on different accounts, this may be maintained here.

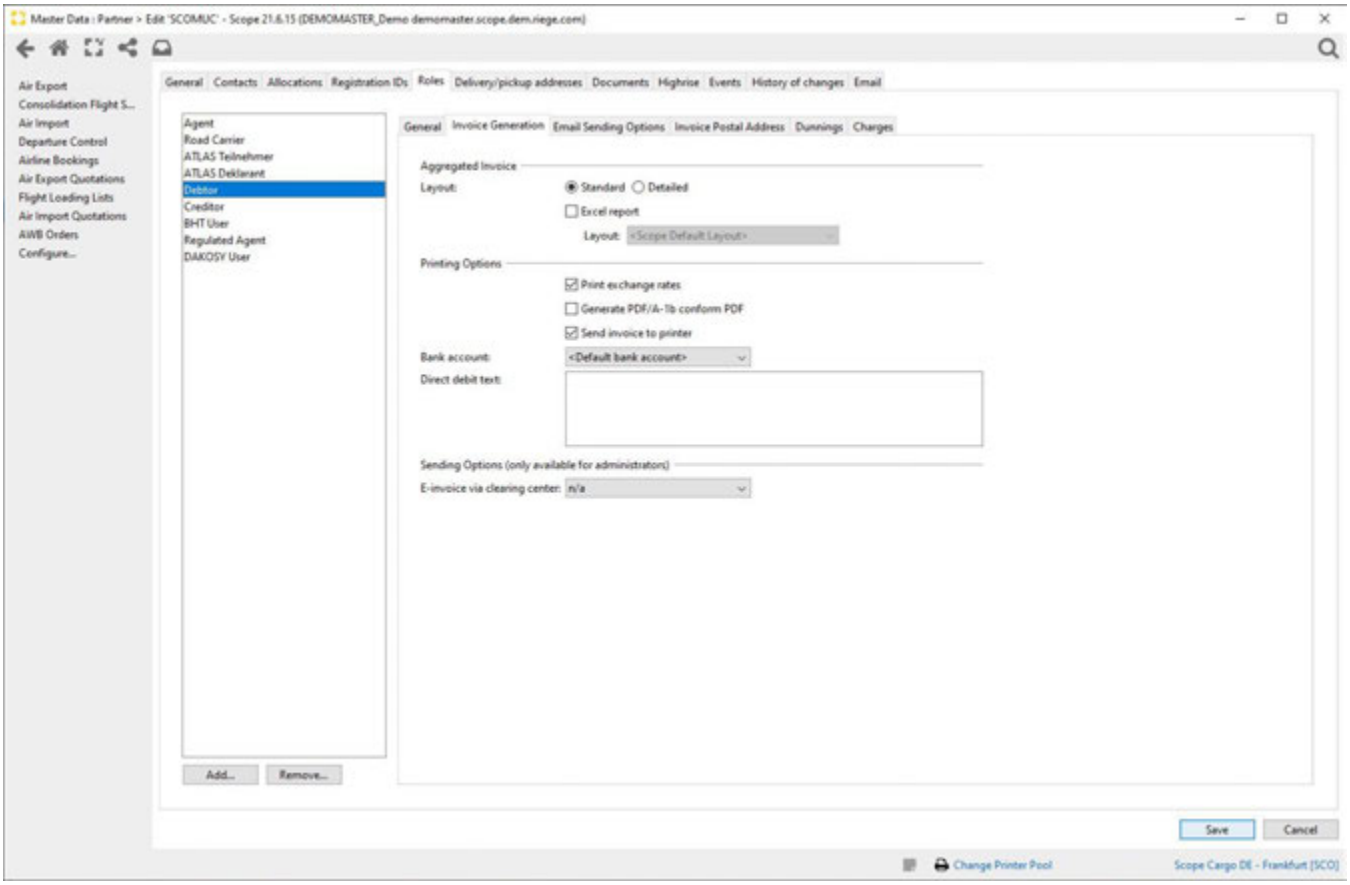
Credit limit

Credit limit and current balance are provided by accounting and imported into Scope, so the credit limit can be checked in operations. Only the credit limit can be amended manually. However the manually changed amount is not reported back to accounting.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Debtor - Roles - Partner - Maintenance - (2) Invoice Generation

Description



Aggregated invoice

Layout

A Standard-layout and a Detailed layout are available.

Excel report

The aggregated invoice can be provided as an Excel file. This file can be in the standard layout or a user defined layout.

Printing Options

Print exchange rates

By activating this check box the applicable exchange rate at the point of invoice finalisation is printed on the invoice document.

Generate PDF/A-1b confom PDF

The PDF for the aggregated invoice is generated in the internationally accepted format for long time archiving.

Send invoice to printer

The invoice is physically printed on the assigned printer.

Bank account

A maintained bank account to be printed on the invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Direct debit text

A text to be printed on the invoice in case the invoice amount is settled by direct debit.

Sending Options

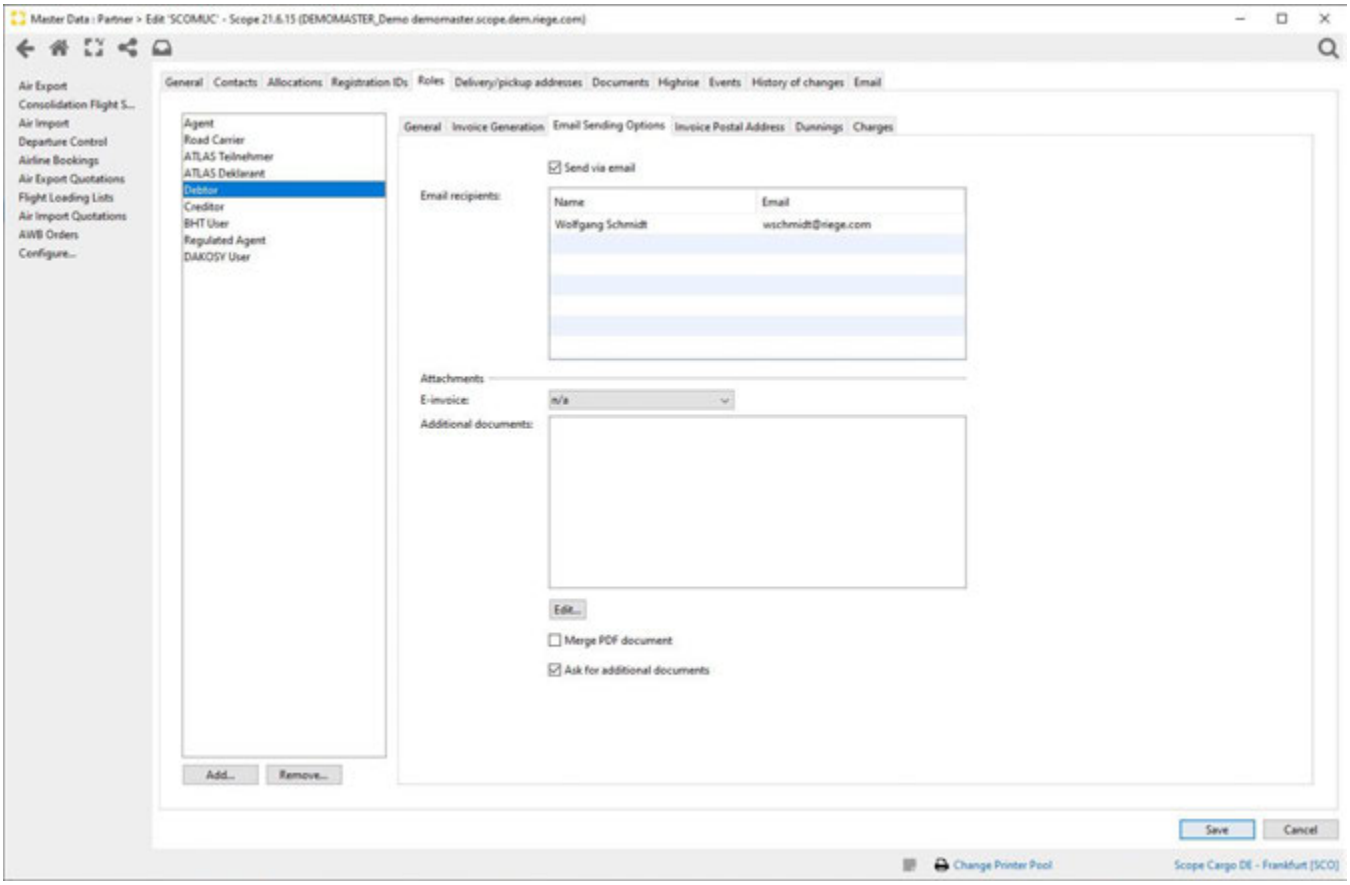
E-Invoice via clearing center

Several e-invoice formats can be selected here. There is no difference between external and internal invoices here. As transfer happens via a clearing center additional adjustments and settings need to be provided by Riege Software. Please contact our customer support.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Debtor - Roles - Partner - Maintenance - (3) Email Sending Options

Description



Send via email

By activating this checkbox the invoice will be sent automatically via email upon finalisation. The recepients are all email recepients maintained as invoice recepient in the contact tab of the partner.

E-Invoice

An E-Invoice-format can be selected that is attached to the email.

Additional documents

Additional documents can be selected from a list. Those will be attached to the invoice email in case they are available on the particular shipment.

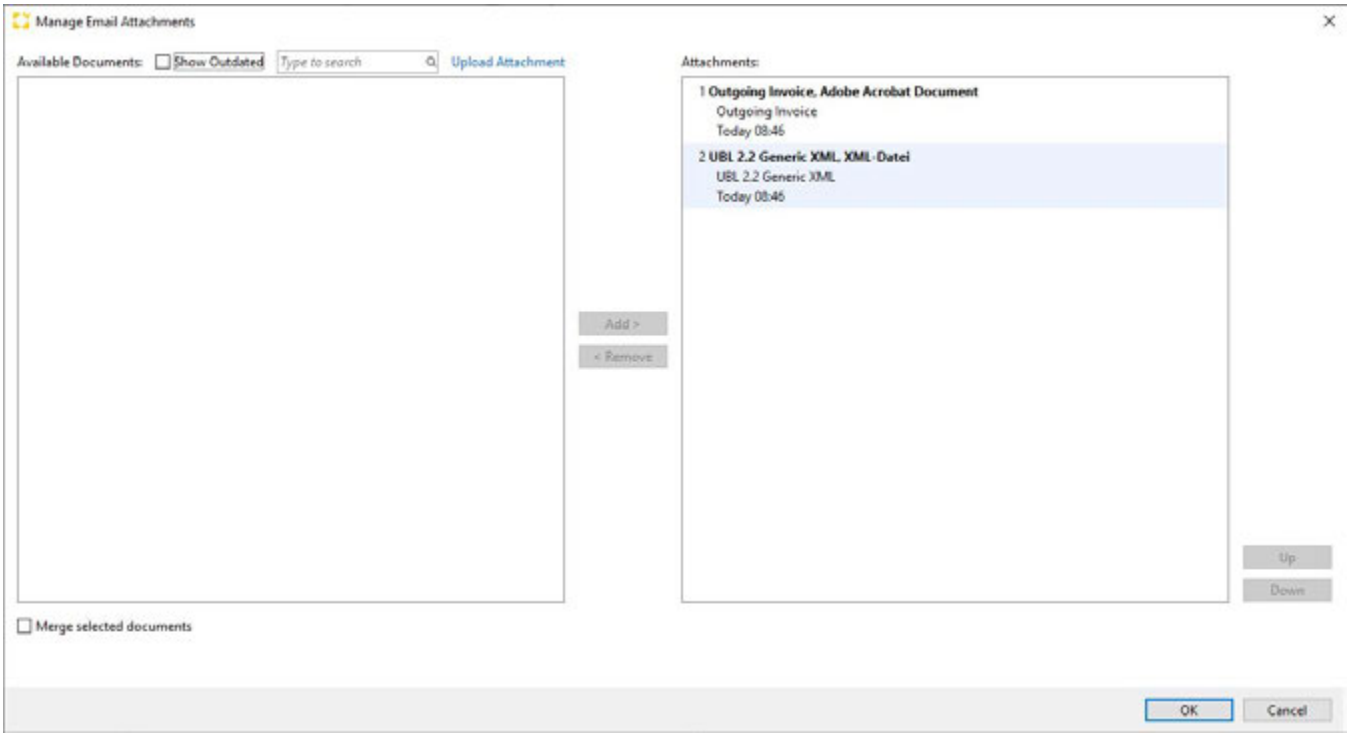
Checkbox "Merge PDF document"

By activating this checkbox all attached PDFs wil be merged into one single PDF document.

Checkbox "Ask for additional documents"

By activating this checkbox a dialog is opened upon finalisation to allow the selection of further documents available on the particular shipment.

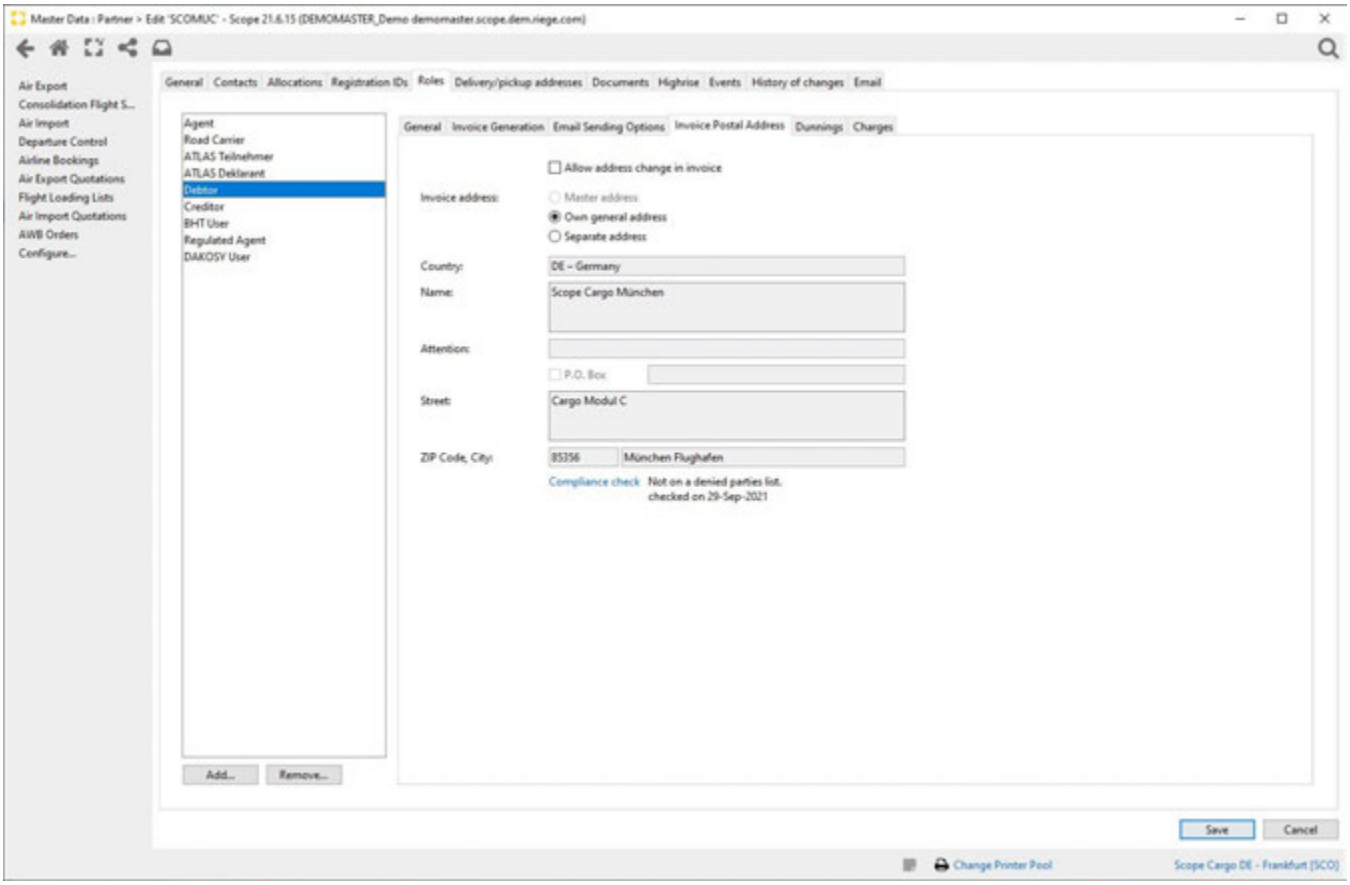
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Debtor - Roles - Partner - Maintenance - (4) Invoice Postal Address

Description



Allow address change in invoice

By activating this checkbox the invoice address can be manually changed during invoice creation.

Invoice address

Using the radiobuttons an already maintained address of the partner can be selected.

By selecting "Separate address" the respective address can be maintained in the fields below.

Country

Country code of the address. Depending on the country, the system might ask for and validate additional information (e.g. ZIP code)

Name

Company name of the partner

Attention

Applicable person or department

P.O.Box

By activating the checkbox the field behind becomes available to maintain a P.O.Box address of the partner. In turn the field Street becomes unavailable.

Street

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Street and house number of the partner.

ZIP Code

ZIP Code of the partner

City

City of the partner

Compliance check

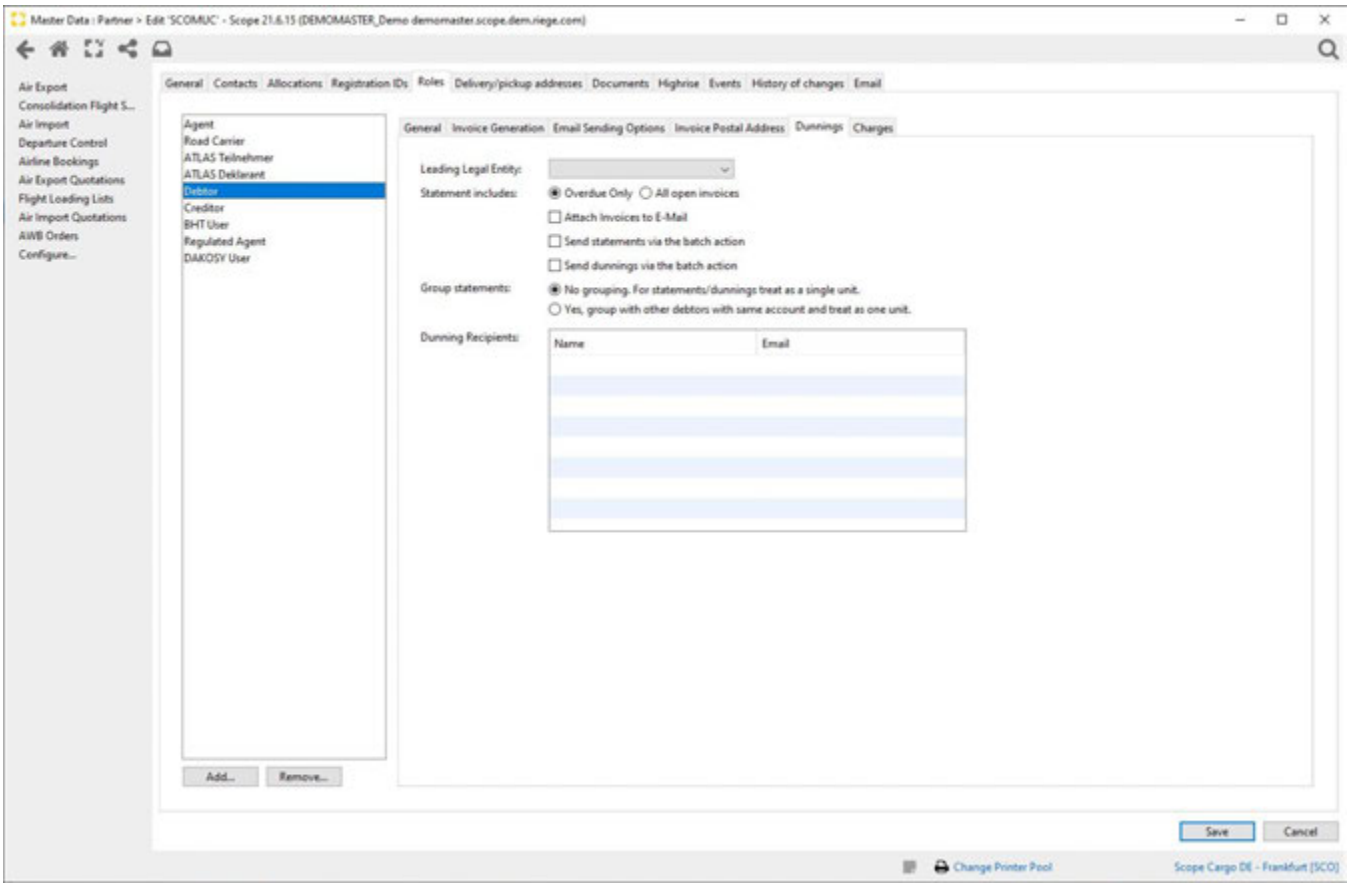
Does a compliance check for the partner. The result and date of the last compliance check is displayed.

As a compliance check is not mandatory in all countries the functionality is only available if activated on the system. Further information is available from RSI customer support.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Debtor - Roles - Partner - Maintenance - (5) Dunnings

Description



Leading Legal Entity

Select the legal entity responsible for the dunning process of this partner . The field can be left empty where not applicable.

Statement includes

The statement can be created to contain only the overdue or all open invoices.

Attach invoices to E-Mail

By activating this checkbox Scope attaches the relevant invoices as PDF.

Send statements via the batch action

By activating this checkbox a statement for this debtor is created during the automatic generation from the Dunnings/Account Statements appliance

Send dunnings via the batch action

By activating this checkbox a dunning for this debtor is created during the automatic generation from the Dunnings/Account Statements appliance

Group statements

It can be selected whether different partners with the same debtor account number should receive individual statements or a combined single one.

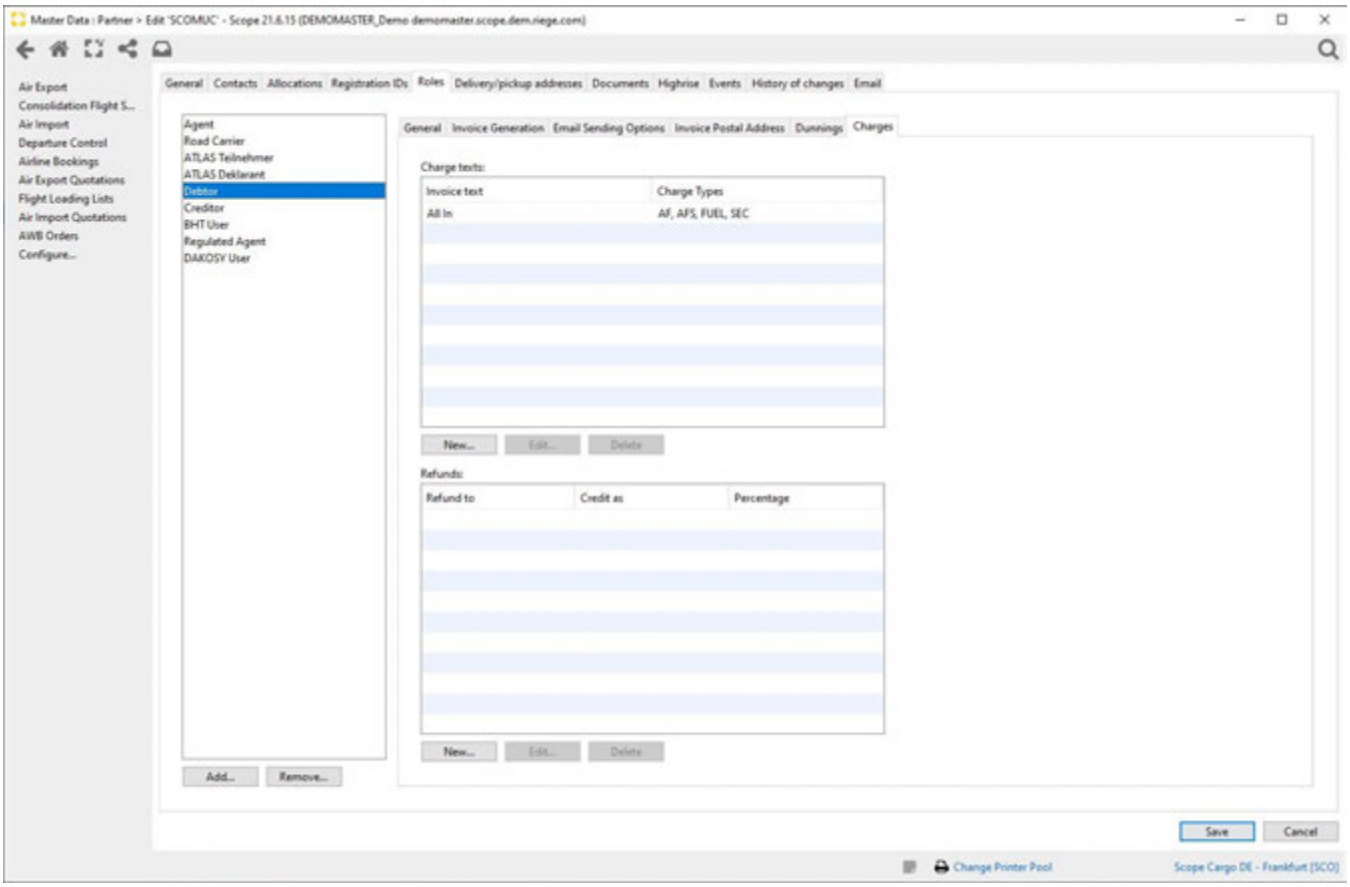
Dunning Recipients

The recepient of the dunning needs to be maintained as "Dunning recipient" in the Contacts-Tab of the partner.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

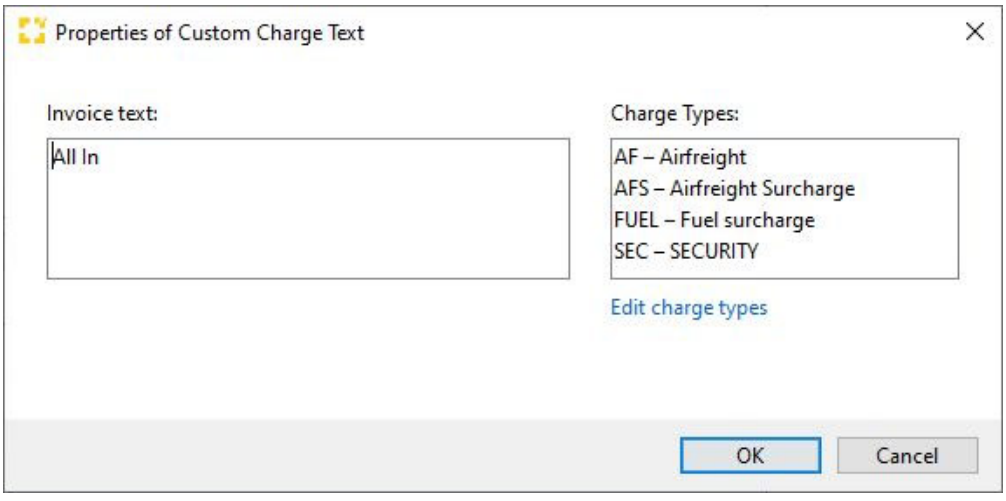
Debtor - Roles - Partner - Maintenance - (6) Charges

Description



Charge texts

Multiple charge types can be combined to show as single item on invoices.



Invoice text

Free text to appear on the invoice.

Charge Types

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Selection of charge types to be combined under this item. Charge types can be added and removed. Each charge type can be only member of one of these items.

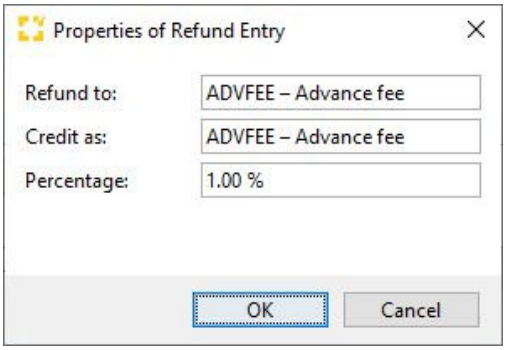
It is also possible to give one chsrge type an individual invoice text.

Refunds

Agreed refunds can be defined here. During invoice generation this refunds are applied automatically.

Refunds appear in jobcosting as open invoice with negative income.

All refunds can be settled as aggregated credit note.



Refund to

Charge type the refund is applied to

Credit as

Charge type the refund is credited as.

Percentage

Applicable percentage of refund.

Forwarding Customer - Roles - Business Partners - Maintenance

- Introduction
- Airfreight

Introduction

When a partner is a shipper or consignee the *Forwarding Customer* may be applied to the partner to store airfreight, seafreight and routing information that is specific to the partner.

Airfreight

The airfreight tab stores information to be used when air shipments are created for this partner.

AWB Hardcopy

Custom details for the partner that are to be used when printing air export AWB's

Custom AWB shipper/consignee address

If the shipper address to be used on a AWB for the partner differs from the address stored in the General tab then this box should be checked in order to insert the custom address.

The text entry box below the check box will be greyed and contain the address from the General tab. Once the box is checked this general address may be replaced with the custom address. On printing an AWB, this custom address will appear as the shipper.

E-freight

For partners who book air export shipments via E-freight, this section of the airfreight tab can be used to specify the address of the partner that is to be used for E-freight purposes.

Custom FWB Address

The check box will be unchecked by default and the partners address details from the General tab will appear in the E-freight address fields.

By unchecking this box, it is possible to replace the the partner's general address for E-freight with custom address details the will by used in the FWB sent to the airline.

Name

The custom name for the partner to be used in the FWB

Street.

The custom street address for the partner to be used in the FWB

Place

The custom town or city name for the partner to be used in the FWB

State

The custom state for the partner to be used in the FWB

Zip

The custom zip code for the partner to be used in the FWB

Phone

The custom phone number for the partner to be used in the FWB

Fax

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The custom fax number for the partner to be used in the FWB

Shipment Defaults

Defaults to be used when creating air export or import shipments.

Notify

The name of the notify party that should default to air export or import shipments for this partner.

Export Vol.Factor

The volume factor calculation is used to determine the charge weight of a package. The normal method in airfreight is to multiply the dimensions of the packages (in centimeters) and then divide the total by 6000. This is referred to as a volume factor of 1:6 or *6*. To specify a different volume factor, insert a number, for example 5 would indicate a volume factor 1:5.

Import Vol.Factor

The volume factor calculation is used to determine the charge weight of a package. The normal method in airfreight is to multiply the dimensions of the packages (in centimeters) and then divide the total by 6000. This is referred to as a volume factor of 1:6 or *6*. To specify a different volume factor, insert a number, for example 5 would indicate a volume factor 1:5.

Seafreight

For partners involved in seafreight shipments, sea specific information for the partner may be stored.

Export

Sea export specific data

Custom B/L shipper/consignee address

Check this box if a custom address is to be used as the shipper address for sea export shipments on the bill of lading. Checking the box will allow the default address details from the General tab of the partner to be replaced with a custom address.

Vol. Factor Main

the volume factor to be used on the main transport.

Import

Sea import specific information for the partner

Vol. Factor Main

the volume factor to be used on the main transport.

Routing

The *Routing* tab of the *Forwarding Customer* role is used to specify which agents should be used for this partner for any departure or destination port. These pairings can be defined for air or sea export or imports.

Routing overview

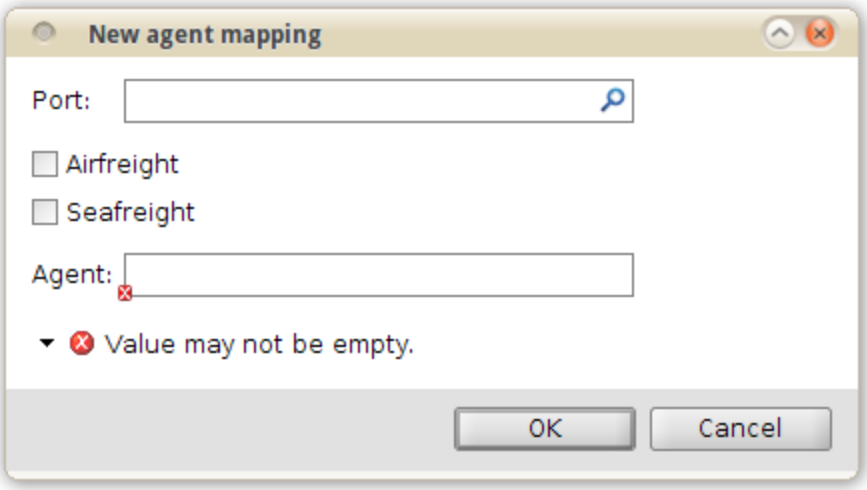
The overview of agent routings shows

- **Location:** The unlocode to which the pairing applies
- **Airfreight:** A checkbox to indicate if the pairing is used for air export and import shipments
- **Seafreight:** A checkbox to indicate if the pairing is used for sea export and import shipments
- **Agent:** The name of the agent to be used in the pairing

New

The *New* function button launches a *new agent mapping* editor where a new paring may be created

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Port

The Unlocode to be used in the pairing. This is a search field and so the port code or name may be used as a search time to locate the correct code.

Airfreight

Check this box if this pairing is to be used for airfreight shipments

Seafreight

Check this box if this pairing is to be used for seafreight shipments

Agent

The name of the agent to be used for the pairing. This is a search field and so the agent name or address may be used to locate the correct agent.

> Note that only partners who have the Agent role and are assigned to be an agent in the port specified above, will appear in the search results.

OK

Save the new new pairing and exits back to the overview

Cancel

Cancels the operation without changes and returns to the overview.

Edit

The *Edit* function button will open the pairing highlighted in the overview and allow changes to be made.

Delete

the *Delete* function will delete the pairing highlighted in the overview.

Saving or Canceling

Once all sub-tabs of the *Forwarding Customer* role have be completed, they may be saved or discarded

Save

Save all new details in all sub-tabs of the *Forwarding Customer* and return to the partner overview.

Cancel

Cancel any changes in all sub-tabs of the *Forwarding Customer* and return to the partner overview.

ICS Declarant - Roles - Business Partners - Maintenance

- Introduction
- General

Introduction

ICS Declarants (also called Reporting Parties) are partners who are responsible for sending ICS inbound messages.

General

This paragraph describes properties relating to ICS Declarant and quoted in ICS inbound messages.

Partner Role

An ICS declarant may be:

- **An Agent**
- **An Owner**

Check the item that applies to the partner.

Branch ID

A Branch Identifier is a facility within the Client Register which enables clients to identify specific areas of their organization in dealings with Customs. The Branch Identifier may be used in ICS Exports, ICS Imports, or both.

Apply to Export

Check this box if the partner does ICS Exports

Apply to Import

Check this box if the partner does ICS Imports

Branch ID details

The 6 character ICS branch ID identifier

ABN

A number issued by the Australian Business Register that identifies an organization or an individual that operates a business like enterprise within Australia. Also issued for individuals who are able to claim GST Input Tax Credits.

The CCID

An identifier issued by the Australian Taxation Office to identify the type of activities (accounts) a client undertakes with the Australian Taxation Office (ATO). E.g. GST, WET, etc.

A partner may only have an ABN or a CCID and not both.

EDI Configuration

EDI communications information

Interchange Creator ID

A unique identifier for an EDI Site for a party creating EDIFACT messages sent to Customs. The EDI Site ID is assigned by Customs at the time the EDI Site is registered.

Interchange Owner ID

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

A unique identifier for an EDI Site for a party responsible for the content of the EDIFACT messages sent to Customs. The EDI Site ID is assigned by Customs at the time the EDI Site is registered. If Interchange Owner Id is left blank, it defaults to the Interchange Creator ID.

Customs Site ID

A unique identifier for an EDI Site used by Customs.

Test

Check this option if ICS messages are to be send to Customs test system.

Production

Check this option if ICS messages are to be send to Customs production system.

Request Customs Acknowledgement

Check this option if each inbound message is to be acknowledged by Customs, by sending control acknowledgement message with appropriate status. Checking this option is recommended.

Save

Save changes made to the *ICS declarant* role and exit to the partner overview

Cancel

Discard changes made to the *ICS declarant* role and exit to the partner overview

Netherland Customs Partner - Roles - Business Partner - Maintenance

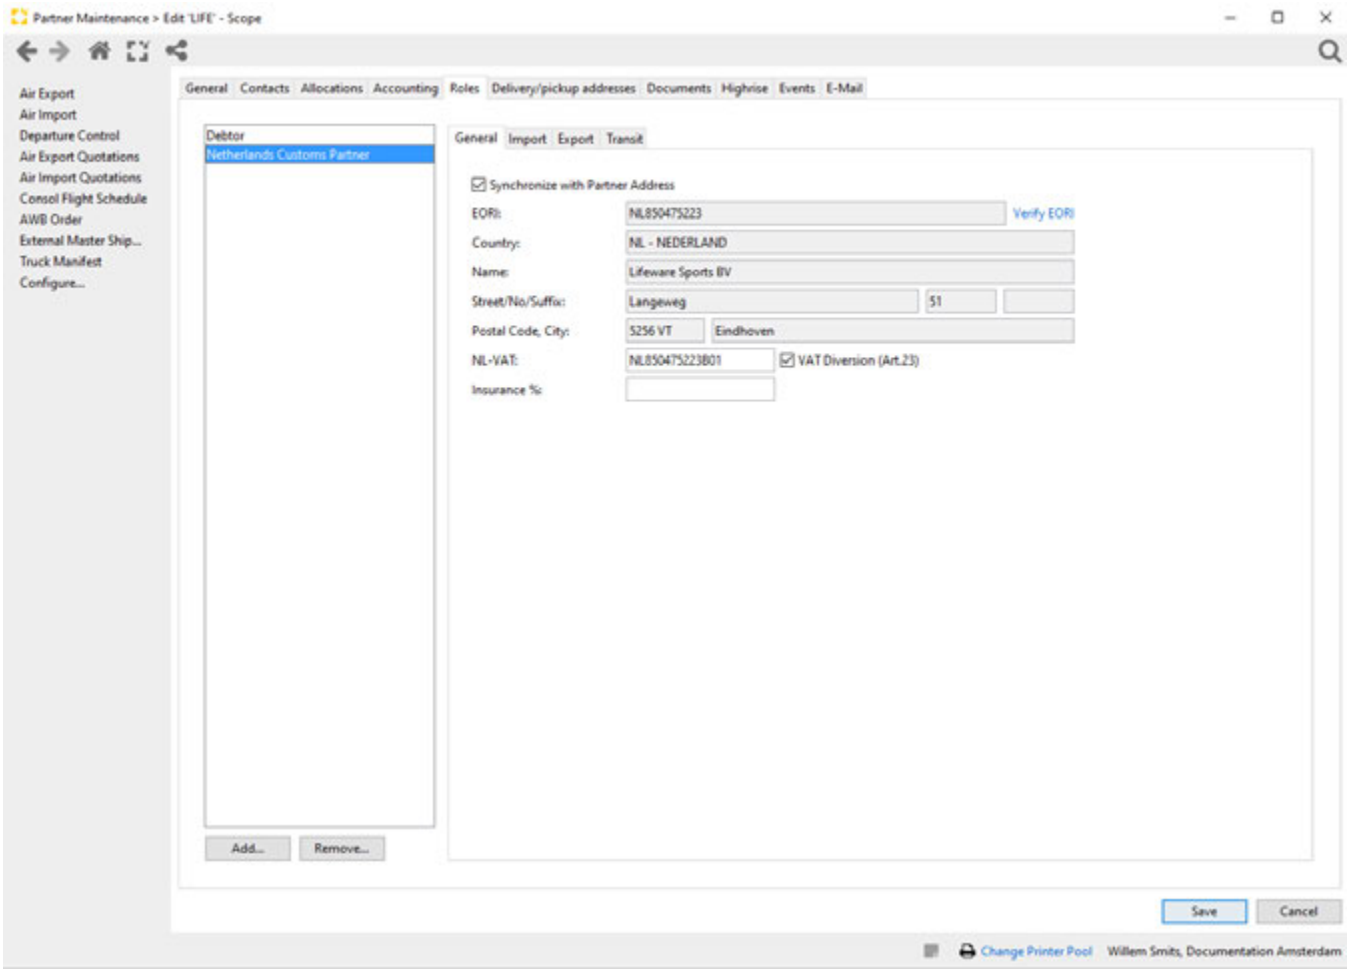
- Introduction
- NL-Customs

Introduction

Partners which will be used on Netherlands Customs modules, as shippers, consignees, ect.. using the Customs Netherlands system(s) should have their Netherlands customs details recorded using this role. The Customs Netherlands module will then automatically use these details for this partner.

NL-Customs

General



Synchronize with Partner Address

This box will be checked by default. As a result the partner address details from the general tab of the master will default to the *Country, Name, Street/No. /Suffix, Postal Code* and *City* fields. If this field is unchecked then these details may be entered as free text.

> ⚠ If the *synchronize with partner address* checkbox is deactivated and free text address details are entered, if the checkbox is subsequently rechecked, any free text address details will be lost and replaced by the address details from the general tab of the partner.

EORI

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The EORI is the partners economic operator's registration and identification, used throughout the EU.

Country

The country where the partner is located for the purposes of NL customs, This field uses the code lists from NL customs and may contain different codes as the general tab of the partner (for instance SR / XS for serbia).

Name

The partner's name for the purposes of NL customs

Street

the street name, of the partner for the purposes of NL customs.

Street No.

The street number of the partner for the purposes of NL customs.

Street Suffix

The street suffix (road, street, place etc.) of the partner for the purposes of NL customs.

Postal Code

The postal code of the partner for the purposes of NL customs

City

The postal city of the partner for the purposes of NL customs

NL VAT

Vat number applicable for this partner in NL Customs entries

VAT Diversion (art. 23)

Indicator if the registered VAT number has been approved for usage of Vat diversion under an article 23, license, This must be set to active else the VAT number will not be available in AGS declarations and the VAT is paid through the AGS declaration.
The value of the license switch will be set automatically if the response Party Information message has been processed.

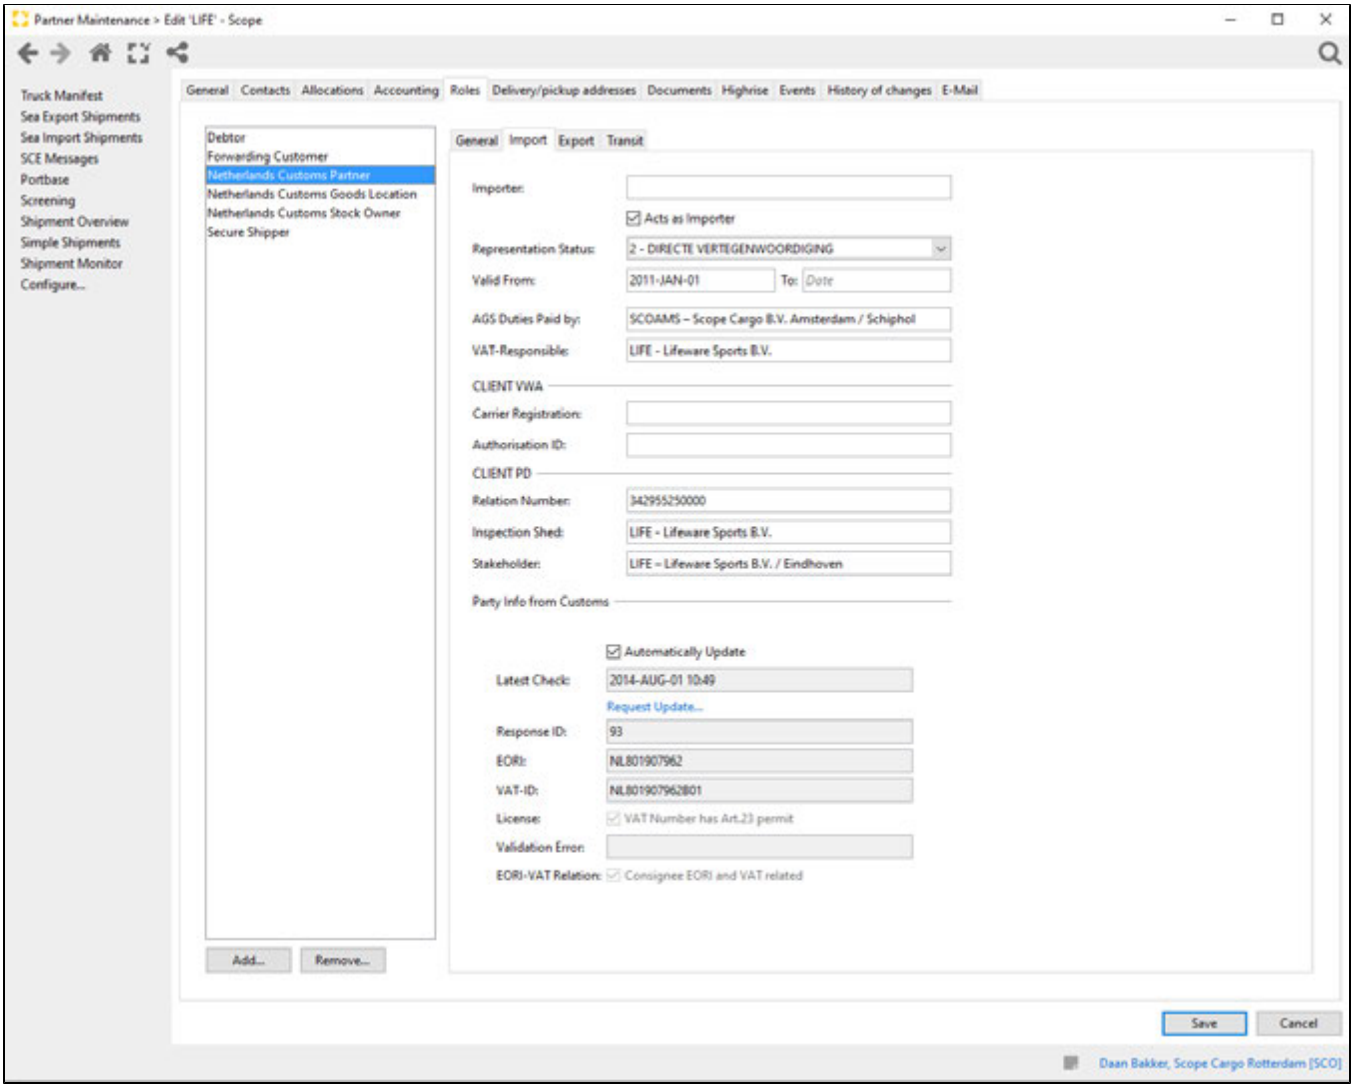
Insurance %

Default percentage amount to calculate customs value insurance in NL customs declarations.

Import

On the tab Import the details for import customs actions are registered.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Importer

This field is populated with the partner that serves as the Importer for this partner when used as consignee in the declaration/shipment, If the partner itself is the importer then this field may remain empty.

Acts as Importer

Indication that this partner may be used as importer in the AGS import declaration.

Representation Status

Use the drop down option to select:

Type	Dutch	English
1	Aangever	Declarant
2	Directe Vertegenwoording	Direct Representation
3	Indirecte Vertegenwoording	Indirect Representation

Valid From - To

The period for which the agent may legally represent the partner.

AGS Duties paid by

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The partner responsible for the payment of duties, this field only needs to be populated when the representation status is set to 2 and the import duties are not to be paid the importer itself.
So in the most common situation, Representation status 2 whereby the customs agent will pay the duties using is bond, the Duties paid by partner needs to be set to the customs agent partner code.

VAT responsible

Select the partner on which the VAT number, to be used in Import declarations is to be used, for instance in cases of Fiscal Representation. This vat number overrules the VAT number of the general tab.

Client VWA

Some Partner defaults for VWA declarations can be stored in this section.

Carrier Registration

In this field the carrier registration as applicable in VWA declaration for the Carrier can be registered

Authorisation ID

When a partner is to be used as carrier in a VWA declaration it might also require a Authorization ID which is maintained in this field.

Client PD

Some Partner defaults for VWA declarations can be stored in this section.

Relation Number

The relation number as used in PD declarations either in the role of debtor number or stakeholder number can be stored here for defaulting.

Inspection Shed

The location where the inspections for this stakeholder (importer) take place can be maintained in this field,
the defaulting of the inspection shed itself is registered in the role NL Customs goods Location

Stakeholder

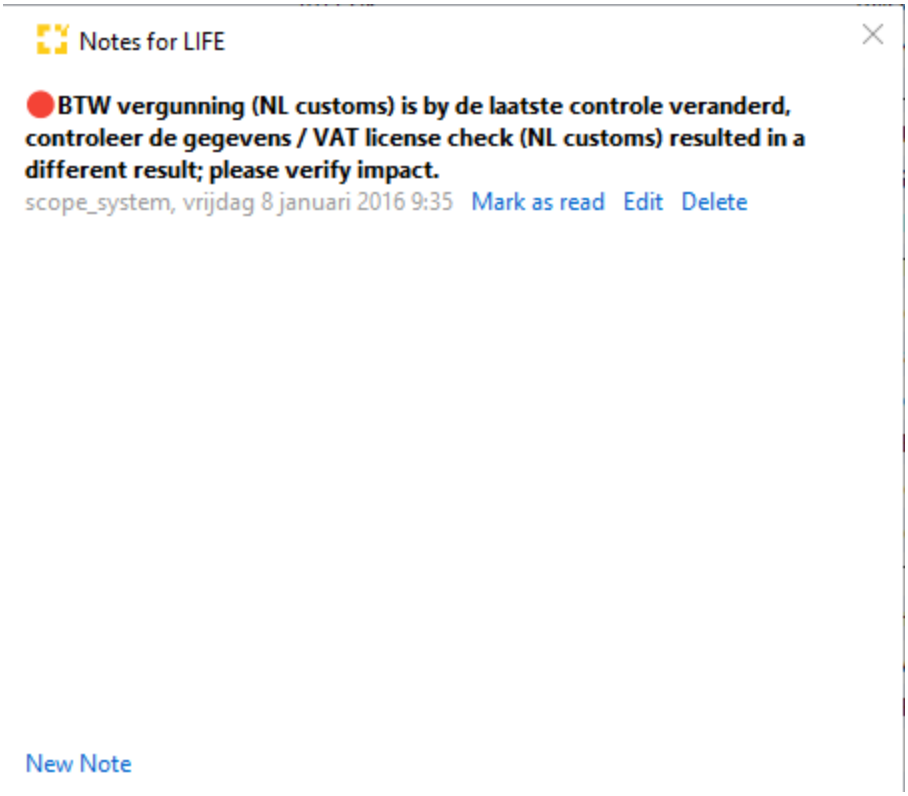
In this field de partner who should be used as stakeholder, in case it is not the customs agent, should be populated in this field, it might be the partners own code,
if this field is left empty it will be defaulted with the License holder partner code

Party Info from Customs

Automatically Update and Latest Check field

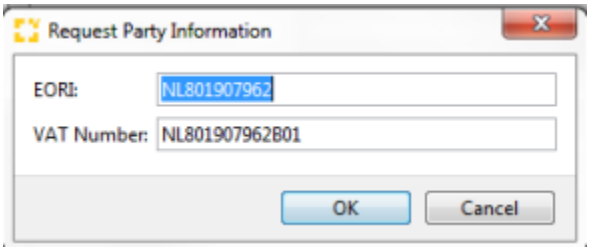
Check this box to ensure that the business partner's VAT status with NL Customs is updated automatically. This update will occur every week and the date of last update will appear in the **Latest Check** field.
If during the last check the VAT registration changes (Art 23, on or of) a note will be generate on the partner so in the next usage of the partner, the user is information about the change.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Request Update

Activates a pop-up window where the VAT number and EORI number of the partner may be inserted to check for update.



Address

When an update request is made, if the update is successful the full address of the partner being updated will appear.
The address details will no longer be populated with address details when the new AGS - Comfort messages will be activated.

VAT Status

On updating the VAT status this field will display the current VAT status of the partner:

AGS

Statement code	StatementTypeCode	Display Result text	Field	Additional Result
0	AIQ	Consignee Eori Number and VAT number are not related	eoriVatRelation	not valid
1	AIQ	Consignee Eori Number and VAT number are related	eoriVatRelation	Valid
0	AAX	Vat Number has no "Art.23" permit	vatLicArt23	de-active the NL customs Partner "VAT Diversion Art 23" checkbox
1	AAX	Vat Number has "Art.23" permit	vatLicArt23	activate the NL customs Partner "VAT Diversion Art 23"

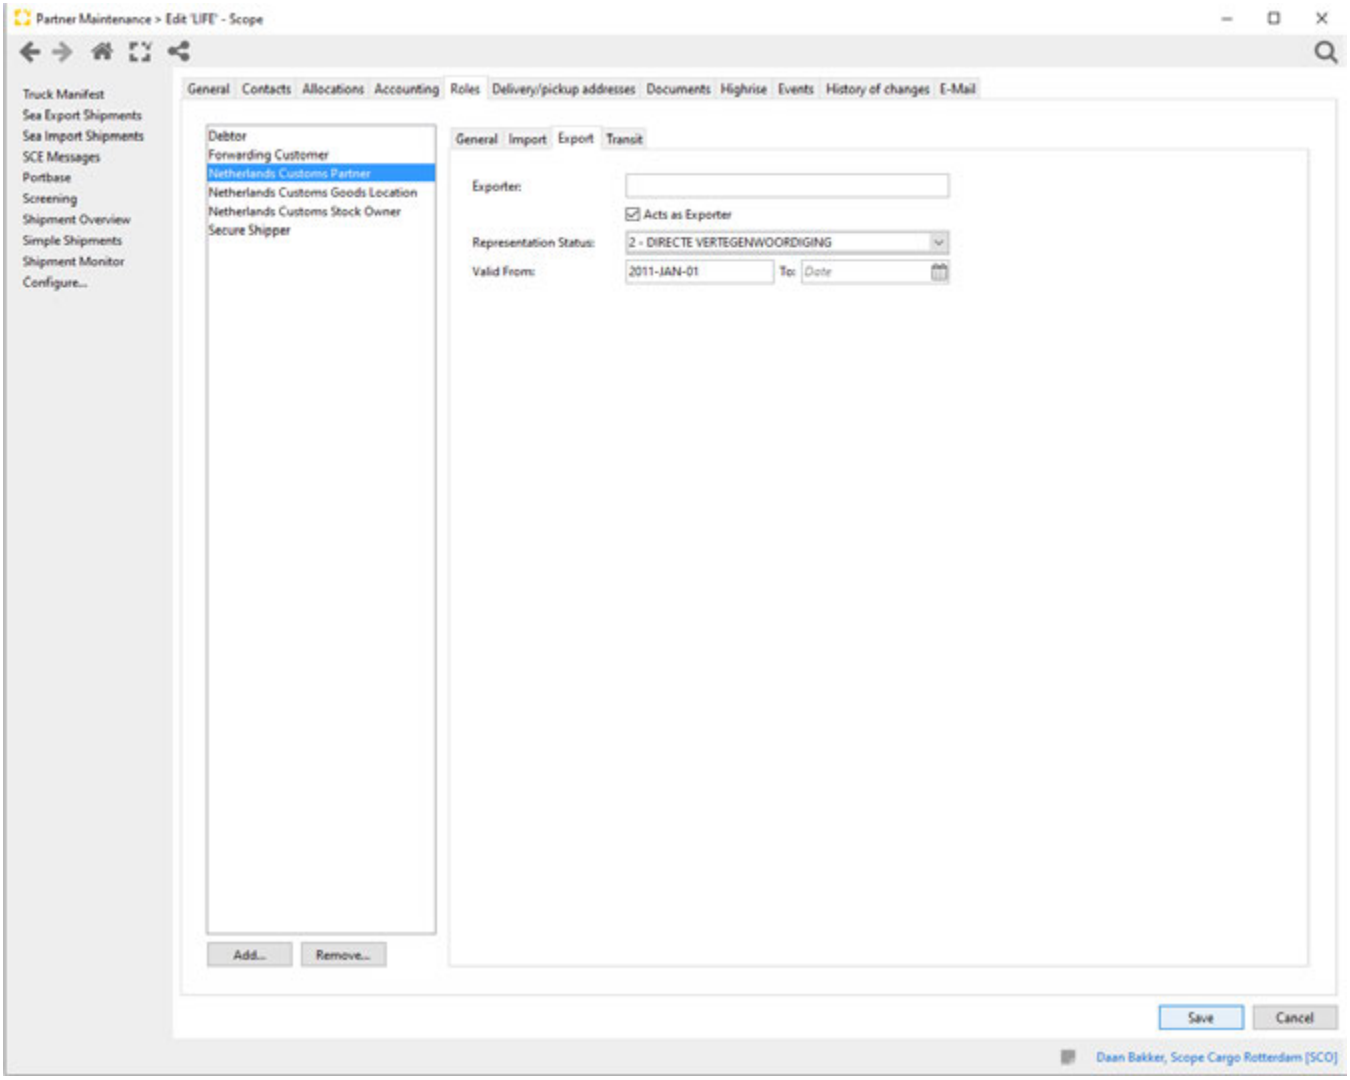
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

				checkbox

Note : If the VAT number and EORI number are not related to each other, AIQ = 0, then NL Customer will not provide information about the status of the Article 23 License.
If this happens and it is certain that the VAT number hold an art.23 licence, the Has Art 23 option in general tab may be activated. But the importer should be informed that their registration details
with NL customs is incomplete.

Export

On the tab export the details for import customs actions are registered.



Exporter

This field is populated with the partner that serves as the exporter for this partner when used as shipper in the shipment, If the partner itself is the exporter then this field may remain empty.

Acts as Exporter

Indication that this partner may be used as Exporter in the AGS import declaration.

Representation Status

Use the drop down option to select:

Type	Dutch	English

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

1	Aangever	Declarant
2	Directe Vertegenwoording	Direct Representation
3	Indirecte Vertegenwoording	Indirect Representation

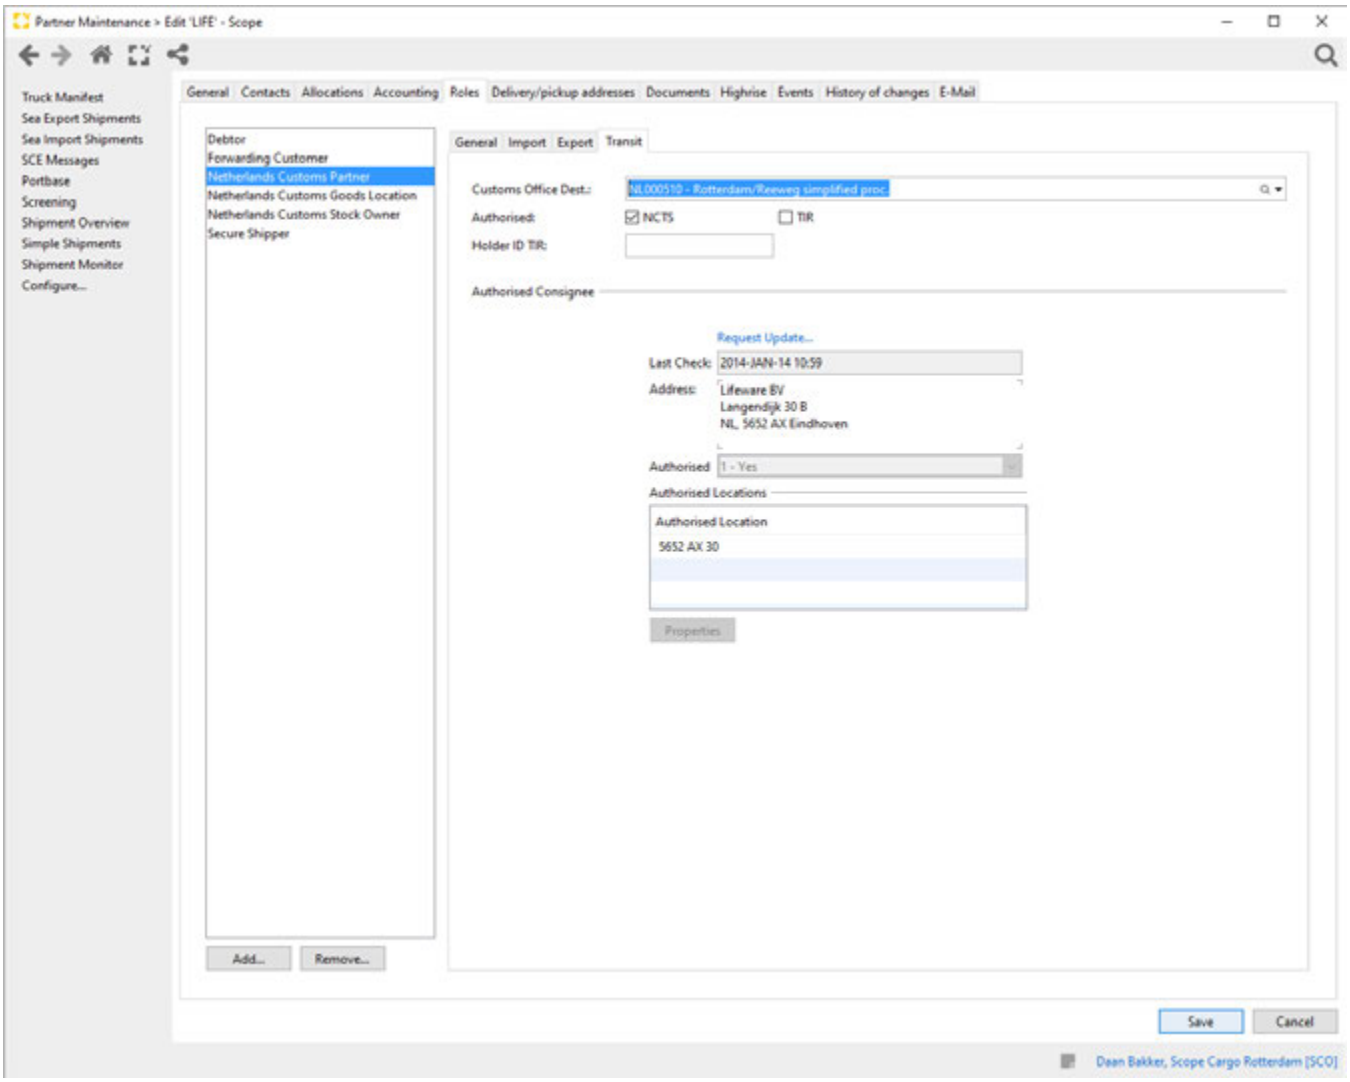
Note: Type 1 should only be used if the customs agent and exporter are the actual exporters of the goods. Freight forwarders/customs brokers are normally not the actual Exporters of the goods. The exception being re-exportation from Bonded warehouses.

Valid From - To

The period for which the agent may legally represent the partner.

Transit

In the transit tab the applicable details for the partner when used as Shipper or Consignee in a AGS declaration.



Transit Customs Office

The partner's local customs transit office.

Authorized - NCTS - TIR

The check boxes indicate if the partner is authorized for **NCTS** (New Computerized Transit System) and/or **TIR** (Transports Internationaux Routiers)

Holder ID TIR

IF the partner is authorized for **TIR**, the **TIR** id can be stored in this field.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Authorized Consignee

An authorized consignee may receive goods that are placed under customs transit procedures directly into into his premises. This avoids the need to present the goods and their customs declaration at the customs office at the destination.

Authorized consignee's may only be enabled if the local branch is also a Netherlands Customs Declarant.

Request update

Check via an NCTS message the locations for which the partner holds a "authorized consignee" permission.

Last Check

The date the previous check of **authorized consignee** status was made.

Address

The address of the authorized consignee linked to the EORI number used in the request. \

Authorized

Details of the authorization.

Authorized locations

The locations where the **authorized consignee** may receive goods placed under customs transit procedures.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Netherlands Customs Goods Location - Roles - Business Partner - Maintenance

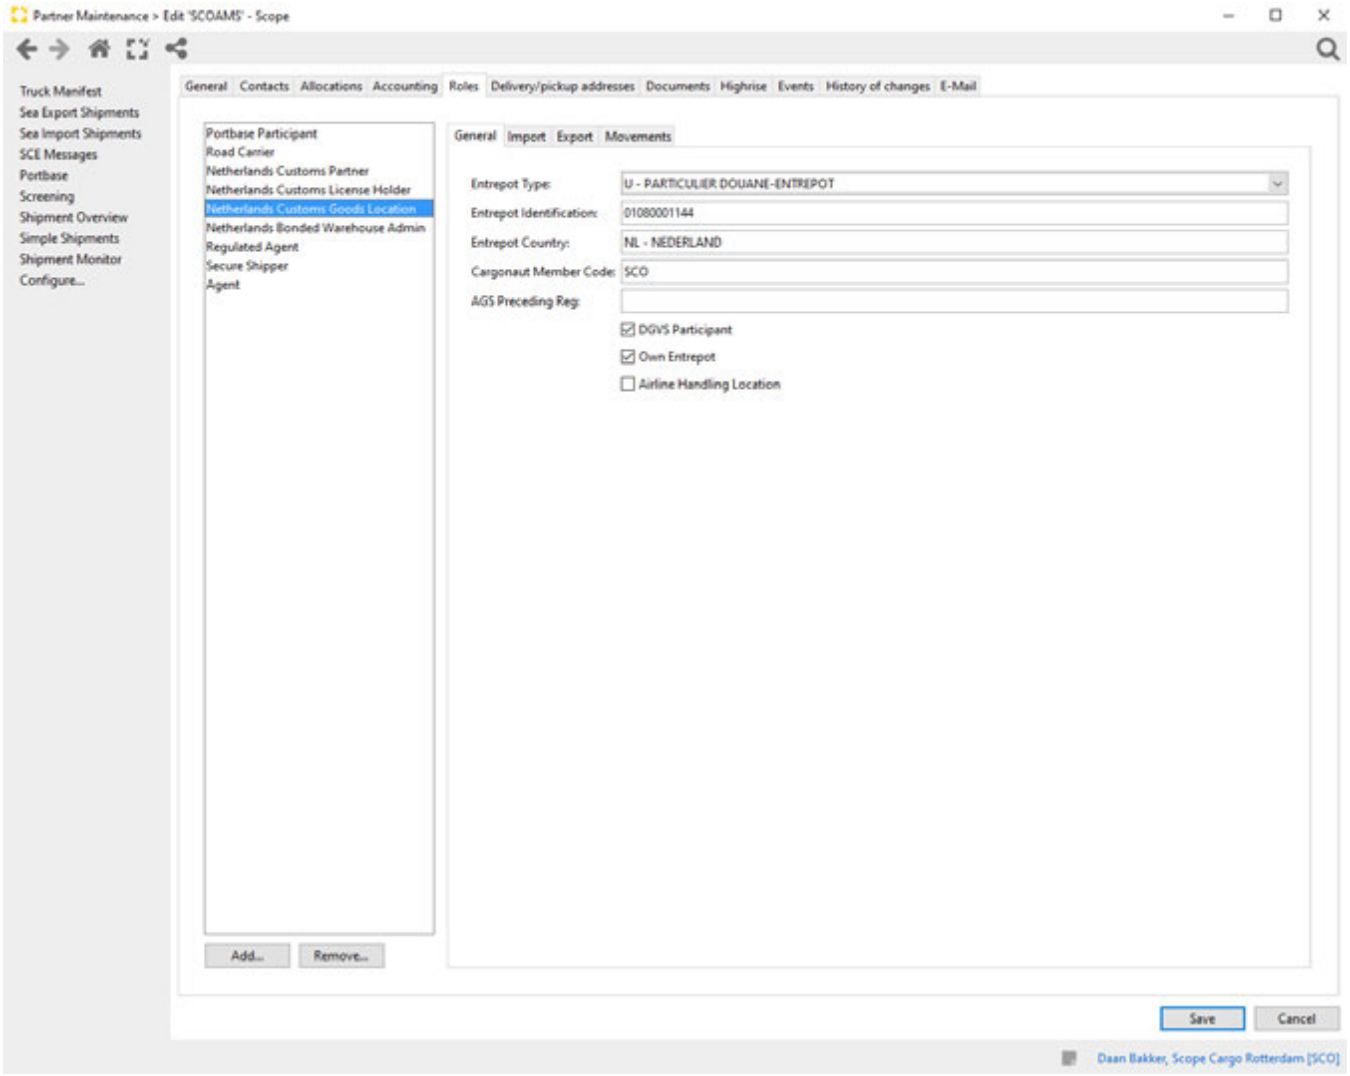
- Introduction
- NL Customs

Introduction

For terminals, sheds, which might be the goods location used in any of the Customs Netherlands modules, should have their Netherlands Customs details recorded using this role. The Customs Netherlands will then automatically use these details for the selected partner

NL Customs

General



Entrepot

The specifics for the customs bonded warehouse applicable for customs declarations, Sagitta Import / Export (box 49), the registered details consist of

Field	description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type	The type of customs bonded warehouse
Identification	The license number of the customs bonded warehouse, The number entered must be a valid number as AGS will reject incorrect numbers. (in case the requested previous regulation = 71, 78)
Entrepot Country	Country code of the issuing country of the warehouse licence
Cargonaut Member Code	The Member code as assigned to this partner by Cargonaut, the Member code is validated as mandatory is case either DGVS participant, Airline handling location or both are set to Active

Netherlands Customs License Holder- Roles - Business Partner - Maintenance

- Introduction
- Description

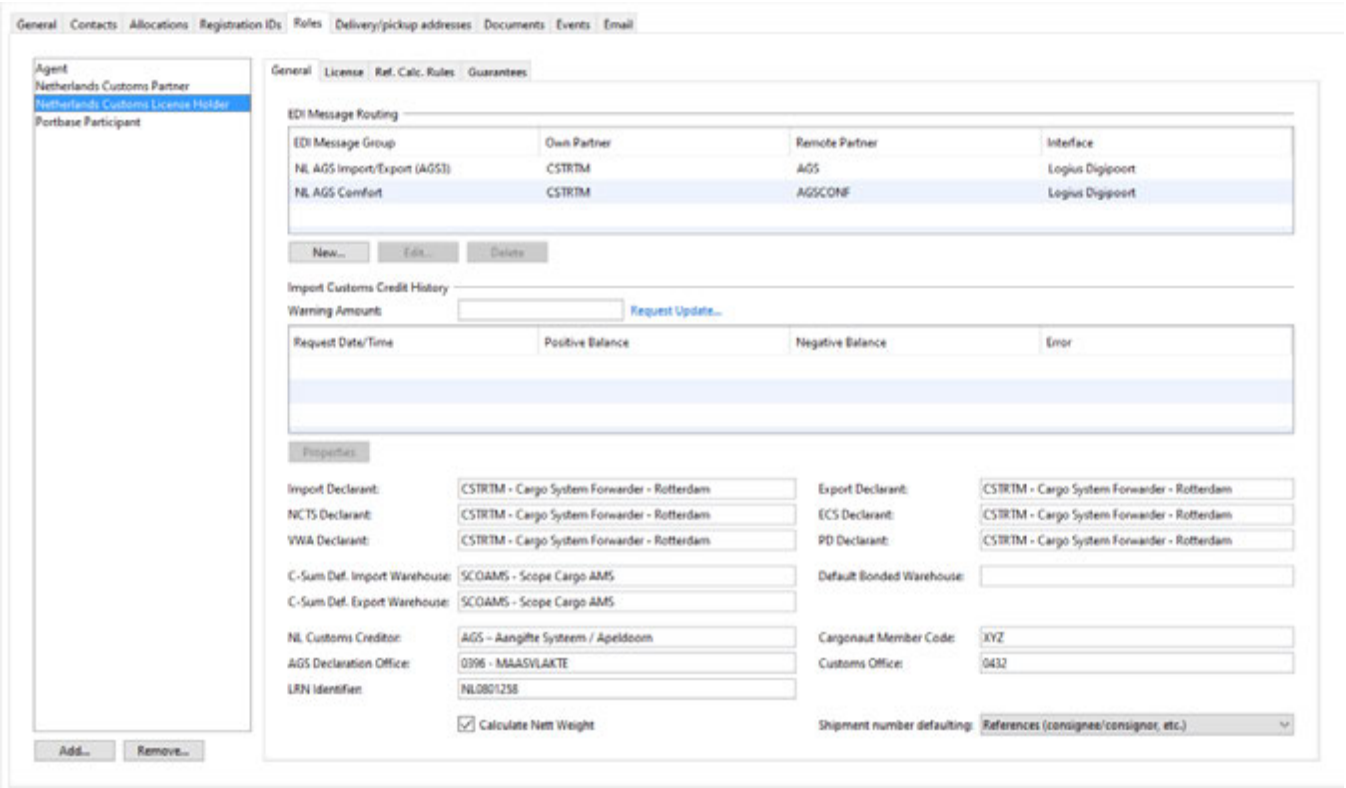
Introduction

The **Netherlands Customs Declarant** role is applied to parties that are permitted to create and transmit import, export or both types of customs entries to Netherlands Customs. This partner is most likely to also be the local branch. All details relating to the connection to Netherlands Customs including financial details are stored in this role. Updates from Netherlands Customs of financial details can also be accessed from within this role.

Description

This role comprises:

- **A general tab** - Edi messaging, Import customs credit history, customs offices and declarant details.
- **A license tab** - details of the licenses for the partner
- **Reference Calculation Rules** - Rules to calculate guaranteed Netherlands Customs amounts for NCTS shipments.
- **Guarantees** - Details of types of guarantees and actual amounts booked.



EDI Message Routing

> ⚠ Contact your local RSI office for configuration of EDI Message Routing, correct connection to Netherlands Customs can only be undertaken by RSI

The EDI message routing section presents a table that indicates how the partner will connect to Netherlands customs for the various EDI Message Groups that have been created, this table displays:

Column	Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

EDI Message Group	RSI Maintains a set of message groups for each EDI routing
Own Partner	The sending partner (EDI ID)
Remote Partner	The receiving partner (EDI ID)
Interface	The interface being used, currently **Cargonaut, Logius Digipoort and Portbase**.

New (EDI Message Routing)

A popup dialogue appears where the items described in the table above can be selected to create a new EDI message routing.

Edit (EDI Message Routing)

To edit an existing EDI message routing, highlight it in the table and select **edit** or *double click*. A popup dialogue appears where the items described in the table above can be edited.

Delete (EDI Message Routing)

To delete an existing EDI message routing, highlight it in the table and select **delete**.

Import Customs Credit History

Whenever the declarant creates import entries where duties/VAT must be paid, these amounts are deducted from the total credit amount that Netherlands customs permit the declarant. This section can be used by the declarant to determine the current remaining credit balance.

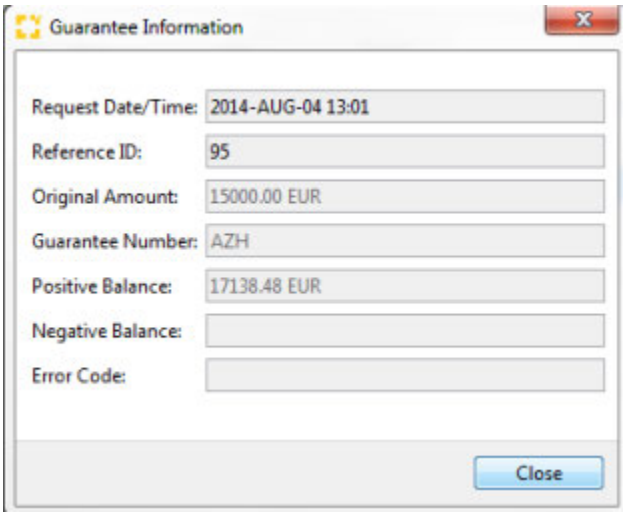
Warning Amount

In the warning amount the threshold for warnings to the user is registered, if the actual bond amount goes below the defined threshold, The user is warning when creating/sending a declaration.

Request Update

This action link will transmit a message to NL customs requesting the current credit balance available. The response from customs will be displayed in the credit history table.
Scope will automatically check the bond amount 3 times a day (06:00, 12:00 and 16:00) to keep a close realtime monitoring.

Import Customs Credit History Table Properties



The table contains response details from Netherlands Customs:

Column	Description
Request Time	The date and time when the balance request was made
Reference ID	Code linked to the response message
Original Amount	Original credit amount

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Positive Balance	Remaining credit amount
Negative Balance	Overdrawn debit amount
Error Code	If Netherlands customs report an Error an error code is shown

Customs offices and declarant partners

This section stores the partners local customs office. It is also possible to specify for a partner which declarant ID to use for imports, exports and NCTS. These details will be pre-defined by RSI support staff, details are related to the EDI Mapping requirements.

Import Declarant

The partner to use for import declarations, dominantly the branch partner code itself, could be a different partner in case a different EORI number or address is applicable.

Export Declarant

The partner to use for export declarations, dominantly the branch partner code itself, could be a different partner in case a different EORI number or address is applicable.

NCTS Declarant

The partner to use for NCTS declarations, dominantly the branch partner code itself, could be a different partner in case a different EORI number or address is applicable.

ECS Declarant

The partner to use for ECS (arrival at exit / summary exit declaration)

VWA Declarant

The partner to use for Client VWA declarations, dominantly the branch partner code itself, could be a different partner in case a different EORI number or address is applicable.

PD Declarant

The partner to use for Client PD declarations, dominantly the branch partner code itself, could be a different partner in case a different EORI number or address is applicable.

C-Sum Default Import warehouse

The Partner on which the default CSUM customs bonded warehouse administration has been registered, for Sea and Air Import and simple shipments, also the default for Inventory Homeview
and corrections.

C-Sum Default Export warehouse

The Partner on which the default CSUM customs bonded warehouse administration has been registered, for Sea and Air export shipments.

Default Bonded warehouse

The defaulted bonded warehouses used in the GPA module of Scope.

NL Customs Creditor

The partner code for the creditor on which the purchase invoices from customs (duties and taxes) is to be generated.

Cargonaut Member code

The cargonaut member code assigned by Cargonaut to be used in ECSHUB and/or DGVS messaging as sending party.

AGS Import Declaration office.

The default customer declaration office (S03)

Customs Office

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The local customs office for the partner

Calculate nett weight

Indicator of the nett weight of items in NL customs declarations should be automatically calculated at 85% (when active) or not.

Shipment number defaulting

A configuration by means of which the population of the shipment reference field in AGS can be manipulated.
This shipment reference field is sent to NL customs and will become available in the OGA reporting.

There are 2 options available:

1) Shipment number. If this option is chosen the shipment reference number in the AGS entry will be set to the linked shipment number.
This is also applicable when creating a followup AGS procedure.

2) References number logic (previously existing logic, will be automatically chosen for existing customers). If this option is chosen the following logic will be applied:
AGS Import
- CNE Reference
- House document number
- Master document number
- If linked to a shipment, shipment number
- If follow-up procedure to PD, the house number mentioned in the PD declaration

AGS Export
- SHP Reference
- House document number
- Master document number
- If linked to a shipment, shipment number

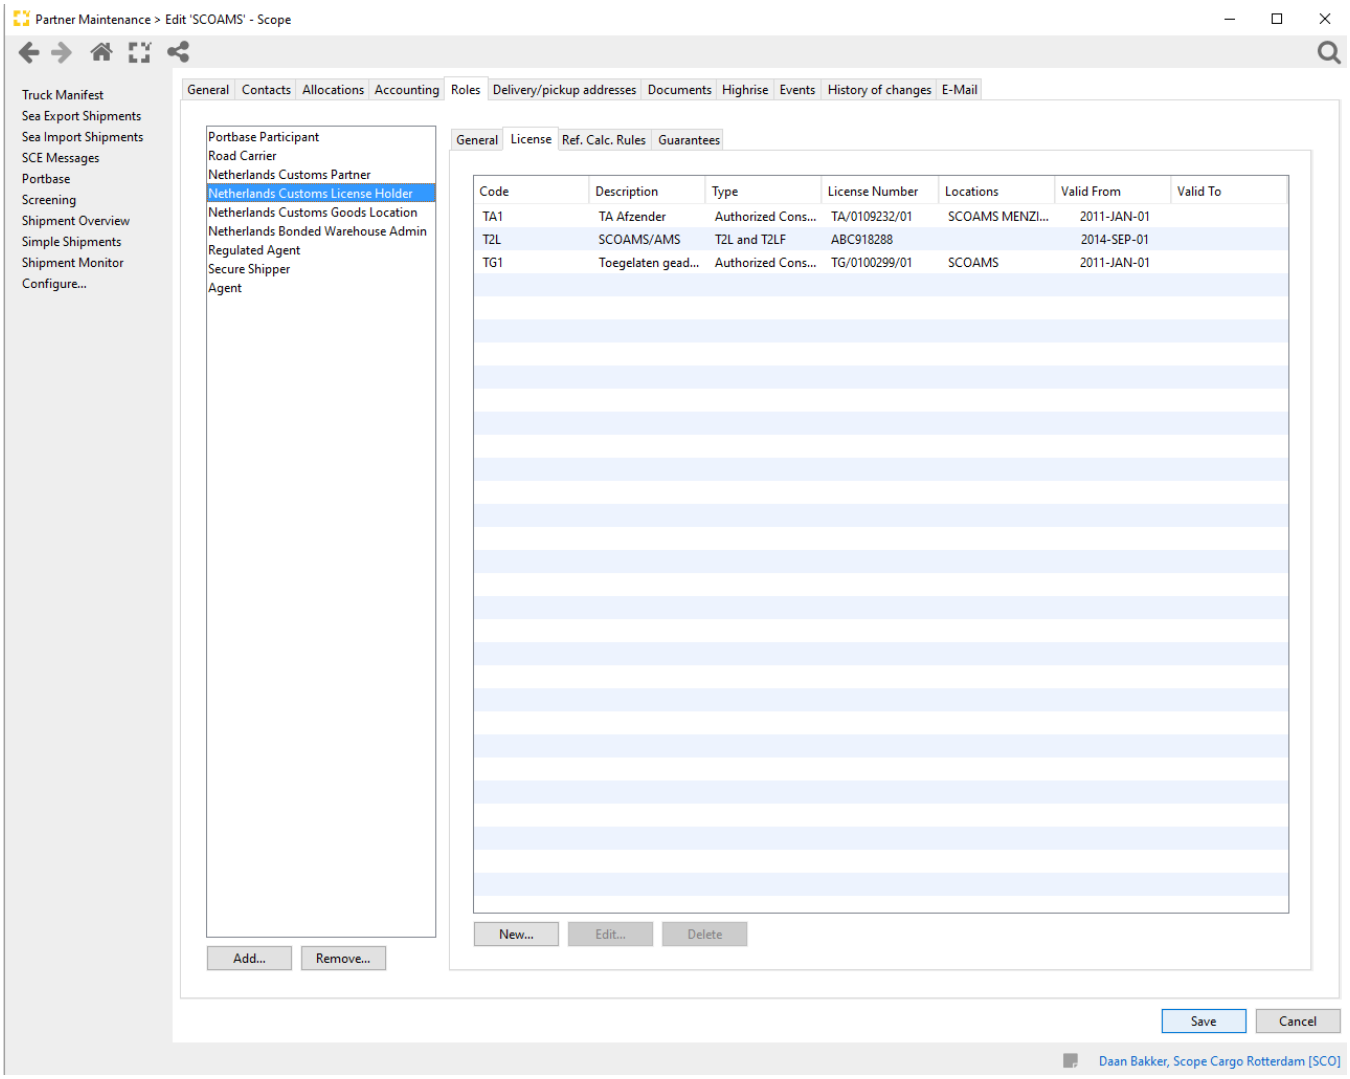
If the reference mentioned first appears available, this will be used, else the system will check the next reference possibility.

LRN Indentifier

In the LRN indentifier the first part of the LRN number for NCTS and AGS declarations is defined, Normally populated with the EORI or VAT number of the branch partner,
Be carefull in changing the number, Incorrect number could cause duplicate numbering at Customs resulting in message rejections.

License

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Under Licenses the details of available customs license can be registered, the current supported types are

TG : Registered Consignee NCTS - Allowed to registered the receipt of an NCTS Movement
TA : Registered Consignor NCTS - Allowed to do NCTS declarations and self printing of the accompanying document (Simplified Procedure)
T2L : Self-Issuance T2L(F) - Allowed to issue/activate T2L/T2LF documents for of EU - proof of origin

Field	Description	TA	TG	T2L
Code	Own created code to indentify the license	✓	✓	✓
Description	Description to specify the usage of the license	✓	✓	✓ (must be the name as prescribed in the licence)
Type	The type of license being registered	ACR	ACE	T2L
License number	The license number assigned by Customs to the license	Will be printed in the Emergency procedure Stamp	-	The licence number for the self issuance of T2L

Regulated Agent - Roles - Business Partner - Maintenance

- Introduction
- Description

Introduction

Agents and subcontractors in the EU may be certified as regulated agents according to EU REGULATION No 185/2010 (Section 6). This regulation dated 4th March 2010 requires data to be collected for the management of aviation security. If all parties involved in the transport chain meet the requirements of these regulations, then the export item may be classified as "safe".

This role is divided into three areas:

1. Regulated Agent Certificate and Expiry Date

The details of the certificate issued by the appropriate authorities which confirms the agent meets air safety regulations.

Example: Partner A (own branch) has a RegB license and stores it with himself.

2. Haulier Declaration Details

Details of the party who filed a declaration on behalf of 3rd party sub-contractors.

```
Example: Partner B (transporter/haulier) signs a haulier declaration with partner A (own branch).
```

3. Third Party Haulier Declarations

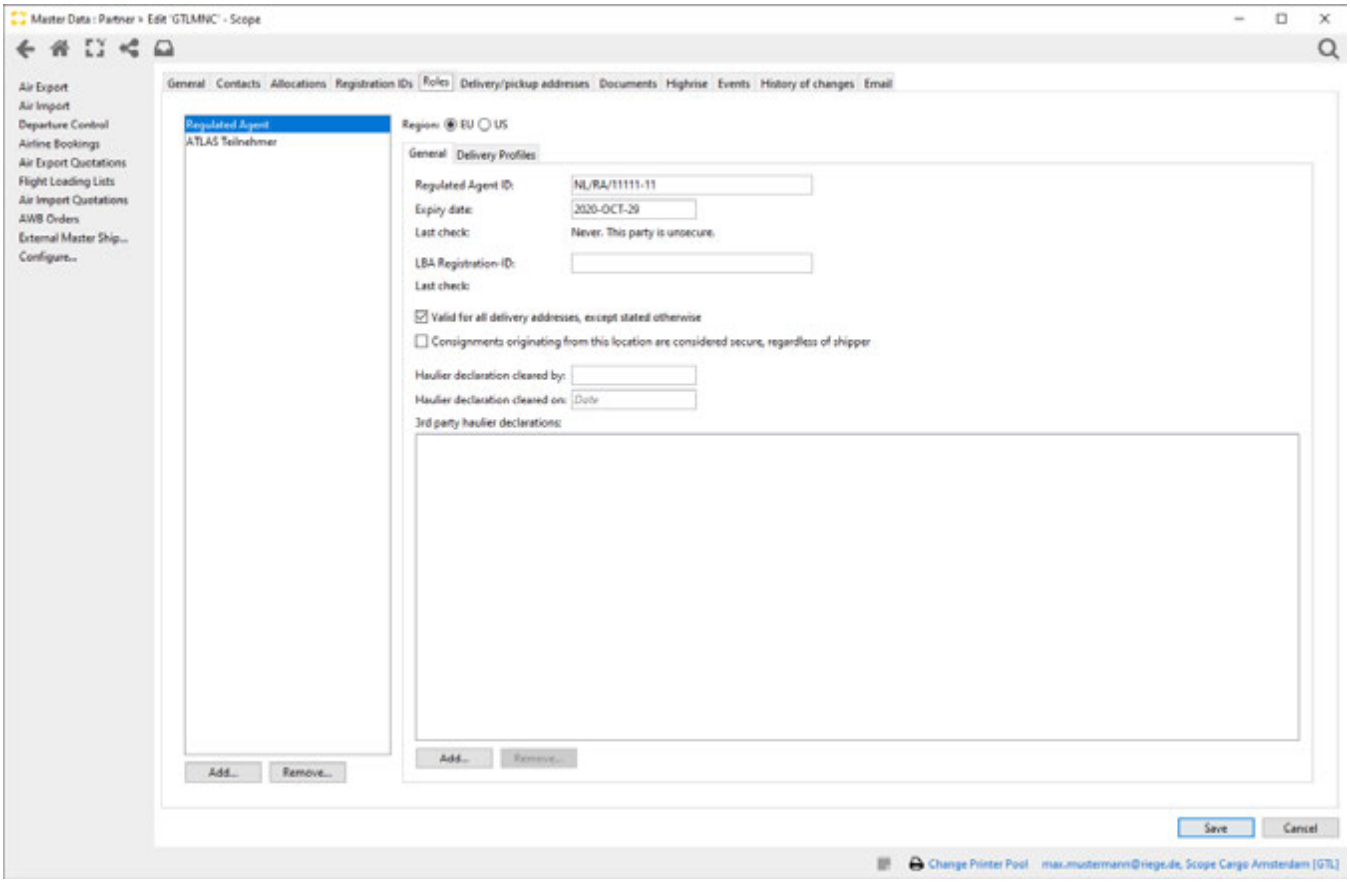
3rd parties with existing declarations can be filed here.

Example: Partner A (own branch) registers the security accreditations of partner B (transporter/haulier) with partners C (known consignor) and D (other carrier, regulated agent).

While the role of RegB / TP is mainly relevant for the area of air freight export shipments, the roles under points 2 and 3 are required in the handling agent area.

Description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Regulated Agent ID

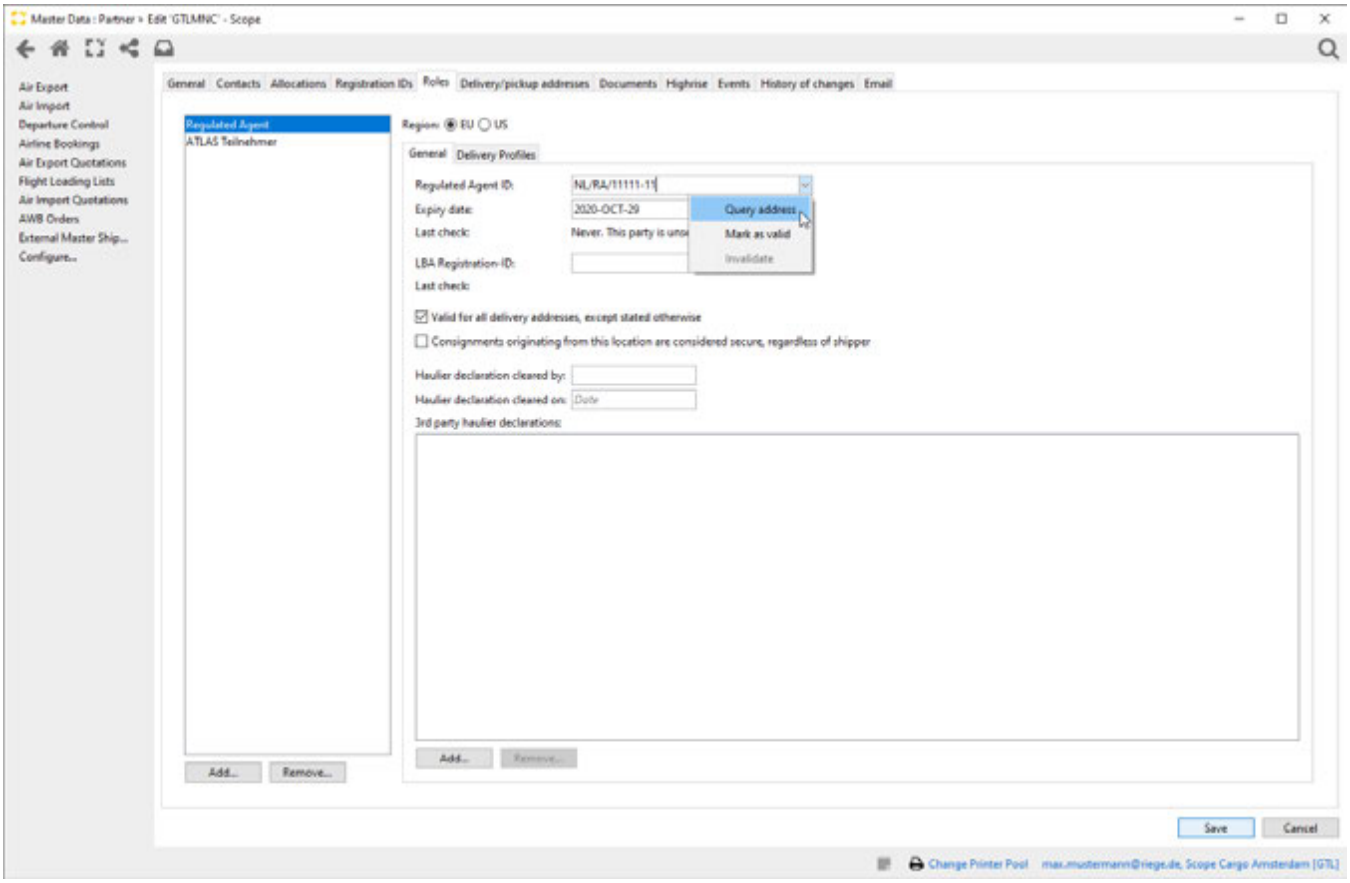
When the service provider is registered as a "regulated agent" their assigned ID may be entered here. It is possible to find a possible matching RA number in the EU / RAKC database,
if any address possible matching address if found then these will be listed and the applicable one can be selected and the KC number and expiry date will be copied to the corresponding fields.

Query Address, Validate, Invalidate

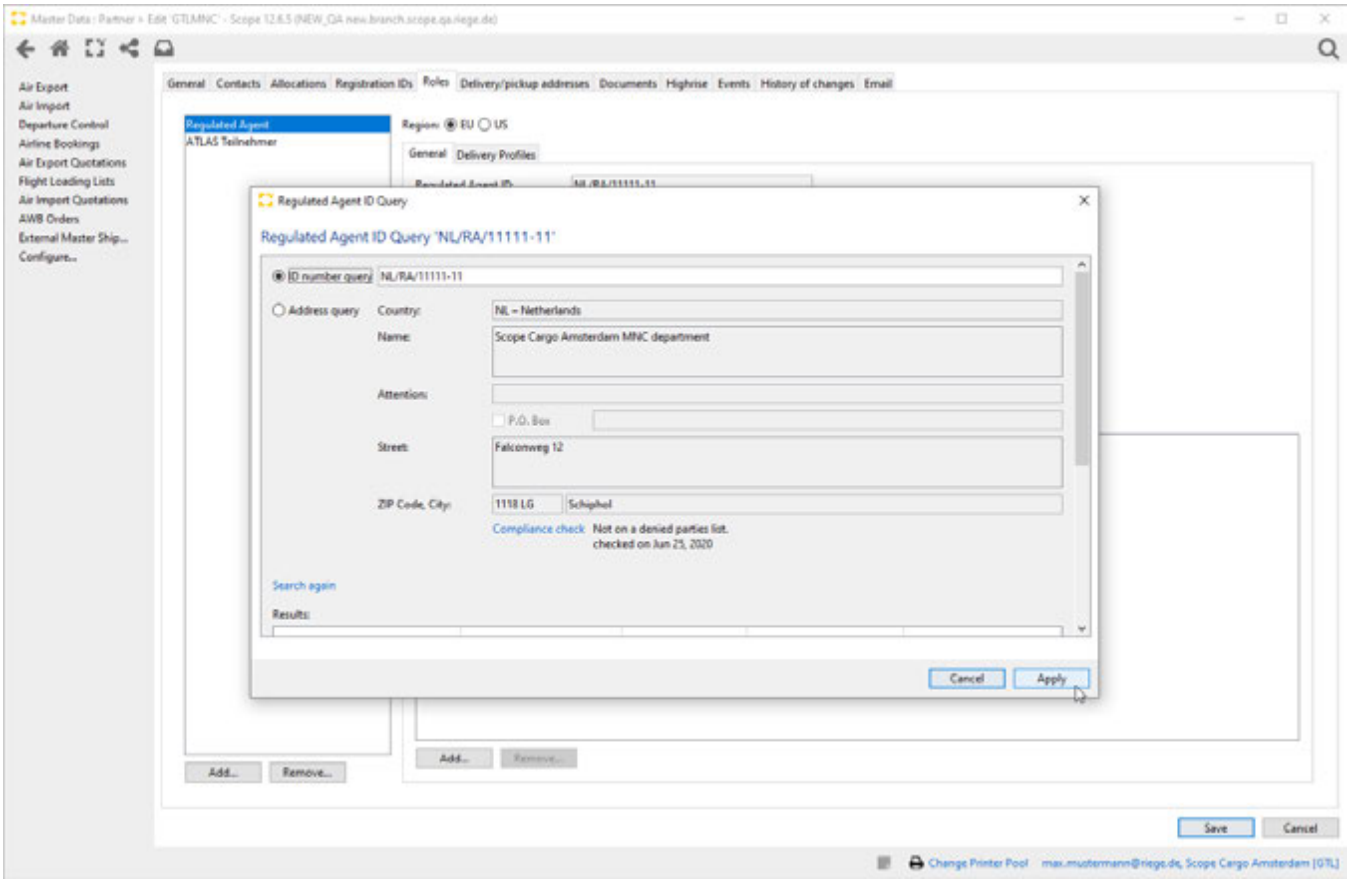
A dropdown menu can be used to open an address query against the Union database for security of the supply chain in order to check the validity of the registration number. The registration number can also be declared valid manually or the validation can be revoked.

query address

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



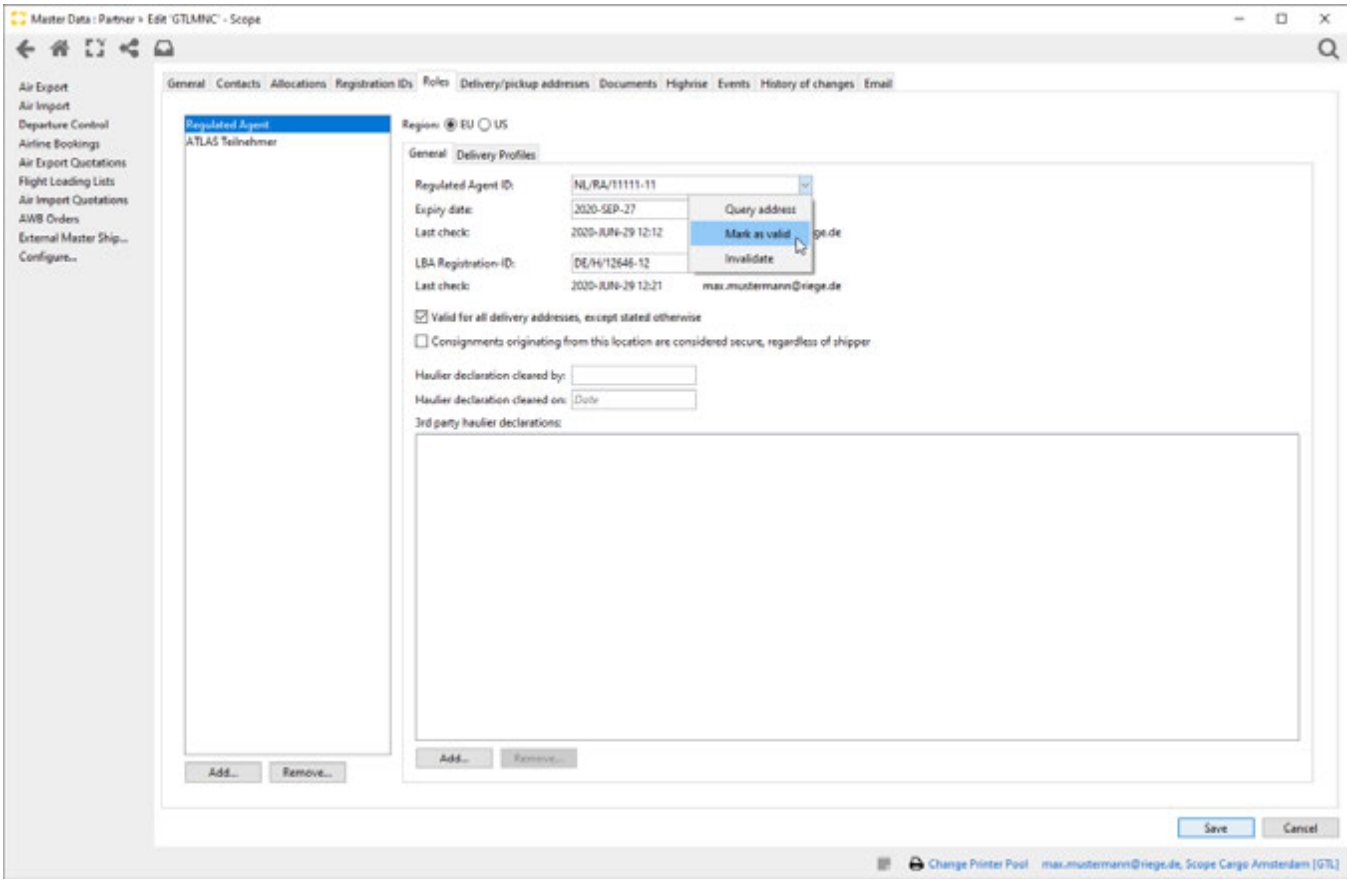
Once the access data for the EU Cargo DB user (EU Cargo DB user and EU Cargo DB password) has been entered under the menu item Air Export Security Setup - Airfreight - Settings, the ID query for the Regulated Agent opens directly via the address query.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

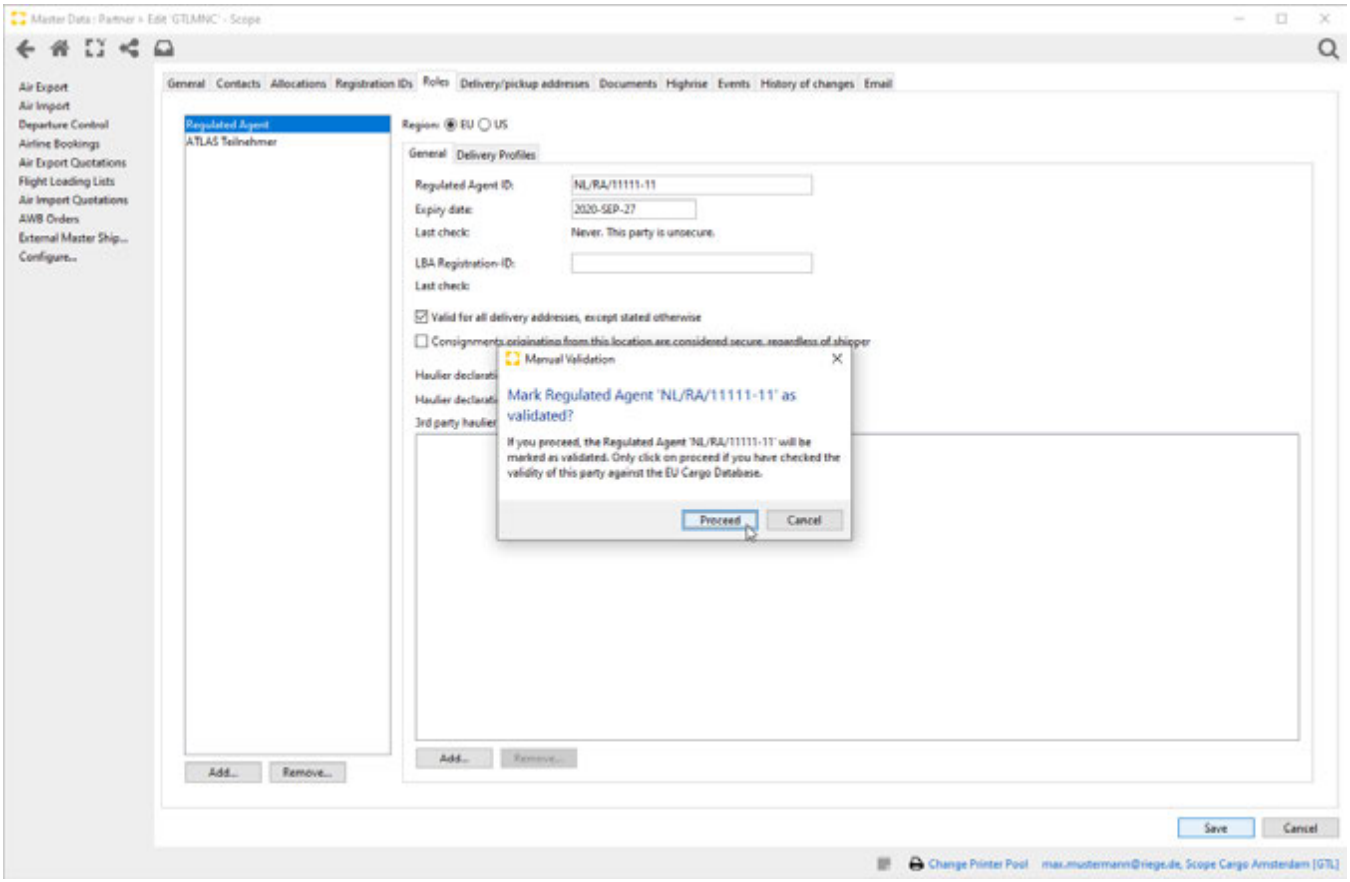
Mark as Valid

This function can be used to manually declare and check the registration number as valid.



The dialog window shown below opens. Manual validation can be confirmed with the Proceed button.

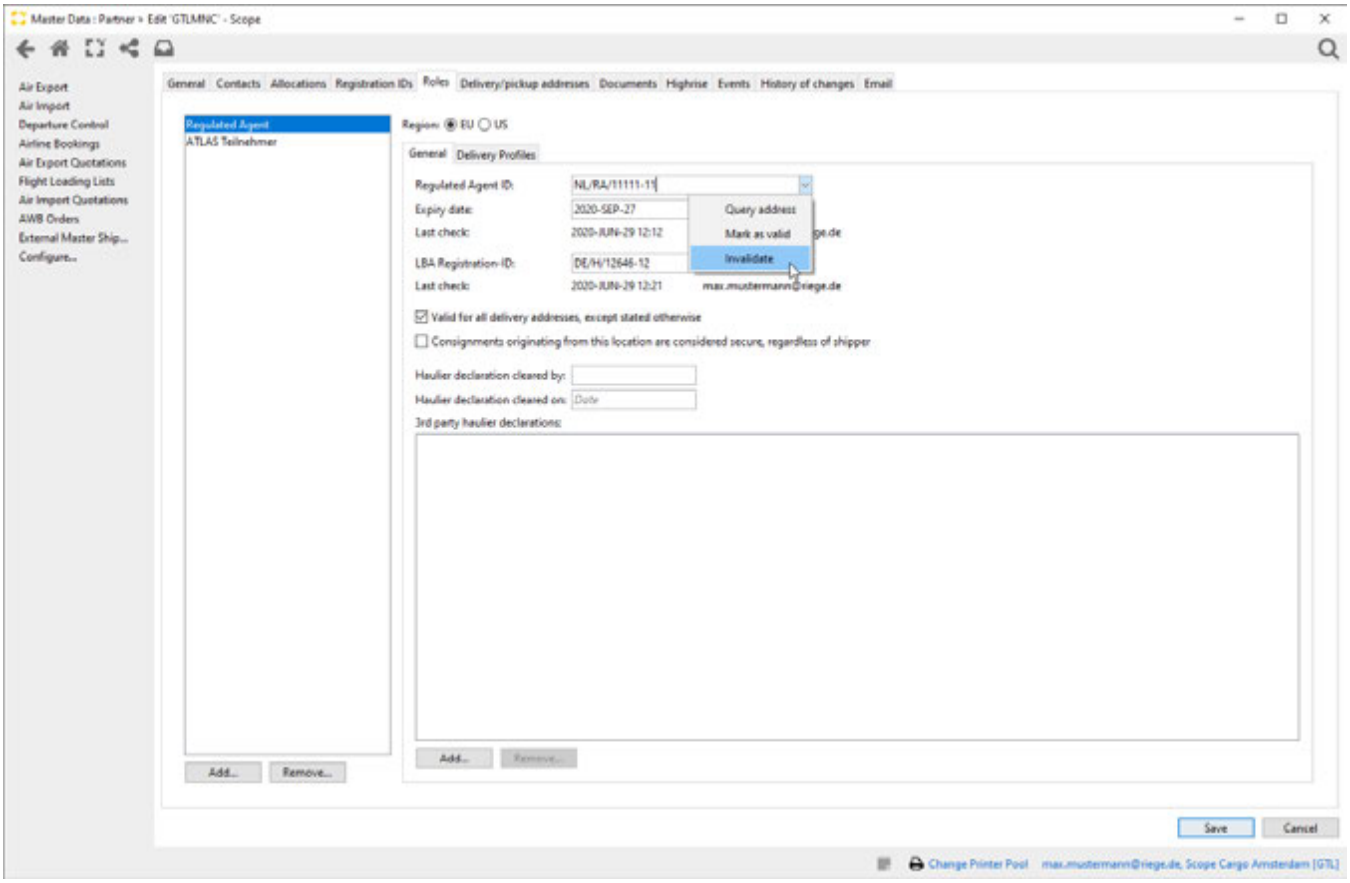
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



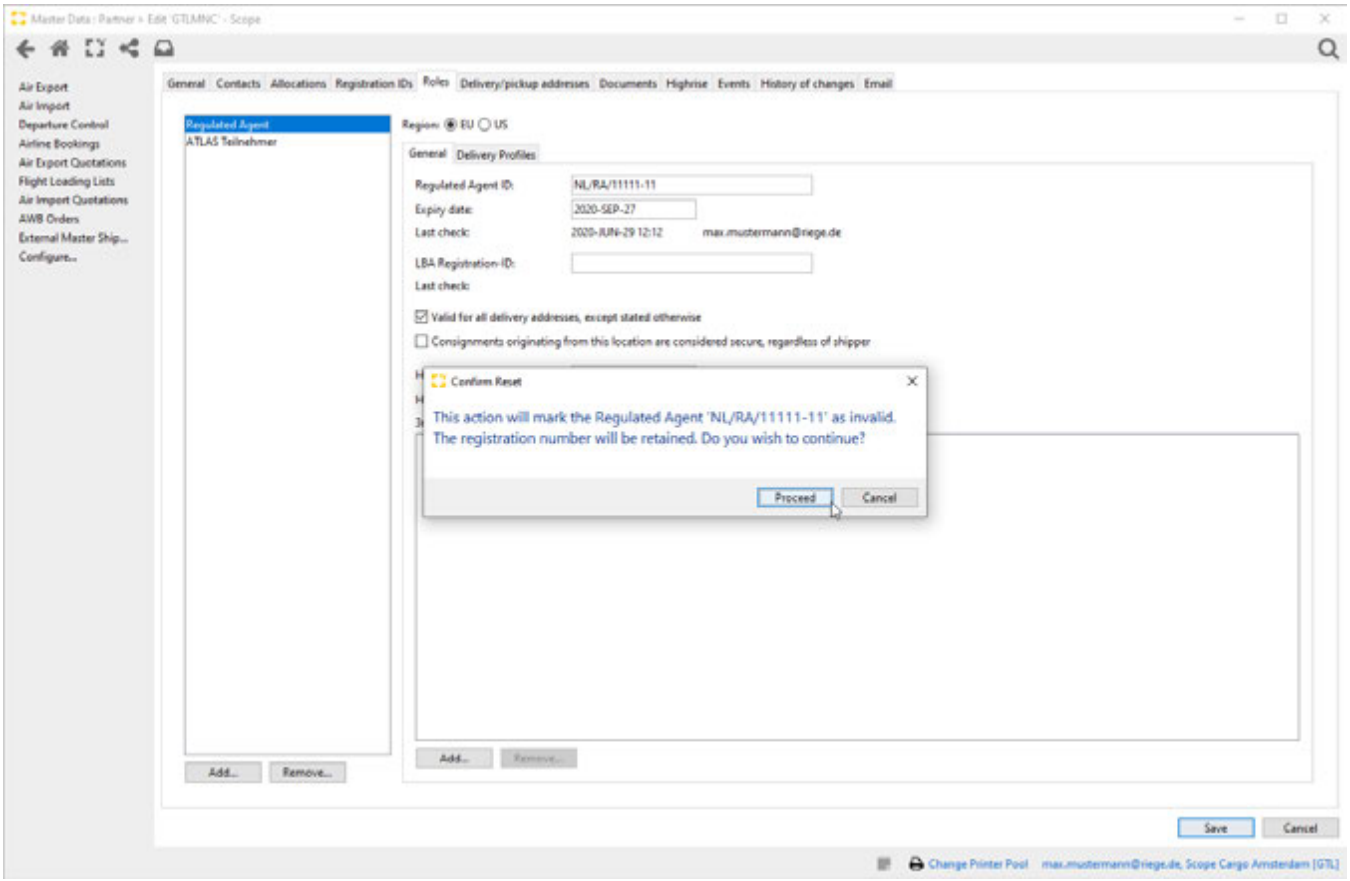
Invalidate

This function can be used to revoke the validation of the registration number for the Regulated Agent.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The dialog window shown below opens. The action to mark the RegB ID as invalid can be confirmed with the Proceed button.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Expiry date

Expiry date of the RegB certificate has to be entered here.

Last check

Displays when and by whom the last EU database check was carried out.

LBA Registration-ID

The registration number is entered in this field. The Air Freight Security Act stipulates that hauliers in Germany must be officially approved. According to Section 22 (3) LuftSiG, the obligation to register begins on 04.03.2018.

Last Check

Displays when and by whom the last check of the Haulier-ID (LBA) was carried out.

Valid for all delivery addresses exept stated otherwise

Indication whether or not the registered RA details should be applied to all entered delivery / pickup addresses or not. When not set to active, each of the registered delivery addresses, needs to have its own RA registration else it
will be considered a non-secure address.

Consignments originating from this location are considered secure, regardless of shipper

Option to define the validity of the registration number for the pick-up and delivery addresses from the "Pick-up / delivery addresses" tab of the business partner. If the pick-up / delivery address has its own registration number, this can be stored in the second tab "Pick-up / delivery address" and checked separately.)

Haulier declaration cleared by

The name of the employee who filed the declaration for a subcontracted 3rd party.

Haulier declaration cleared on

The date the sub-contracted 3rd party's declaration was cleared.

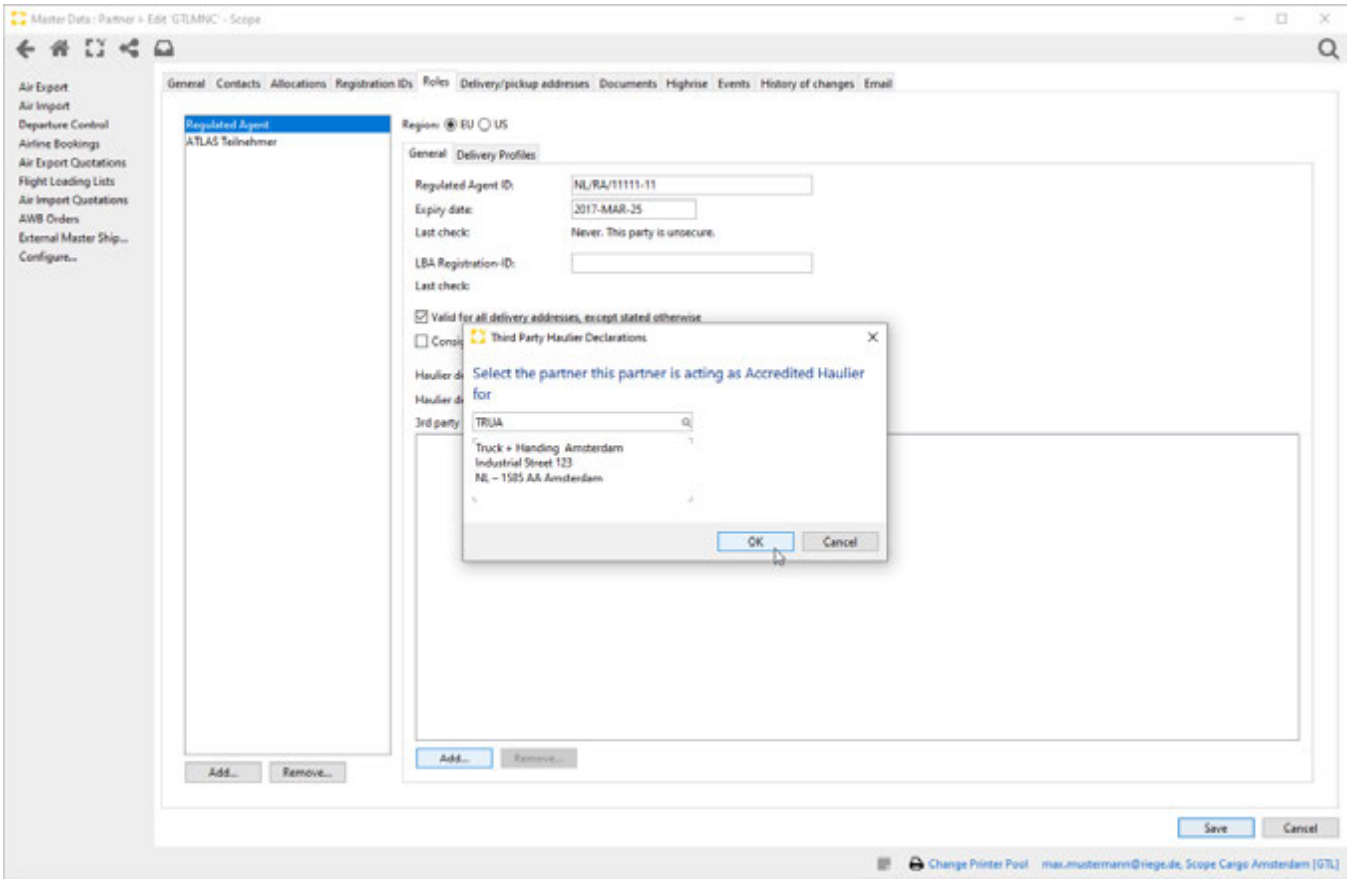
3rd Party haulier declarations

Link to the regulated agent for whom this road carrier is part of the secure supply chain.

Add

Opens a pop-up window where new parties my be recorded. The desired business partners can be located with the search field.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



OK

Stores the data and closes the pop-up window.

Cancel

Closes the pop-up window without further action

Remove

The highlighted partner will be removed from the overview.

Delivery Profiles

Delivery addresses can be stored under the Delivery Profiles tab in order to define the validity of the registration number for delivery addresses from the "pick-up / delivery addresses" tab of the business partner. If the pick-up / delivery address has its own registration number, it can be stored here and checked separately.

Secure Shipper - Roles - Business Partner - Maintenance

- Introduction
- Description

Introduction

This role is used to record the security status of a shipper in order for this status to be evaluated during the creation of an air export shipment. Information regarding known consignors (ID known Shipper), security declarations and assigned pick-up and delivery addresses can be stored here.

1. Known Consignor

A business partner may be accredited by the appropriate authorities as a "Known Consignor" (EU Regulation 185/2010, Section 6.4.1). A known consignor registration number is issued with such an accreditation and is known as a "Known Consignor ID". This ID can be entered in the "ID Known shipper „field.

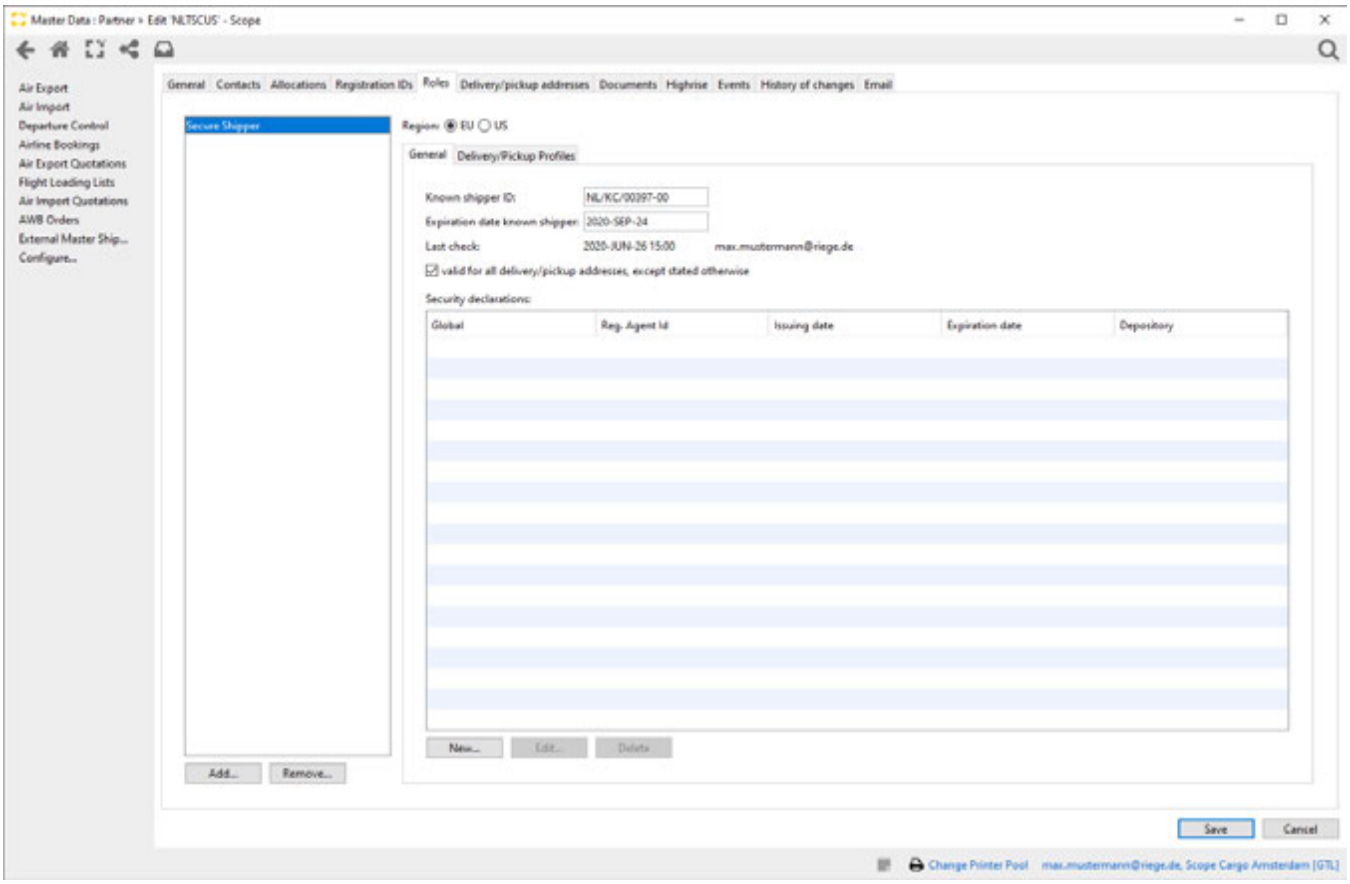
2. Security declaration via a regulated agent

The business partners of a regulated agent may have a security declaration (before 28th April 2010) or a "declaration of commitment - account consignor" in accordance with EU regulation 185/2010, Annex 6-D (after 28th April 2010). This confers the status of "Account Consignor".

Description

- Known Shipper - Region EU
- Known Shipper TSA - Region US

Known Shipper - Region EU



Known Shipper ID - Region EU

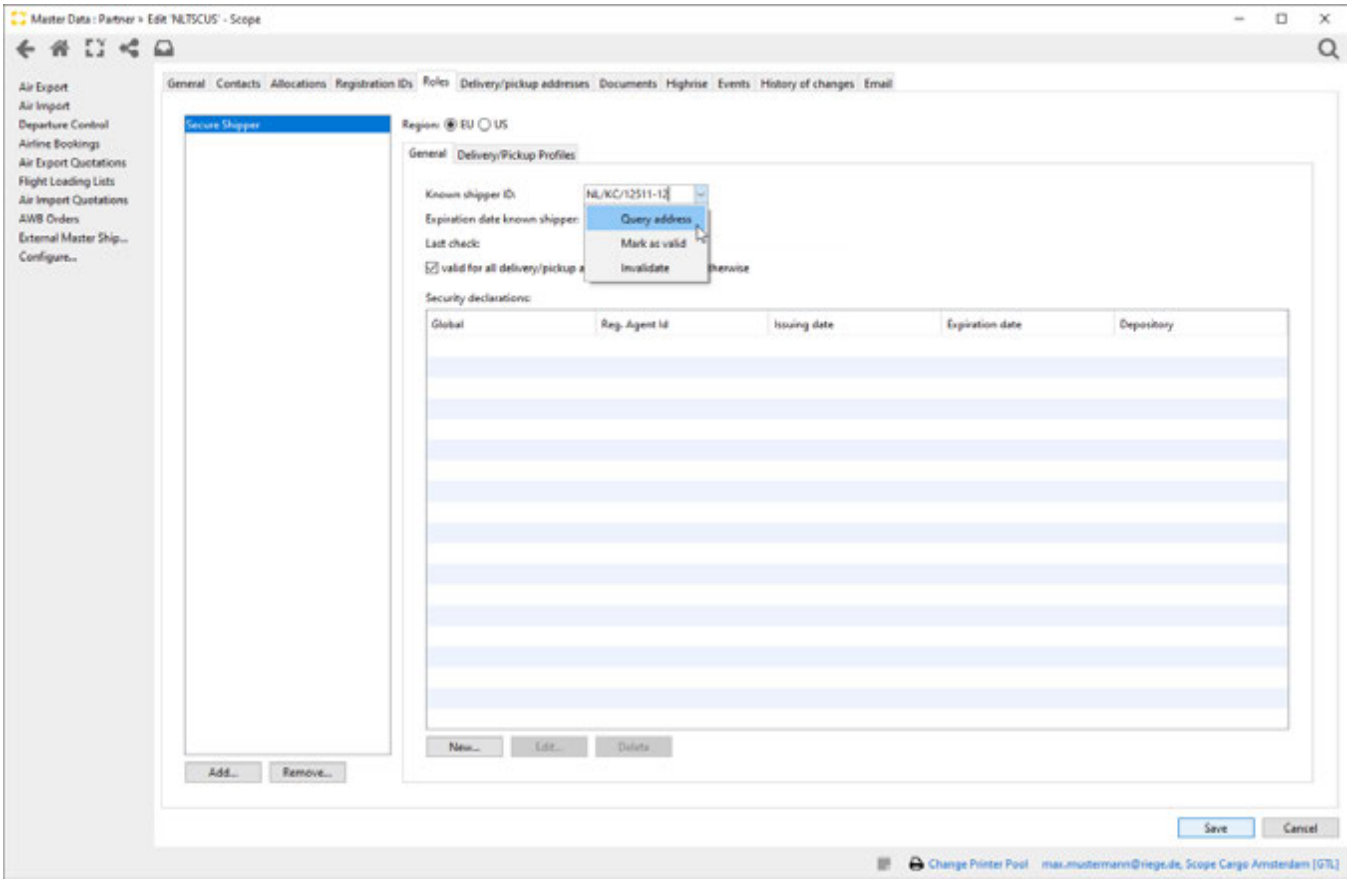
When the shipper is registered as a "known consignor" their Known shipper ID may be entered here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Query address, Validate, Invalidate

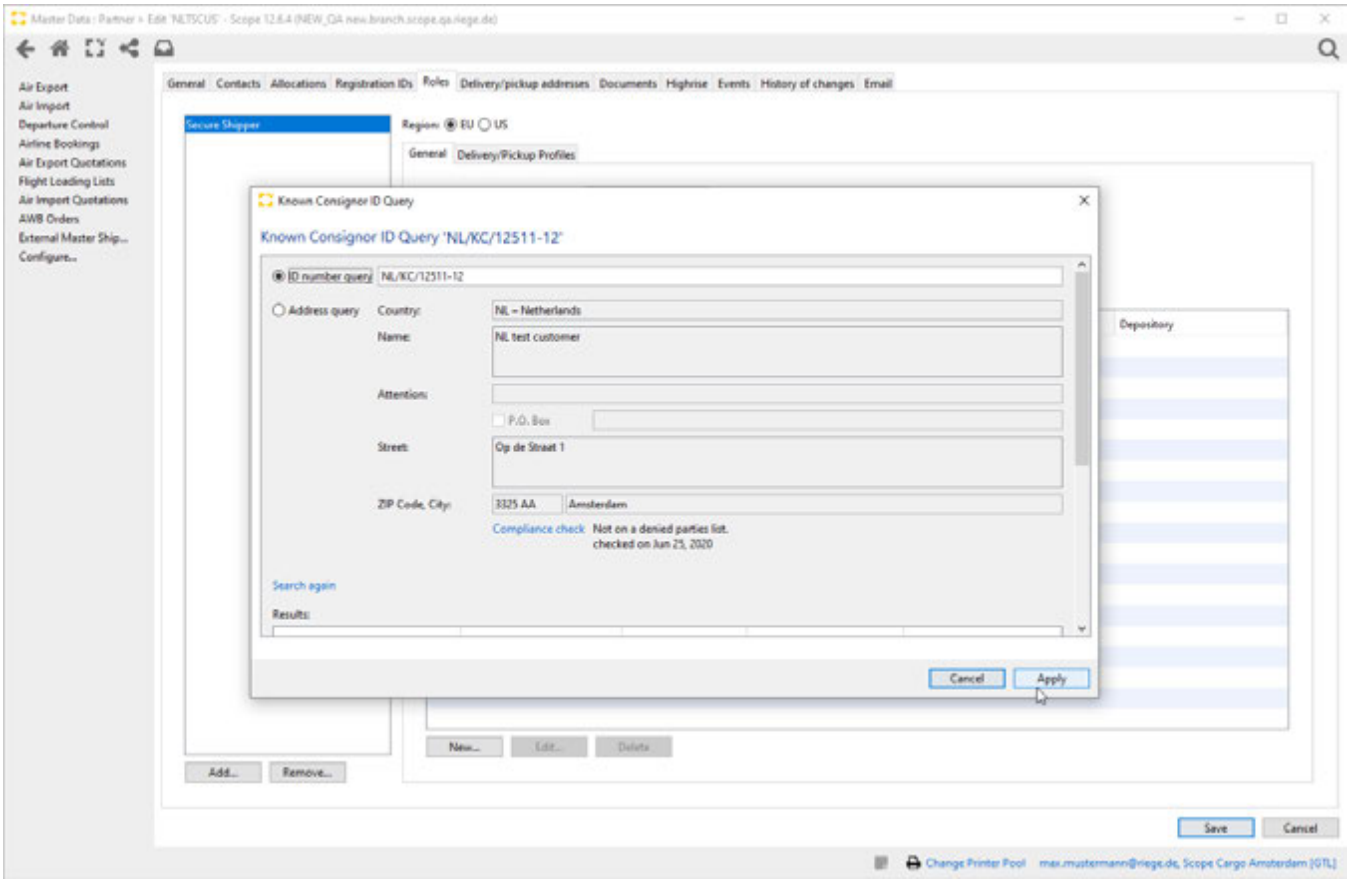
A dropdown menu can be used to open an address query against the Union database for security of the supply chain in order to check the validity of the registration number. The registration number can also be declared valid manually or the validation can be revoked.

Query address



Once the access data for the EU Cargo DB user (EU Cargo DB user and EU Cargo DB password) has been entered under the menu item Air Export Security Setup - Airfreight - Settings, the ID query for the known shipper opens directly via the address query.

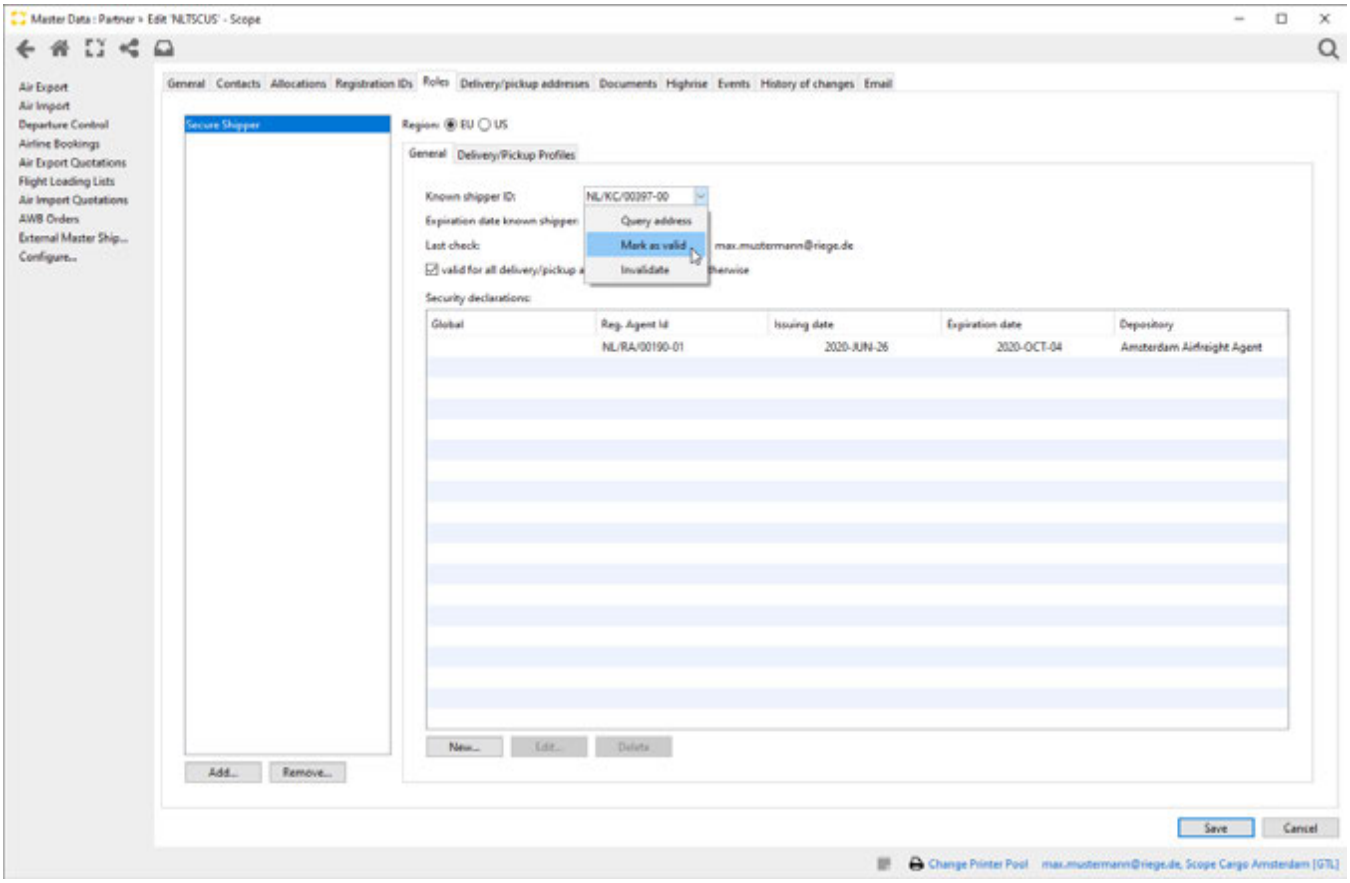
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



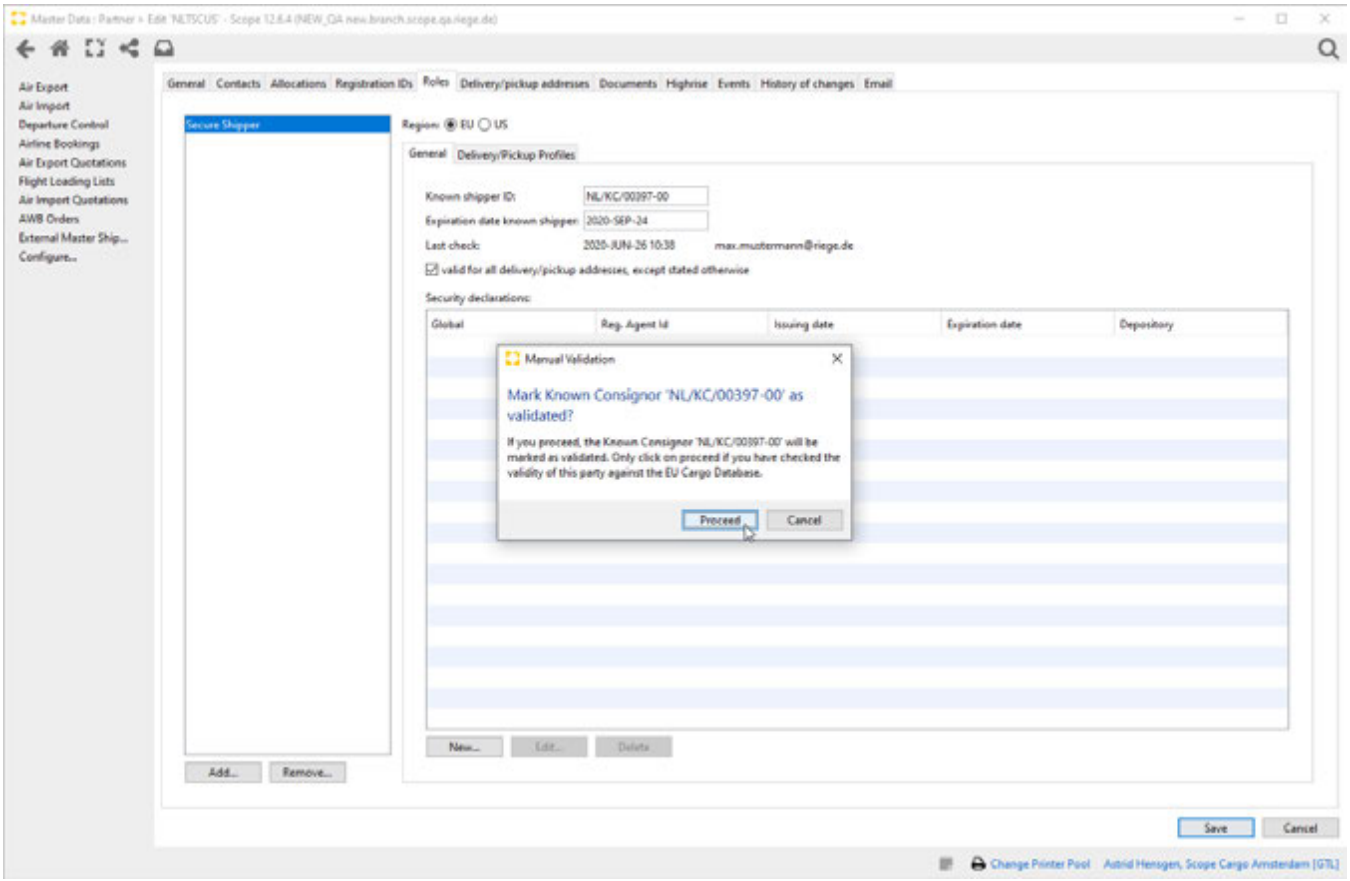
Mark as Valid

This function can be used to manually declare and check the registration number as valid.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



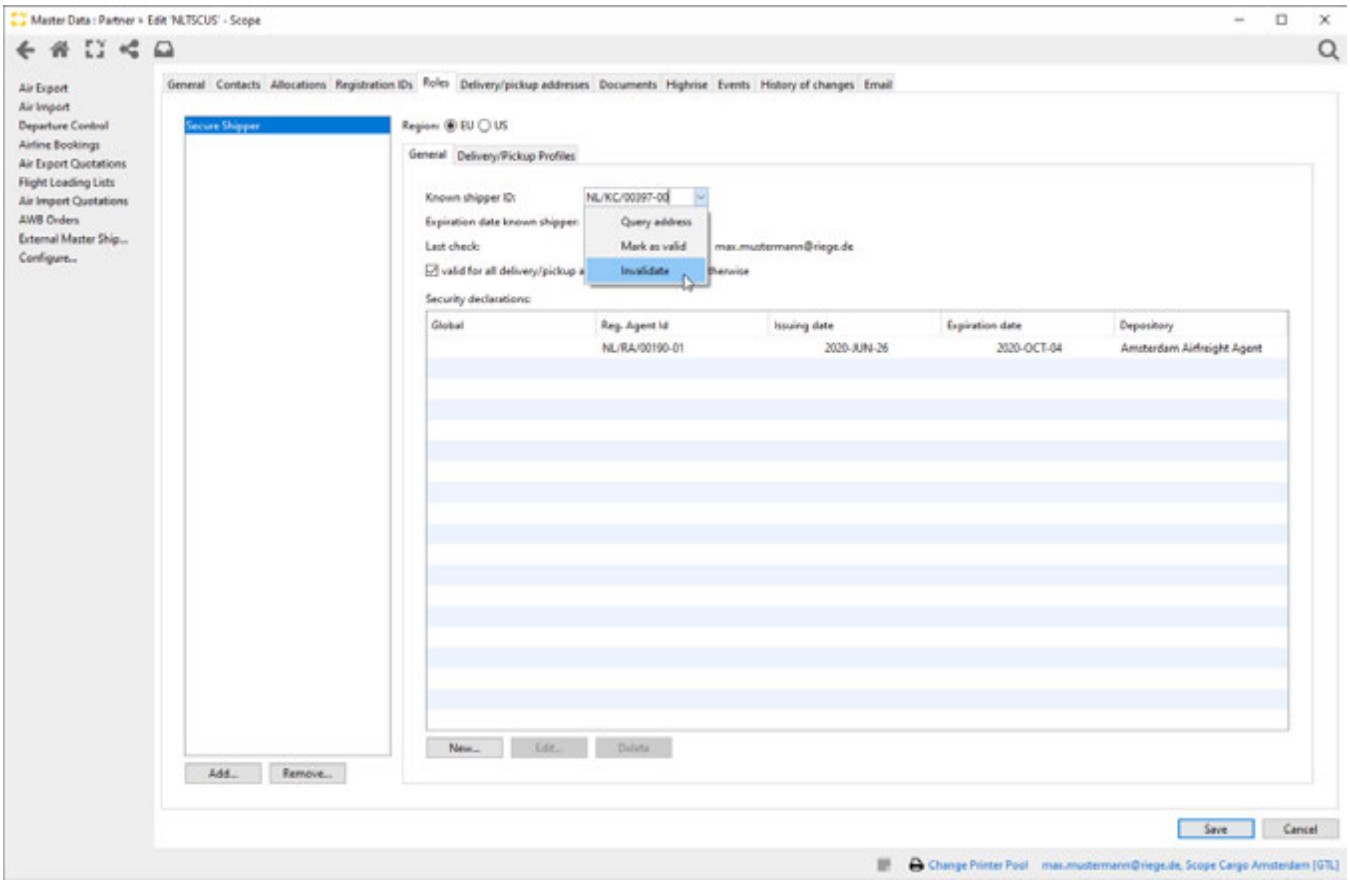
The dialog window shown below opens. Manual validation can be confirmed with the Proceed button.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

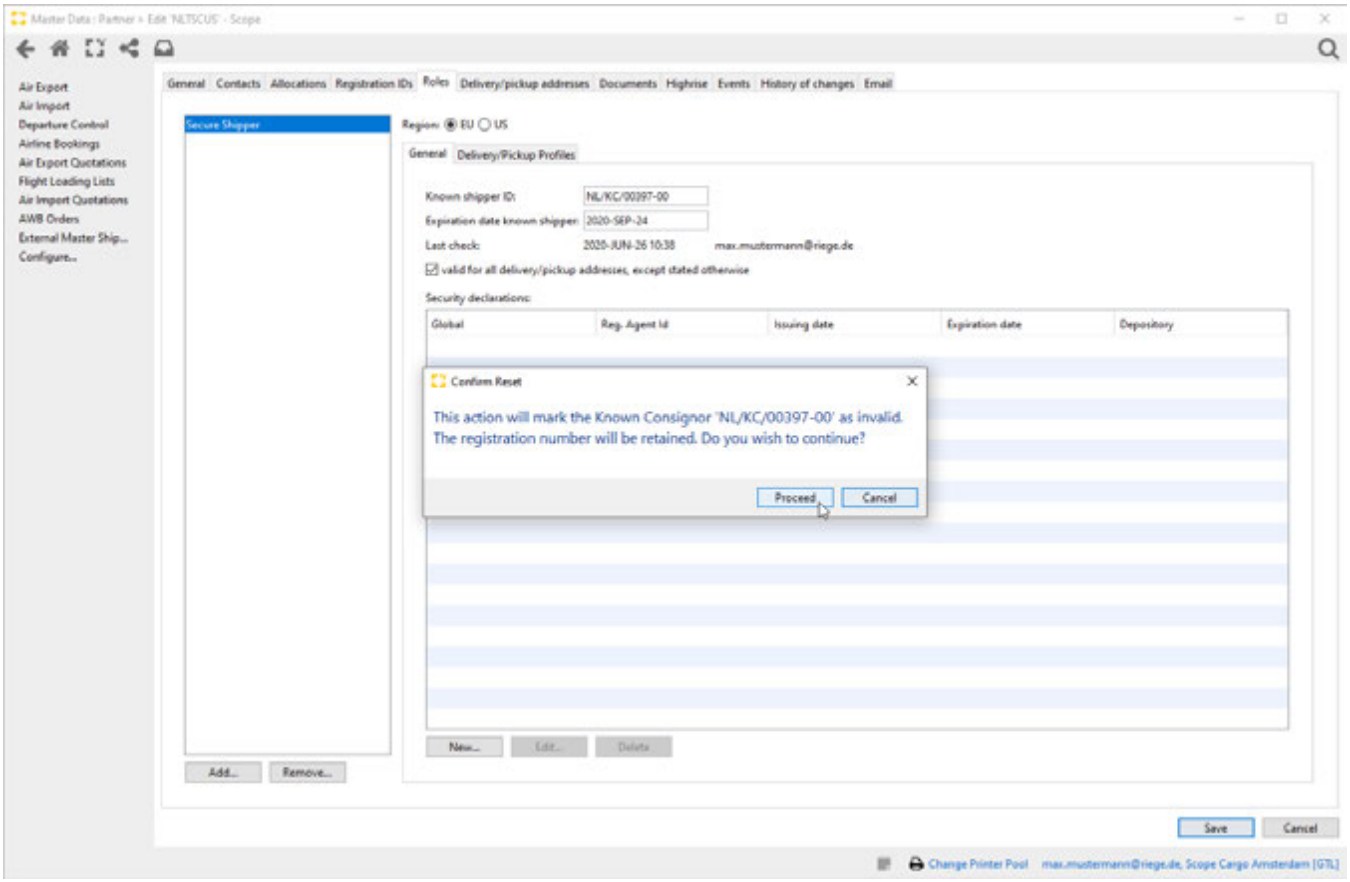
Invalidate

This function can be used to revoke the validation of the registration number for the known shipper (known consignor).



The dialog window shown below opens. Confirmation of the revocation can be completed with the Proceed button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Expiration date known shipper

Shippers with a Known Shipper ID will also have an expiration date for their security status that must be entered.

Last check

This will be populated by the date / time and the user id when the details where last validated in the the EU-RAKC database of manually set to validated.

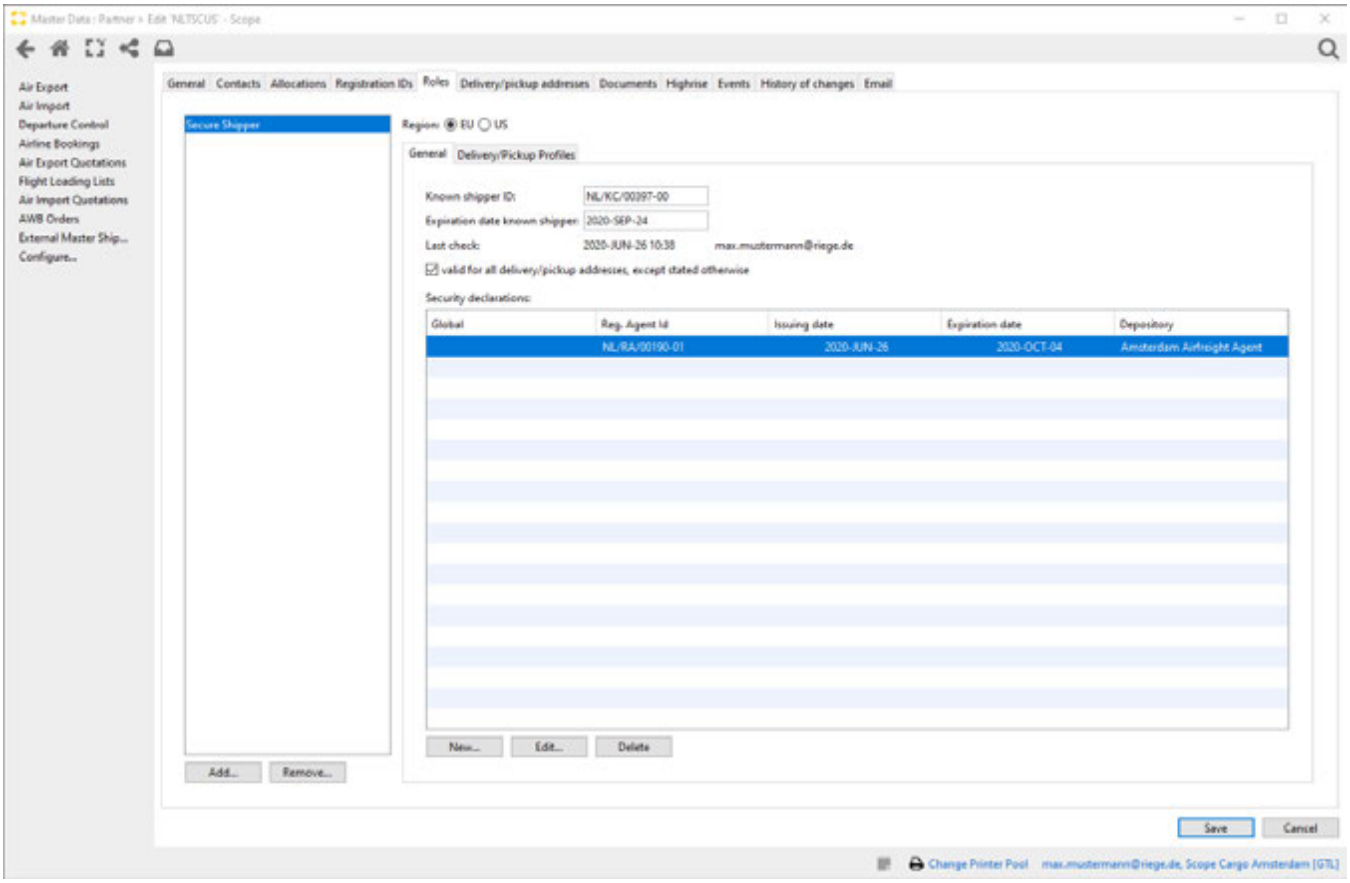
Valid for all Pickup / Delivery addresses

Indication whether or not the registered KC details should be applied to all entered delivery / pickup addresses or not. when not set to active, each of the registered delivery addresses, needs to have its own KC registration else it
will be considered a non-secure address.

Security Declarations:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This table shows security statements that have already been entered.



Global

Here it is defined whether the security declaration applies to all branches of your company.

Reg. Agent Id

Registration number of the regulated agent

Issuing date

date the security declaration was issued

Expiration date

Date the security declaration will expire

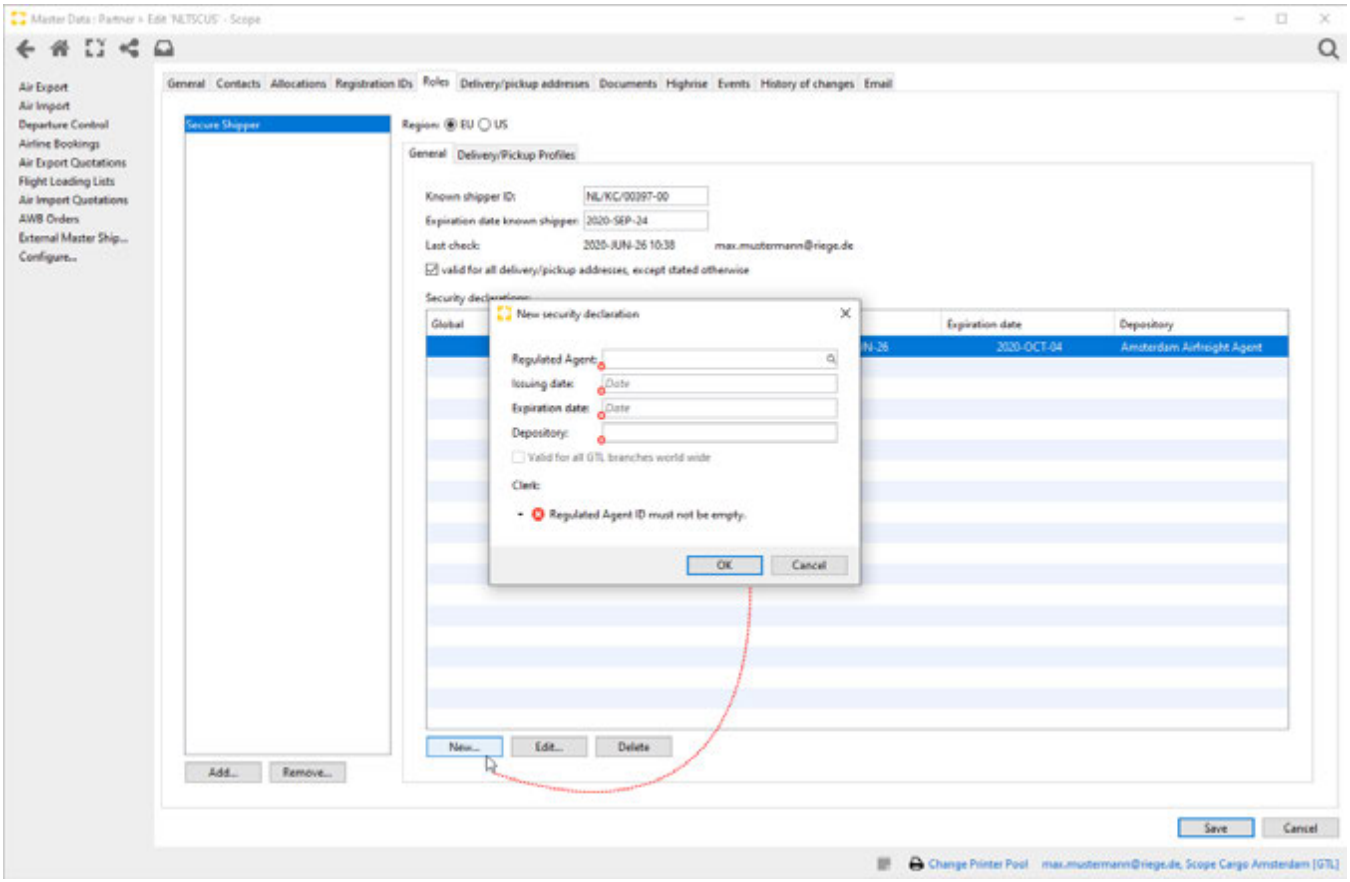
Depository

Location of the physical document

New

The data on security declarations can be entered using the New button:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Regulated Agent

The registration number of the business partner who assigns "Account Consignor" status to the shipper.

Issuing Date

The date of issue of the "Account Consignor" status.

Expiration Date

The date of expiry of the "Account Consignor" status.

Depository

The location of the certificate identifying the shipper as an "Account Consignor"

Valid for all branches worldwide

This checkbox is used to indicate the security declaration may be used by all branches throughout the company. This option should only be used by organizations with centralized security management.

Clerk

The name of the user responsible for creating the security entry.

OK

Saves the data and exits the editor.

Cancel

Exits the editor without further action.

Edit

Opens the highlighted security declaration for editing.

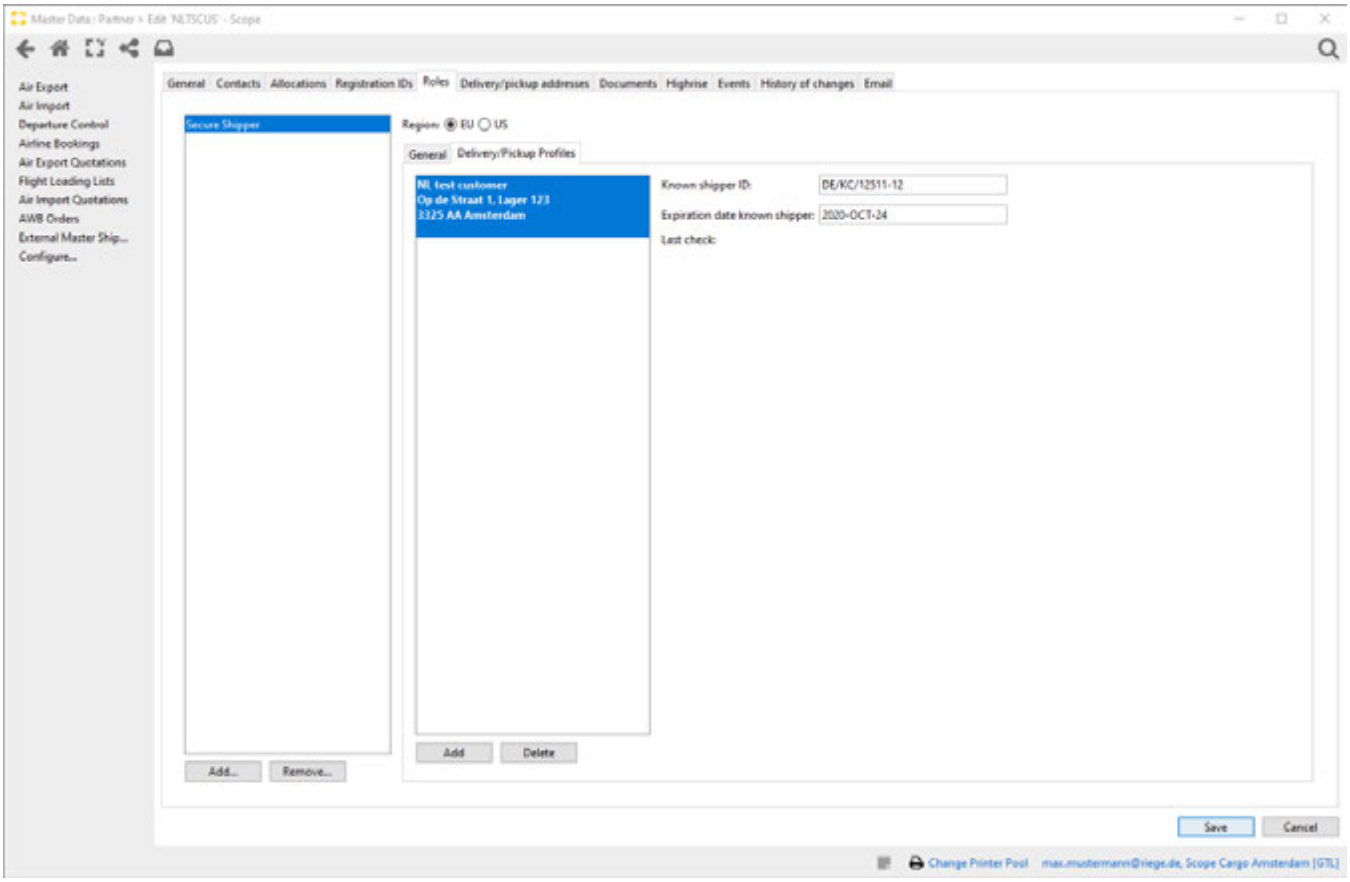
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

Deletes the highlighted security entry.

Delivery / Pick up Profiles

The Delivery Addresses KC details can be set on the tab delivery profiles. Assigned pick-up and delivery addresses can be stored under the pick-up / delivery addresses tab in order to define the validity of the registration number for the pick-up and delivery addresses from the "pick-up / delivery addresses" tab of the business partner. If the pick-up / delivery address has its own registration number, this can be stored here and checked separately.



Relationship between Regulated Agents and Secure Shippers

For the automatic determination of the security status of an export consignment, the information from the roles RegB / TP and Secure Shipper is determined as follows:

Security status of the freight forwarder	Security status of the shipper	Security status of the cargo	Reason for issue
✗	✗	not secure	Irrelevant / not set
Regulated Agent	✗	not secure	Irrelevant / not set
Regulated Agent	Account consignor	SCO - full security for cargo aircraft	AC - Account Consignor
Regulated Agent	Known Shipper	SPX - Safe for passenger aircraft	KC - Know shipper (known consignor)
Regulated Agent	Regulated Agent	SPX - Safe for passenger aircraft	RA - Regulated Agent (regulated agent)
Regulated Agent	Air Carrier	SPX - Safe for passenger aircraft	CA - airline (carrier)

Determining the security status of a shipper

If the shipper is accredited centrally, they may be used as a known consignor (KC).

If the shipper has a valid AEO certificate, they may be termed an Account consignor (AC)

Safety statements or commitments depend on their date of issue:

- If the date of issue of the safety declaration is before 28th April 2009, the security status is *KC* security status if the shipment is within the validity period of the Declaration of Security (1 year after date of issue) otherwise *UNSECURE*.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- If the date of issue of the security of understanding is between the 28th April 2009 and 28th April 2010, the security status is *KC* if the shipment date is between the issue date and the closing date of 25th March 2013. Otherwise *UNSECURE*.
- If the date of the Declaration of Commitment is after 29th April 2010 and the shipment date is after the date of issue, the security status is *AC*.

> According to EU regulation 185/2010, Section 6.5.4 the status "Account Consignor" is revoked if no shipments are handled for a period of 2 years. Scope does not automatically check this possibility.

US Partner Profile - Roles - Business Partners - Maintenance

- Introduction
- Description

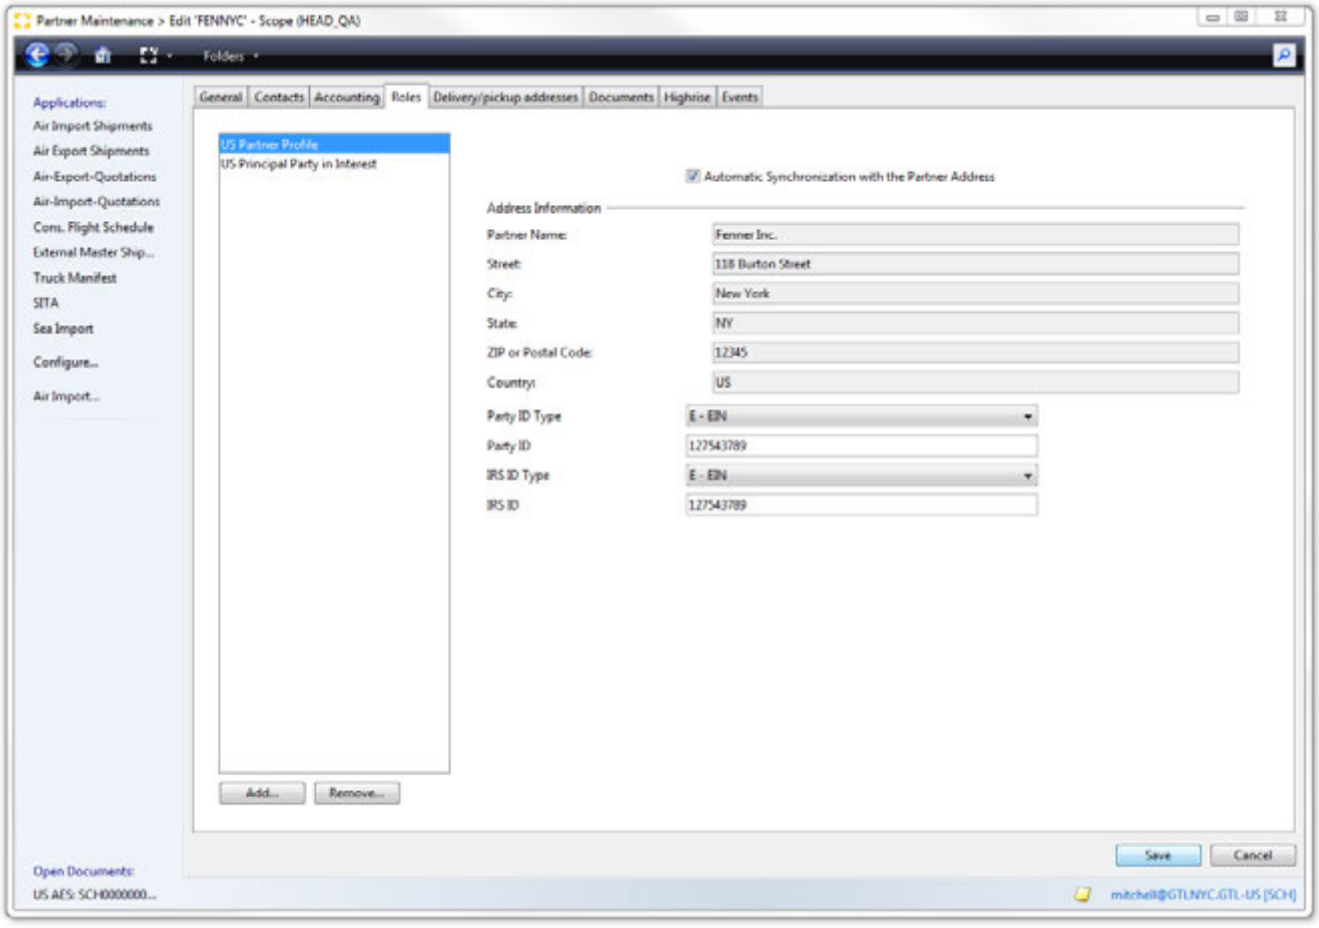
Introduction

This role is used for business partners for whom USA specific information must be stored, typically this will be partners located in the USA or Puerto Rico.

If the partner is a USPPI and requires EEI entries to be filed on their behalf for exports from the USA and Puerto Rico, then it is mandatory for the partner to be assigned the US Partner Profile role in order for a valid tax identifier to be stored.

In addition to identifying information for USPPI's, IRS (Inland Revenue Service) identifying information may also stored. This is useful where the partner requires customs clearance of cargo being imported into the USA. This IRS data is then readily available for Customs Broking operations.

Description



Automatic Synchronization with the Partner Address

This box is checked by default and indicates that the address to be used is the same as the address found in the general tab . This general address will also appear in the address fields below, but in a greyed out format, indicating the information cannot be changed. If the US partner requires that an address different to the general address should be transmitted as the USPPI address, then this box should be unchecked. This will allow different address details to be entered for the USPPI. If the "synchronize" box is subsequently re-checked, then any address details in this role will be lost and replaced by the general address details.

Partner Name

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The name of the USPPI to be sent to CBP.

Street

The street address of the USPPI

City

The city where the USPPI is located.

Zip or Postal Code

The ZIP or postal code of the USPPI

Country

The country of the USPPI (Should be USA or Puerto Rico only.)

Party I.D. type

The ID type to be used to identify the USPPI to CBP. This is a drop down list that offers 3 possibilities:

Type	Description
DUNS	DUNS Number
E.I.N.	EIN Number
Type T	Foreign Entity

Party ID

Depending on the ID type chosen, this should be the DUNS number, the E.I.N. or the I.D. issued to the foreign entity.

IRS ID Type

The type of IRS Identification used when customs clearing goods into the USA. This is a drop down list offering 2 types of IRS ID:

Type	Description
DUNS	DUNS Number
E.I.N.	EIN Number

IRS ID

The DUNS or EIN number of the partner.

Save

Stores the data and closes the US Partner Profile.

Cancel

Closes the US Partner Profile without further action.

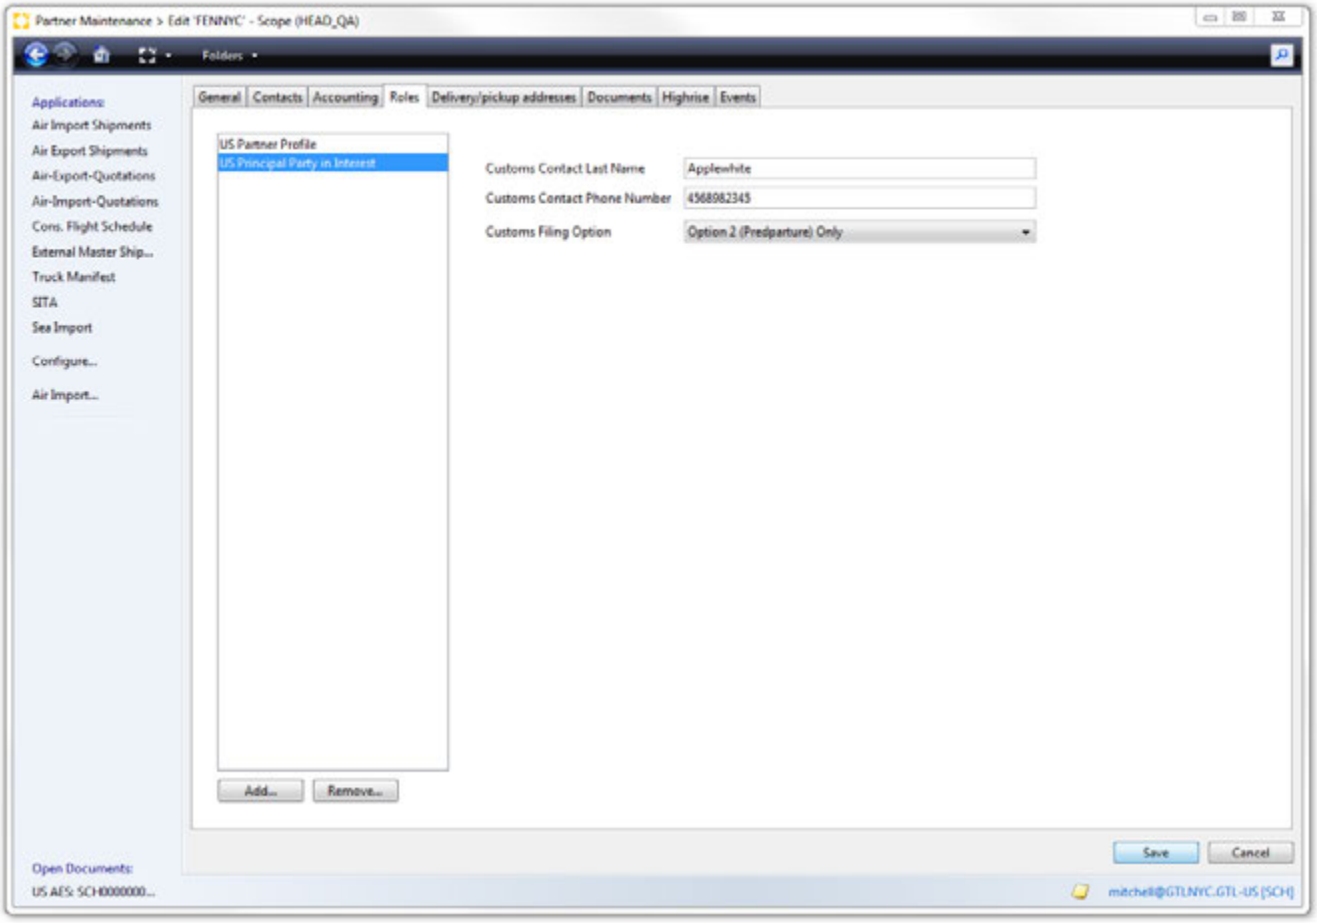
US Principle Party In Interest - Roles - Business Partners - v

Introduction

This role is used for business partners on whose behalf electronic entries will be submitted to the United States Customs and Border Protection for air and sea export shipments. The partner and the agent submitting the electronic export entries will also be required to have a US Partner profile.

When electronic export entries are created, the US AES application will use the data stored in this role to transmit the correct USPPI (United States Principle Party in Interest) details to the CBP. The USPPI may or may not be the shipper. It is not possible to transmit a US electronic export declaration unless this role is present for the USPPI.

Description



Customs Contact Last Name

When the Partner is a USPPI, the last name of the responsible person who is the USPPI or in the employ of the USPPI must be submitted to CBP. This information should be stored in this field.

Customs Contact Phone Number

When the Partner is a USPPI, the contact phone number of the responsible person who is the USPPI or in the employ of the USPPI must be submitted to CBP. This information should be stored in this field.

Customs Filing Option

Where the partner is a USPPI, the type of electronic export declarations made on their behalf should be stored in this field. This will then be used by the US Export declaration module to ensure the correct type of data is requested during creation of the export declarations and it will ensure the correct data is sent to CBP.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This is a drop-down field offering 3 selections:

Type	Description
Option2	Full details are to be submitted on export of the goods
Option 4	Post departure. Partial details are submitted on export of the goods. With full details to follow within 10 days of export. Only CBP approved parties can be option 4.
Option 2 or 4	The party may submit both option 2 and option 4 EEI entries.

Save

Stores the data and closes the USPPI role.

Cancel

Closes the USPPI role without further action.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Reasons - Master Data

- Introduction
- Description

Introduction

Various applications in scope (e.g. credit control, notes, AWB pool etc.) send a notification to the user when certain events occur. These notifications are then displayed at the bottom right of the user interface as so-called growl or sticky messages.

Description

Depending on the application, notifications are e.g. displayed when using a business partner in a shipment entry, when opening a shipment or when obtaining a waybill number. Depending on the priority (notes) or meaning, these messages are automatically hidden again after a few seconds (Growl Nachrigt) or must be actively closed (Sticky message).

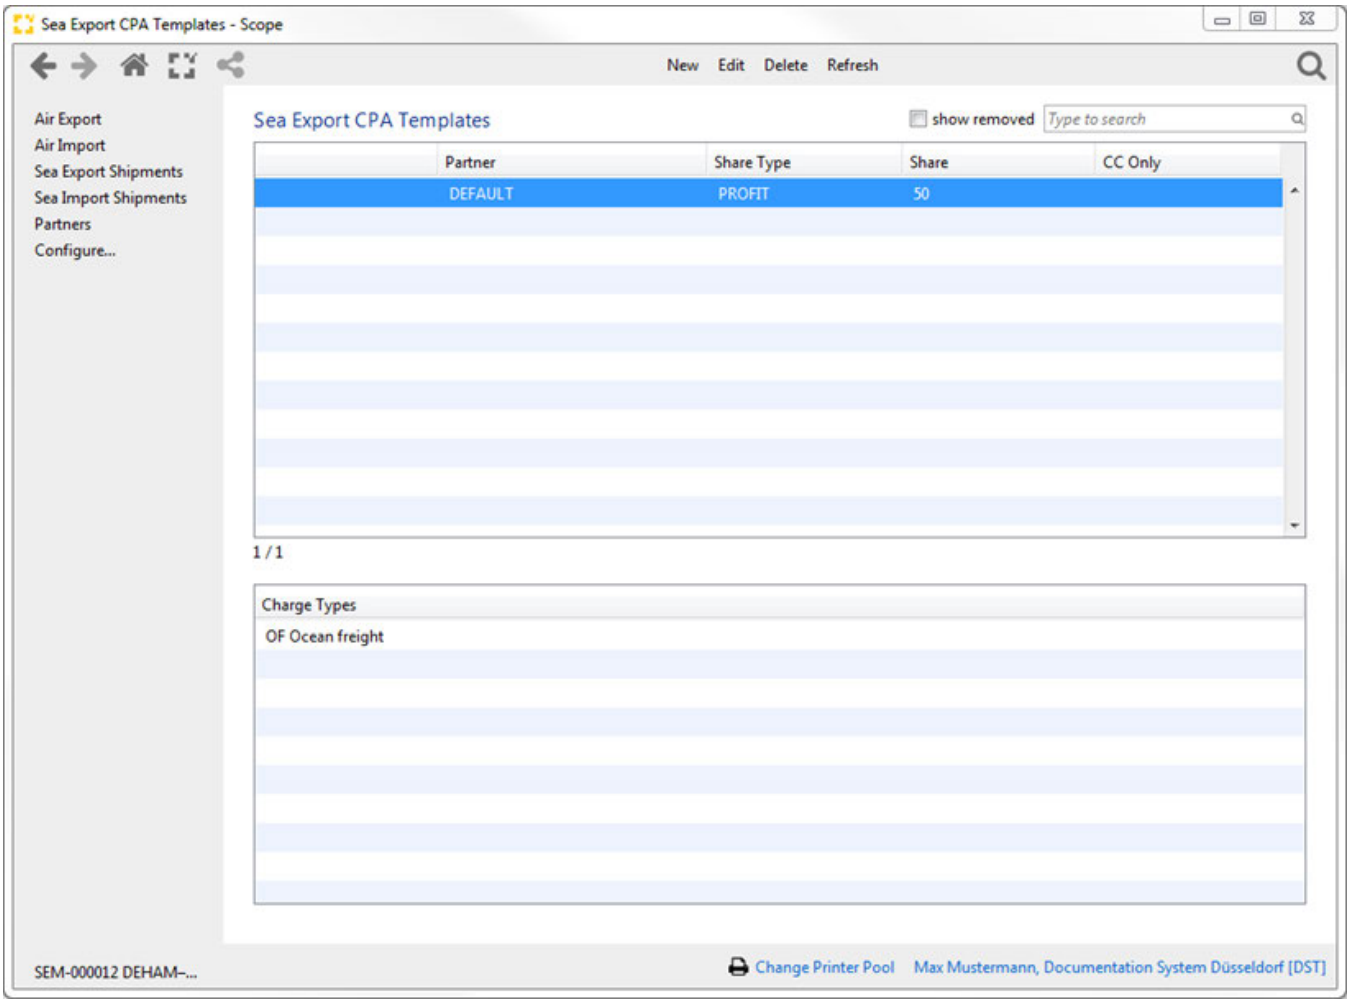
CPA Templates - Seafreight - Maintenance

- Introduction
- Description

Introduction

CPA templates are used for automatic calculation of profit share and the branch consol profit analysis per house bill. These templates are used to highly automate the profit share process. A "default" template can be created which serves as the basis for new, more specific CPA templates. The "default" template can also be use in the Consol profit analysis for agents who have no specific templates.

Description



New

This function is used to create a new CPA template and pops-up a dialogue window where the partner for the CPA template can be inserted or searched for. Only partners who are agents will be available. If the field is left blank, this indicates the default template is being created and only one instance of this default CPA template may exist.

Click "OK" to proceed and the CPA template editor opens.

> ⚠ Multiple instances of CPA templates for the same partner or multiple instances of the default template cannot be created and will produce an error message.

Edit

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Opens the highlighted CPA template in the CPA Template Editor.

Delete

Removes the highlighted CPA template from the overview. This is not permanently deleted, but marked as inactive and removed from the field of view.

Refresh

Refreshes the list of CPA templates to ensure the latest information is visible.

CPA Templates

The summary list of CPA templates displays the CPA partner name, the type of share, the amount of share - percentage or actual amount and the charge codes include in the profit share calculation.

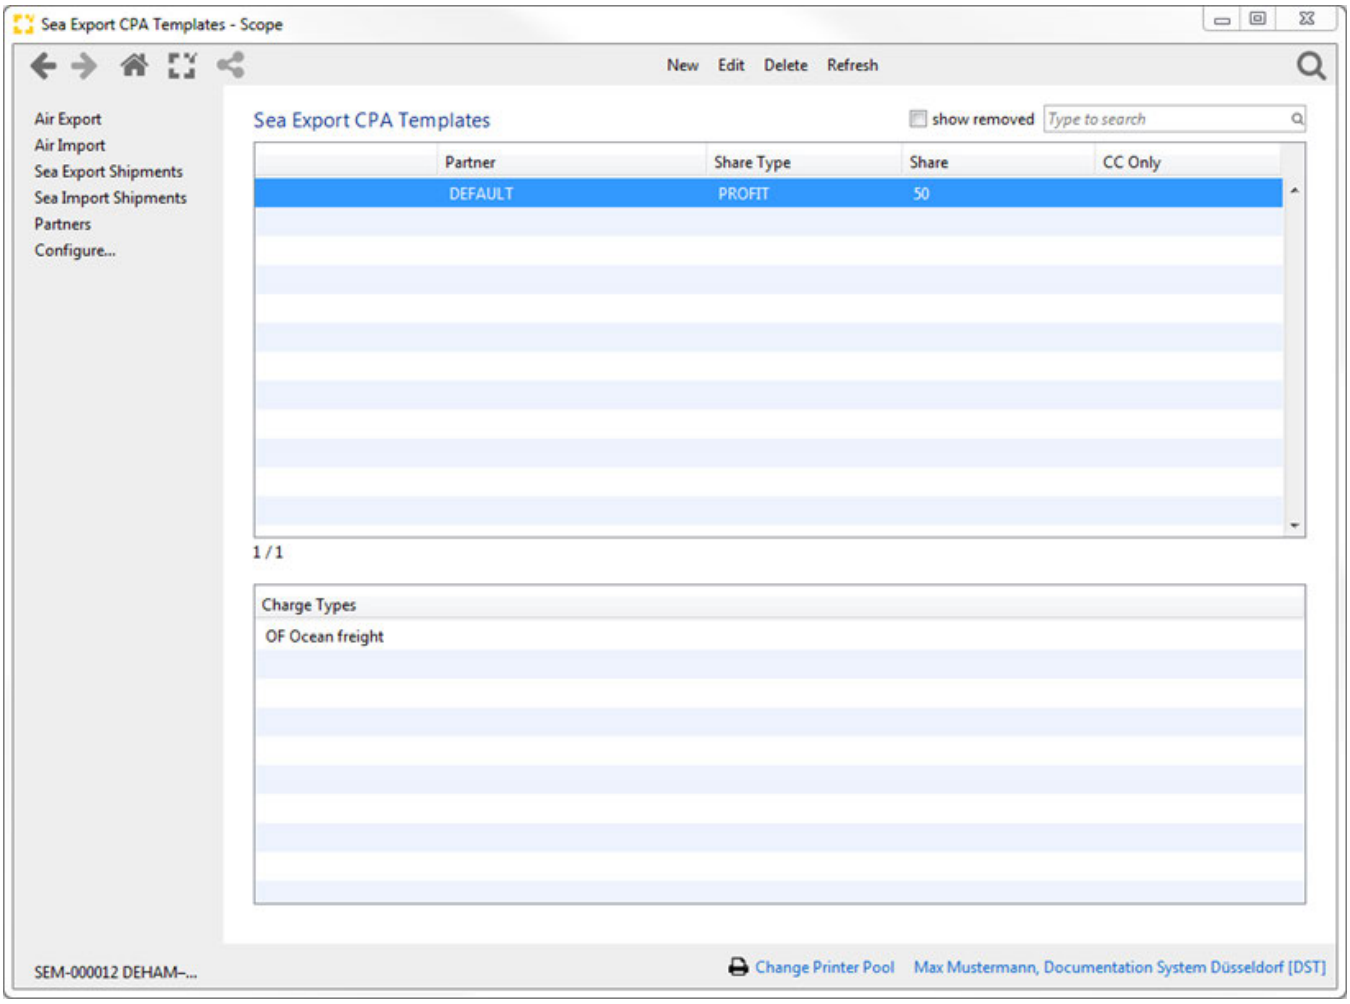
Show removed

Include any deleted CPA templates. This will be shown with the "trash" icon to the left. If clicked, they can be restored.

Type to search

Enter keywords in the search field to filter the list of CPA templates.

CPA Template Editor



Partner

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The name of the partner for whom the profit sharing arrangement is being created.

Share Type

The type of profit share arrangement with the partner selected from a drop down list:

Type	Description
Profit	Participation in profits
Income	Participation in revenue
Fixed amount	Participation via a fixed amount

Share

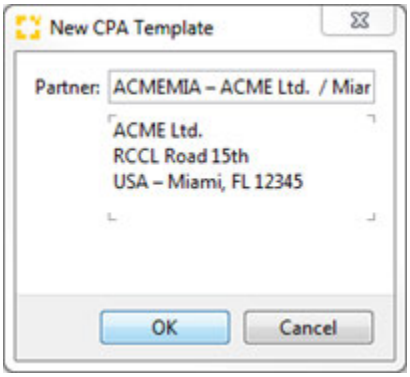
The "profit" or "income" share must be expressed as a percentage of the total in this field. A "Fixed Amount" will be recorded here as a fixed figure. The normal arrangement is a "Profit" participation with a 50% share for the partner.

Charge types

The table displays the type of charges to be included in the profit share arrangement.

New

Opens a window to enter a partner. The CPA template is only valid for this partner.



After ticking OK, a window opens where detials for the CPA template can be done.

Partner

Partner address. The field cannot added.

Share Type

Here, the Share Type (type of profit sharing) are defined which will apply to this partner . Three options are available in the drop-down list

Type	Description
Profit	Share in profits
Income	Share in income
Fix amount	Share in fix amount

Share

The height of the participating is defined in this field. For " profit " and " income " a percentage is set here . For " fixed amount " may be a fixed amount in local currency will be deposited . In many cases , the profit share is set at 50% of profit.

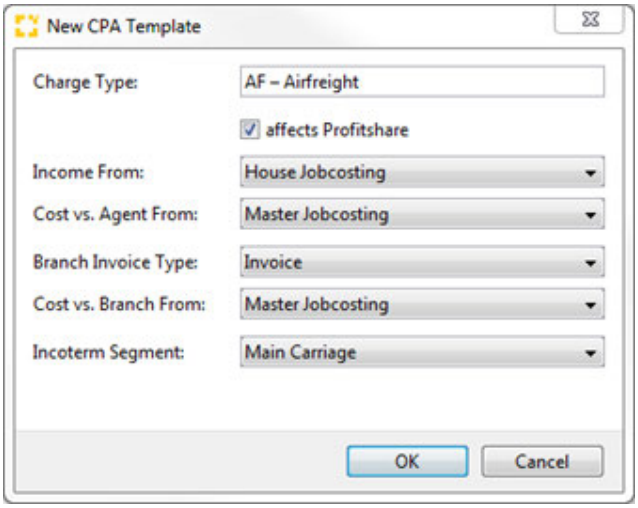
Charge Type

This table shows the charge types are displayed on which a profit share to be calculated.

New

Opens a charge type editor where details of the charge code for the profit arrangement can be stored.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Charge Type

The Charge code to be used, this can be found using the field search function.

Effects Profitshare

Indicates if the charge is to be used in the profit share or if to be used only for billing. By default this option is enabled.

Income from

Specifies how the costs are to be calculated:

Menu Item	Description	Standard
No automatic calculation	No amounts are calculated automatically but can be entered manually.	
House Jobcosting	Proceeds are calculated from the area of costs and revenues of the HBLs	✓

Cost vs. Agent from

Specifies how the costs are to be calculated. The following options are available in the drop-down menu:

Menu item	Description	Standard
No automatic calculation	No amounts are calculated automatically but can be entered manually.	
Master Jobcosting	The costs will be covered from the jobcosting of B / L	✓
Recalculate on Master	The cost is calculated based on the stored in the accumulator internal tariffs	
Recalculate on Master (Agent tariff)	The cost is calculated based on the collector deposited agents tariffs.	
Recalculate for each House (internal tariff)	The cost is calculated based on the stored indoors internal tariffs .	

Branch invoice type

Here can be defined as the Branch account (Housing bill) to be created. The following options are available in the drop-down menu:

Menu item	Description	Standard
Empty	The cost is not taken into account only in the Profit Share in the Branch account	
Invoice	The cost will be charged as a invoice to the branches	✓
Credit note	The cost will be charged as a credit note to the branches	

Cost vs. Branch from

Menu item	Description	Standard

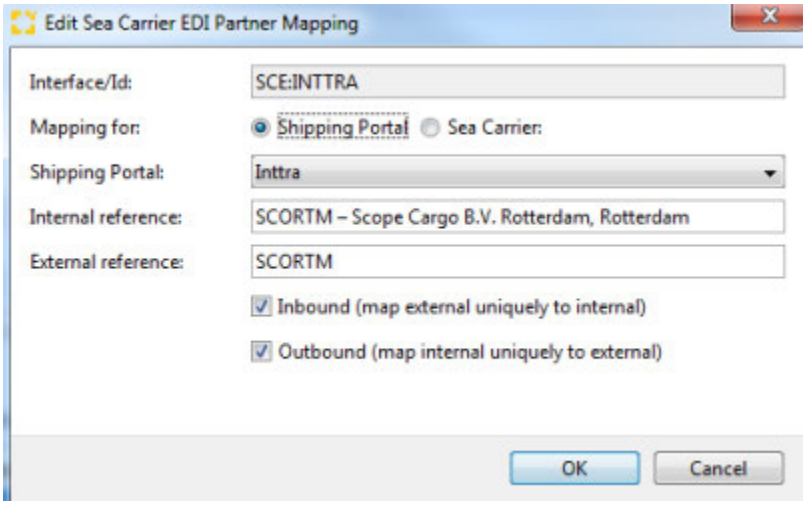
Sea Carrier - EDI Partner Mapping

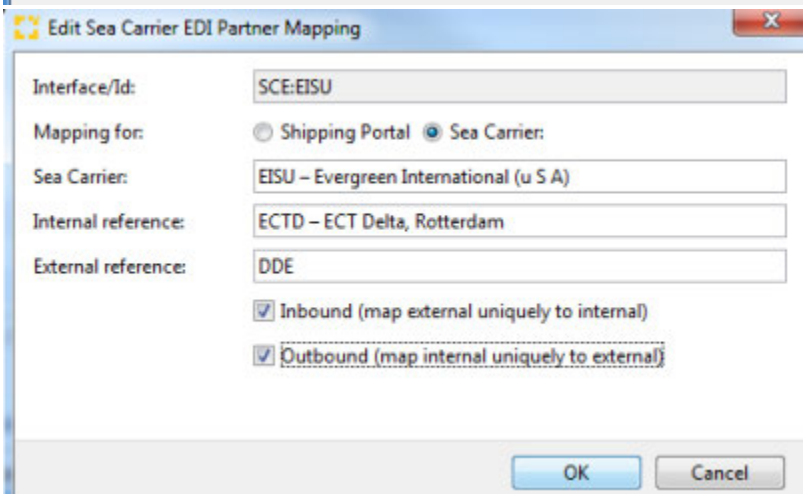
- Introduction
- Description

Introduction

In Sea Carrier EDI partner Mapping, the external codes for Scope Partners

Description





Interface/id:

The type of Partner mapping, Disabled field the value will be determined by the "mapping for/shipping portal" setting

Mapping For

With the mapping for it is indicated the purpose of the external reference

Type	Description
Shipping Portal	Set to shipping portal the mapping is done for a Scope Branch Partner and registration id of that partner in the shipping portal
Sea Carrier	Set to sea carrier the mapping can be used to map company code as used by the carrier for container depots, terminals etc, to possibly available Scope Partner

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Shipping Portal

Indication for which Portal where this coding is applicable ("Mapping for" is set to Shipping Portal)

Carrier

Indication for which Carrier this coding is applicable ("Mapping for" is set to Carrier)

Internal references

In internal reference the partner where this coding applies is selected

External Reference

WIth the external reference the code as applicable for the external party is registered

Inbound

When active a validation will be done the control wether for this partner only 1 unique code has been assigned, should only be used when multiple external codes link to the same partner (valid for inbound messages)

Outbound

When active a validation will be done the control wether for this partner only 1 unique code has been assigned, should only be used when multiple partners link to the same external code (valid for outbound messages)

Sea Export Sailing Schedule - Seafreight - Maintenance

- Introduction
- Description

Introduction

Seafreight carriers operate according to sailing schedules. The application allows these schedules to be created together with their related information. During sea export shipment creation, when entering the voyage details, it is then possible to view and select sailings from the schedule and apply these to the shipment.

Description

The sailing schedule application presents a table showing all existing sailings together with extensive details about these sailing. There is a menu bar to modify the sailings and search functions to find sailings based on ports, date ranges and keywords.

? Unbekannter Anhang

New

This function on the menu bar will open the sailing schedule editor where a new sailing schedule may be created.

Edit

This function on the menu bar will open the schedule highlighted in the overview using the sailing schedule editor . This will allow an existing sailing schedule to be edited.

Delete

This function on the menu bar will delete the schedule highlighted in the overview.

Refresh

This function on the menu bar will update the list of sailing schedules to ensure the latest information is visible.

Sailing Schedules

The sailing schedules window lists all available sailings or those matching any filter criteria. the table shows:

- Voyage number
- Departure port
- ETS (Estimated time of sailing)
- Liner Agent
- Vessel Name
- Destination port
- ETA (Estimated time or arrival)

The sailing schedules listed may be sorted by clicking the title of each column.

From Port

To view sailing from a particular port, type the name of the port or the port code. This is a full search text field that will search the database of all available sea ports.

To Port

To view sailing to a particular port, type the name of the port or the port code. This is a full search text field that will search the database of all available sea ports.

Earliest ETS

To search the list of sailings from a defined depart date, enter the earliest sailing date that should be used as the start point for the search. This is a date and time field and so the calendar function is available to the right. The results will include only sailings that occur on or after this depart date.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Earliest ETA

To search the list of sailings up until a defined arrival date, enter the latest arrival date that should be used for the search. This is a date and time field and so the calendar function is available to the right. The results will include only sailings that arrive on or prior to this arrival date.

Type to search

This full search text field allows all tariffs to be searched using particular keywords such as vessel names, voyages, port names etc.

Destinations - Sea Export Sailing Schedule - Seafreight - Maintenance

- Introduction
- Description

Introduction

For each sailing, multiple destinations and their associated details may be created using the **Destinations** tab.

Description

The application displays a list of existing destinations and functions to add new destinations, edit existing destinations or delete destinations.

? Unbekannter Anhang

The overview displays:

- Port (code)
- Name (Port Name)
- ETA (Estimated arrival date)
- B/L Form

New

Opens the **New Sailing Destination** editor to enter a new destination and details.

Destination Port

The port the sailing will arrive at. This is a full search text field and the port code or name may be entered to obtain the desired port.

E.T.A.

The Estimated time of arrival at the port. This is a date and time and so the calendar is available to the right.

B/L Form

The name of the bill of lading form that should be used for this sailing destination.

OK

Saves the new sailing destination and exits back to the **Destinations** application.

Cancel

Exits the new sailing destination without saving changes and returns to the **Destinations** application.

Edit.

Opens the destination highlighted in the overview using the **New Sailing Destination** editor in order to change the destinations details.

Delete

Deletes the destination highlighted in the overview.

Save

Saves any changes to the **Destinations** data and returns to the Sailing Schedule overview

Cancel

Exits the **Destinations** tab without saving any changes and returns to the Sailing Schedule overview

General - Sea Export Sailing Schedule - Seafreight - Maintenance

- Introduction
- Description

Introduction

The general sailing schedule editor is used to create and edit sailing schedules. The **General** tab is used to capture the basic details about the schedule and the departures of the sailing. CFS and CY details that relate to the departure are also captured.

The application has a second tab which is the Destinations tab where destinations and arrival dates for the sailing may be stored.

Description

? Unbekannter Anhang

General

Voyage

The voyage number issued by the carrier for the sailing.

exDakosy

If the sailing is provided via Dakosy, this box will automatically be checked.

Liner Agent

The agent representing the carrier. This is a full search text field . The agent name or code may be entered to locate the desired Liner Agent. Only business partners who have the role Liner Agent assigned to them will be available in this field.

The Liner agents address will appear below the agent name.

Carrier

The carrier who operate the sailing. This is a full search text field . The carrier name or code may be entered to locate the desired carrier. Only entities created in the seafreight carrier maintenance will be available in this field.

Vessel

The name of the vessel used for this sailing.

Lloyds Number

The Lloyds vessel number

Flag

The country where the vessel is registered. This is a full search text field in which the country name or code can be entered to located the desired country.

Type of vessel

This is a drop down list that allows classification of vessels as:

- Container Ship
- Dry Bulk Carrier
- Ferry
- General Cargo Vessel
- Grain Carrier

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Liquefied Natural Gas Carrier
- Liquefied Petroleum Gas Carrier
- Ocean Vessel

Remarks

Any remarks relevant to the sailing.

h2 Departures

Once general details for the sailing have been entered. The ports and related departure details may be stored in the departures section. This displays a list of all the departures for a sailing, comprising:

- Port (Code)
- Name (Port Name)
- ETS (Estimated Time of Sailing)
- CFS Location (Container Freight Station Location)
- CFS Closure (Container Freight Station closing data and time)
- CY Location (Container Yard Location)
- CY Closure (Container Yard closing data and time)

New

Create new departure details with the **New** function key. This will launch a **New Sailing Departure** editor:

? Unbekannter Anhang

Departure Port

This is a full search text field where the code or name of the departure port may be entered to locate the correct depart port.

E.T.S.

The estimated time of sailing from the departure port. This is a date and time field and so the calendar is available to the right.

CFS Location

The name of the container freight station that will be used for this sailing. full search text field .

CFS closing data and time

The date and time when the CFS closes for cargo on this sailing. This is a date and time field and so the calendar is available to the right.

CY Location

The name of the container yard that will be used for this sailing. full search text field .

CY closing data and time

The date and time when the CY closes for cargo on this sailing. This is a date and time field and so the calendar is available to the right.

OK

Saves the new sailing departure information and exits back to the **General** tab of the sea export sailing schedule.

Cancel

Exits back to the **General** tab of the sea export sailing schedule without saving any changes.

Edit

Opens the departure highlighted in the list using the **New Sailing Departure** editor. Changes may then be made to the departure.

Delete

Deletes the departure highlighted in the list

Save

Saves any changes to the sailing and exits.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Cancel

Exits the sailing without saving any changes.

Seafreight Carriers - Seafreight - Maintenance

- Introduction
- Description

Introduction

The seafreight carrier maintenance application is used to add, edit and delete seafreight carriers. Currently seafreight carrier information is limited to the carrier name and SCAC code.

Description

Th application displays a complete listing of existing carriers and their SCAC codes. This listing can be managed using the functions on the menu bar and the full search text field

New

The **new** menu option will present an editor with two text fields used to capture the new carriers details:

SCA Code

The 4 digit SCAC code of the carrier

Name

The full name of the carrier

Save

Saves the new carrier details

Cancel

Exists the new carrier editor without saving any information.

Edit

Opens the carrier highlighted in the overview using the carrier editor. This enables the carrier details to be edited.

Delete

Deletes the carrier highlighted in the overview. A warning message appears prior to deletion requesting confirmation that the deletion should be completed.

Delete

Select delete to delete the carrier.

> Carriers are not physically deleted, but simply removed from view

Cancel

Select cancel to exit without deleting the carrier.

Refresh

updates the overview of carriers to ensure the latest carrier details are present.

Seafreight Carrier

An overview window showing all carriers or carrier matching the keyword in the search field.

SCA code

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The carriers SCA code

Name

The carriers full name

Show removed.

When checked, this check-box will ensure that any deleted carriers are also displayed in the listing.

Type to search

A full search text field . Typing in the carrier code or keyword will restrict the list of visible carriers to those matching the search term.

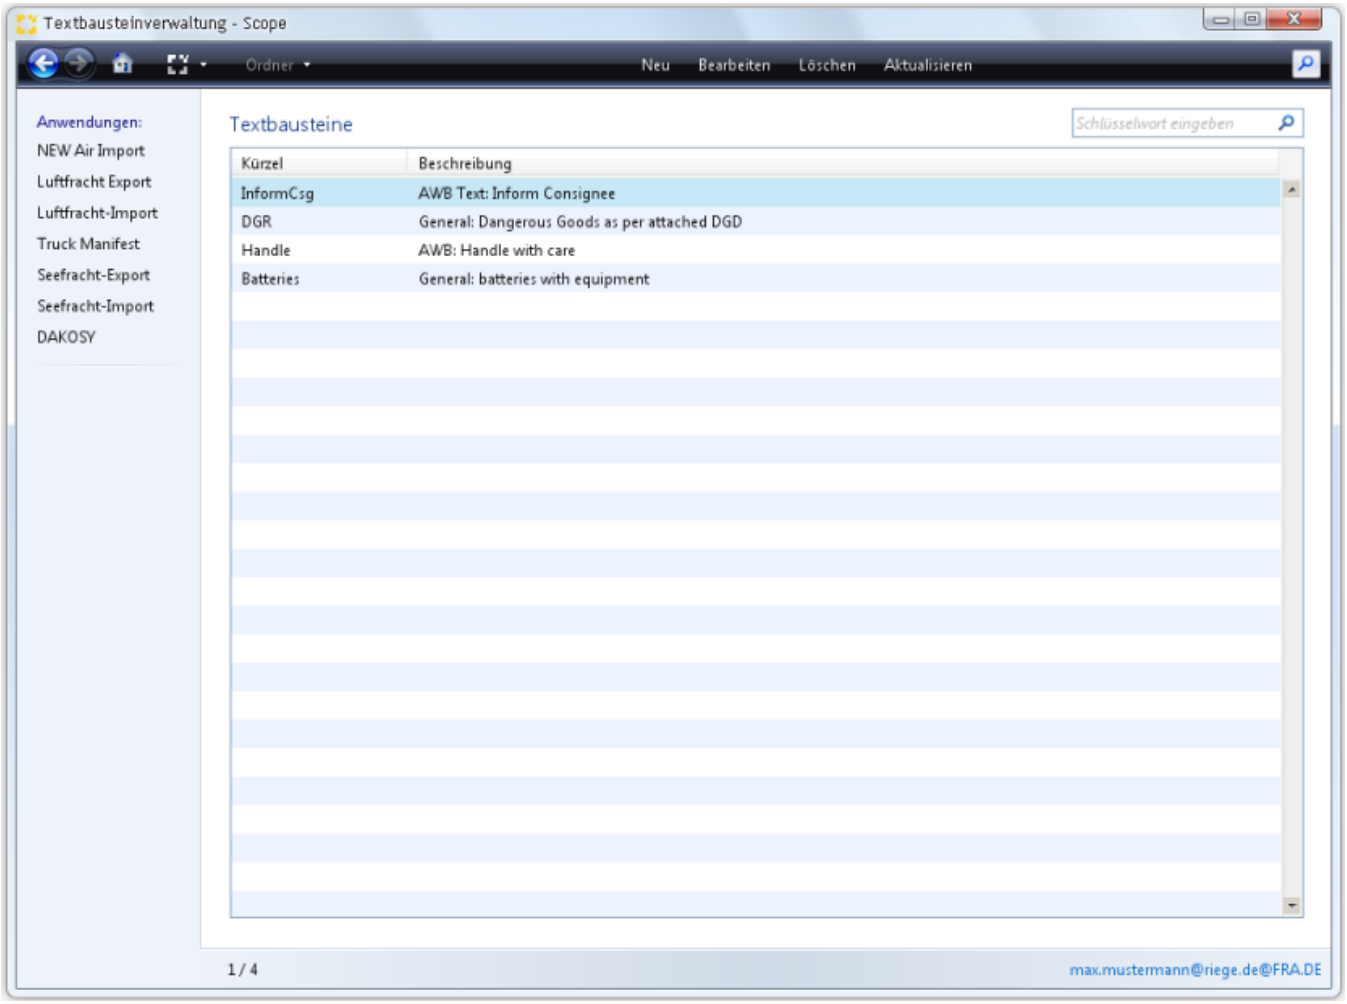
Text Blocks - Maintenance

- Introduction
- Description

Introduction

Text blocks are standard blocks of text that are used regularly and need to be stored within the application so that they can readily be called up when needed. This application is for the creation and maintenance of text blocks. Text blocks are defined entirely by the customer. They can be called up in other applications when in text fields, these text fields can be right clicked followed by the selection of "select text blocks" from the context menu. It is then possible to search for and select the appropriate text block and paste it into the current application.

Description



The following functions are available.

New

To create and store a new text block.

Edit

Open the text block highlighted in the overview and revise it if necessary.

Delete

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete the text block highlighted in the overview.

Refresh

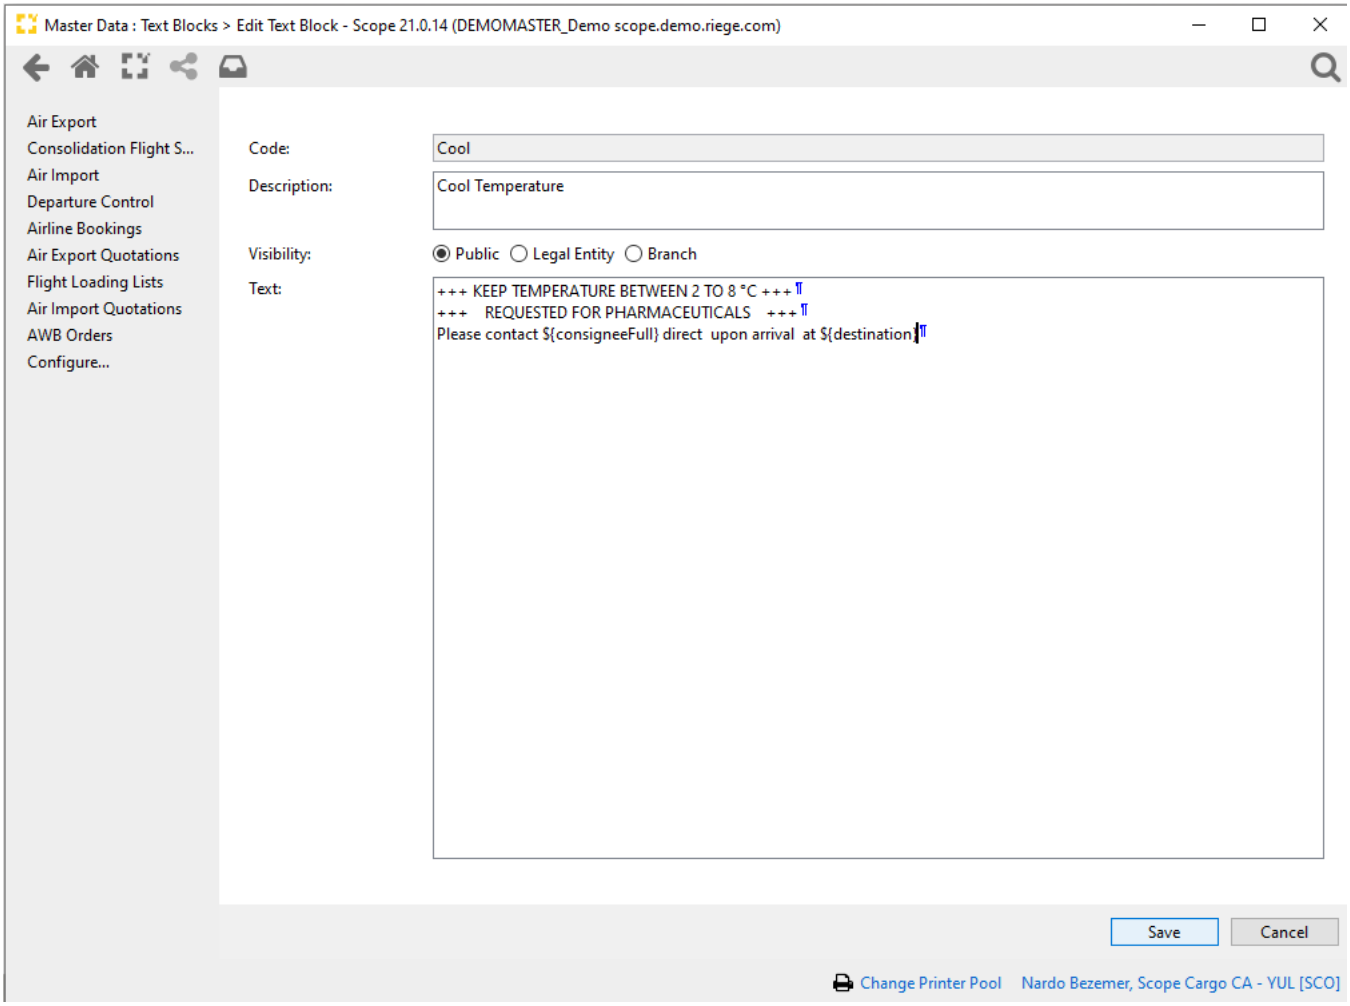
Update the index to ensure the latest text blocks are present.

Type to search

This is a full text search field. A part of a text block or code may be entered in order to find that text block in the list.

Editor

The *New* and *Edit* functions launch the text block editor.



Code

A unique alpha-numeric code that represents the text block.

Description

A short description of the code and perhaps it's use.

Visibility

Determine where the text-block should be available

Level	Meaning

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Public	Text block available everywhere in the organisation
Legal Entity	Text block available in the legal entity active when the block was created
Branch	Text block available in the branch active when the block was created

Text

The text of the text block. This may be one or multiple lines. It is possible to use placeholders in the text allowing the placeholder to be populated with shipment related data. You can double-click using your mouse in the text block text field to get a popup showing the placeholders you can select from.

Placeholder	Meaning
${user.name}	User name inserting the textblock
${user.phone}	Telephone number of the user
${branch.phone}	Telephone number of the Branch where the shipment belongs to
${orderer}	Customer Name
${ordererFull}	Customer Full address
${shipper}	Shipper Name
${shipperFull}	Shipper Full Address
${consignee}	Consignee Name
${shipmentnumber}	Scope Assigned shipment number
${transportnumber}	Transport document number (AWB - AIR / OBL - SEA)
${departure}	Departure Name
${destination}	Destination Name

Save

Saves the text block details and returns to the overview.

Cancel

Cancels the action without saving any changes.

UNLocodes - Maintenance

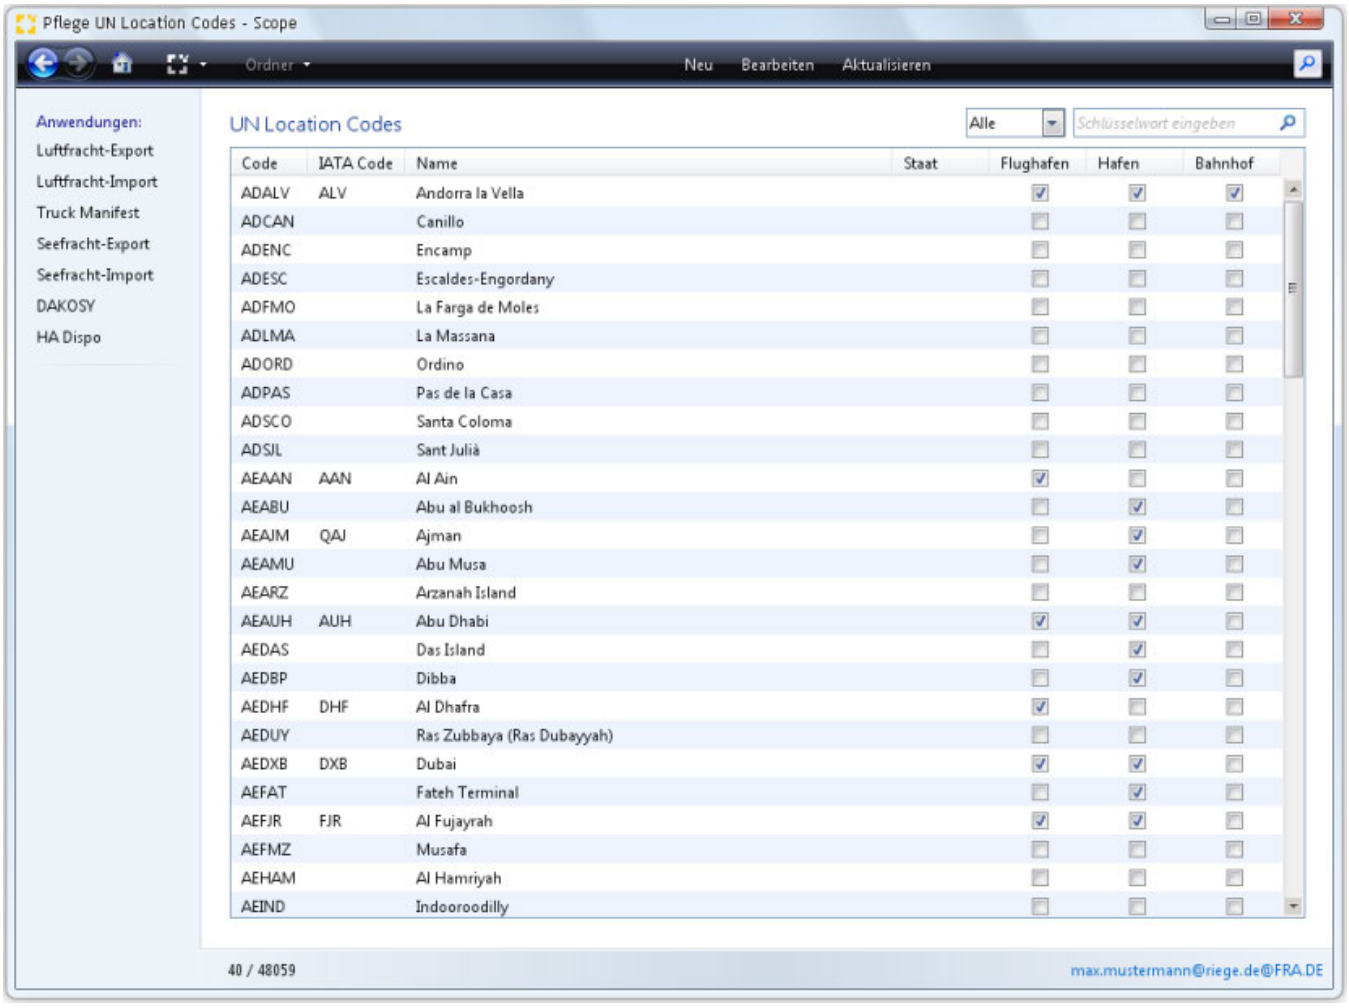
- Introduction
- Description

Introduction

The application maintains UN location codes and IATA airport codes. These codes are used in most freight applications to define the departure and destination points.

> This data is standardized internationally. To ensure error free operation, country data is therefore maintained by **Riege Software International** via the SDS master system and distributed to all customer systems. ***Users should not have access to, nor change in any way this data.***

Description



New

This action creates a new UN Location Code using the Editor.

Edit

Opens the location highlighted in the overview with the Editor for further adjustment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Delete

Removes the UN Location code highlighted in the overview. The recorded is not physically deleted, but marked as inactive and may be restored as described below.

Refresh

Updates the index to ensure the latest UN Location codes are visible.

UN Location Codes

An overview of existing UN Location codes, showing, code, IATA code, name. state and indicating if the the location is an airport, seaport or railway station.

Show removed

Check this box to display previously deleted locations. These deleted locations will appear in the listing with the *Trash* icon in the left hand column. Editing deleted items will restore them to active status.

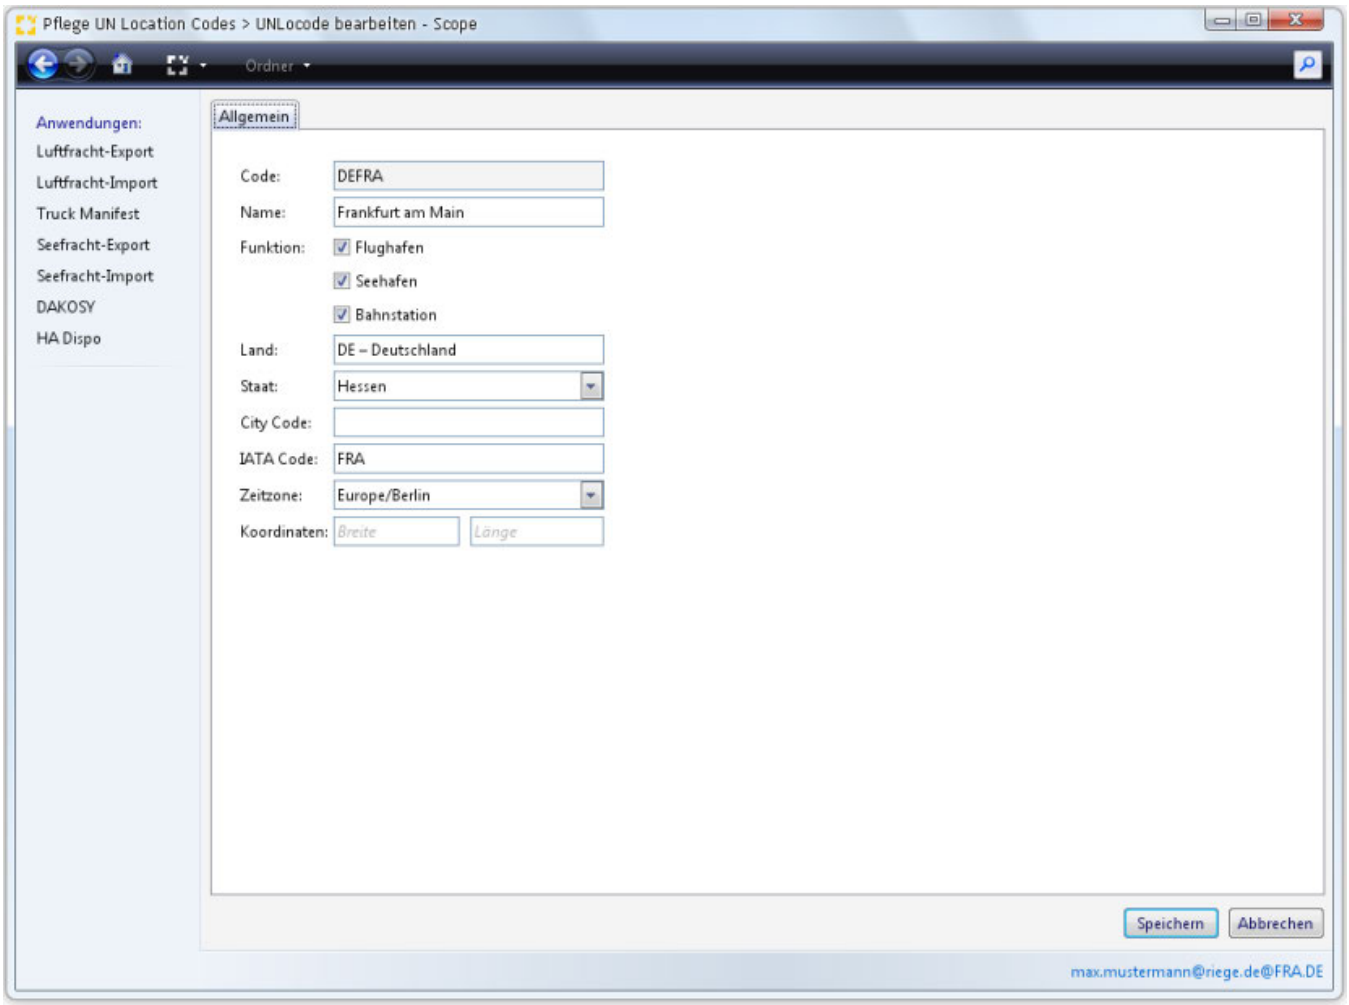
Filter (All, Airports, Port, Railway Stations)

The filter provides a drop down list to restrict the listing of locations to the desired type of location such as airports only. This field will default to *All* to ensure all locations are initially displayed.

Text to search

The full text search field can be used to search for locations using keywords, such as the UNLocode, the IATA code or the location name or part of the name.

Editor



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Code

The international standardized code (UN Location Code) for this location.

Name

Name of the location

Function

Three check boxes are present that are used to indicate if the location is one or more of the following:

- Airport
- Seaport
- Railway Station

> ⚠ This information is used in various applications. It should be noted that a location cannot be used as an airport in an air import application for example, if the location is not identified here as an airport.

Country

The country in which the location is found. The field search function can be used to find the country within the list of valid countries stored by the application.

State

Once the country has been selected, the drop down menu will show a list a states for the country selected. The state of the UNLOCODE must be selected.

City Code

A city code used to identify the UNLOCODE may be stored here,

IATA Code

The locations IATA Code. These codes are internationally standardized.

Timezone

The drop-down menu presents a complete listing of possible time zones for the location. The correct time zone should be selected.

Coordinates (Latitude / Longitude)

The latitude and longitude of the location.

Save

Saves the location details and exits back to the overview.

Cancel

Exits back to the location overview without saving any changes to the location.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Webtracking

- Introduction
- Description

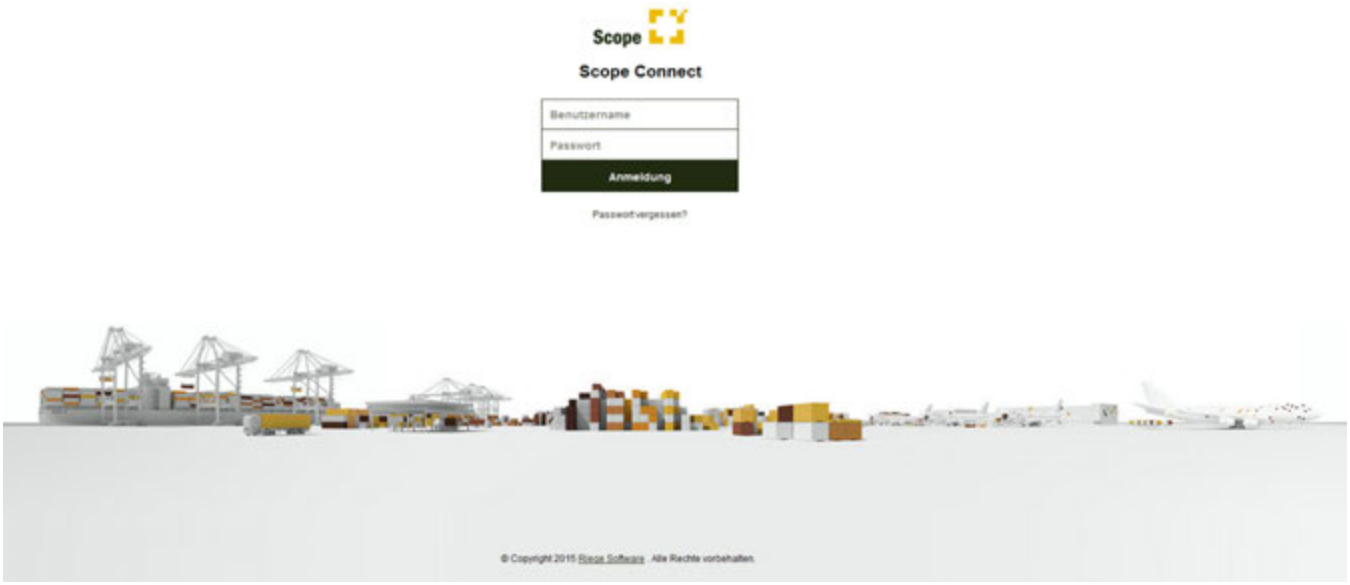
Introduction

To supply third parties (e.g., business partner, agents, customers and employees) with information about their air- and sea shipments, the T&T Webtracking main entrance from Riege can be used. There one can track and trace shipments, see or keyin status events and carry out web bookings which are available in Scope immediately. The advantage here is that the user works on the same database as the SCOPE system and therefore movements and changes to the shipments are visible immediately for the user.

With a suitable login on this T&T web main entrance the third who have no access to your Scope system can call away in such a way by web browser, the topical shipment data concerning them and status events of her shipments without detour - on a real-time basis-. In addition, can be added - according to access rights - by these third status events to shipments. With the login and the regarding rights is made sure with the fact that third receive only access to the information for which they became a free-switched before by you.

In addition the Riege T&T Webtracking gateway offer the option to carry out a booking on-line via web browser which flows in immediately automatically onto the Scope system and by which Scope user after confirmation to a shipment can be processed. The use of this enlarged possibility is also steered about access rights.

Description

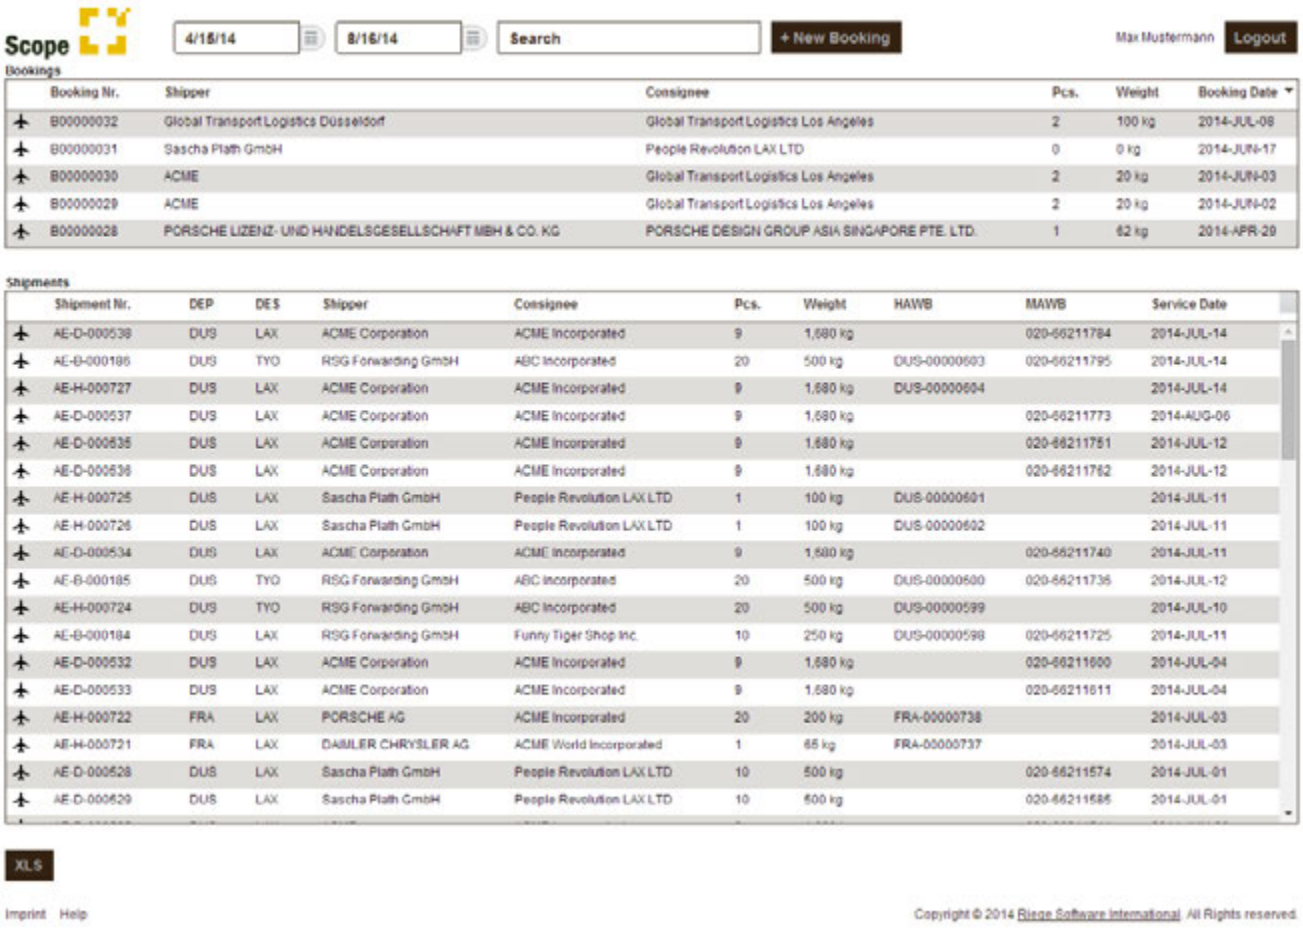


Shipment Query

Selection

After successfully Login at the Riege T&T Webtracking-Portal the user has various possibilities of selection to locate the search of data:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the upper action bar the user can keyin a search key, a time frame (standard 4 month) and, if allowed, a booking.

For shipment search a date range at webtracking is available. Standard is from: (today - 3 month) to: (today + 1 month)

The date range can be changed and also applies to bookings (bookings, not converted to shipments and not older than 3 month will be included). The date range applies to the economic date (Leistungsdatum).

The following search criterias are available:

Selection	Description
Shipment Number	Shipment Number
Booking Number	Booking Number
From country or Location	Keyin of the UNLocode acc. keyin of the country of the departure for one USLAX or HKG
To country or Location	Keyin of the UNLocode acc. keyin of the country of the destination for one USLAX or HKG
Shipper	Name of the Shipper
Consignee	Name of the Consignee
HAWB / BL-Number	Keyin of the regarding HAWB Number (Air) or BL-Number (Sea)
MAWB / MBL-Number	Keyin of the regarding IATA AWB Number (Air) or Master BL-Number (Sea)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The output of the search can be sorted. You can use any search term from the headline. With a klick at the wanted column the records will be sorted automatically up and down.

Overwiew Bookings

Bookings

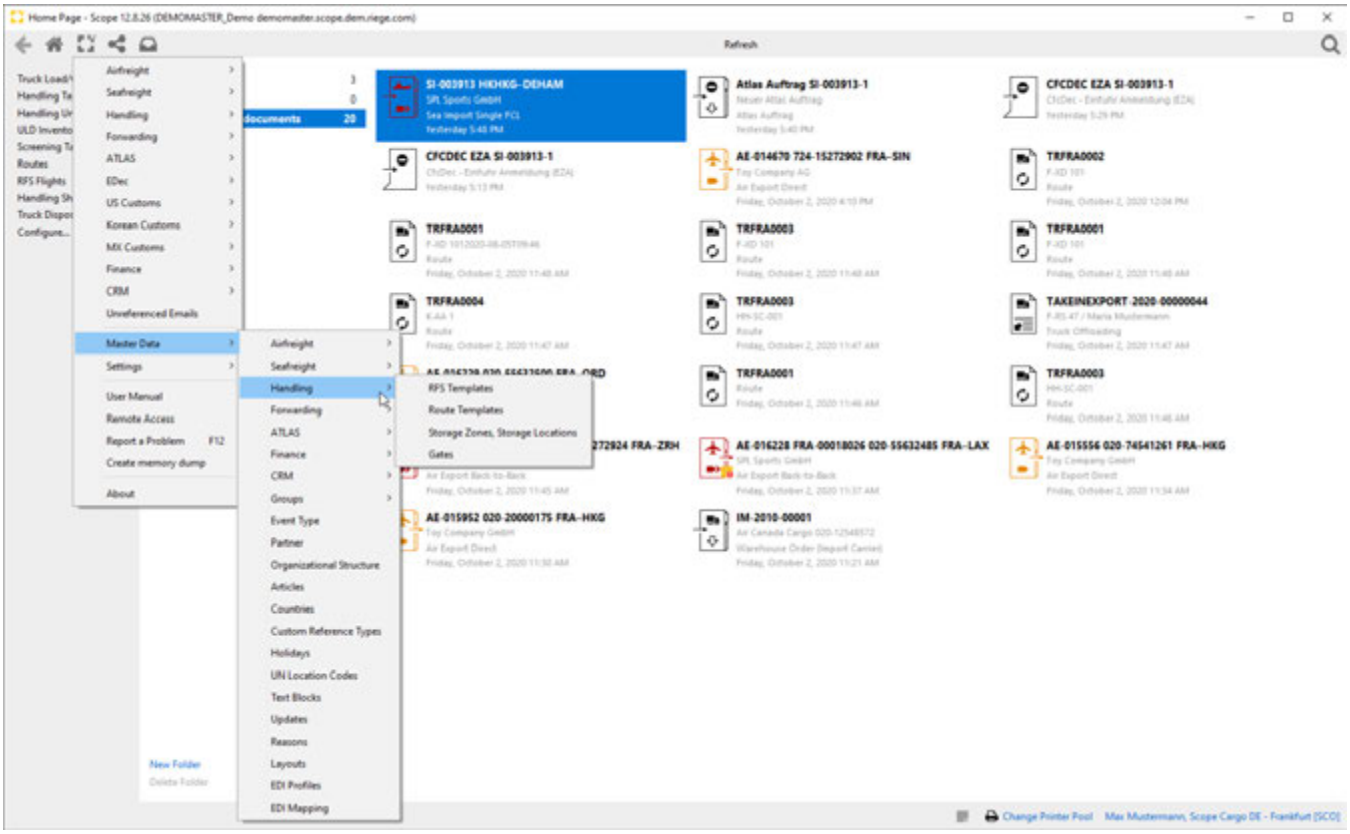
Handling - Master Data

- Introduction
- Description

Introduction

The handling master data can be accessed via the Scope menu Master data - Handling. In this application, the master data specifically for the Scope Handling application can be stored.

Description



These applications are described in detail in the following chapters.

- (a) RFS Templates - Handling - Master Data
- (b) Route Templates - Handling - Master Data
- (c) Storage Zones, Storage Locations
- (d) Gates - Handling - Master Data

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

(a) RFS Templates - Handling - Master Data

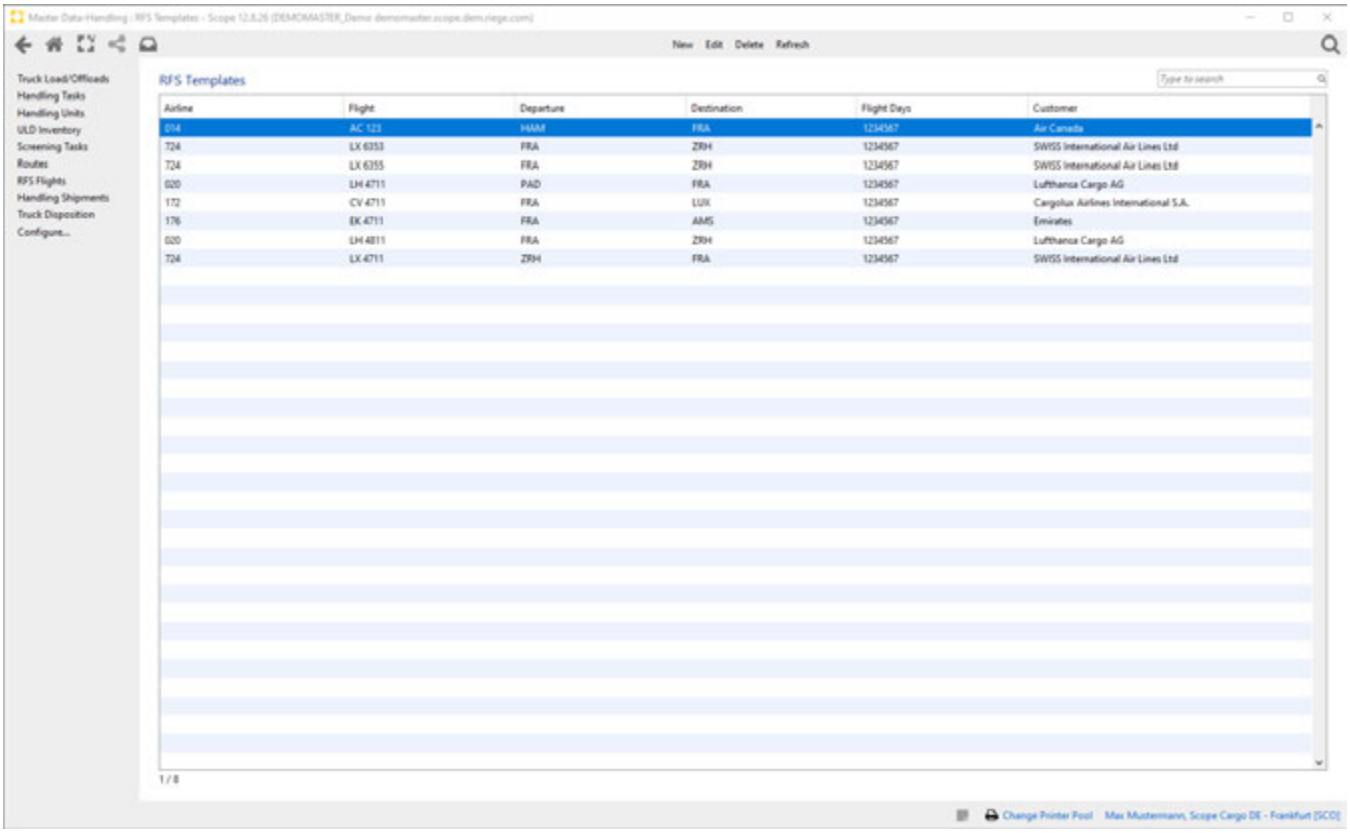
- Introduction
- Description

Introduction

In the Scope application RFS templates, all RFS (Road Feeder Service) master data can be stored, which are used in the truck unloading import as well as in the handling routes.

Description

- Program Action
- Field description



Program Action

New

Creates a new RFS template.

Edit

Opens the data record selected in the overview table for editing. Alternatively, this can also be opened by double-clicking on the corresponding line in the overview table.

Delete

Deletes the selected RFS template in the overview.

Refresh

Updates the data in the overview

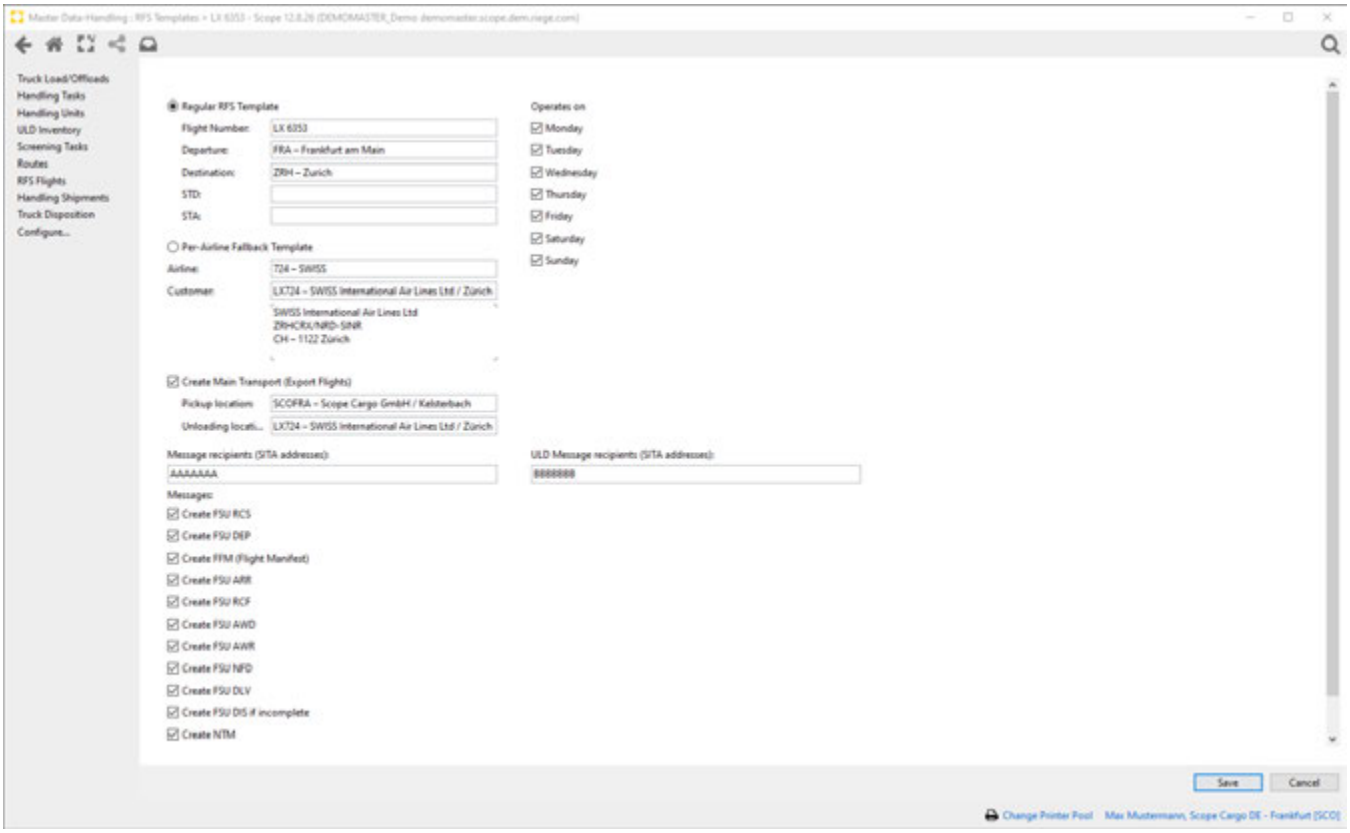
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Field description

Keyword search

By entering of one or more search terms, the templates displayed can be filtered accordingly.

RFS Templates



Flight Number

Specifying the flight number.

Operates on

Indication of the flight days on which this flight operates. This information is provided for information only at the moment.

Departure

Airport of Departure of the flight (RFS truck)

Destination

Airport of Destination of the flight (RFS truck)

STD

Planned time of Departure

STA

Planned time of Arrival

Per-Airline Fallback template

Record of the airline. The airline master data is part of Scope's standard set-up. The airline can be found using the airline prefix (e.g. 020 = Lufthansa) or the two-letter code (e.g. LH)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Customer

The partner to whom the handling of the shipments on this flight is charged. This is usually the airline itself or the handling agent used by the airline.

Create Main Transport (Export Flights)

If the check mark is set, a pick up and unloading location can be entered for the main leg (Export)

Pick up Location

Location for pick up

Unloading Location

Location for unloading

Message recipients (SITA Addresses)

Specification of the SITA addresses to which the SITA advices will be sent when handling this flight. If there are several SITA addresses, the information is separated by a comma ",". e.g. SITANR1, SITANR2, SITANR3 etc.

ULD Message recipients (SITA Addresses)

Specification of the SITA addresses of the ULD message recipient.

Messages

Overview of possible messages

Messages Import

Message	Description	Message Trigger	Date, Time of the input field
FSUARR	The consignment has arrived on a scheduled flight at this location	Receipt of the EU_P (ATLAS)	Time Truck Arrival
FSUAWD	The arrival documentation has been physically delivered to the consignee or the consignee's agent on this date at this location	Send ESV (ATLAS)	End of Unloading
FSUAWR	The arrival documentation has been physically received from a scheduled flight at this location	Send a pre summary declaration (ATLAS)	Start Unloading
FSUDLV	The consignment has been physically delivered to the consignee or the Consignee's agent on this date at this location		Date of Delivery, date of division
FSUDIS	Discrepancy		
FSUNFD	The consignee or the consignee’s agent has been notified, on this date at this location, of the arrival of the consignment		End of Unloading
FSURCF	The consignment has been physically received from a given flight or surface transport of the given airline	Send the ESV (ATLAS)	End of Unloading
FSUDEP	Departure Event	Execution event upon completion	
NTM	create an NTM		

Messages Export

Message	Description	Message Trigger	Date, Time of the input field
FFM	Airline Flight Manifest		
FSURCS	The consignment has been physically received from the shipper or the shipper’s agent on this date at this location

(b) Route Templates - Handling - Master Data

- Introduction
- Description

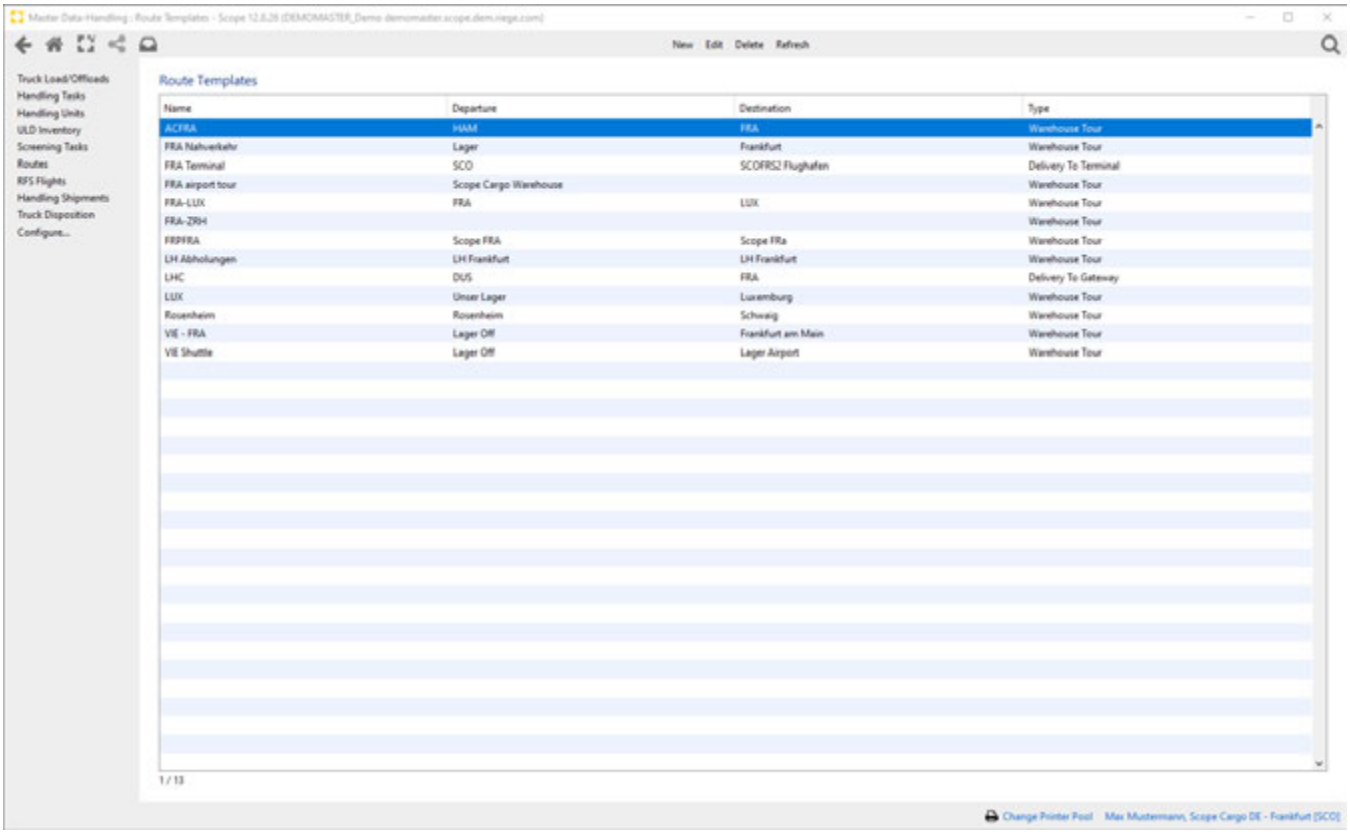
Introduction

Route templates can be created in this application. These templates are required in the handling module and the Truck Manifest in order to be able to create, document and schedule transport tours from / to a gateway or terminal as well as general pick-up and delivery tours.

Description

- Program Action
- Field description

In this overview, all route templates that have already been created are displayed.



Program Action

New

Open the editor *New template* to create a new Route Template.

Edit

Opens the data record selected in the overview table for editing. Alternatively, this can also be opened by double-clicking on the corresponding line in the overview table.

Delete

Deletes the selected Route template in the overview.

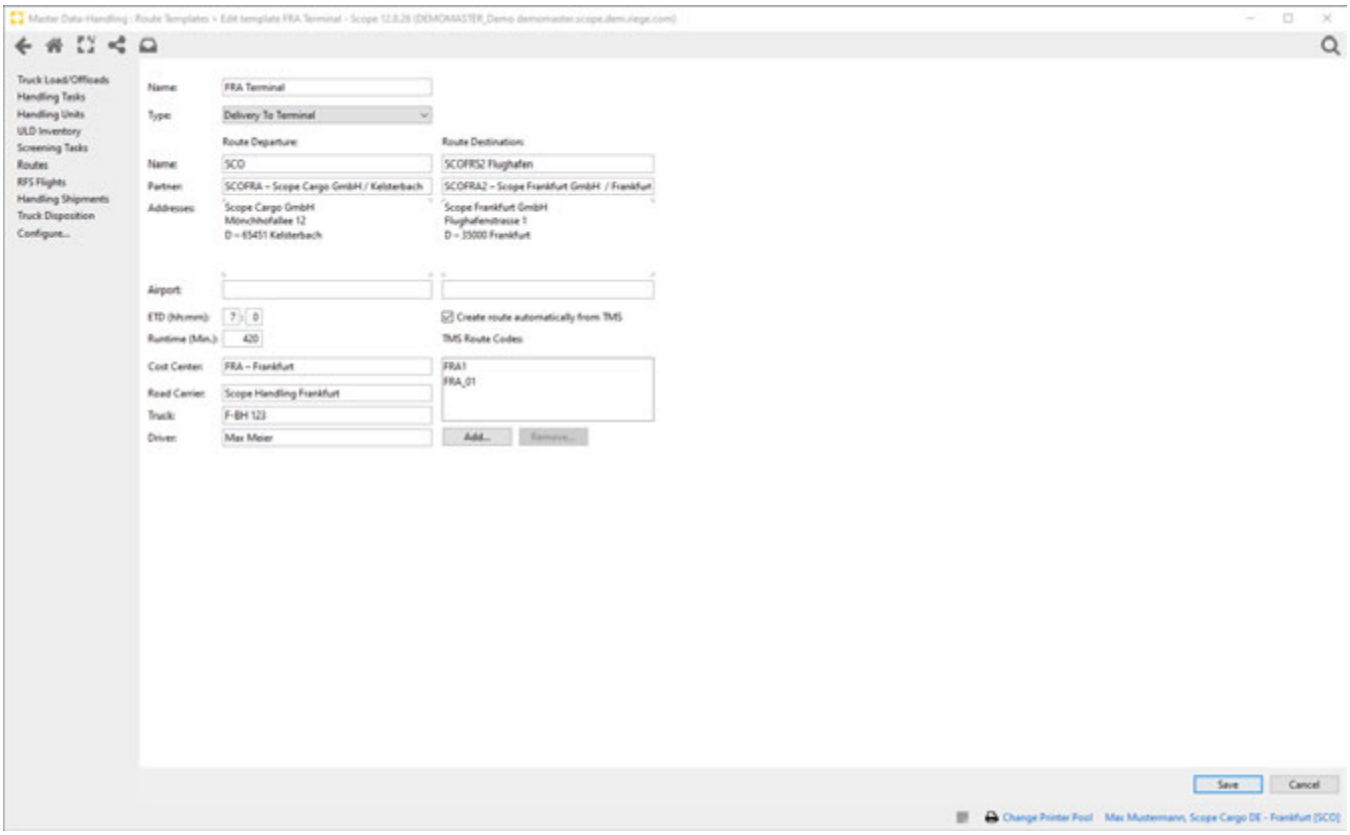
Refresh

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Updates the data in the overview

Field description

Edit Template



Name

A name for the route template must be entered here. The name can be freely chosen but may only be used once. If the selected route name already exists, this field is validated as an error and a corresponding message is displayed.

Type

The desired tour type can be selected from the stored drop-down list here. The following types are available:

Type	Description	Use
Warehouse Tour	Pick up- and Delivery Tour in general	only used in handling module
Delivery to Gateway	Tour to/from a gateway	mainly used in Truck Manifest
Delivery to Terminal	Tour from/to a terminal	mainly used in Truck Manifest
Delivery to Branch	Delivery to Branch	

Route Departure, Route Destination Name

Name of the start or end location. The name is freely selectable.

Partner

The respective partner with whom the tour starts or ends. The desired business partner can be found and used with the field search function.

Addresses

After selecting the partner, the corresponding address is displayed here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airport

Airport Code where the tour starts and ends.

ETD

An Estimated Time of Departure (ETD) for the route can be entered here.

Runtime

Runtime of the tour in Min

Create route automatically from TMS

By activating this check box, you can control whether routes from external TMS data inputs should be created automatically.

> **Attention!**
>
> The handling module can also process data from external systems (e.g. Procars). These Transport Management Systems (TMS) can send route data with predefined route codes to the handling module, where, depending on the settings mentioned above, new routes based on a route template are automatically created or existing routes are added accordingly.

TMS Route Codes

TMS tour codes that have already been entered are displayed in this field.

Cost Center

Cost Center can be entered here

Road Carrier

The road carrier can be entered here by whom the tour is to be carried out. The desired business partner can be found and used with the field search function.

Truck

The truck with which the tour is to be carried out can be selected from the drop-down list stored here.

Driver

The driver who should carry out the tour can be selected from the drop-down list stored here.

> **Attention!**
>
> Road Carrier, as well as Truck and driver data can be stored in the partner master data, in the role Road Carrier - Roles - Business Partner - Maintenance.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

(c) Storage Zones, Storage Locations

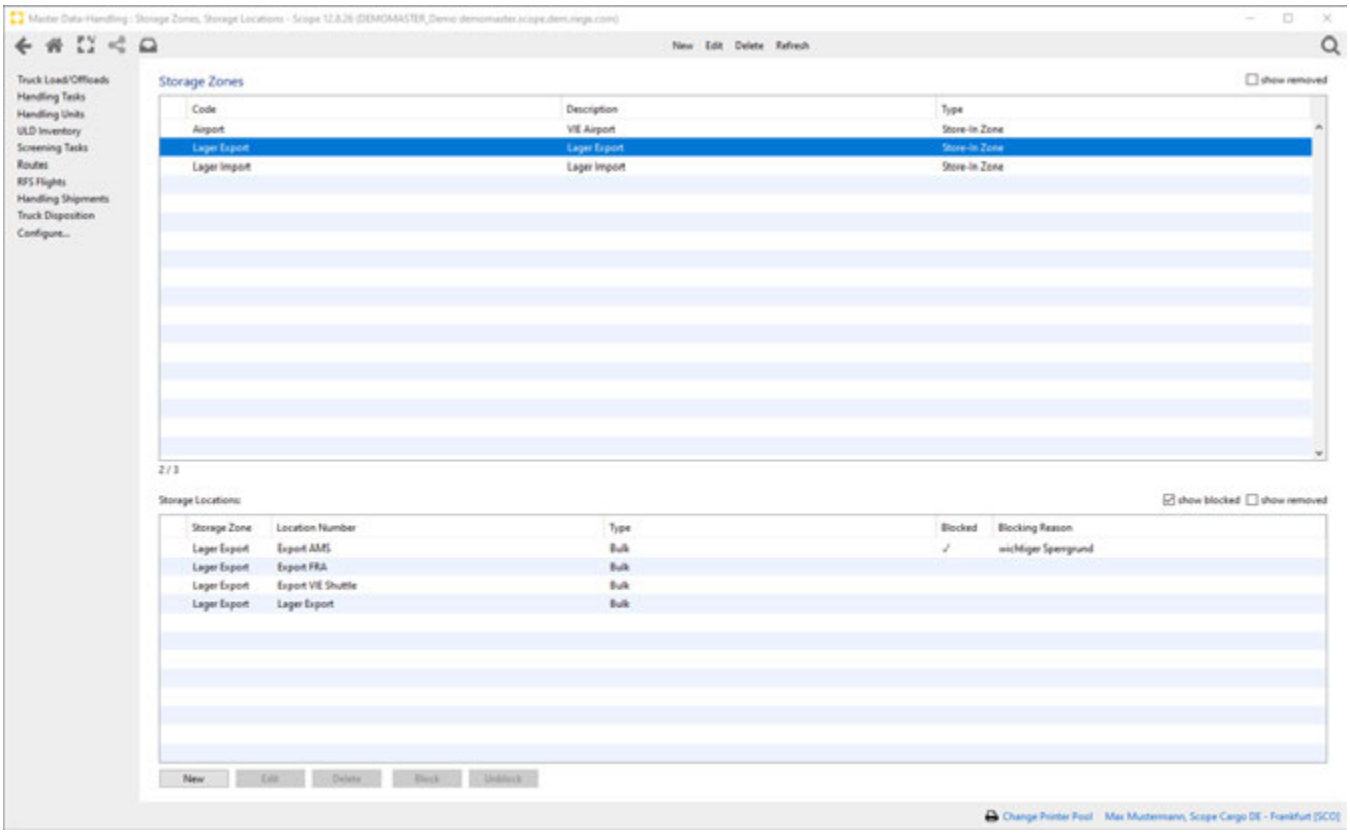
- Introduction
- Description

Introduction

In this application, storage zones with storage locations can be recorded. These are used within the handling module to document goods storage locations. These storage locations and zones are also used in the Gate handling master data to define the loading and unloading location.

Description

- Program Action
- Field description
- Storage Locations
- Field description

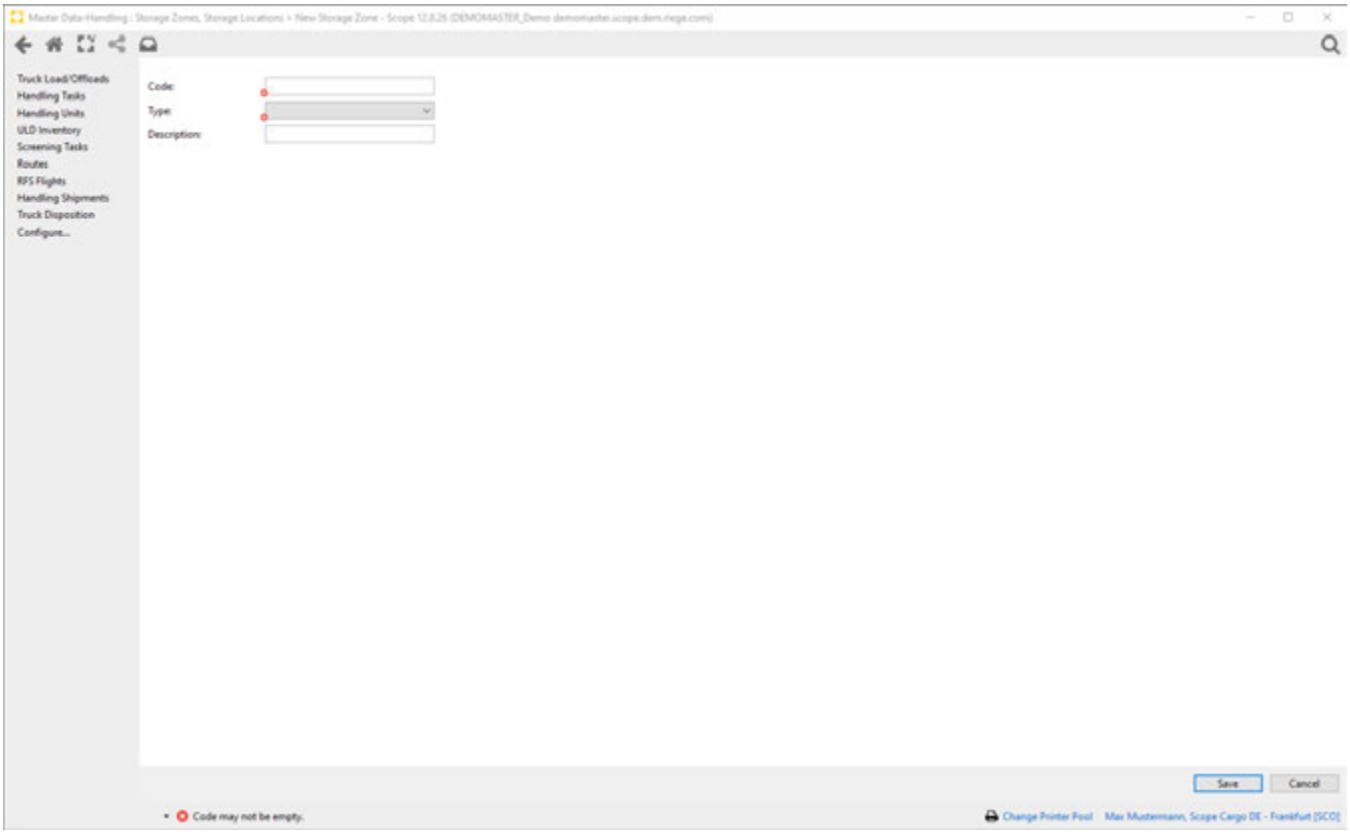


Program Action

New

Creates a new storage zone.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Edit

Opens the data record selected in the overview table for editing. Alternatively, this can also be opened by double-clicking on the corresponding line in the overview table.

Delete

Deletes the selected storage zone in the overview.

Refresh

Updates the data in the overview

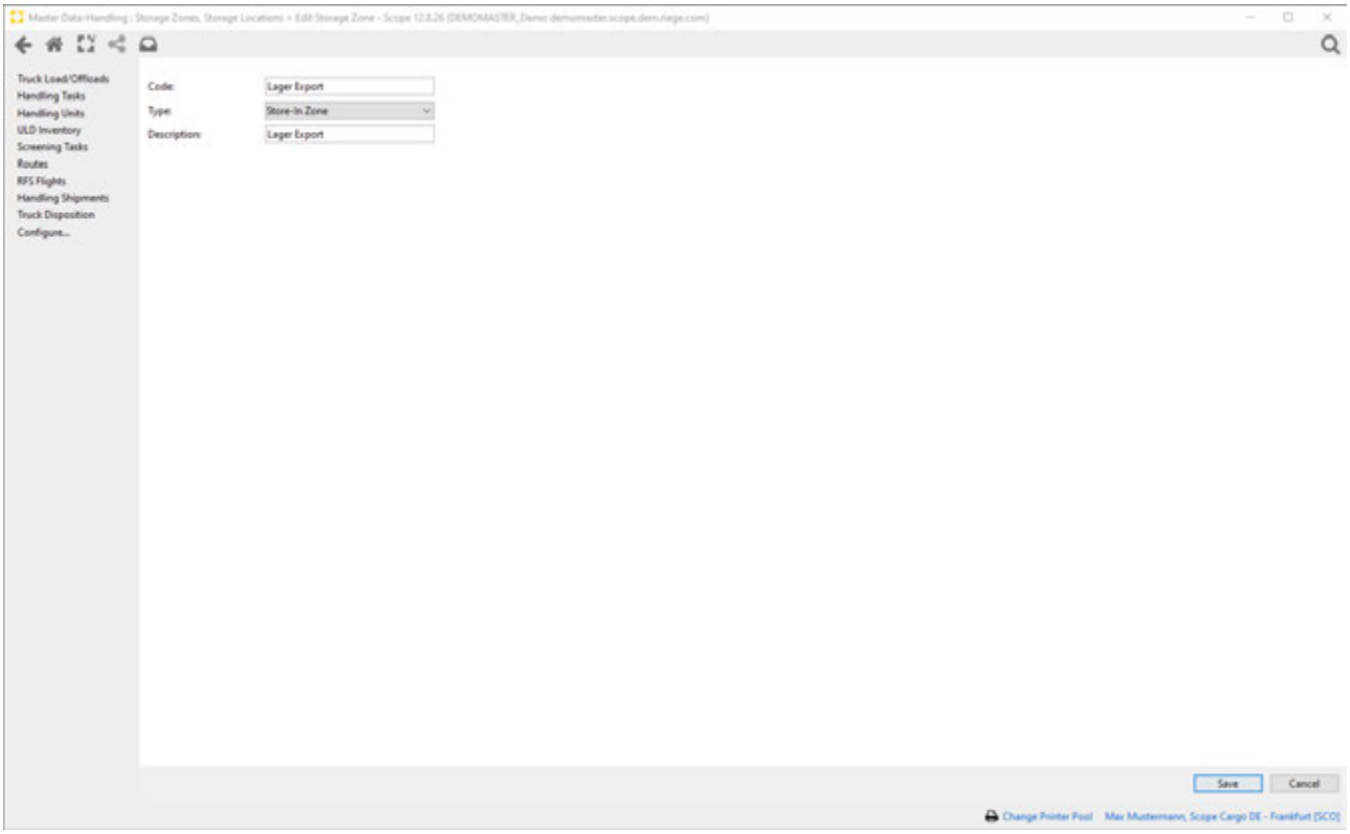
Field description

show removed

By checking this box, deleted storage zone data will be displayed in the overview

Edit storage Zone

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code

The code for the storage zone. Can be defined freely.

Type

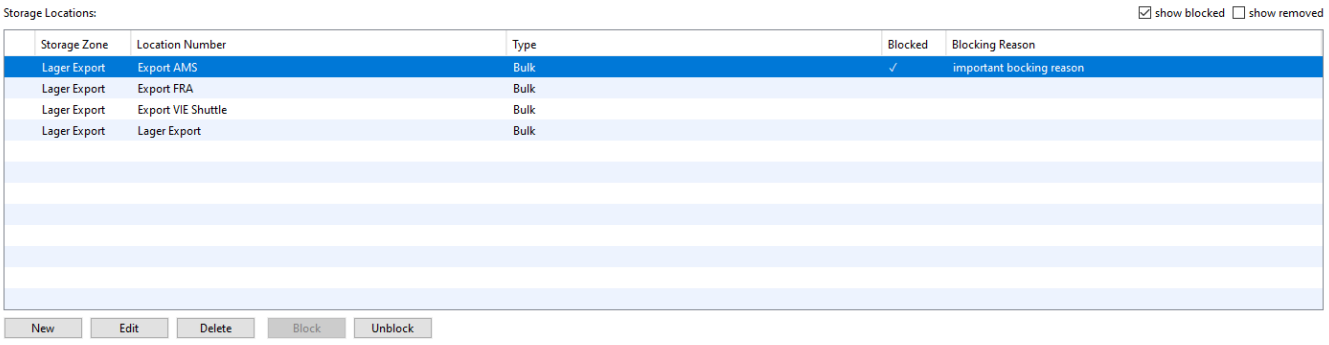
Type of the Storage Zone, that can be chosen from the drop-down list.

Description

The textual description of the storage zone

Storage Locations

In the overview of the storage Locations table, all created storage locations for the storage zone are displayed with the storage location number and type.



Field description

show blocked

If this checkbox is marked, the data records that have been blocked are also displayed in the overview of the storage locations.

show removed

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If this checkbox is marked, the data records that have been deleted are also displayed in the overview of the storage locations.

New

With the *New* button the editor can be opened for entering the data of a new storage location.

Edit

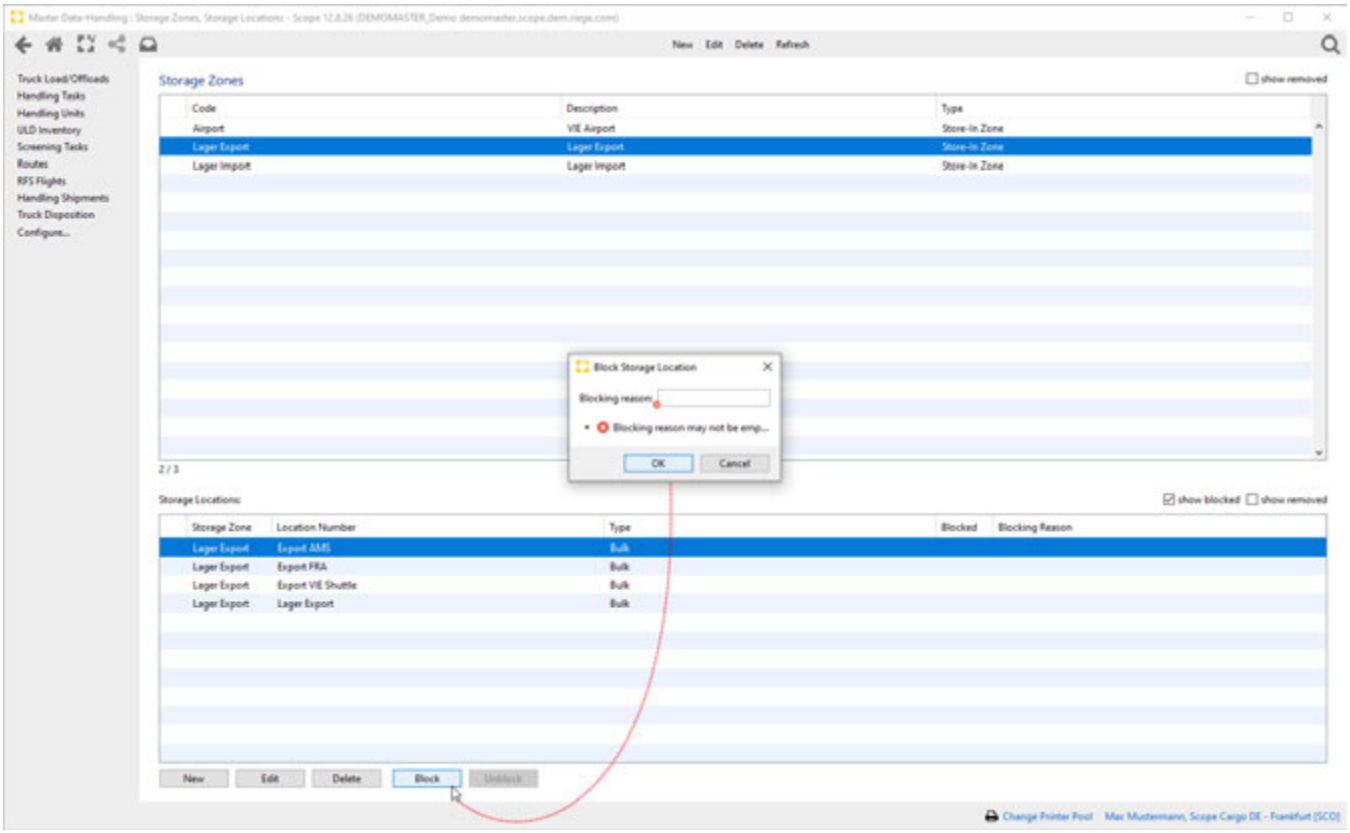
Opens the data record selected in the overview table for editing. Alternatively, this can also be opened by double-clicking on the corresponding line in the overview table.

Delete

Deletes the selected storage zone in the overview.

Block

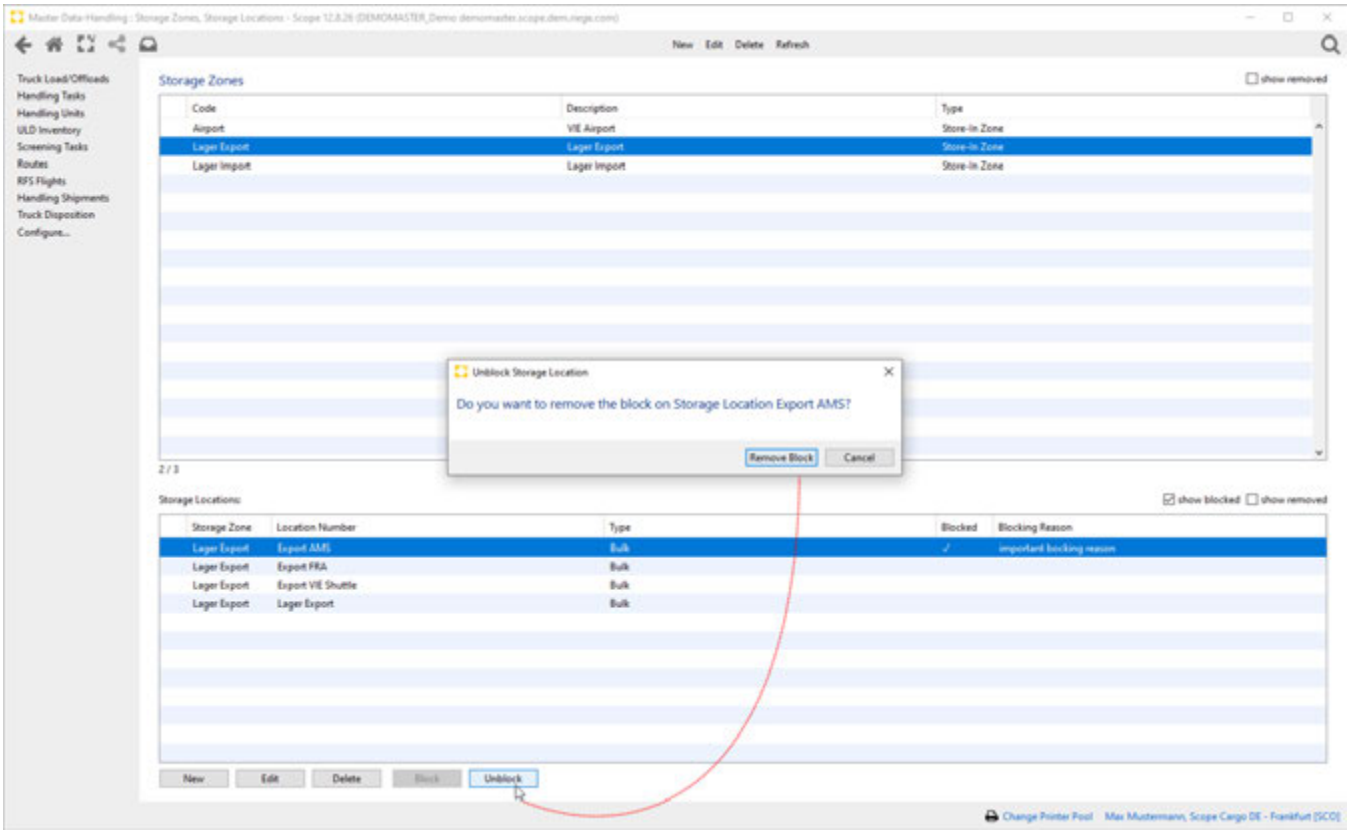
Opens the *Block Storage Location* editor. The storage location can so be blocked for further use by specifying a blocking reason in the corresponding input field.



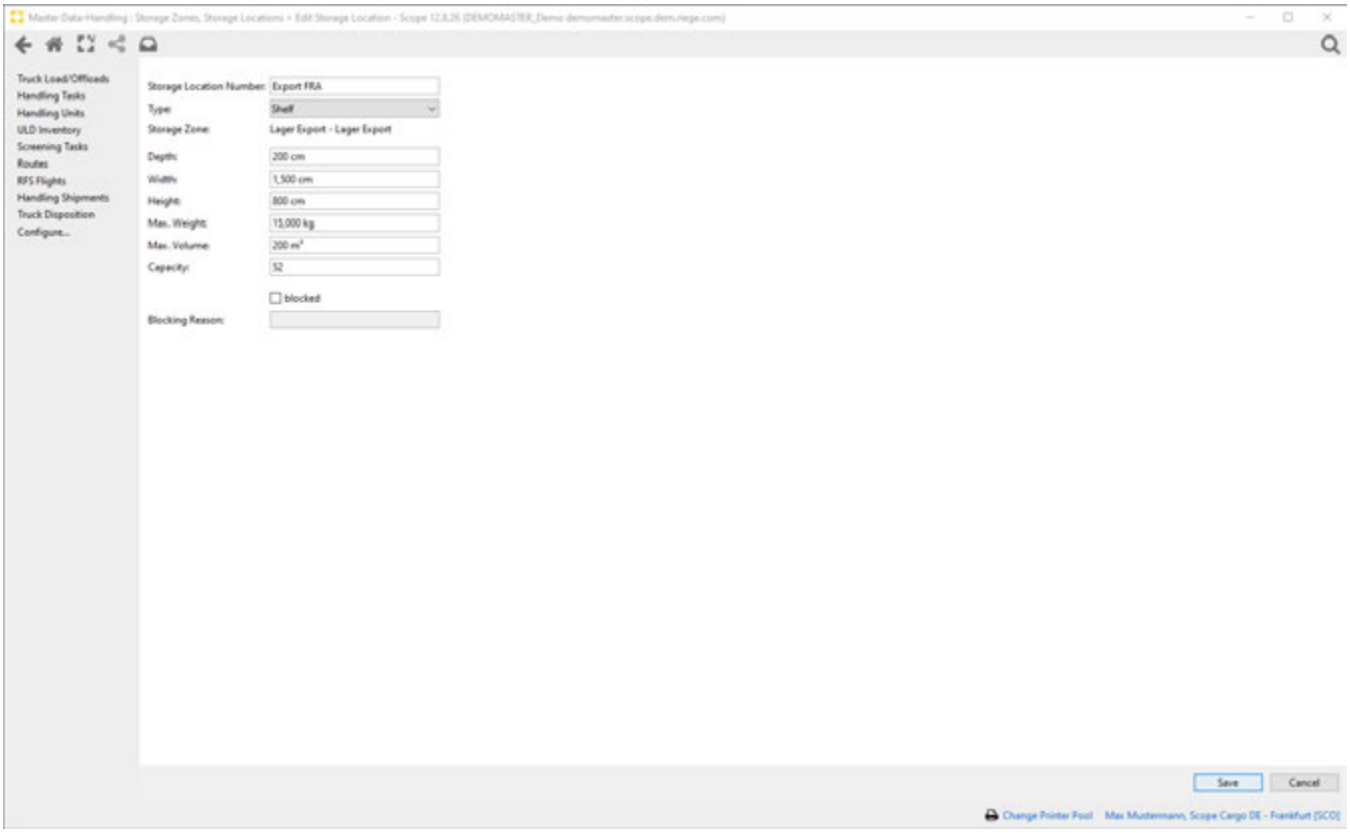
Unblock

Opens the Unlock Storage Location editor. The storage location can then be released for use again by confirming with the Remove Block button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Edit storage location



Storage Location Number

A storage location number must be assigned here. This number can be freely selected but must be unique.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Type

Type of the storage location can be selected from a drop-down list. Following types are available:

- bulk
- rack
- shelf

Storage Zone

Name of the corresponding storage zone is displayed here.

Depth/Width/Height

Dimensions (depth, width and height) of the storage location in cm.

Max.Weight/Max.Volume

Maximum weight and volume in kg or m3 which are specified for this storage location

Capacity

The maximum capacity of the standard packing units for this storage location can be specified here. (e.g. max. number of pallets)

blocked

By activating this check box, a storage location can be marked as blocked. This is then no longer available for selection in the Handling Modules.

Blocking Reason

If the blocked check box is marked, a reason for this blocking can be entered here.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

(d) Gates - Handling - Master Data

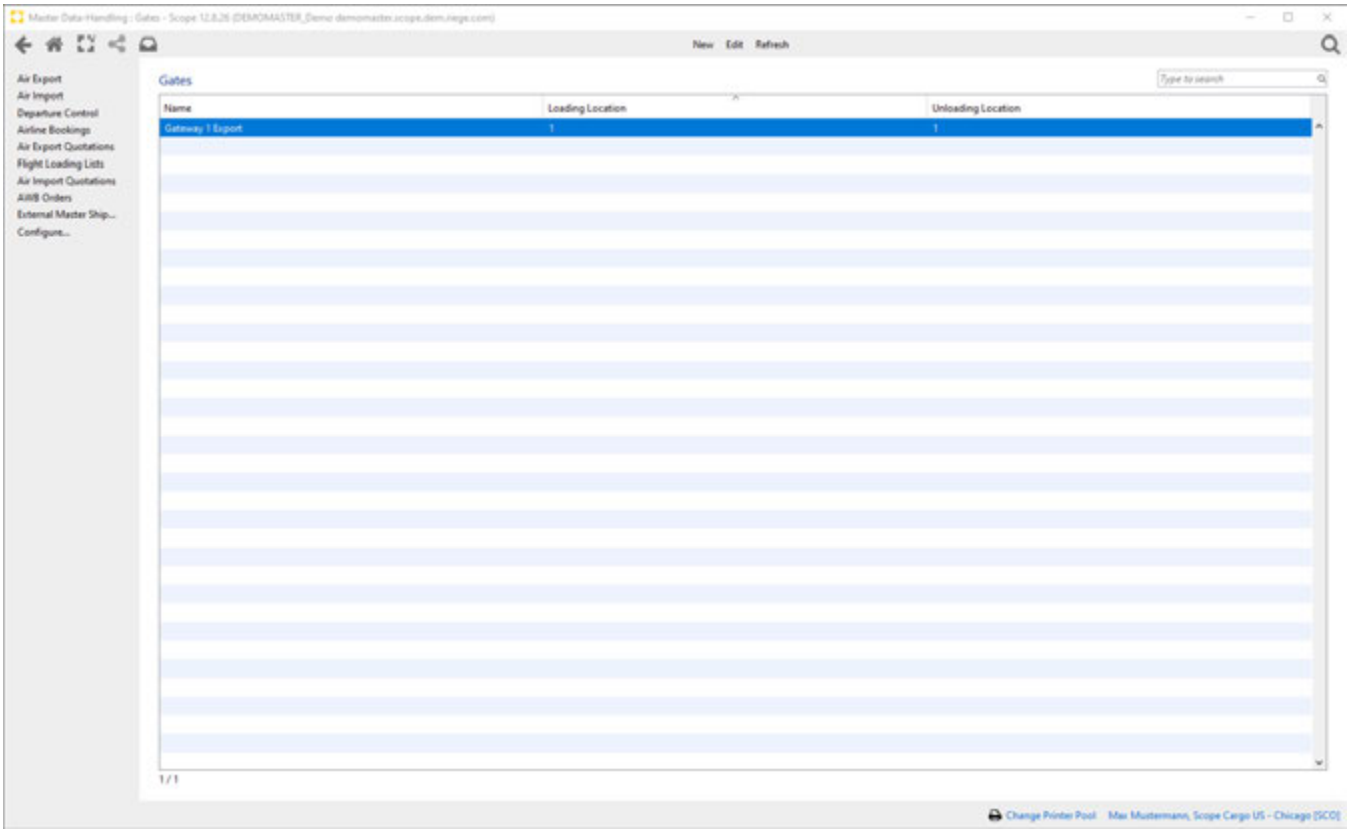
- Introduction
- Description

Introduction

In this application, warehouse gates, ramps, etc. can be recorded. These are used within the handling module to document loading and unloading processes.

Description

- Program Action
- Field description



Program Action

New

With this action a new storage gate can be created in the editor.

Edit

Opens the data record selected in the overview table for editing. Alternatively, this can also be opened by double-clicking on the corresponding line in the overview table.

Refresh

Updates the data in the overview

Field description

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

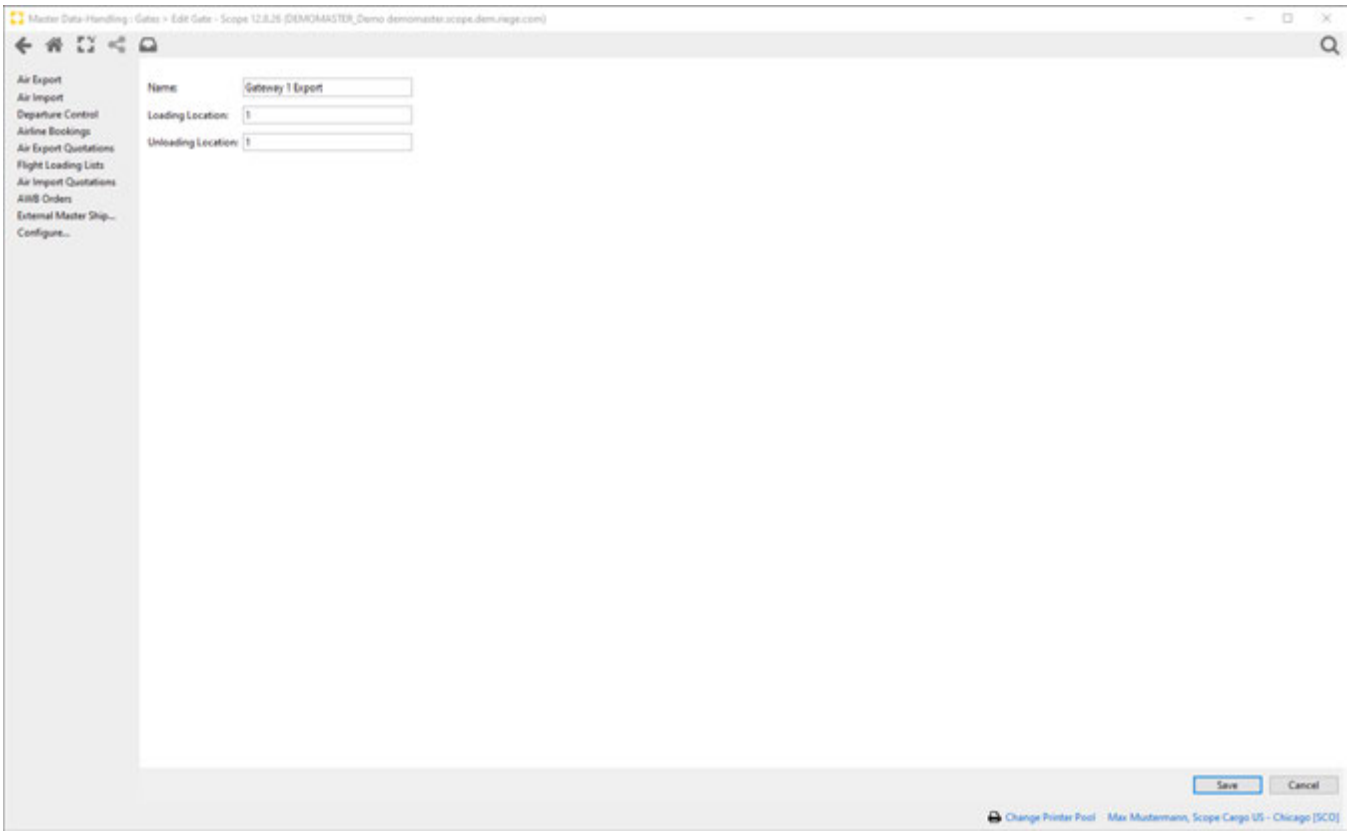
Keyword search

By entering of one or more search terms, the Gates displayed can be filtered accordingly.

Gates

In the overview table, the gates that have already been created are displayed with their name, loading and unloading location.

Edit Gate



Name

A name for the gate must be given here. This can be freely selected but must be unique.

Loading Location

A storage location for the gate must be determined on which the goods are made available for loading. The loading location can be found and selected with the field search function.

Unloading Location

A storage location for the gate must be determined on which the goods are made available for unloading. The unloading location can be found and selected with the field search function.

Save

Saves the data and closes the editor.

Cancel

Closes the editor without further action.

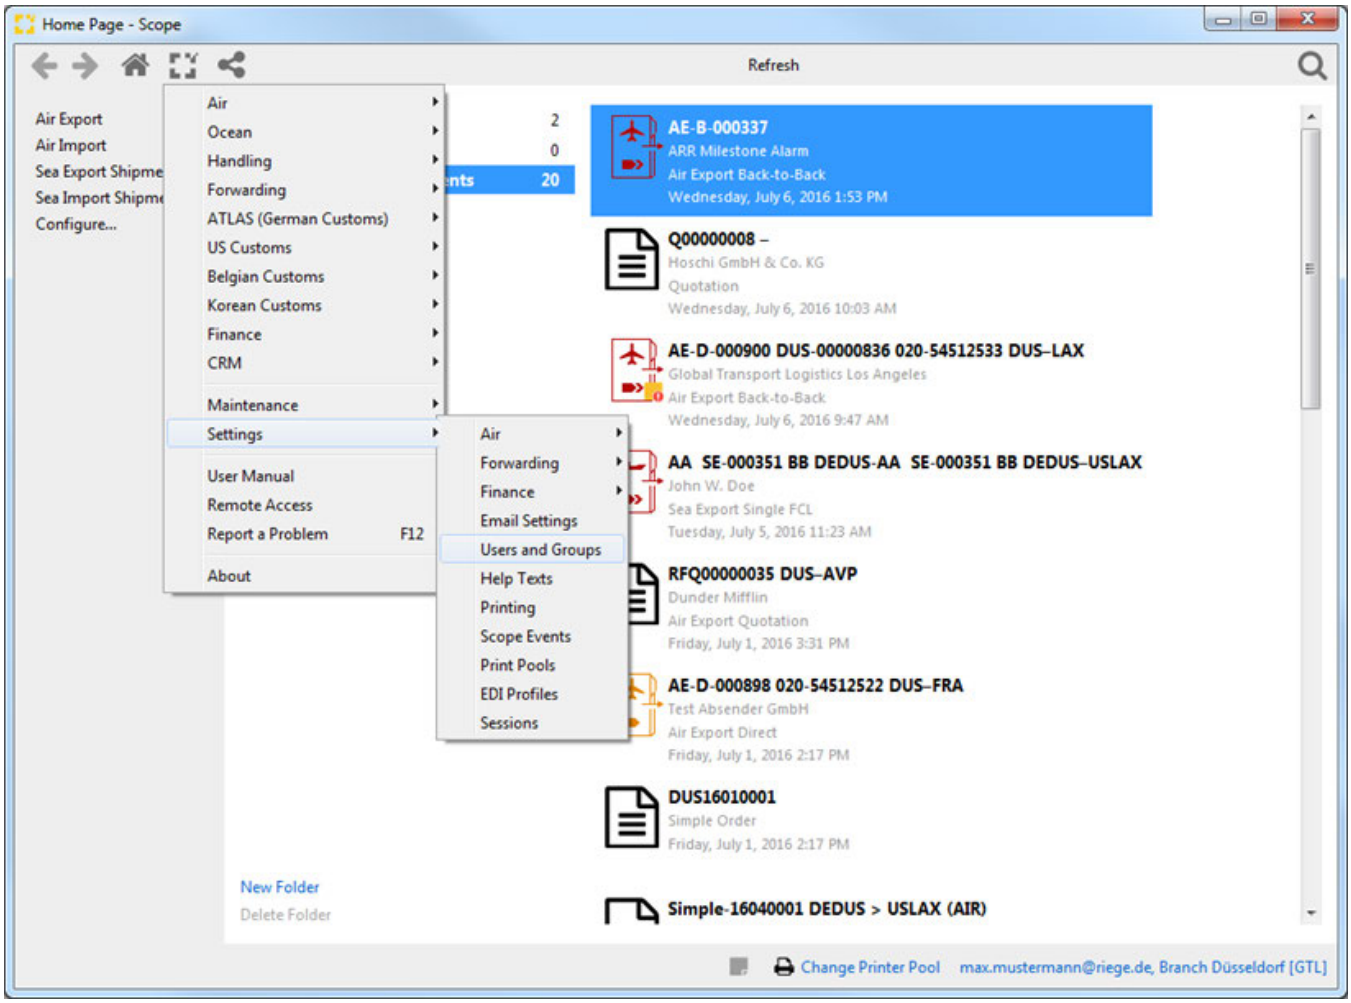
Settings

Introduction

Under **Settings** all settings can be add, wich are important for the company. For instance user and groups as well printer-pools will be also administered here.

Description



- Airfreight - Settings
- Tracking
- Users and Groups

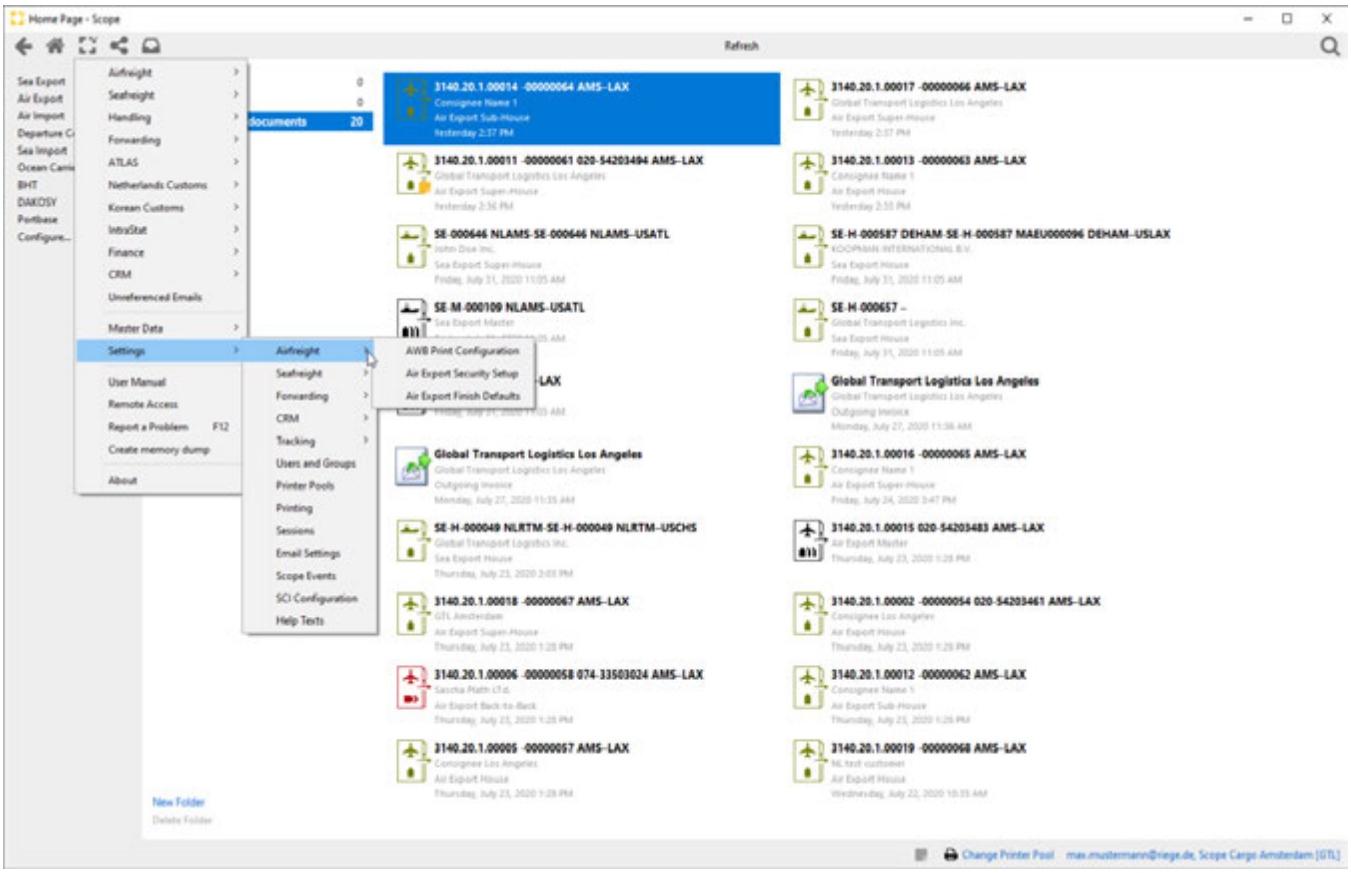
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Airfreight - Settings

Introduction

Under the Airfreight Settings all important settings regarding the handling of airfreight shipments can be added, such as AWB Print Configuration, Air Export Security Setup, or the definition of Air Export Finish Defaults.

Description



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AWB Print Configuration - Airfreight - Settings

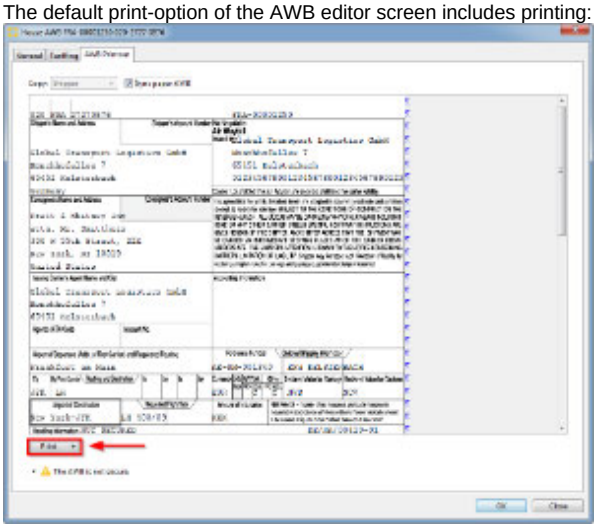
- Introduction
- Description

Introduction

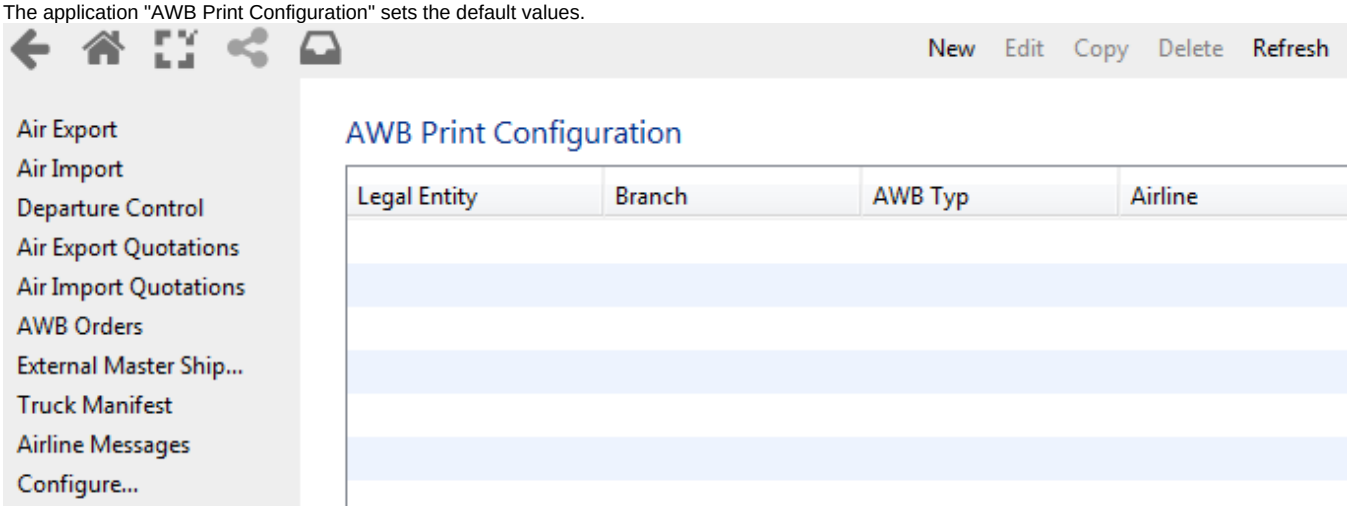
The application "AWB Print Configuration" manages the print options for the AWB.

Description

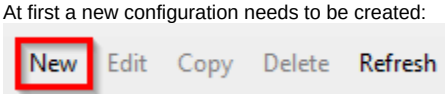
The default print-option of the AWB editor screen includes printing: one print of the AWB Label, one AWB Shipper copy, one AWB Consignee copy.



The application "AWB Print Configuration" sets the default values.

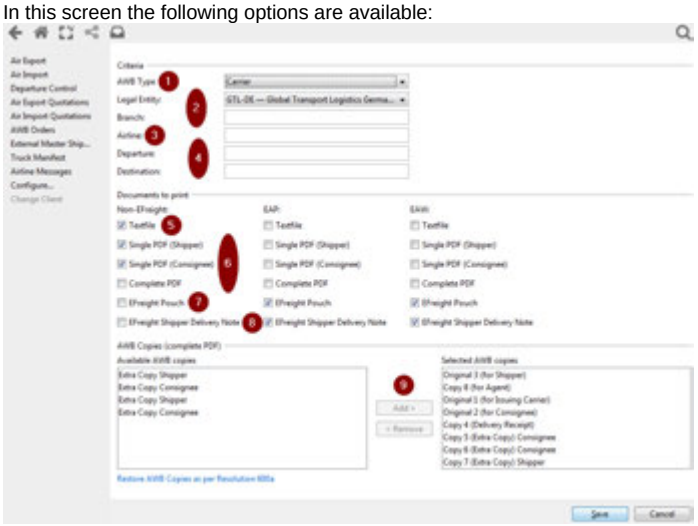


At first a new configuration needs to be created:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In this screen the following options are available:



1. Define AWB Type: Carrier oder House.
2. Restrict the printing options by legal entity & branch.
3. Restrict the printing options by airline.
4. Restrict the printing options by departure & destination.
5. Activate the text file option. This is used for automated printing to a label printer.
6. Activate for special PDF versions: single PDF(shipper), single PDF(consignee) & complete PDF.
7. Automated delivery of an EFreight Pouch.
8. Automated delivery of an EFreight Shipper Delivery Note.
9. The default setting for option "complete PDF", where a document can be added or removed to the default set. Just select the document and press the applicable butten to remove or add it from the complete PDF.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Air Export Security Setup - Airfreight - Settings

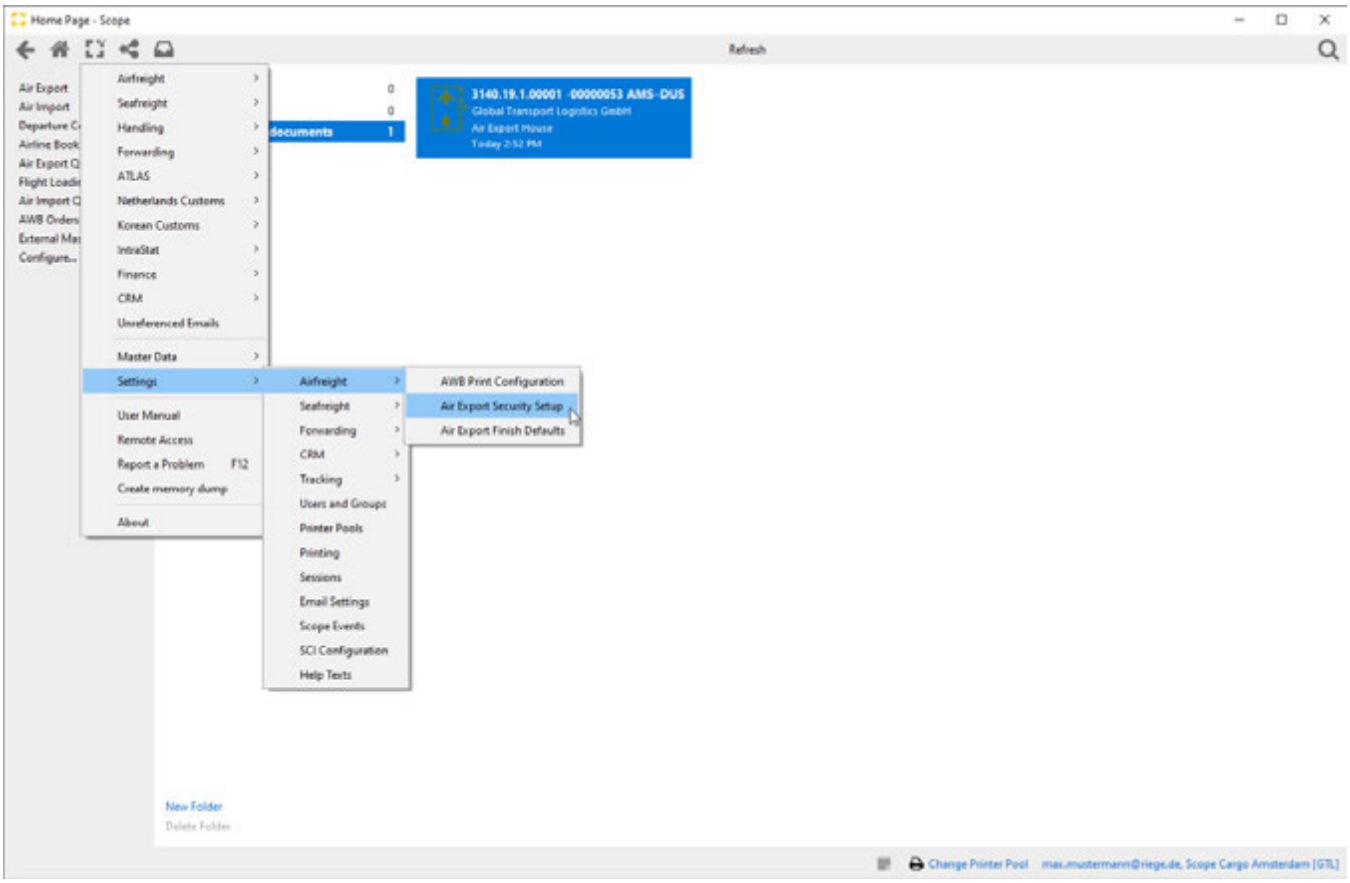
- Introduction
- Description

Introduction

In this application a validation process setup can be configured, which will assist you in a better and efficient manner to cover the air security requirements and the security guidelines provided by EU and local authorities. There are various options here. A batch validation against the EU database, which defines at which fixed times business partners with the roles of Secure Shipper, or Regulated Agent are automatically checked against the EU database for known consignors and regulated agents. Validation parameters can be defined to set a time for how long a validation success of a verified address lasts, or for how many hours a verified address is declared valid. The access data for EU Cargo DB users can be entered and stored here. Once stored here, this data will be available automatically in Scope. The individual validation events are recorded in a log. A query log can be generated as an Excel file.

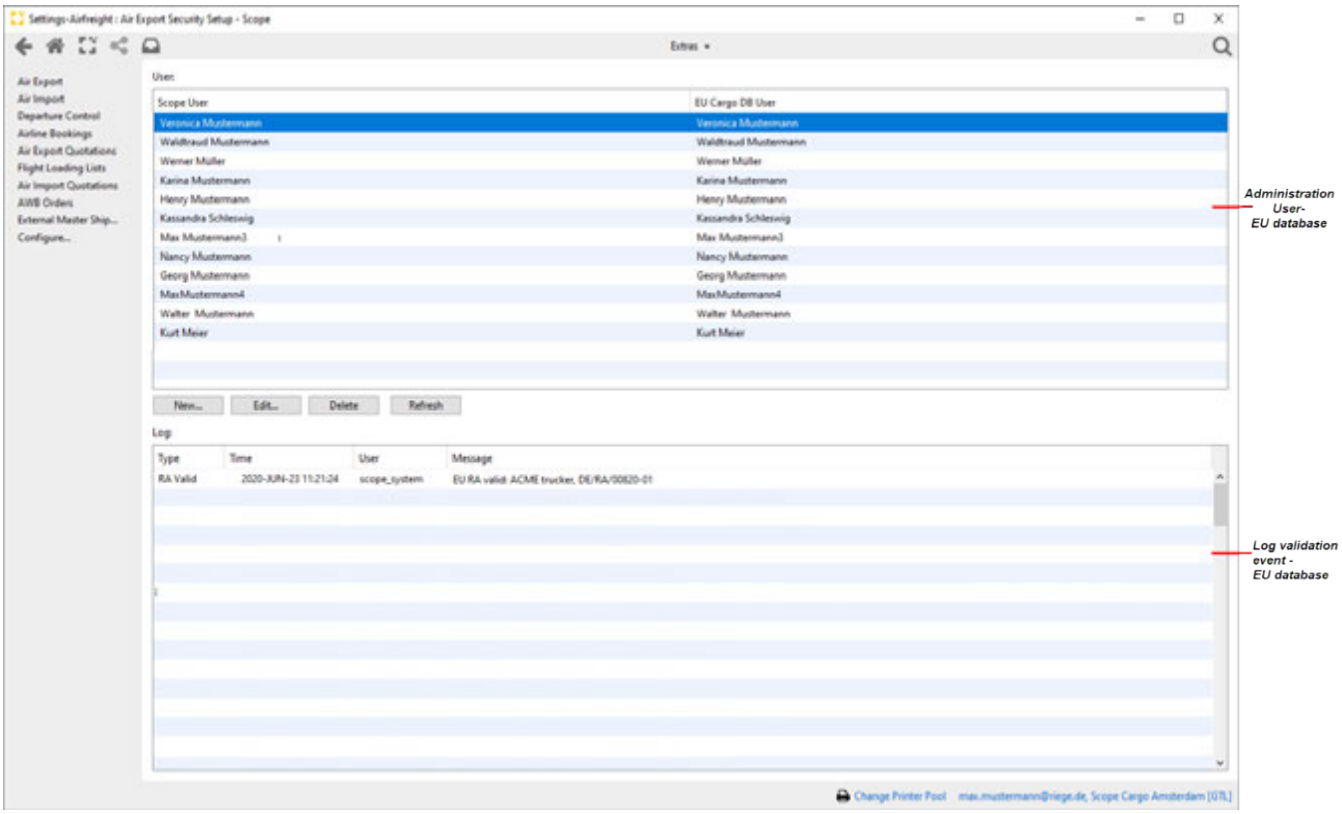
Description

`The application can be opened via the menu item Settings - Air Freight - Air Freight Security Setup.`



In the user interface of the Air Freight Export Security Setup module, a table lists all **users** stored in Scope who are allowed to query the EU database. The data can be managed centrally in this module. In the LOG area of the user interface, the individual validation events are recorded and displayed as an entry by also specifying the user account. The additional functions for batch validation, validation settings or a query log can be opened via the program function *Extras*.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

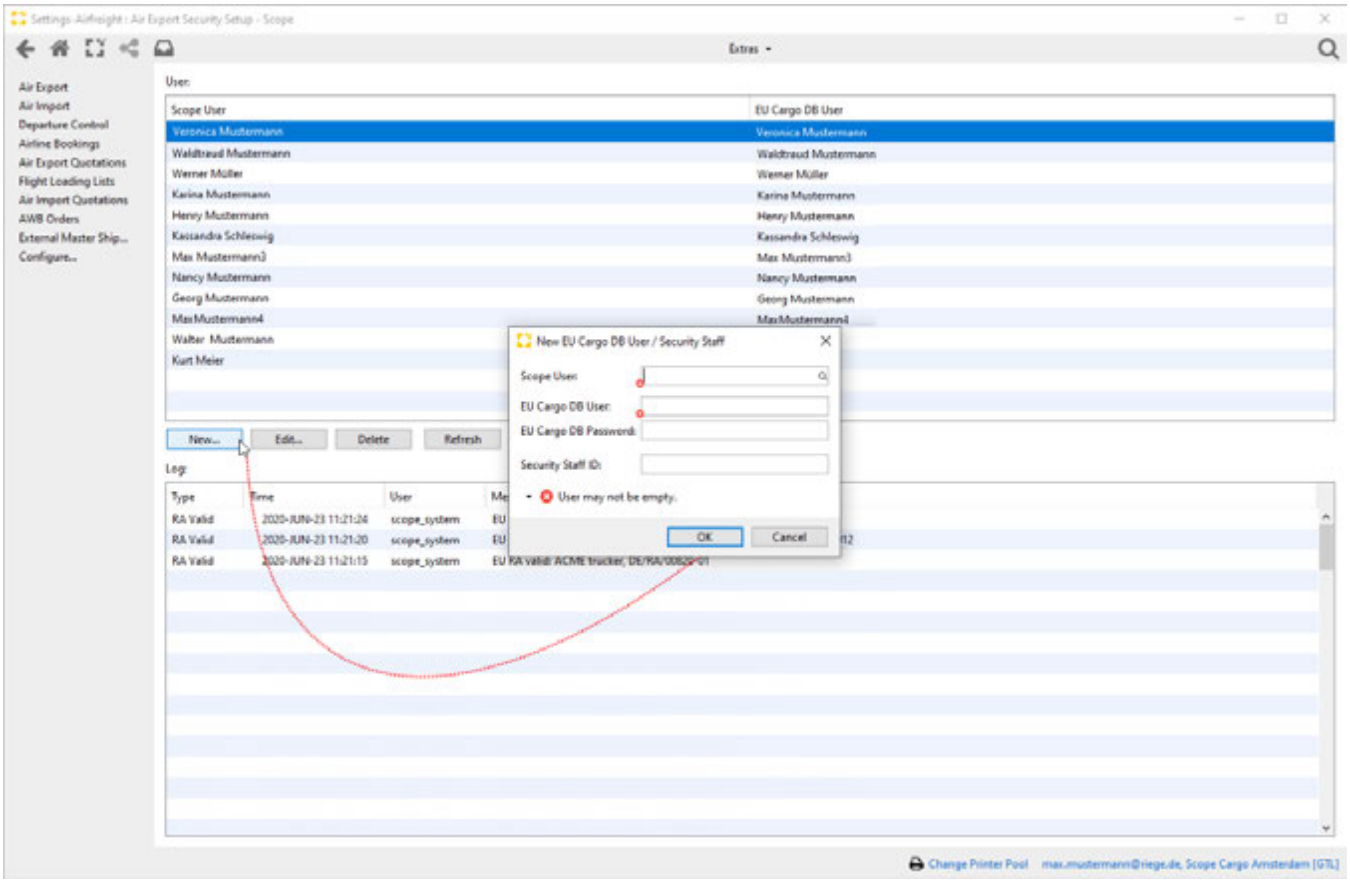


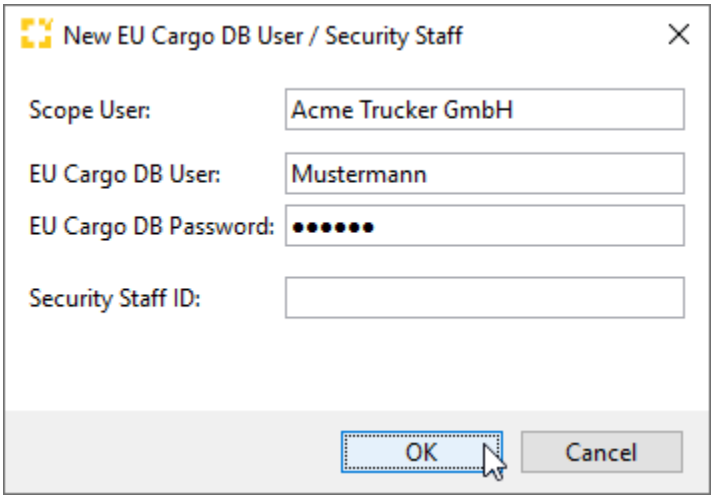
- **User EU Cargo DB**

New

With the *New* button, the access data for a new EU Cargo DB user can be created. Once stored under this menu item, you do not have to enter this data manually for each single query.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





Edit

An existing data record can be opened and edited using the *Edit* button.

Delete

An existing data record can be deleted using the *Delete* button.

Refresh

The data can be updated in the overview using the *Refresh* button.

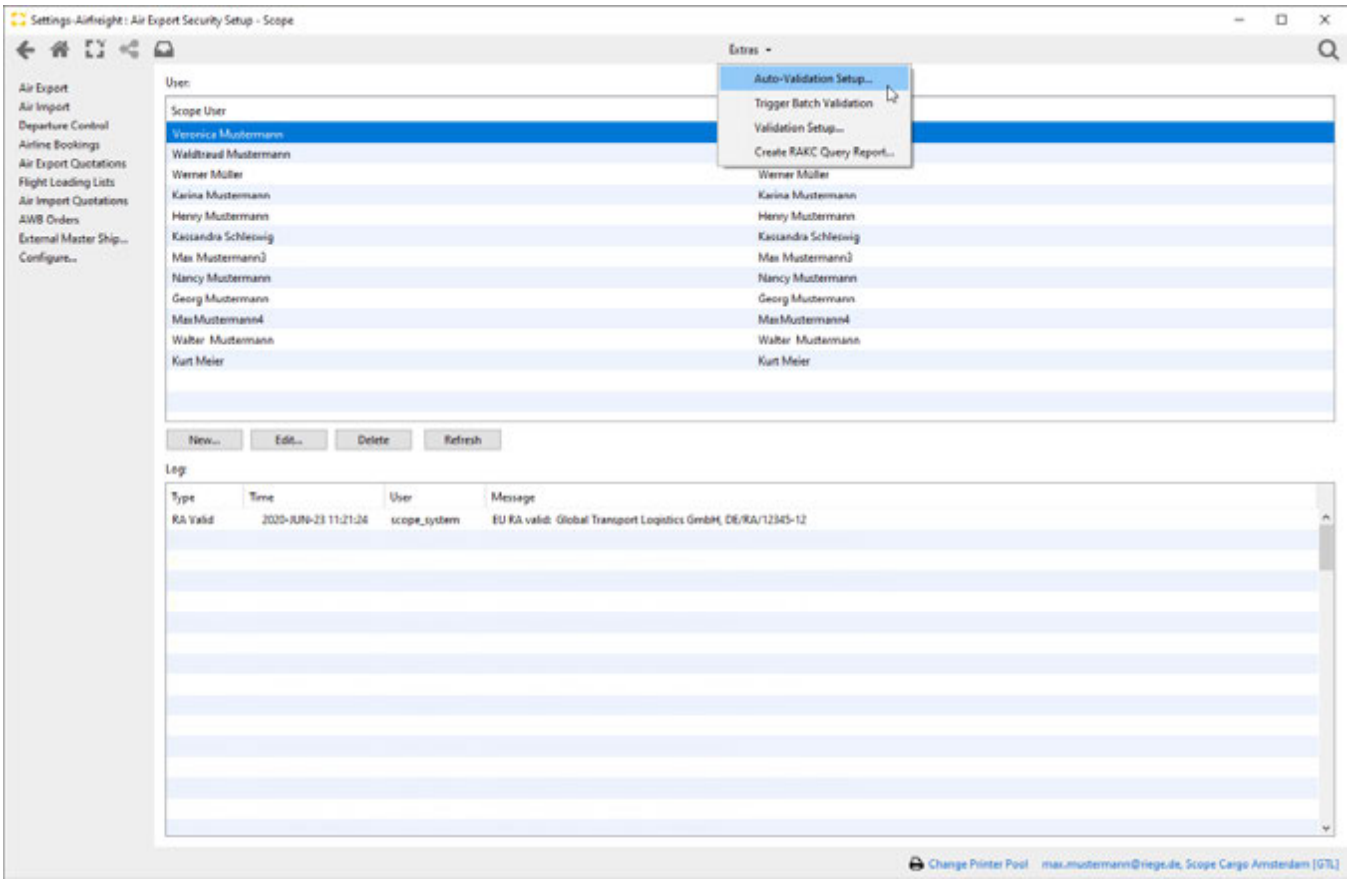
- ### LOG

In the LOG area of the user interface, the individual validation events are recorded and displayed by also specifying the user account.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **Extras**

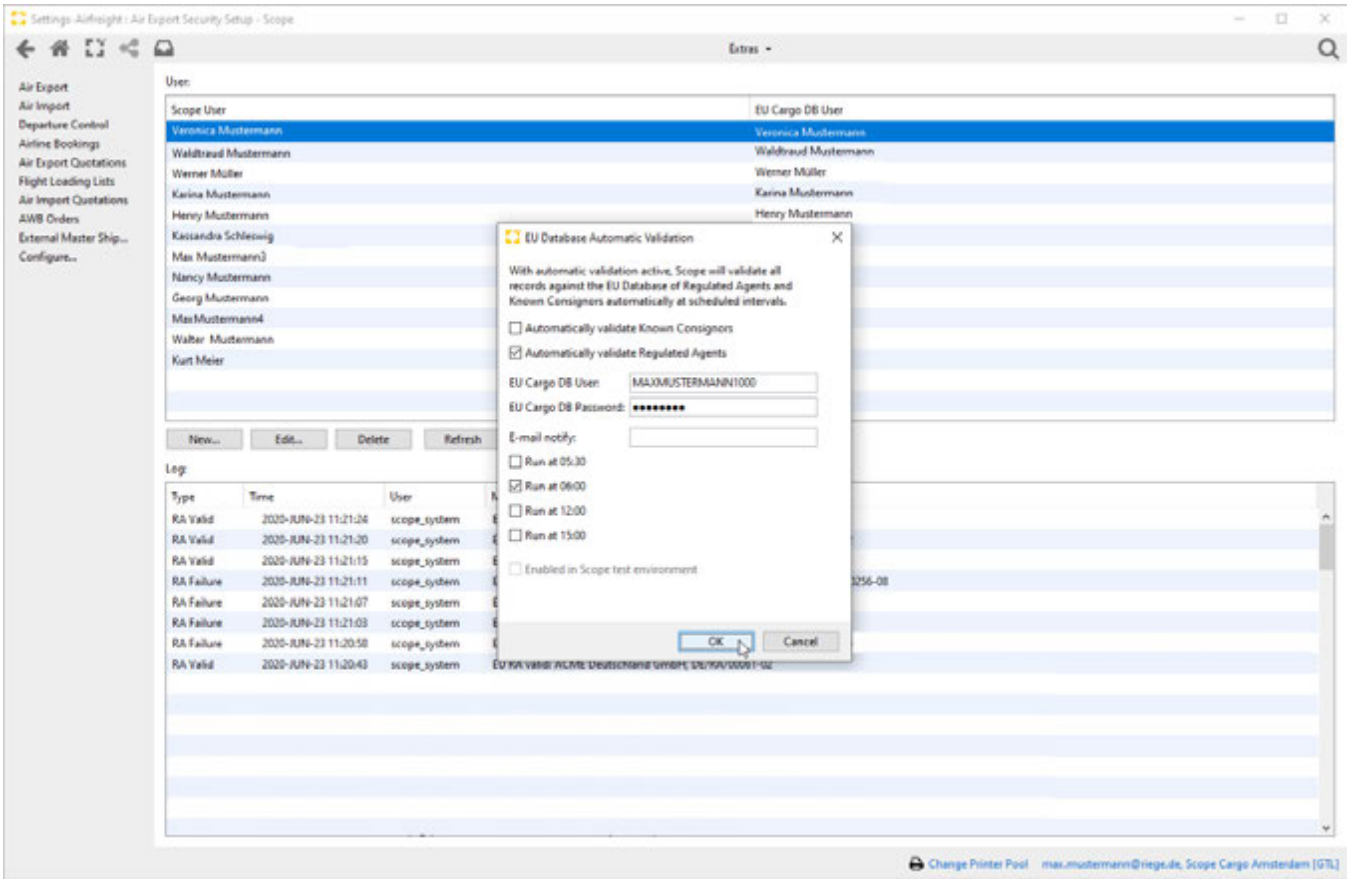
Additional functions for setting the security setup can be opened via the program function *Extras*.



Auto-Validation Setup...

If the Auto-Batch validation is activated, Scope automatically validates all business partners with the roles of Secure Shipper or RegB / TP against the EU database for known shippers and regulated agents at the specified times. It can also be defined which EU Cargo DB user should carry out these queries.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Trigger Batch Validation

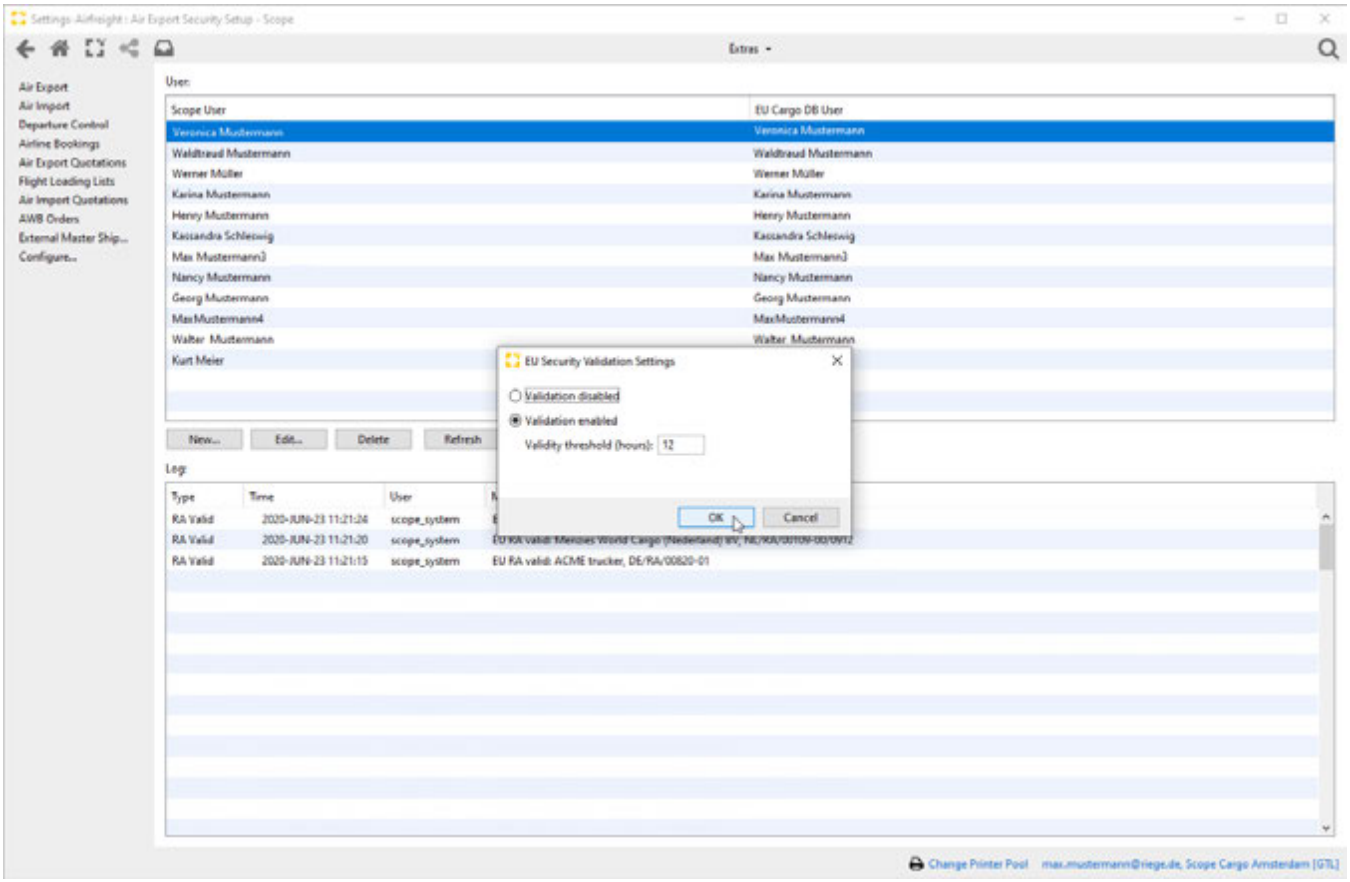
The batch job for validating the KC and RegB registration numbers against the EU database can be triggered with the program function *Trigger Batch Validation*. The function may be made available to users with the role of system administrator.

Validation Setup...

With the program function *Validation Settings ...* the following validation settings for EU air cargo security can be set up. This also refers to manually checked Haulier-IDs.

- Validation disabled: This selection turns off the validation for EU air cargo security
- Validation enabled: This selection turns on validation for EU air cargo security. If the validity of a checked address is to be validated again after a certain period of time, this selection "Validation on" must be activated and an indication must be made in hours of when the address must be checked again.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Create RAKC Query Report...

With the program function *Create RAKC Query Report* ... a RAKC report can be generated as an Excel file by querying the EU website within a certain period of time.

Introduction

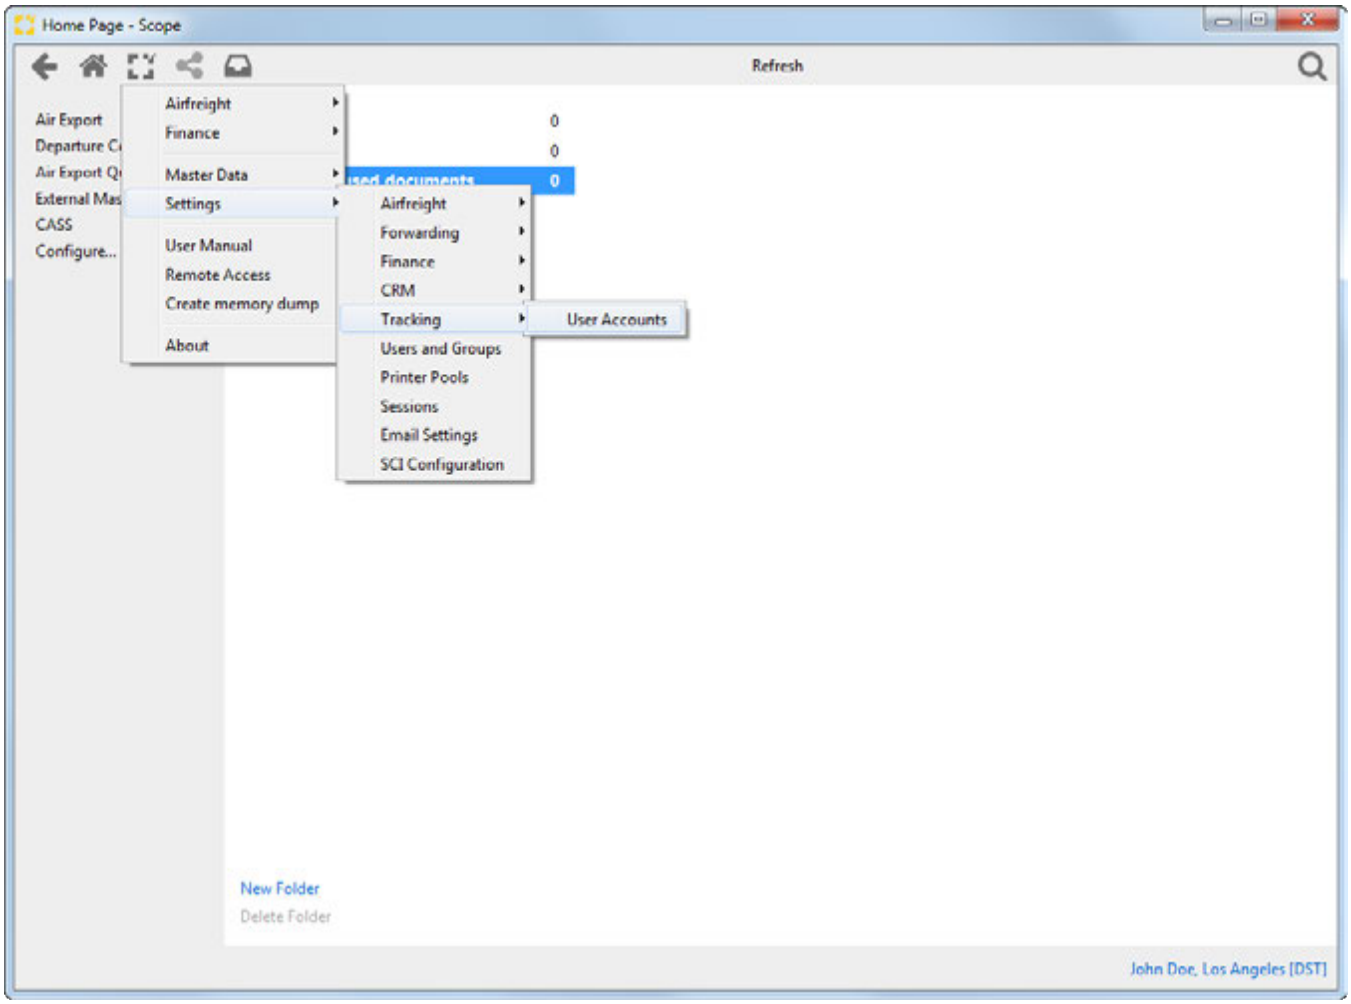
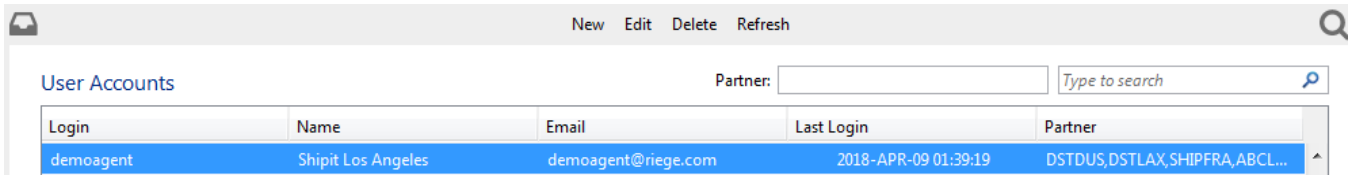
The application User Accounts maintains entries for Scope Connect. Scope Connect is web-based Scope access and enables tracking of shipments and events as well as entering bookings (Export) or prealerts (Import) and tracking events.

Description

The program is found under Settings Tracking User Accounts

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





New

Creates a new login

Edit

Changes an existing login

Delete

Deletes an existing login

Refresh

Refreshes the homeview

Partner

Allows entry of a partner to see which accounts have access to this partner

Search

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Searches the existing Scope account (Name of the login)

Login

Login name of the account

Name

Name which is displayed to the account after login on the webpage

Email

Assigned email of the account

Last Login

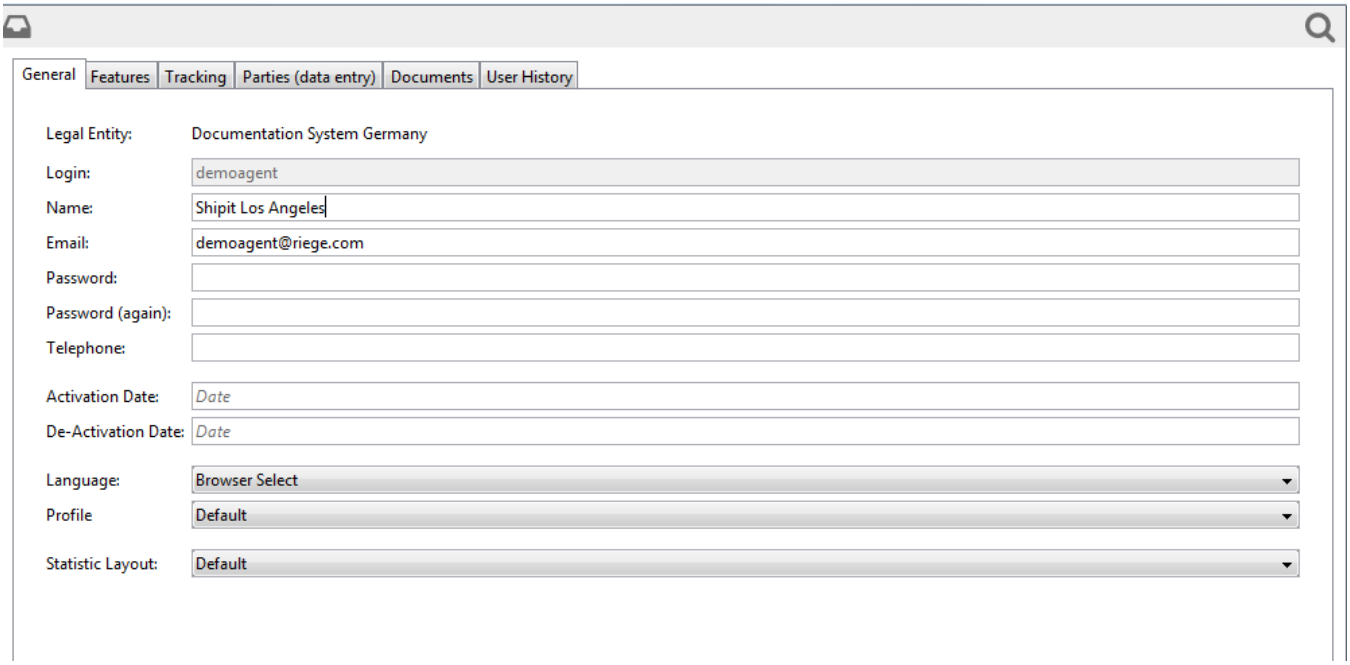
Timestamp of the last login in Scope Connect.

Partner

The account can track any shipment where a partner entered matched the partner in the shipment

Detailentry

General



Login

Login of the account. The login has to be an email address.

Name

Name which is displayed to the account after login on the webpage

Email

Email of the login. This is used by Scope to send the initial email after account creation and emails for password reset.

Passwort / Passwort (again)

Initial password of the account. After entering the password it is not visible and the account can change the password via reset function.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Telephone

Telephone number of the account. This is only for information purposes.

Activation Date

The activation date of the account. It can be left blank. If a date is entered, login is only possible from this date. ⚠ This does not affect the data displayed for the login. All shipments entered in Scope are visible. ⚠

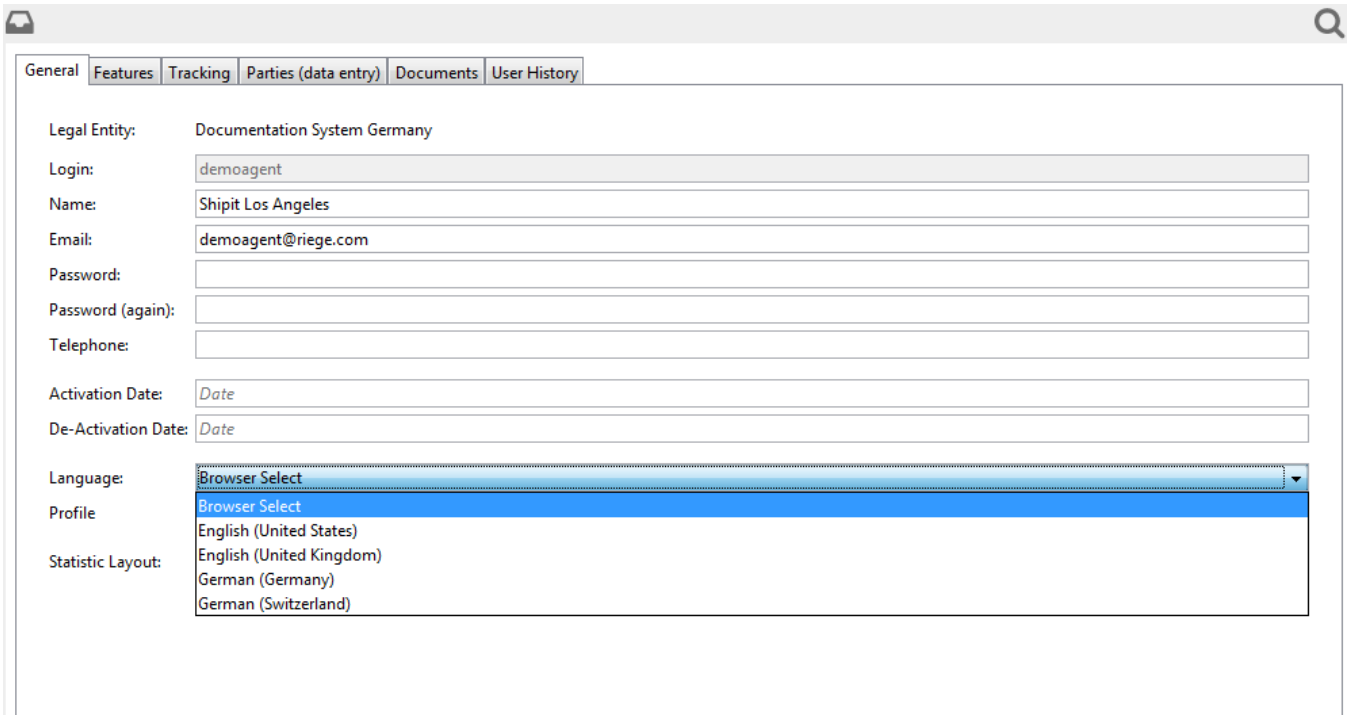
De-Activation Date

The de-activation date can be left blank. If it is entered, login after this date is not possible. ⚠ This does not affect the data displayed for the login. All shipments entered in Scope are visible. ⚠

Using activation and de-activation date you can enable a trial period for you customer to test Scope Connect.

Language

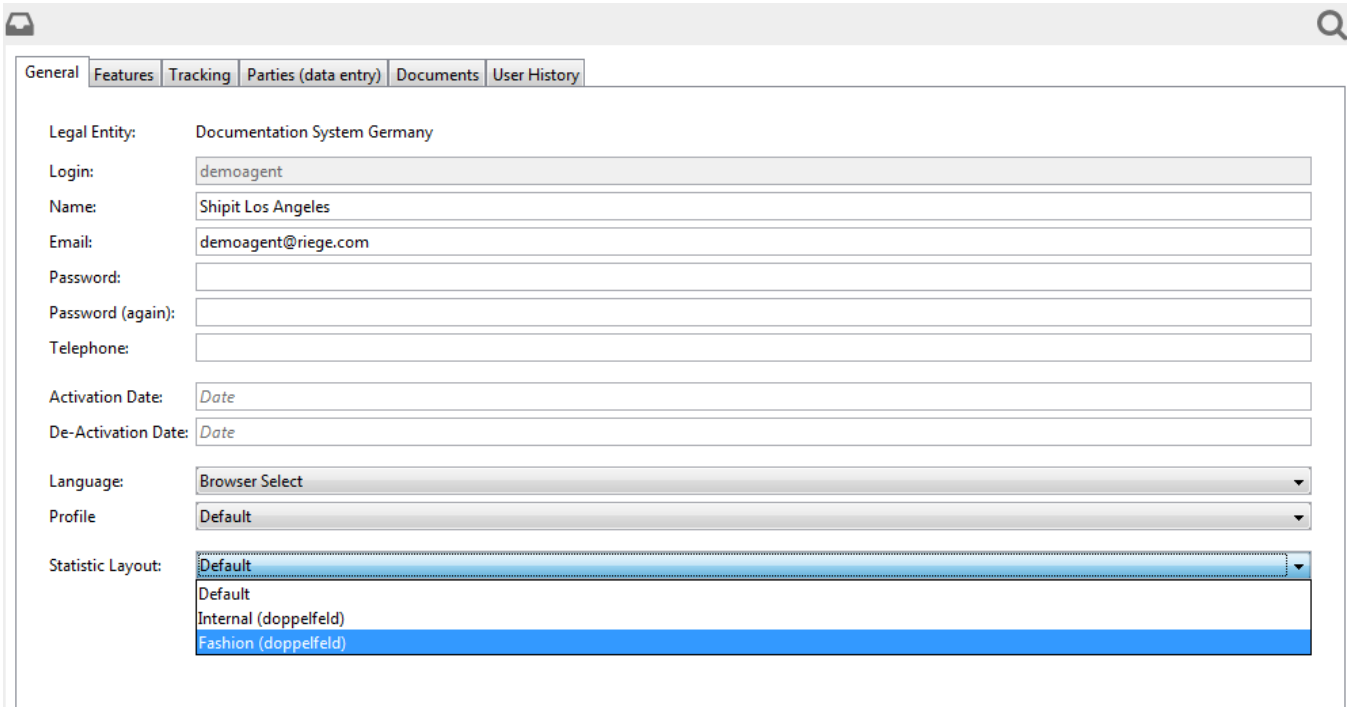
- Browser Select: Scope Connect tries to use the language setting of the browser. Currently we support the following languages: German, English and Chinese. Every other language (e.g. spanish, italienian, polish) uses english as a fallback.
- Englisch: Defaults Connect to english language
- German: Defaults Connect to german language



Profile

- Standard: RSI maintaines the standard profile or other required profiles. In the profile we define colour scheme, logos and visibility of planned times

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

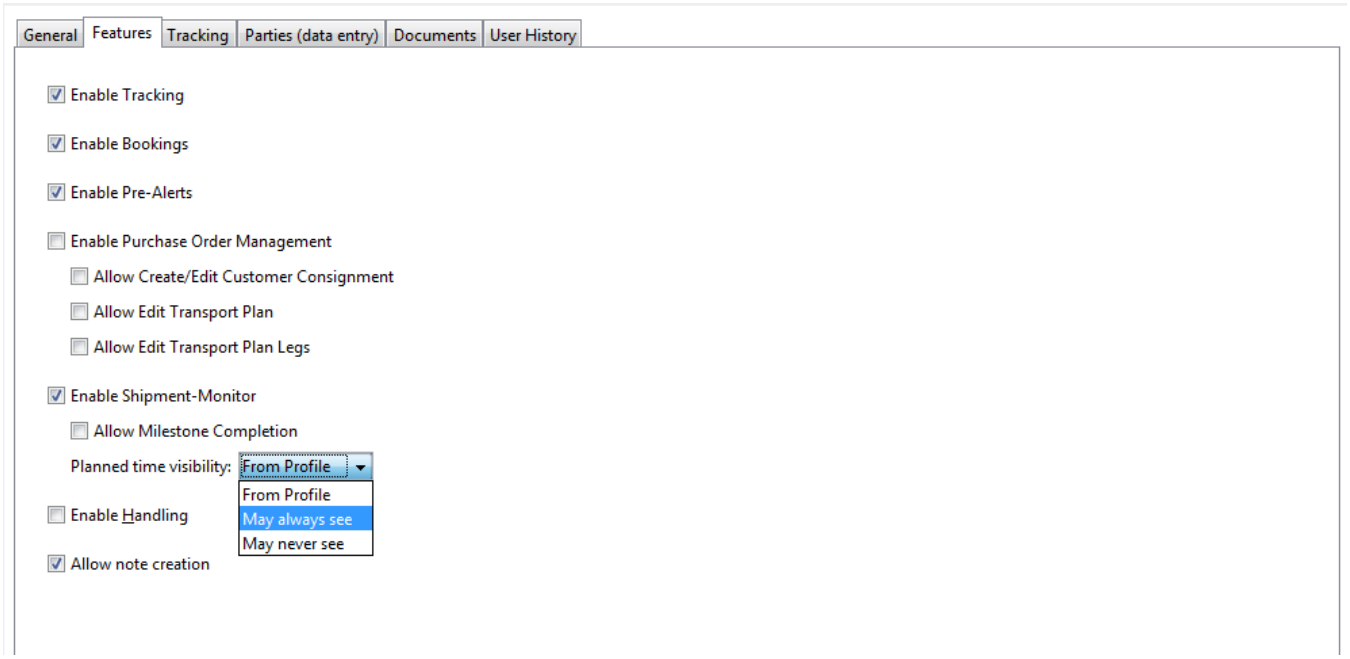


Statistic Layout

Connect accounts are able to download shipment data. The Statistic layout defines the format of this output.

- Standard: Output of the RSI default setting.
- specific layouts: Scope users can define specific layouts in application Master data Layouts. After creation of the layout it can be assigned to a specific account.

Features



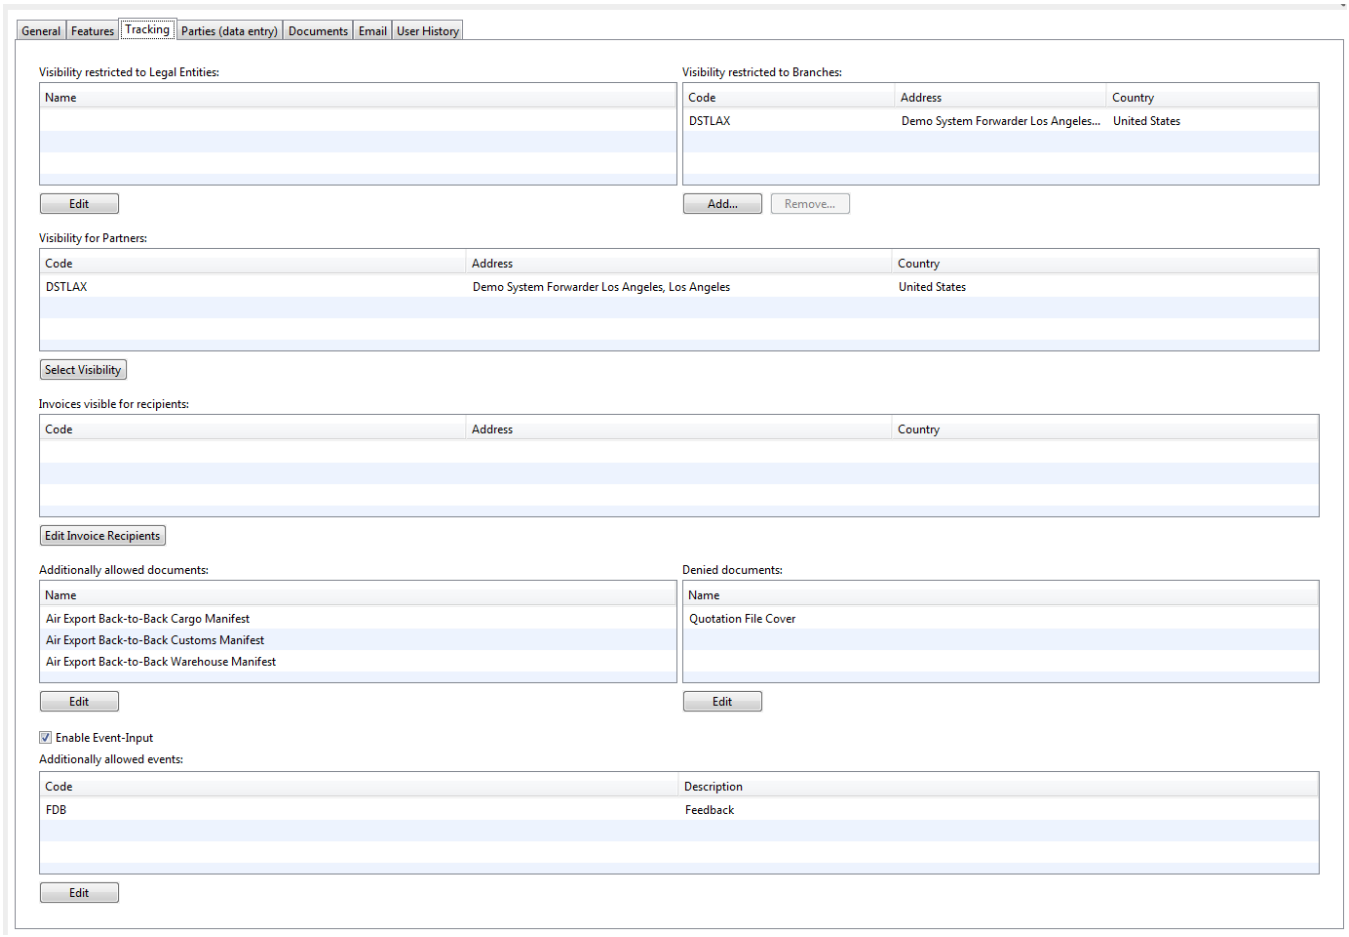
In this tab the features of the account are selected

- Enable Tracking: Minimum requirement. The account can login and see shipments / bookings / prealerts

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Enable Bookings: The account can create air and sea export bookings. This needs further entries in tab "Parties (data entry)".
- Enable Pre-alerts: The account can create air and sea import prealerts. This needs further entries in tab "Parties (data entry)".
- Enable Purchase Order Management: The account can create entries for purchase order management. This is a seperate module in Scope.
- Enable Shipment-Monitor: The account can see the Scope shipment monitor and if "Allow Milestone Completion" is selected, the account can fulfil milestones
- Enable Handling: This is a german specific module
- Allow note creation: The account can add a note to existing shipments / bookings / prealerts

Tracking

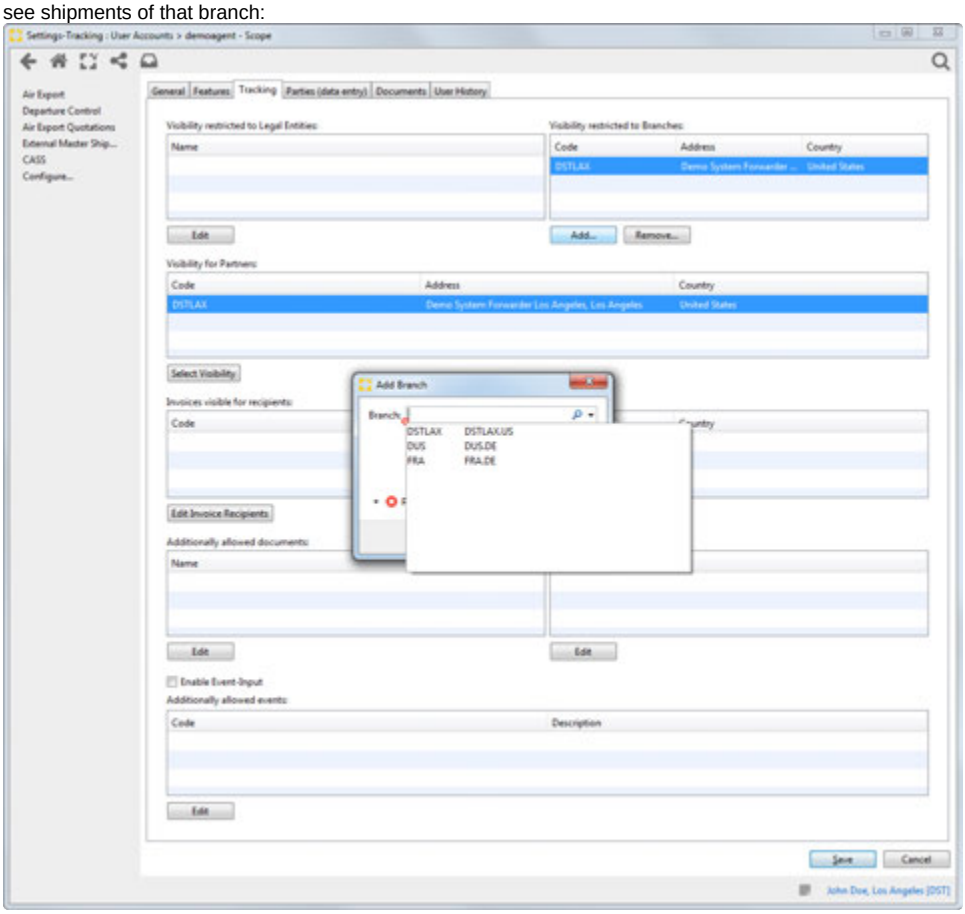


In this tab the requirements for visibility of shipments is defined.

- Legal Entities: if blank the account can see all shipments of the Scope Server. If a legal entitiy (e.g. US or DE) is entered, the account can only see shipments of that legal entitiy

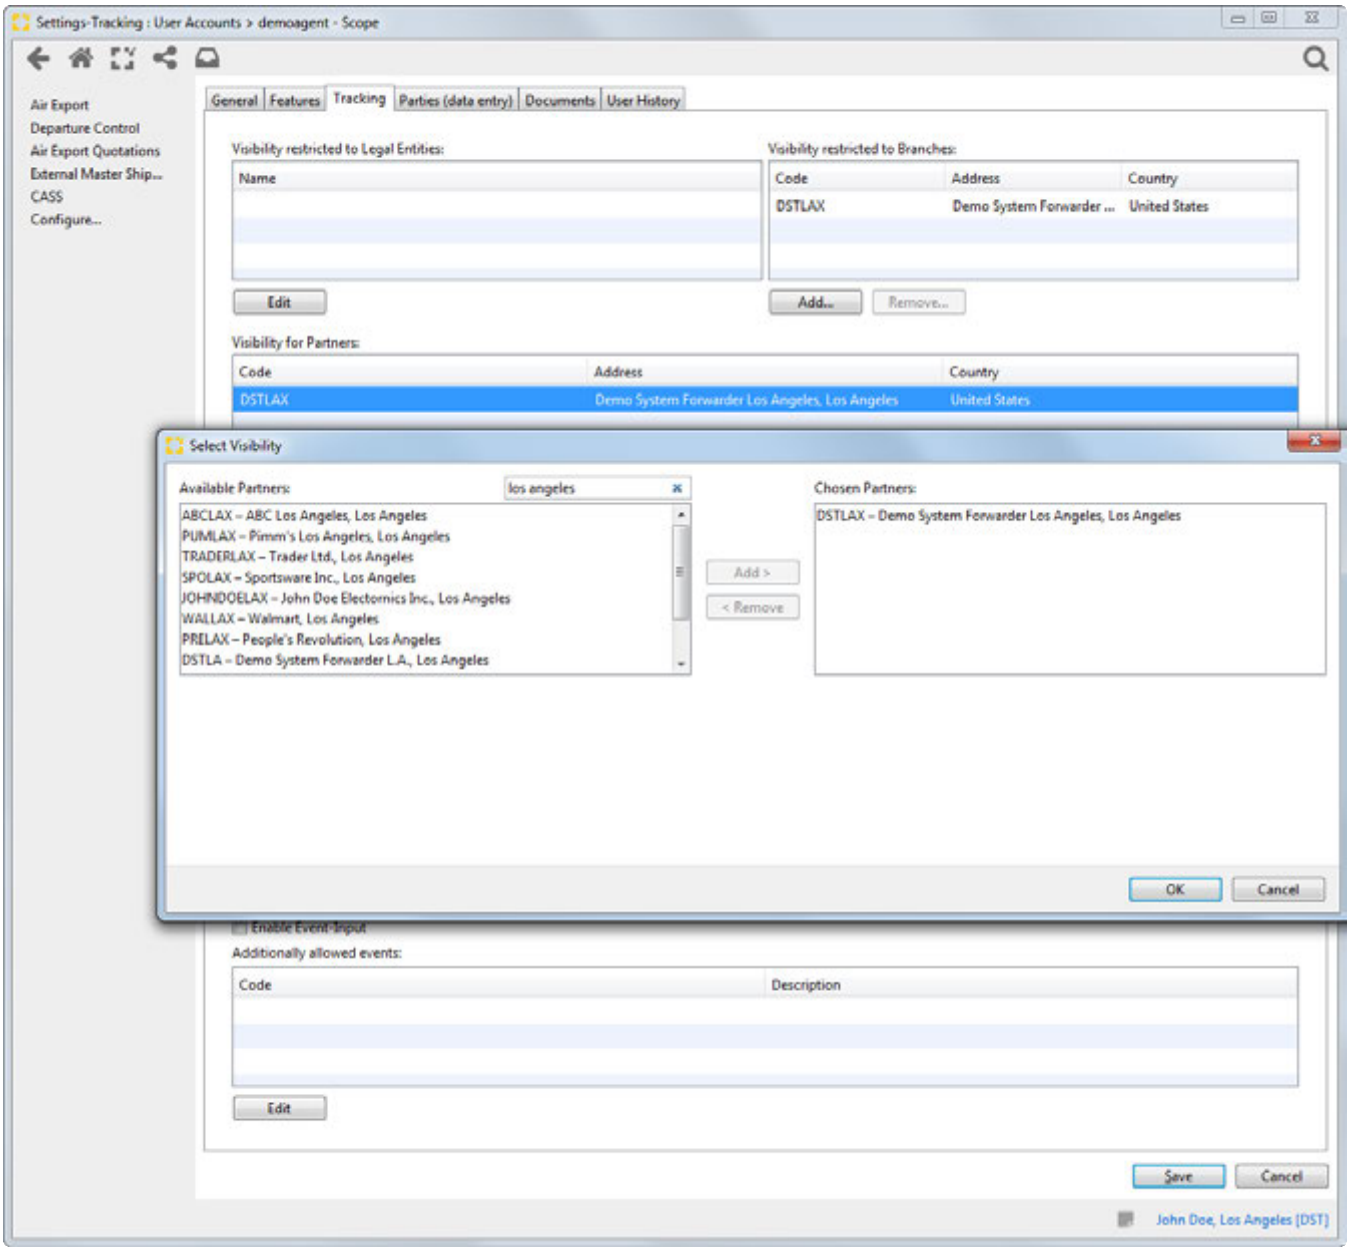
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Branches: if left blank the account can see all shipments of the Scope server or entered legal entities. If a branch is entered, the account can only see shipments of that branch:



- Visibility for Partners: Select the partners for which the account can see shipments. Any partner selected here (regardless of the role in the shipment) causes the display of the shipment for the account:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Invoices visible for recipients: enter a partner to allow vouchers created with this partner as invoicee to be visible in the web

Standard Document visibility

The following logic is hardcoded and the default for displaying documents in Scope Connect. We check the role of the partner in the shipment and display the following:

Shipmenttype	Role	Document

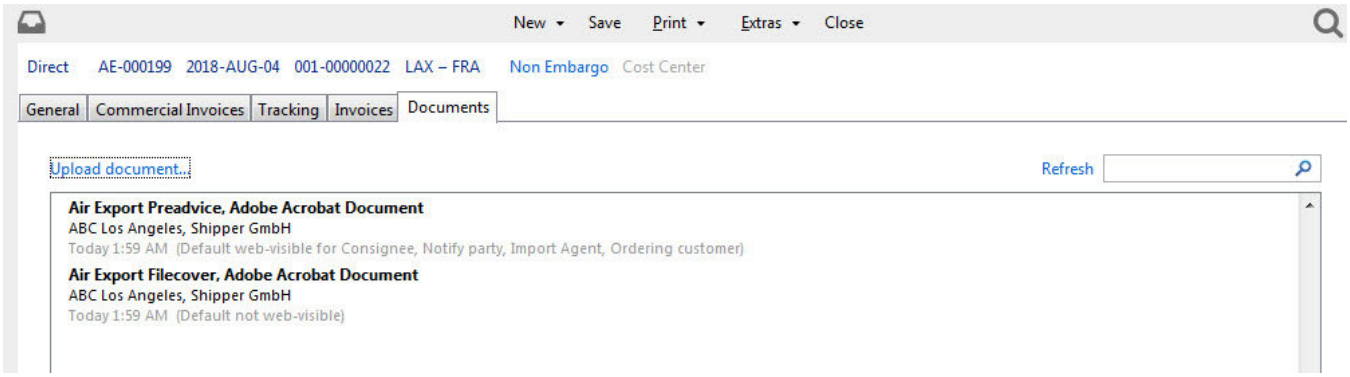
	Shipper	Pickup Order

The document tab of a shipment also displays if a document is visible in Connect and if so, for which role:

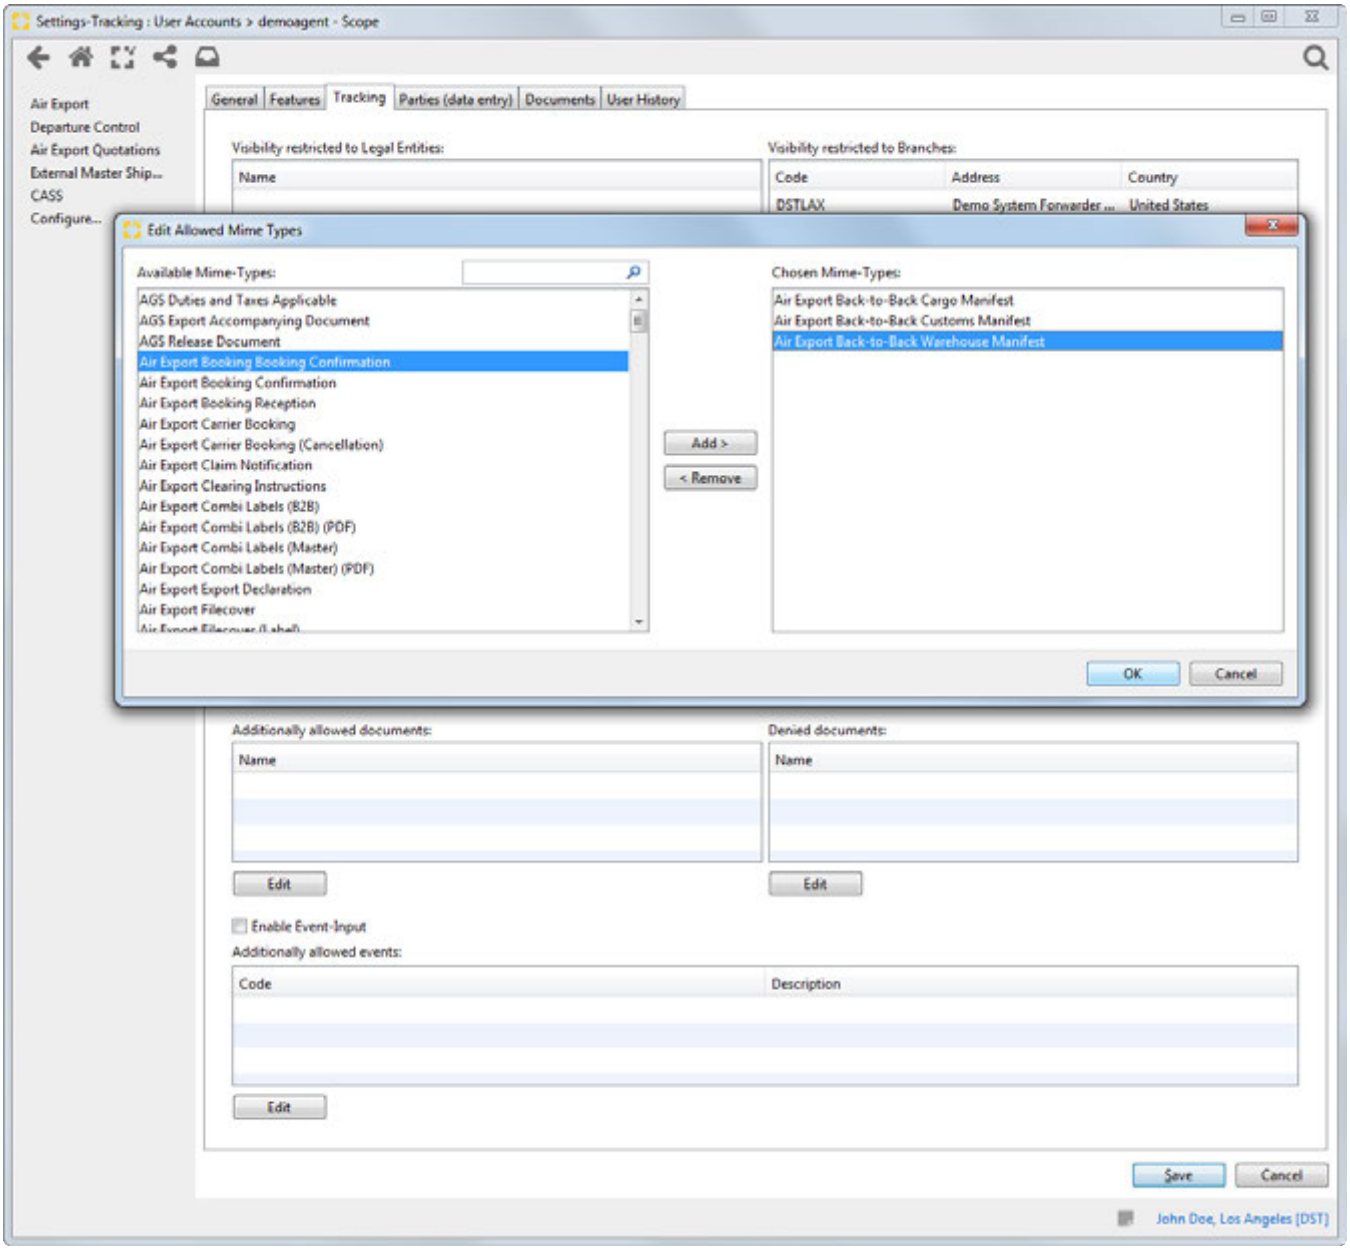


Additionally allowed documents

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This function allows a specific account to see more than the standard set of documents (see: Standard Document Visibility).

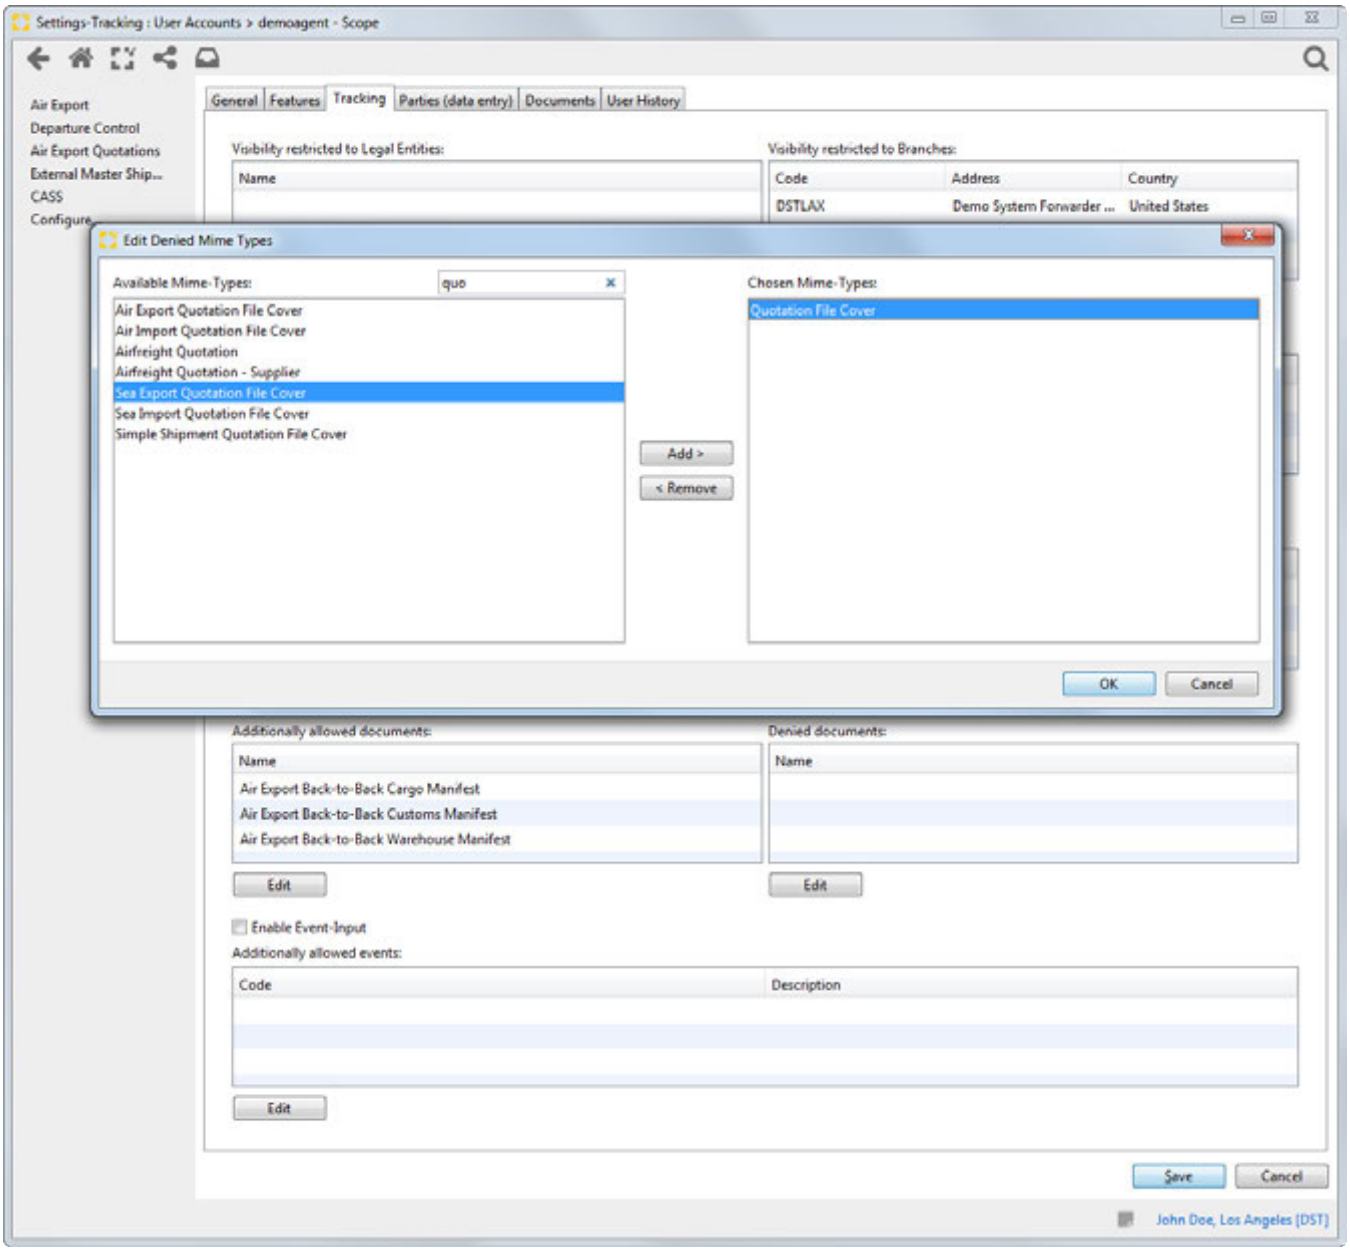
⚠ This does not work for manually uploaded documents. Manuallly uploaded documents can only be made visible for everyone and it needs to be done for every shipment ⚠



Denied documents

This function allows a specific account to see less than the standard set of documents (see: Standard Document Visibility).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

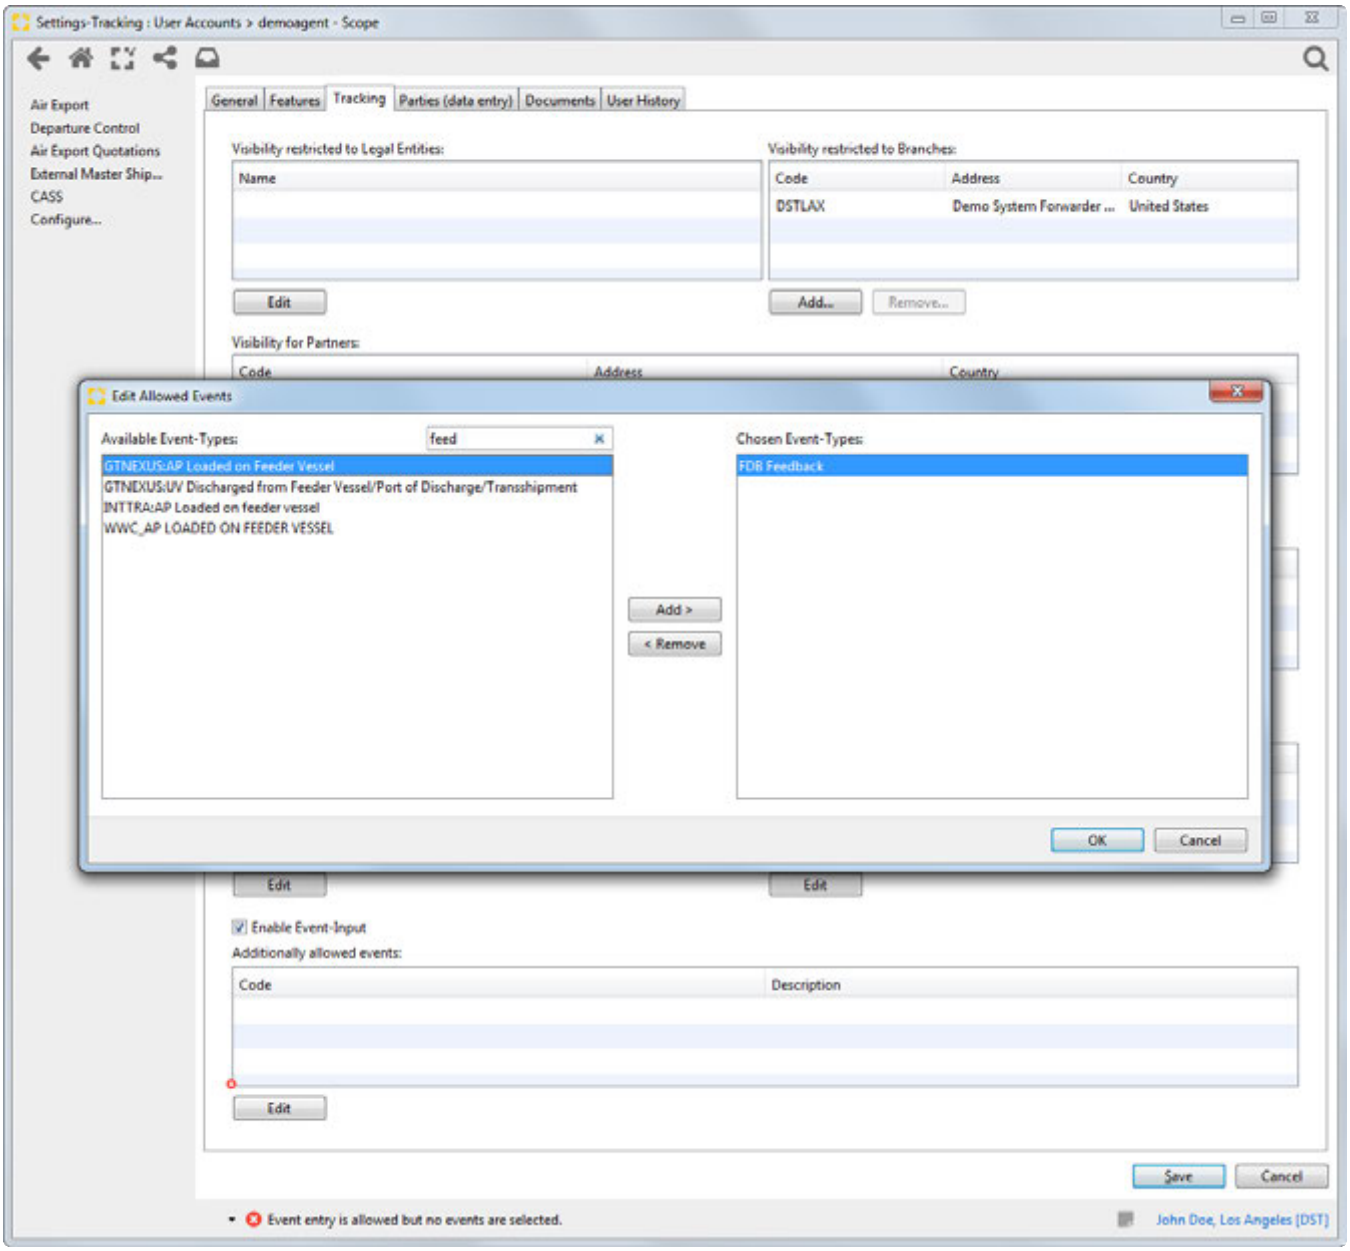


Event Settings

Checkbox "Enable Event-Input"

This function allows the account to enter manually defined events in Scope.

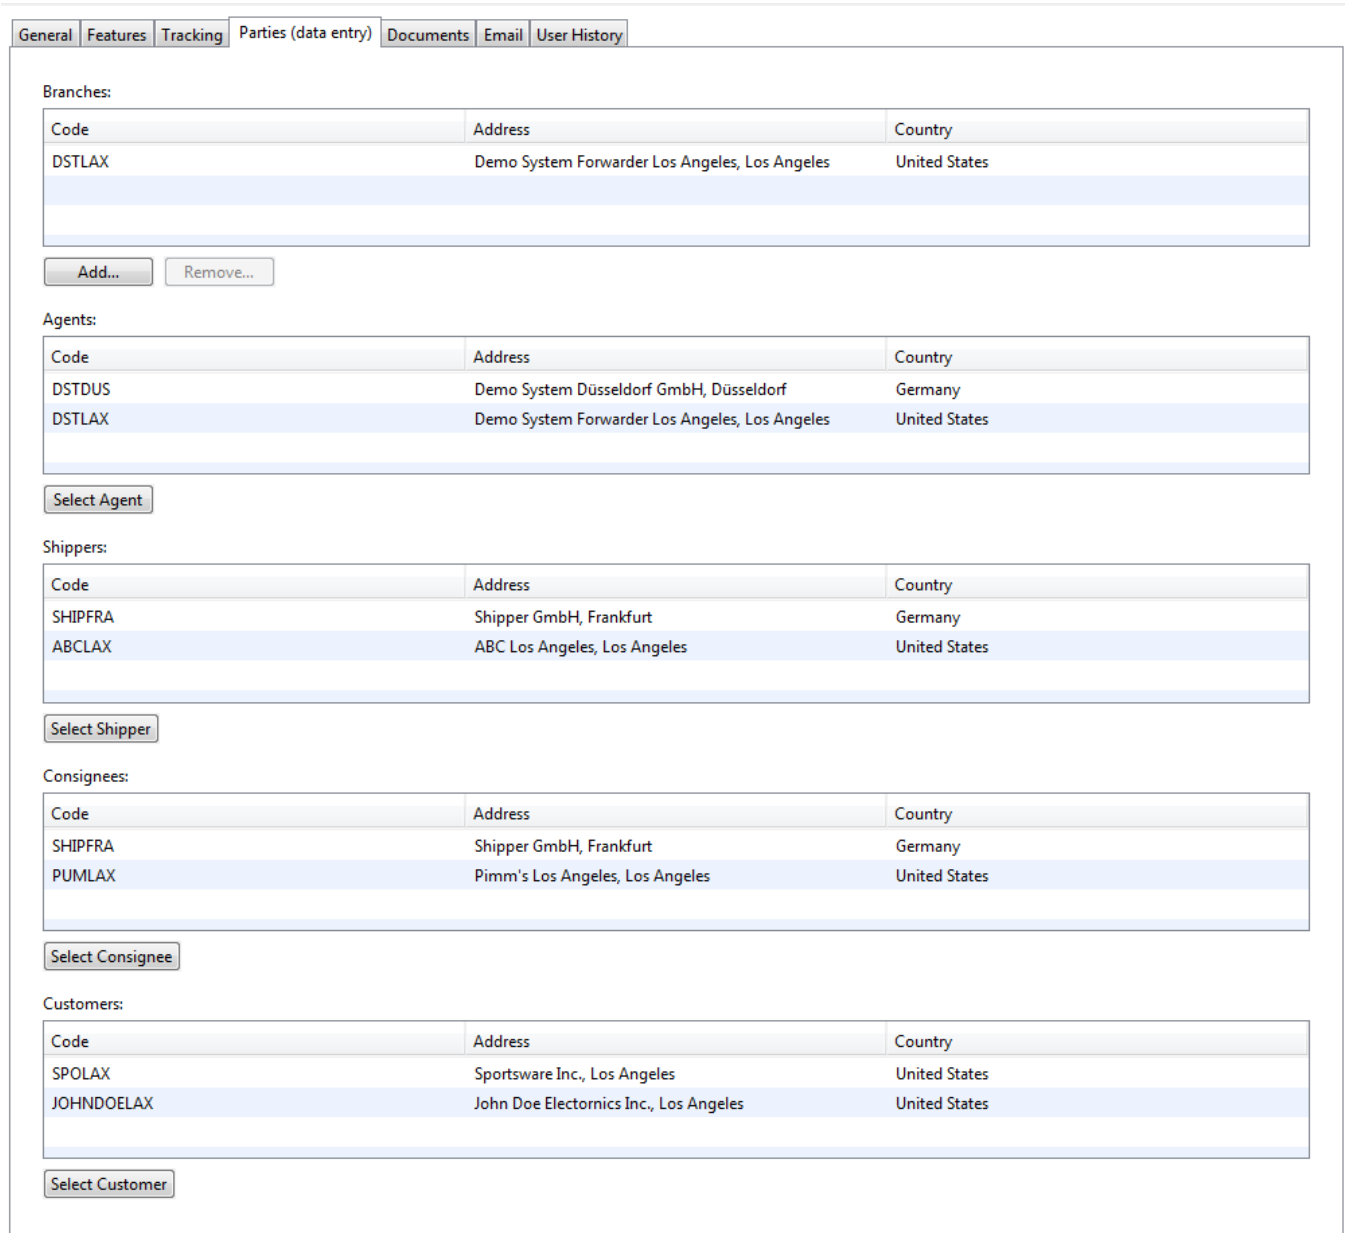
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Parties (data entries)

In this tab the partners are maintained which can be used for data entry (booking / prealert) in Connect. This does not affect visibility of data.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



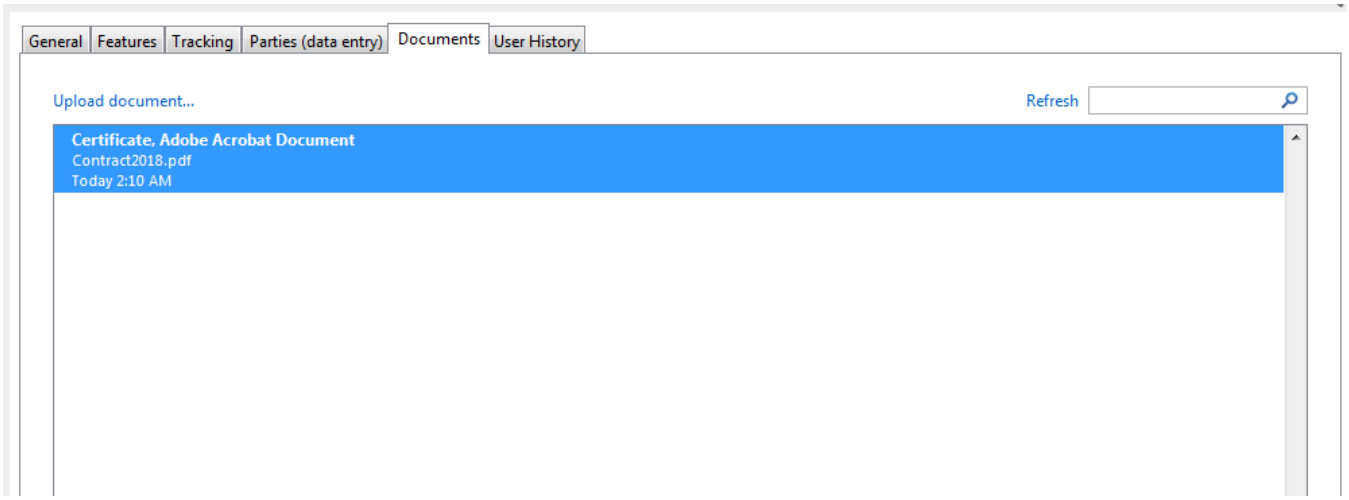
- Branches: if blank the account can book in all branches. If one or multiple branches are entered, the account can only book in the selected branches
- Agents: The partners entered here can be used as agents in booking / prealerts
- Shippers: The partners entered here can be used as shippers in booking / prealerts
- Consignees: The partners entered here can be used as consignees in booking / prealerts
- Customers: The partners entered here can be used as customers in booking / prealerts

Documents

Uploading documents

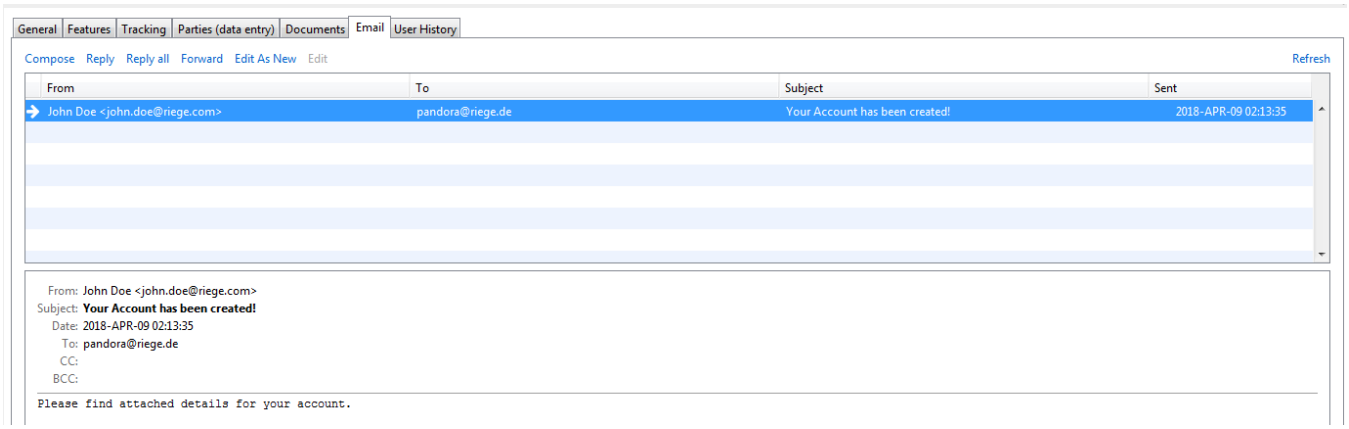
This function is used to upload documents pertaining to this account. The documents are not visible in Connect, only in Scope for information purposes.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



EMail

This tab displays emails Scope automatically sends to the account (initial account creation, password reset).



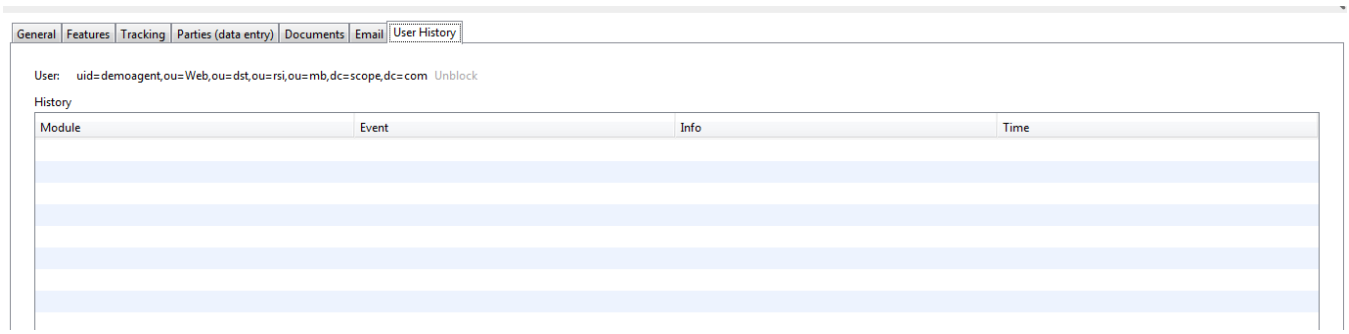
User History

This tab shows the logins of the user. The following is displayed:

- Modul: WEB: Webtracking
- Event: LOGIN, LOGOUT or PASSWORD RESET
- Info: SUCCESS if login was successful, FAILED if login was unsuccessful, DENIED if the account is blocked, REQUESTED after a PASSWORD RESET or DONE after successful PASSWORD RESET
- Time: Time of the event (date, time)

This can be used to evaluate how often an account uses Connect.

An account is blocked if the password is entered incorrectly four times. The account unblocks itself after 9 minutes. The actionlink "Unblock" can be used to unblock the account right away.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Users and Groups

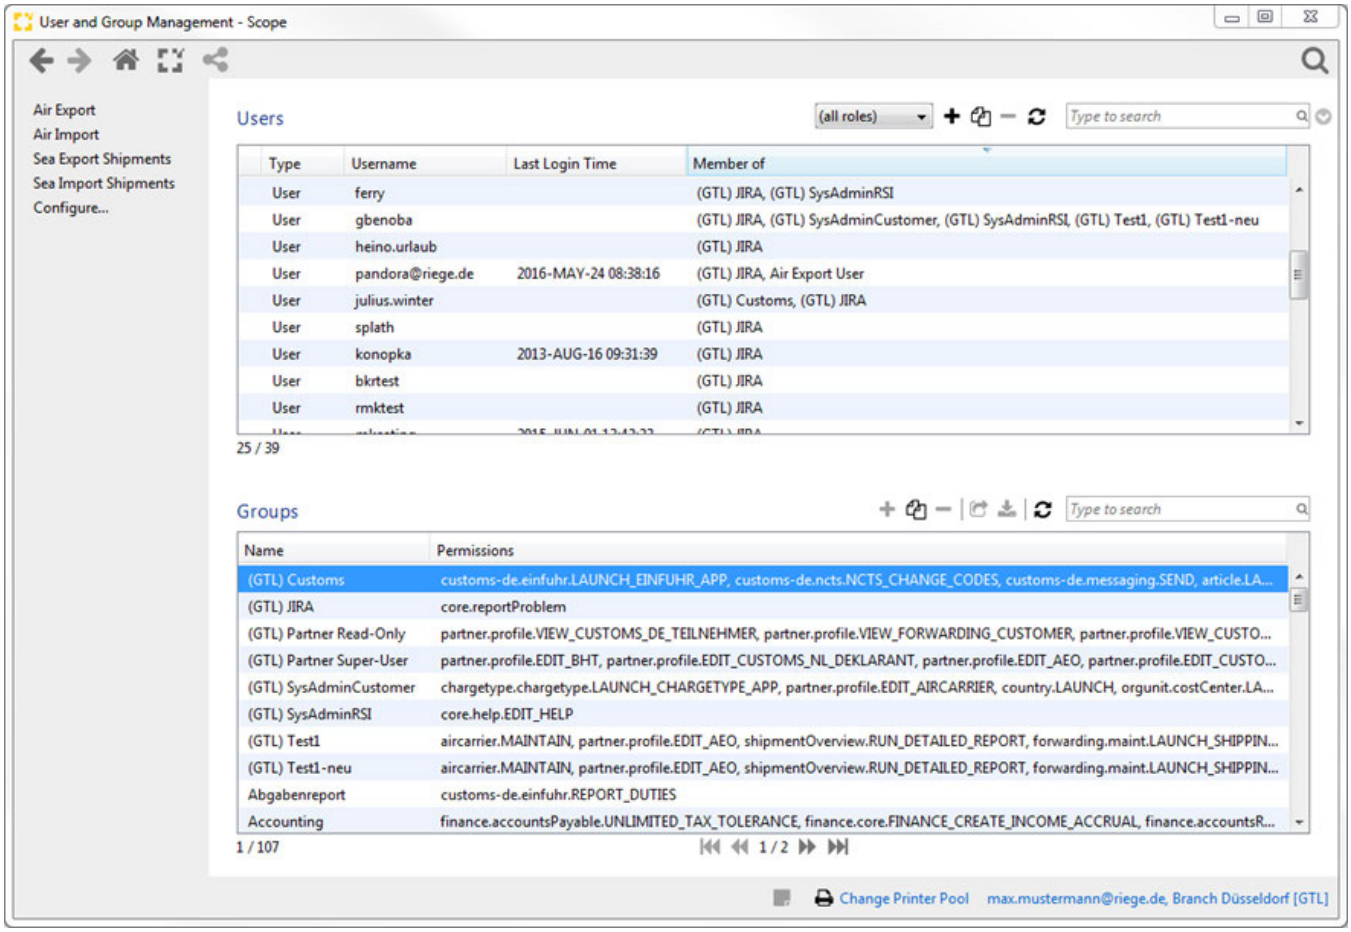
Introduction

Every user must have there own account, so that Scope pulls the suitable authorizations, accesses to the right establishment and if necessary special printer settings with the registration of the user in Scope. If no user profile exists, the user can not log in into Scope.

The user information (name, password, phone, fax and email) must be consigned in the LDAP application. The user profile refers to the LDAP entry and used the data for the Scope login.

Description

In the user management new users and groups can be create or existing data can be change. A group is a summary of permissions to assign this group to individual users. The befit is, that it is not necessary to add for each user all permissions individual.



Users

By ticking + a new user can be add. To copy an user press . By ticking − a marked user can be delete.

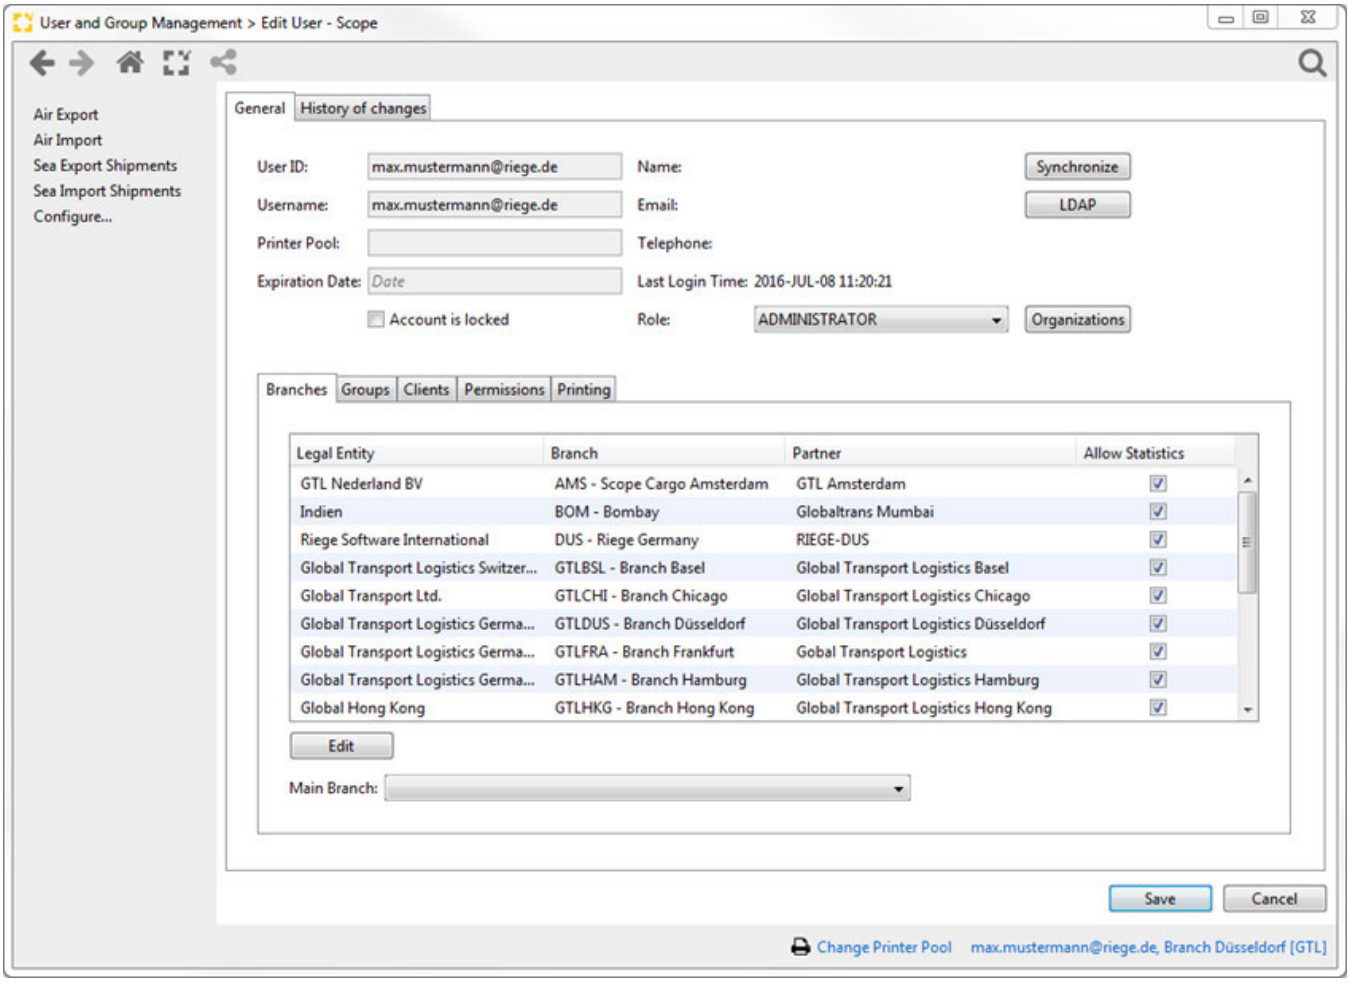
In the overview, all users from a branch will displayed.

- Type = User, administrator or support
- Username = Name of the User
- Last Login Time = show the last login time from the user
- Member of = Show for which groups the user has the authorization

New

Creates a new user account. In the new window the follow information are needed:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



User ID

LDAP Referenz ID. It is necessary to create a LDAP entry, before a new user can be add in Scope.

Username

Username, with which the user will login into Scope. Use the email address, because the email address is unique. The user will be login with his email address.

Printerpool

Printers can be assigned to a user. If no printer pool is specified, Scope will us the default printer pool from the brach. If the user changes the branch, the printer pool is updated accordingly.

Expiration Date

After this date, the user can not log in anymore. The date can be set in the past or into the future.The user get the information, that the account is expired.

Checkbox "Account is locked"

By ticking the checkbox, the user cannot log in into Scope. The user get the information, that the account is locked.

Synchronize

Synchronies the settings with an already existing user. To use this function, the user must have the role "support".

LDAP

Transfers the data to a liked LDAP profile.

Role

The user can get on of the follow Roles:

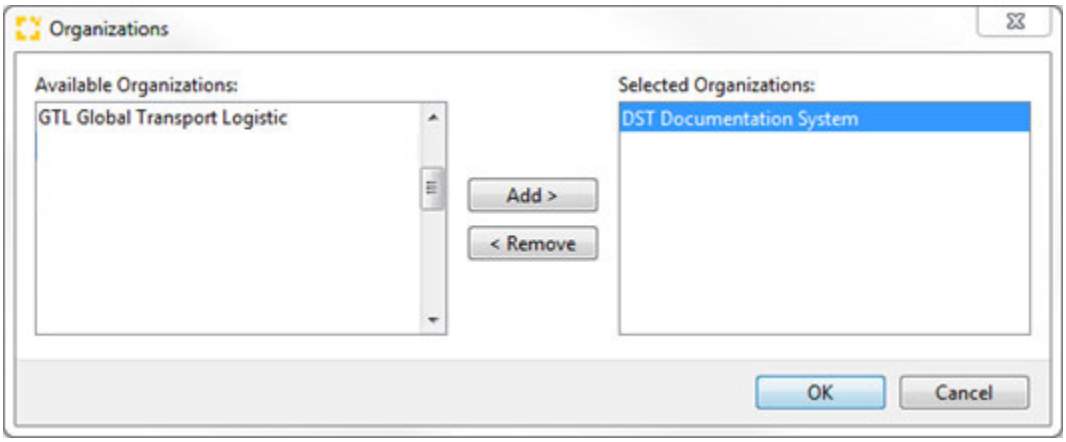
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- User - User with the most restricted permissions
- Administrator - User with extended permissions, for example access to User and Groups and country embargo's.
- Support - User with most permissions. Offers the same options as an Administrator but include functions like EDI Mapping and activities involving XML.

Please find an overview of the applications per role here.

Organization

Users with the role "administrator" must assigned to an organization. By ticking the button a new window will appear to add the organization to the user.



Add

Add the marked organization to the user.

Remove

Remove the marked organization from the user.e

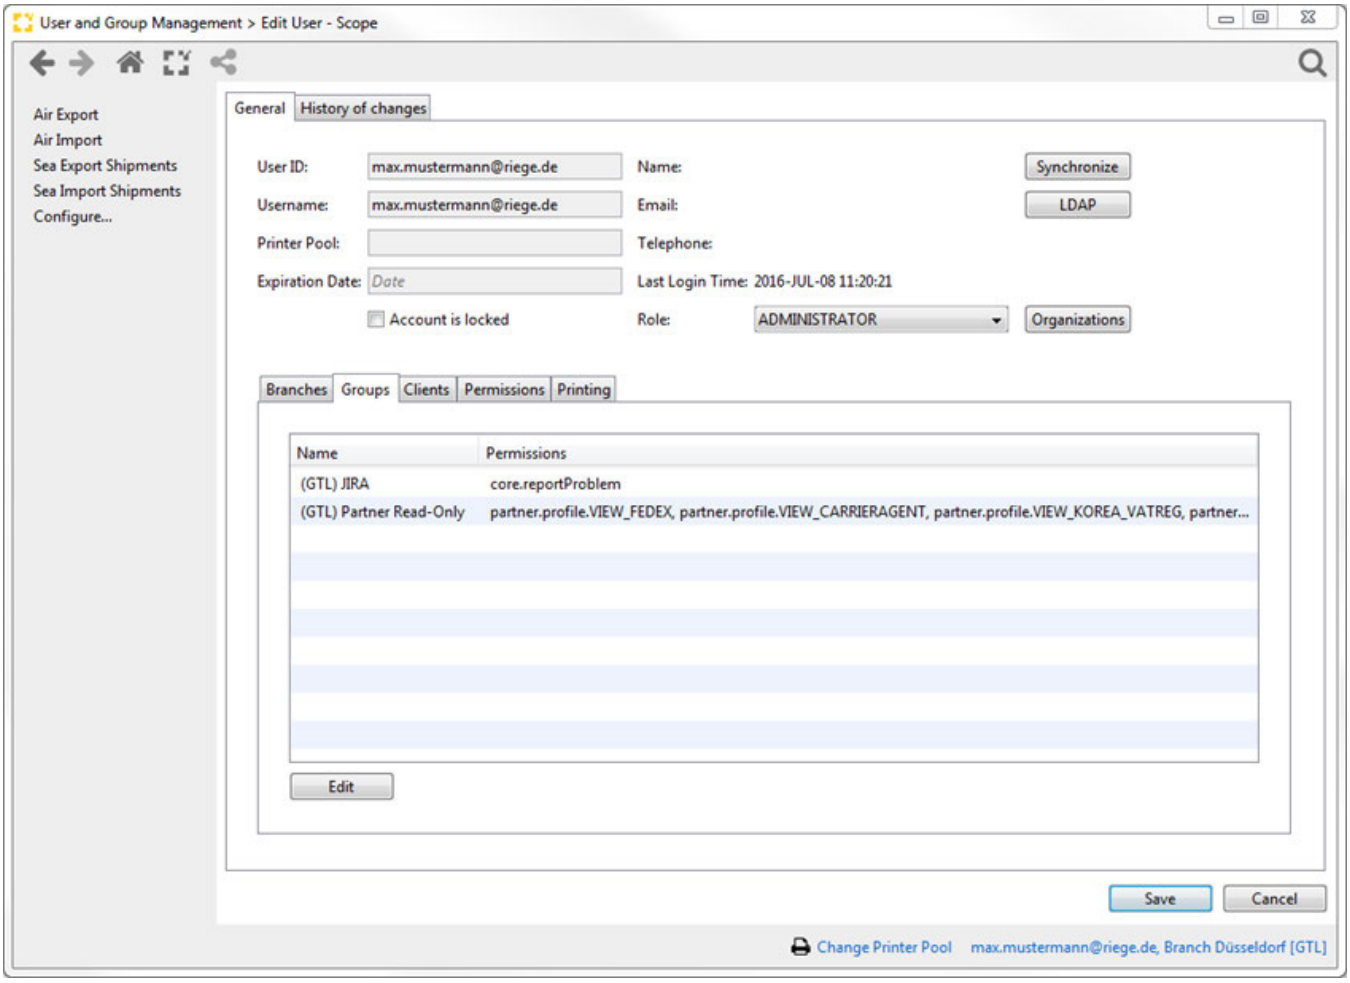
Tab "Branches"

One branch must be assigned to the user profile. However, several branches can be assigned to the user, so the user is able to change the branch in Scope without logout.

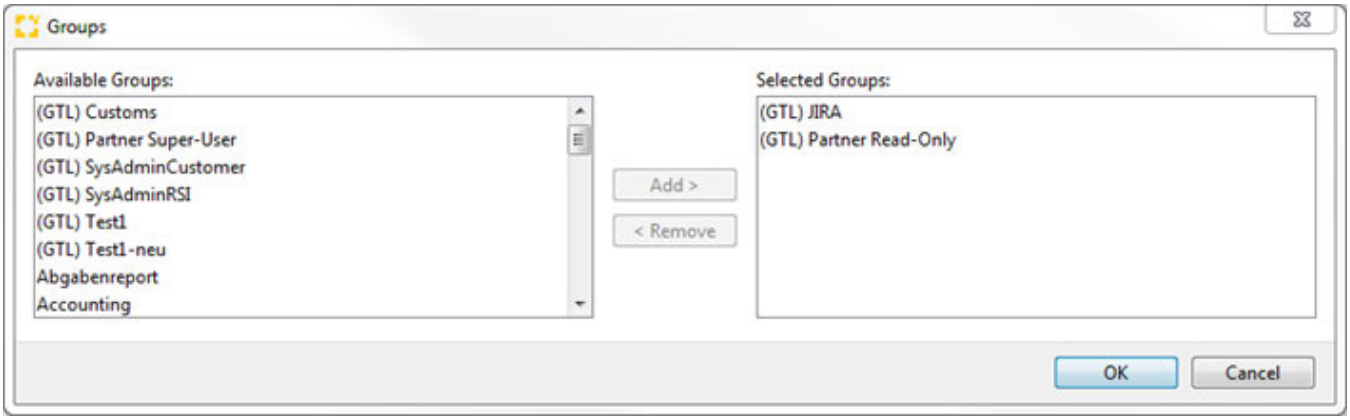
Tab "Groups"

A group is a summary of permissions. The group name and the assigned permission will shown in the overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



By ticking the Edit button, a new group can be assigned to the user profile.



Add

Add the marked group to the user.

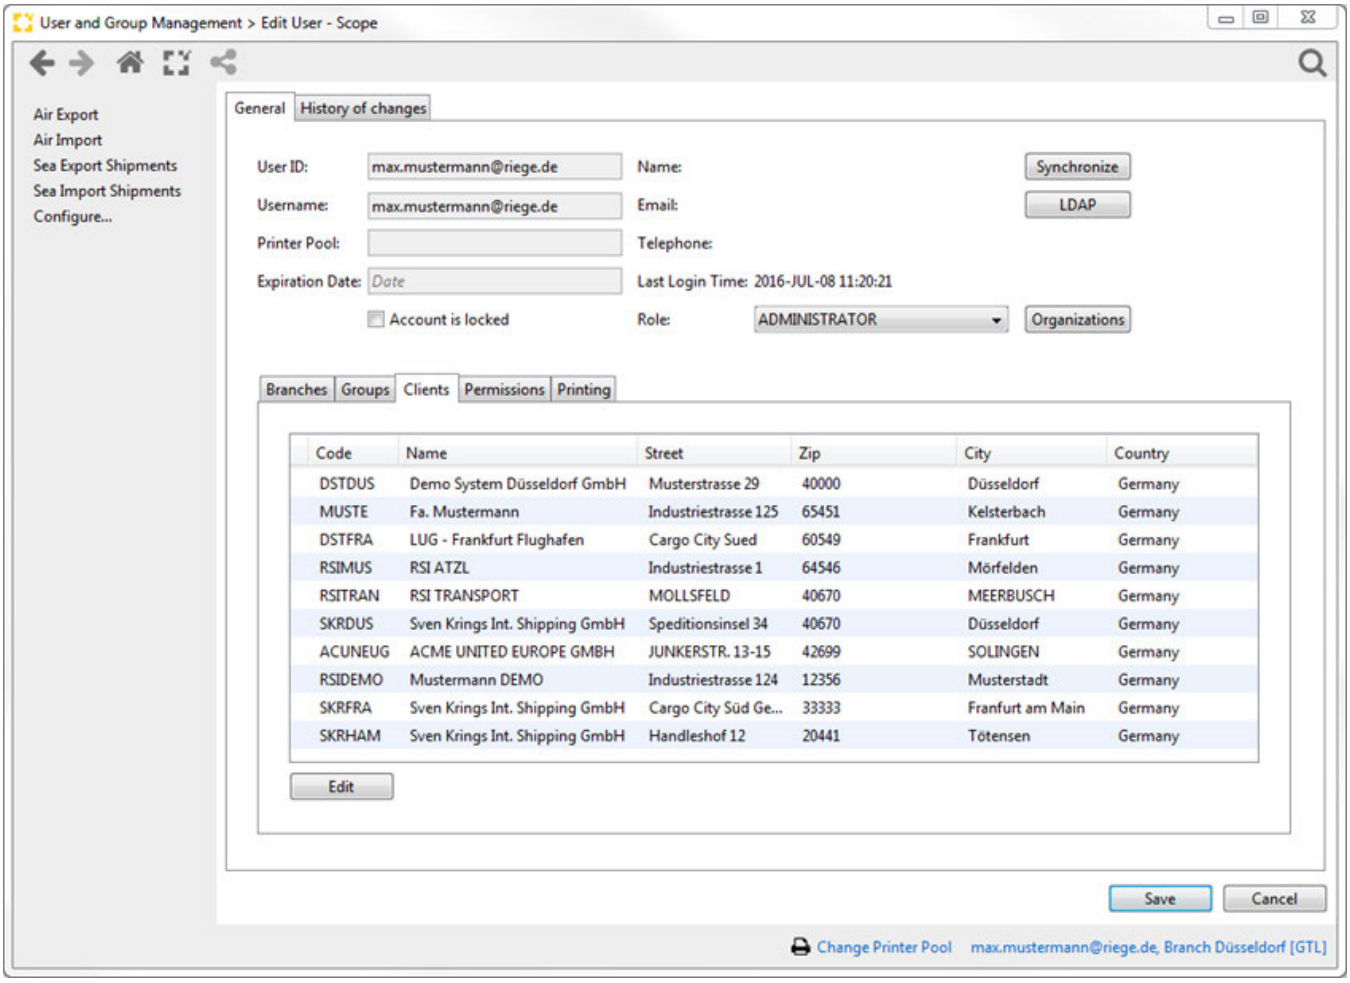
Remove

Remove the marked group from the user.

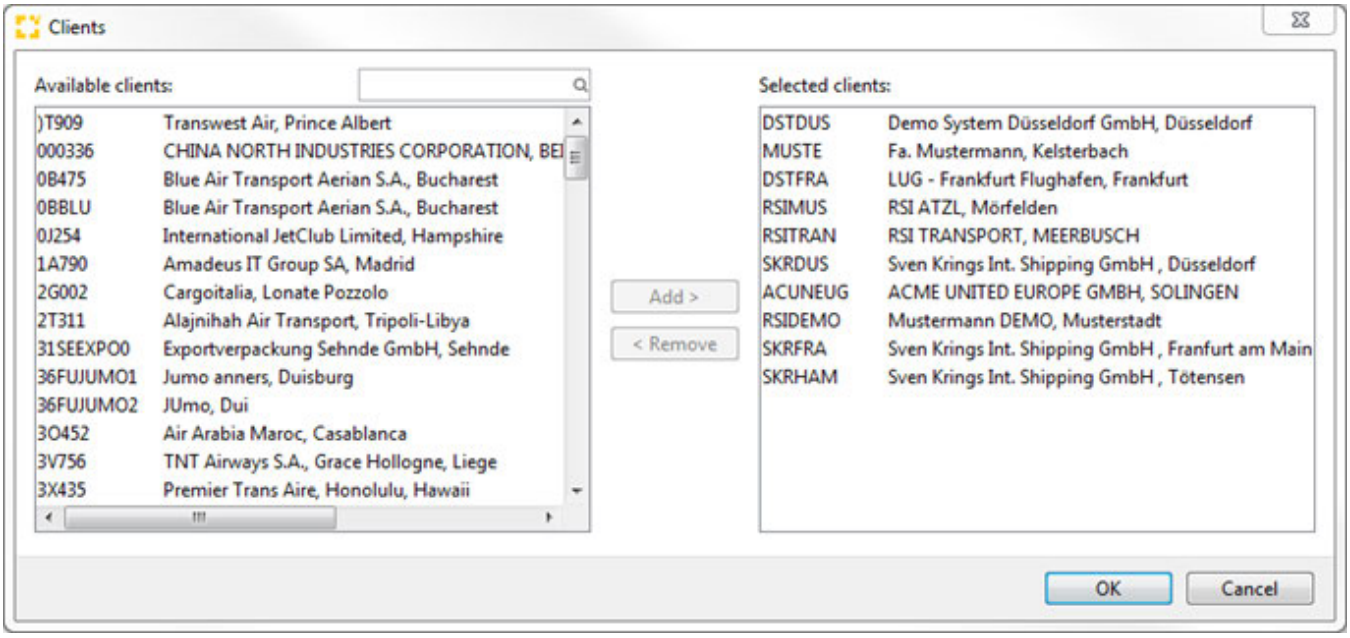
Tab "Clients"

Users can only show and work on define clients. To use this function, it is necessary to activate it in the organization structure.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



By ticking the Edit button, a new client can be assigned to the user profile.



Add

Add the marked client to the user.

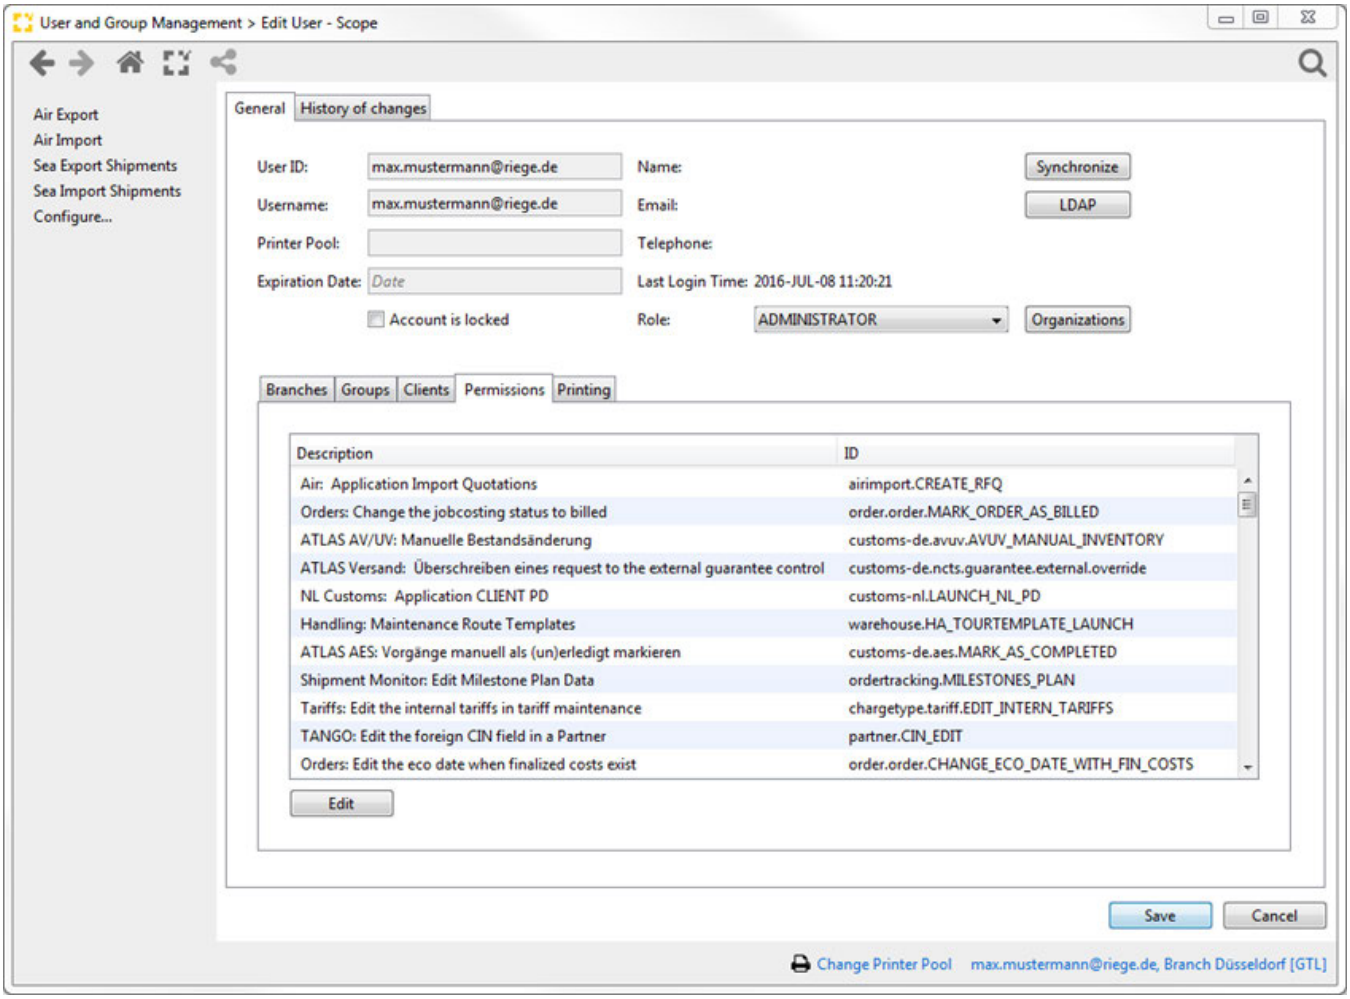
Remove

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

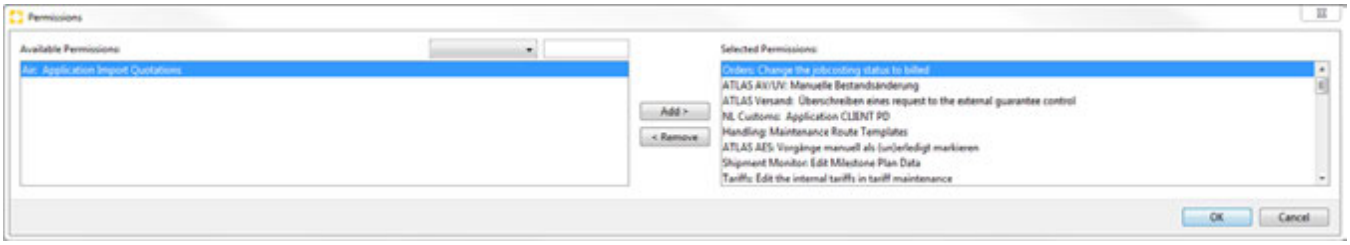
Remove the marked client from the user.

Tab "Permissions"

Additionally to the groups it is possible to set single permissions to the user profile.



By ticking the Edit button, a new permission can be assigned to the user profile. The follow permissions are available: Permissions



Add

Add the marked client to the user.

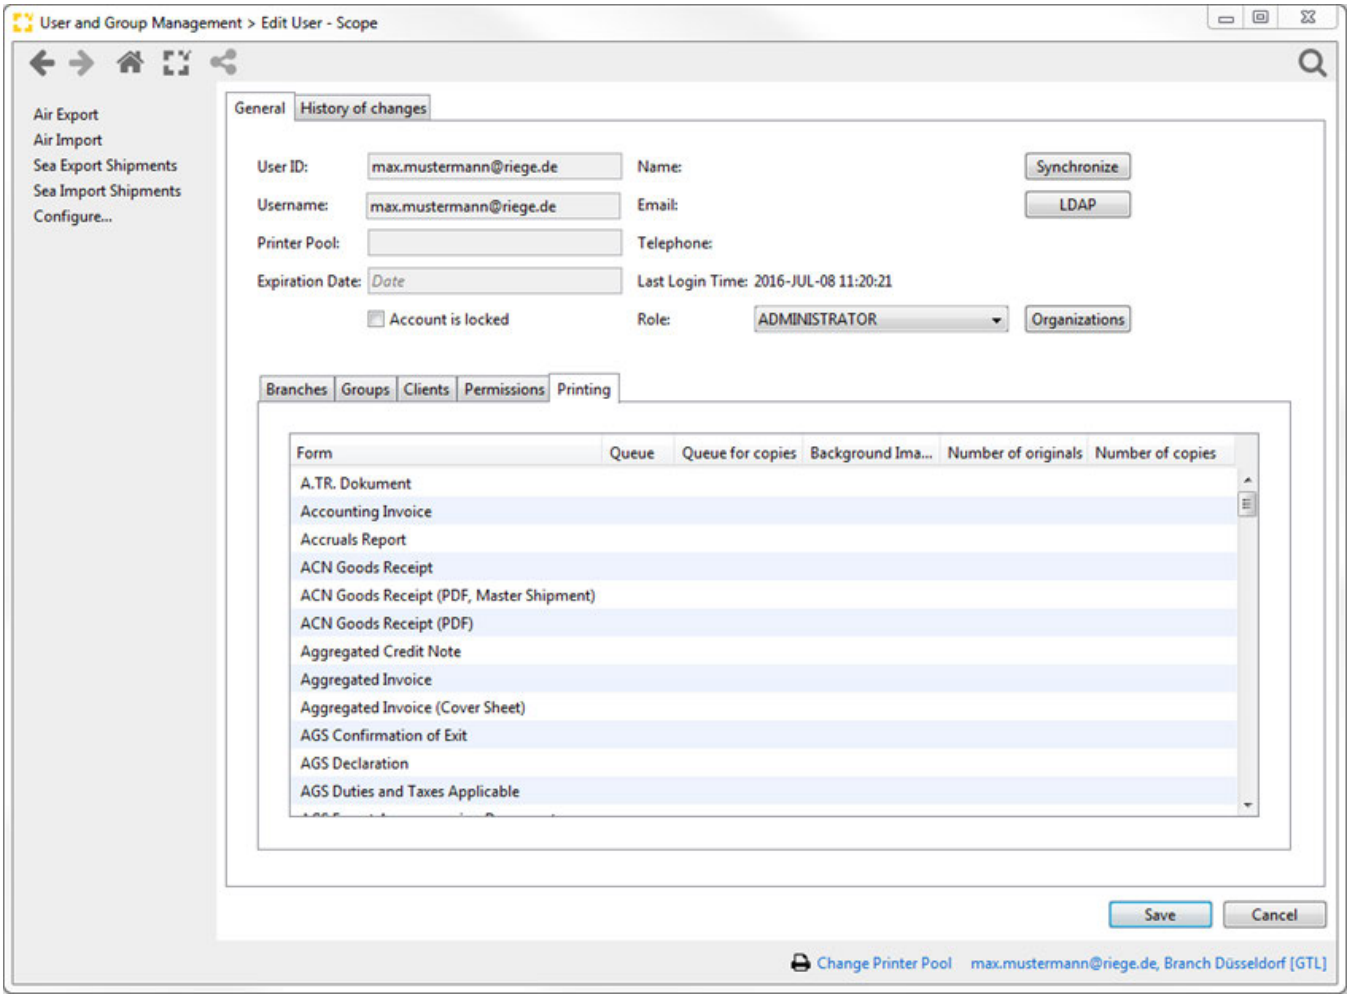
Remove

Remove the marked client from the user.

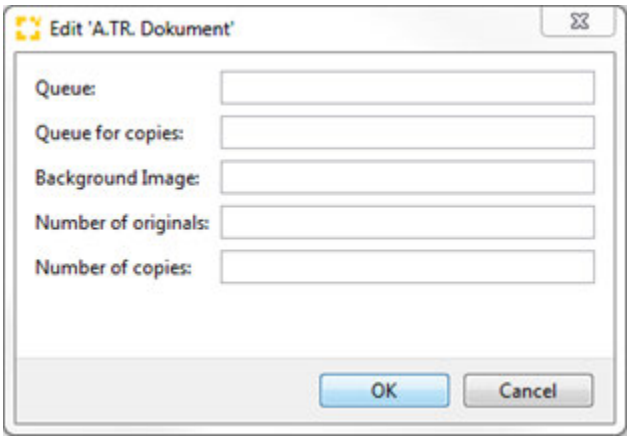
Tab "Printing"

Additionally to the printer pool, it is possible to set a special printer and backgrounds for individual prints. By double mouse click on the document the printer can be add or change.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



By double mouse click on the document the printer queue can be add or change.

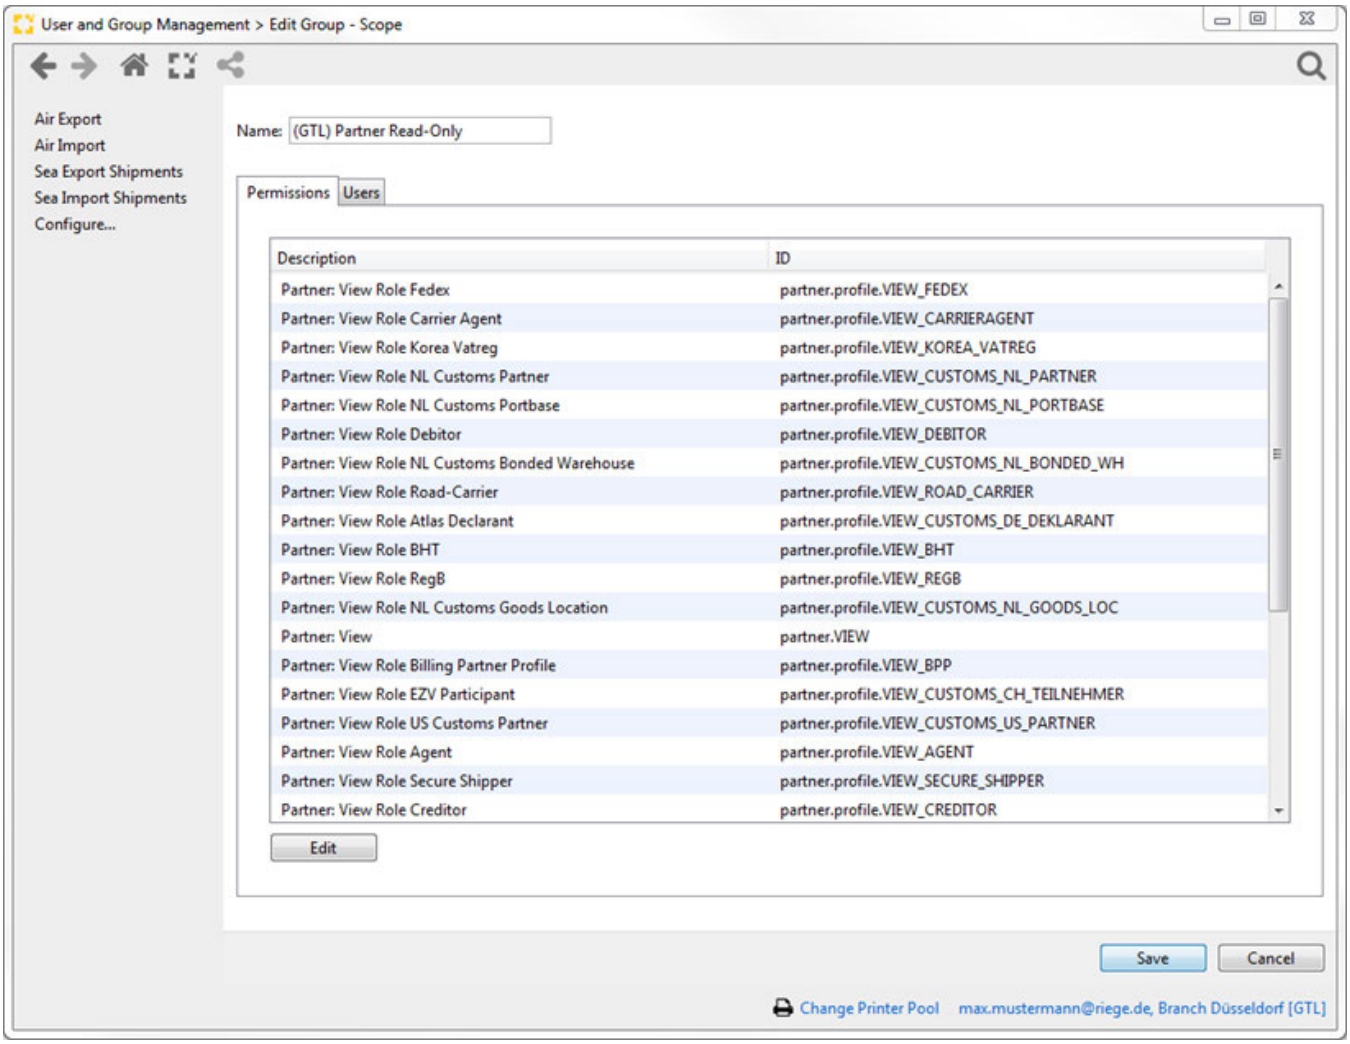


Groups

In the overview all funded groups are displayed. The group name and the assigned permission will shown in the overview.

By ticking + a new group can be add. To copy a group press . By ticking − a marked group can be delete. It is also possible to export or import groups by ticking or . To refresh the overview press .

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Name

Name of the group to identify it for later usage.

Tab "Permissions"

In the permission tab, the permissions can be add to the group.

Tab "Users"

In the users tab, the users can be selected to the group.

Edit

By ticking the Edit button a new window appears for user or permission selection.

Permissions - User - Settings

Introduction

By using permissions, users gets access to actions and modules in Scope. The permission can add to the user individual or as an user group.

Scope Modules

The follow Scope modules are available:

BASIC	Basic functions and maintenance
BHT	BHT data exchange
COMPLIANCE	Compliance Check via AEB
CRM	Customer relationship management
Zoll (BE)	Belgium Customs
Zoll (CH)	Swiss Customs
Zoll (DE)	German Customs
Zoll (NL)	Netherland Customs
Zoll (US)	US Customs
Dakosy	Dakosy data exchange
DUNNING	Dunningmodule
EZT	electronic customs numbers (TARIC)
FORWARDING	Air- ans Seafreight shipment and maintenance
ON_HAND	On Hand
RAKC	Connectivity to RegB database
SEA_CARRIER_EDI	Data exchange for Seafreigth
Shipment Monitor	Order Tracking application
WEB	Track and Trace connectivity
Manage the TACT Rates in Air Export	CUSTOMER_SUPPORT
Reload all code lists from the code list information dialog	CUSTOMER_SUPPORT
Manage "custom" reference types per Organization	SYSTEM_ADMINISTRATOR
Manage the EDI Mappings	CUSTOMER_SUPPORT
View Scope Jobs, Exceptions and restart them	CUSTOMER_SUPPORT
Manage Organizational Units, Legal Entities and Branches	CUSTOMER_SUPPORT
Configure Printer Setup	CUSTOMER_SUPPORT
Configure Printer Pools	SYSTEM_ADMINISTRATOR
Open the Session appliance and view active sessions	SYSTEM_ADMINISTRATOR
Manage UN Location Codes	CUSTOMER_SUPPORT
Update Scope Master Data from SDS	CUSTOMER_SUPPORT
Lock and Unlock a User Account in the User Appliance	SYSTEM_ADMINISTRATOR
Manage Embargo Countries	CUSTOMER_SUPPORT
Manage Country Masterdata	CUSTOMER_SUPPORT
Start the Holiday Maintenance	CUSTOMER_SUPPORT
Change the ATLAS release used by a Partner	CUSTOMER_SUPPORT

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Rebuild Status of an ATLAS procedure	CUSTOMER_SUPPORT
ATLAS External Interface Configuration	CUSTOMER_SUPPORT
Configure DAKOSY EDI Mapping	CUSTOMER_SUPPORT
Edit DAKOSY Partner Profile (including Login-Name and Password)	CUSTOMER_SUPPORT
View DAKOSY IFTSAI (Sailing Schedule) transmission data	CUSTOMER_SUPPORT
Configure Accounting Interface	CUSTOMER_SUPPORT
Configure download of European Central Bank Exchange Rates	CUSTOMER_SUPPORT
Edit Carrier Handling Agent Master Data	CUSTOMER_SUPPORT
Export Carrier Handling Agent data in RSIXML2 format	CUSTOMER_SUPPORT
Handling Agent Master Data	CUSTOMER_SUPPORT
Configure Sea Carrier EDI (Inttra and GT Nexus)	CUSTOMER_SUPPORT
Configure Web-based Track & Trace System	CUSTOMER_SUPPORT

Description

Roles

The follow permissions are replaced by the role and cannot assign separately. The hierarchy of the roles are:

- Root: all functions
- Customer Support: Riege Software customer support
- System Administrator: Inhouse Scope support (customer)
- User: Operative user
  If a permission is available for the role "System Administrator", this permission is also available for "customer support" and "Root" but not for the role user.

FAQ - How to create a DP World Manifest Sea Freight

This document describes the setup and the creation of the DP World Manifest.

The DP world manifest is a CSV document which needs to be uploaded to DPWORLD application prior to arrival / departure of a vessel at Jebel Ali (AEJEA) or Dubai port (AEDXB)

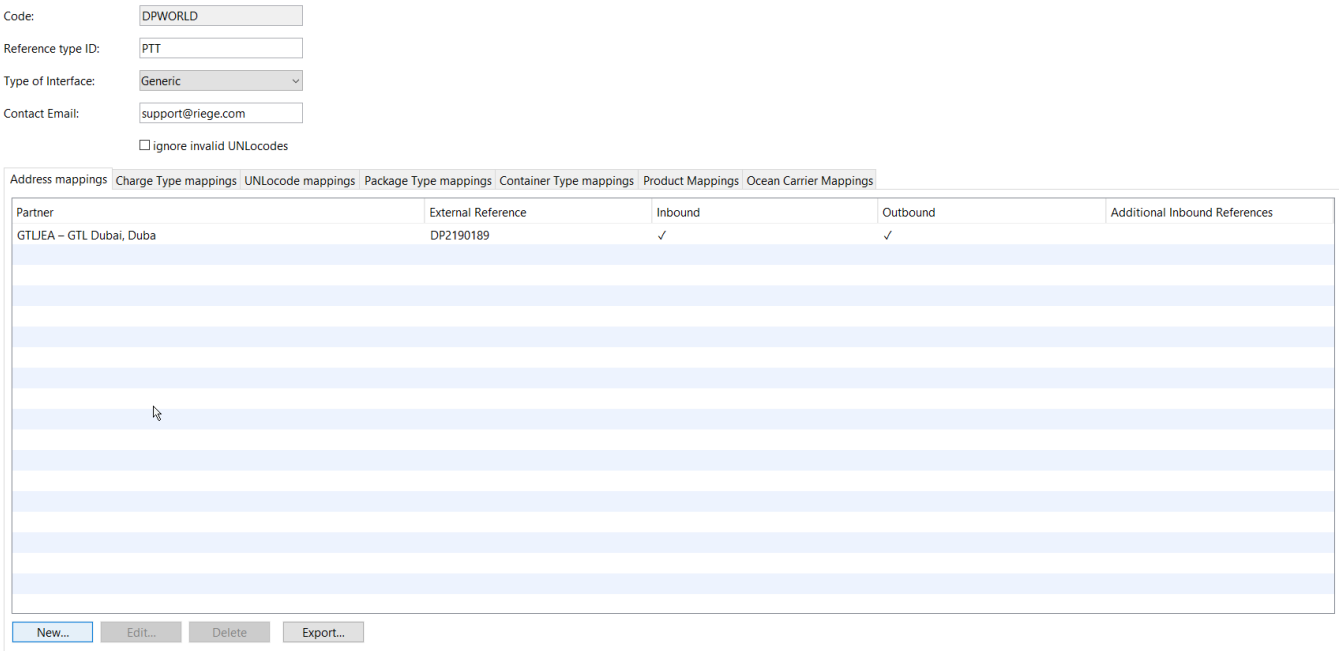
Setup

For the setup there is only the requirement to have an EDI profile with the name
The function EDI profile is started via "Master data \ EDI Profile"

In the EDI Profile a translation is created between the Code of an item in Scope to the supported codes of DP World.

For the following list a mapping (translation) is required

Scope Value	Mapping Tab
Shipping Line SCAC value	Ocean Carriers
Arrival Shipping line Agent	Partners
Branch Partner creating the manifest	Partners
Consignee's for shipment where the final destination is United Arab Emirates	Partners
Packaging Codes	Packaging code Only codes as per appendix 1 are accepted



Registration

Sailing Schedule

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

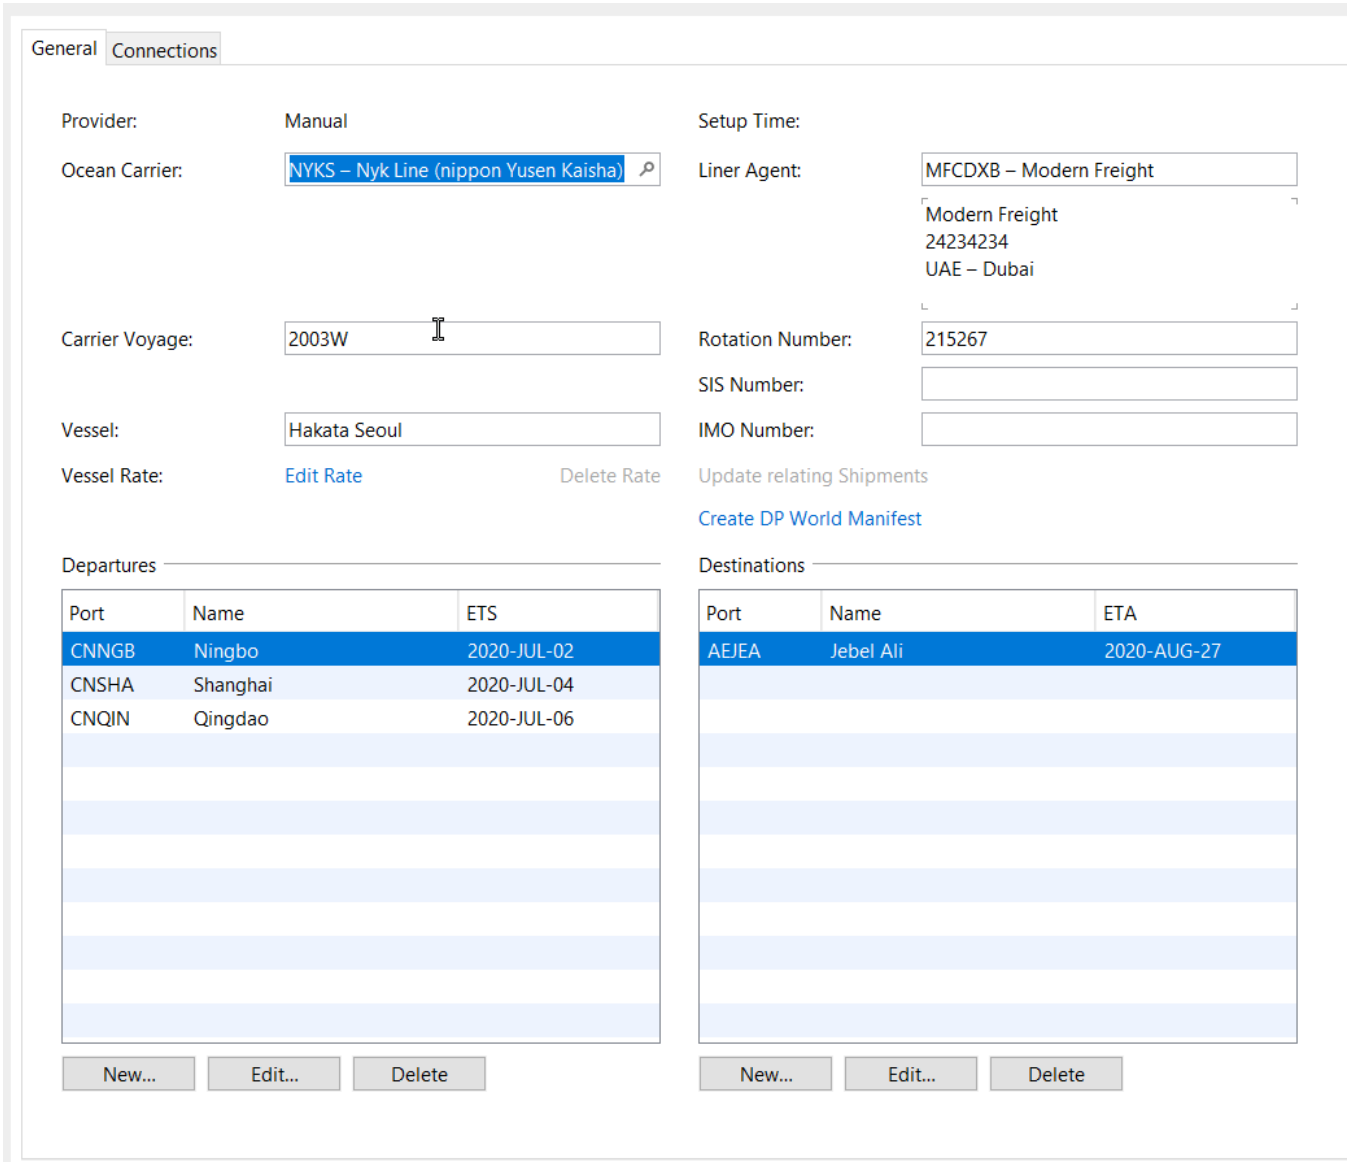
For the correct result of a DPWORLD Manifest it is important that for each vessel for which a DPWorld manifest is required
a vessel entry is created, as described below and that the shipments that are onboard the vessel have been linked to the sailing schedule.

Create a new Sailing Schedule

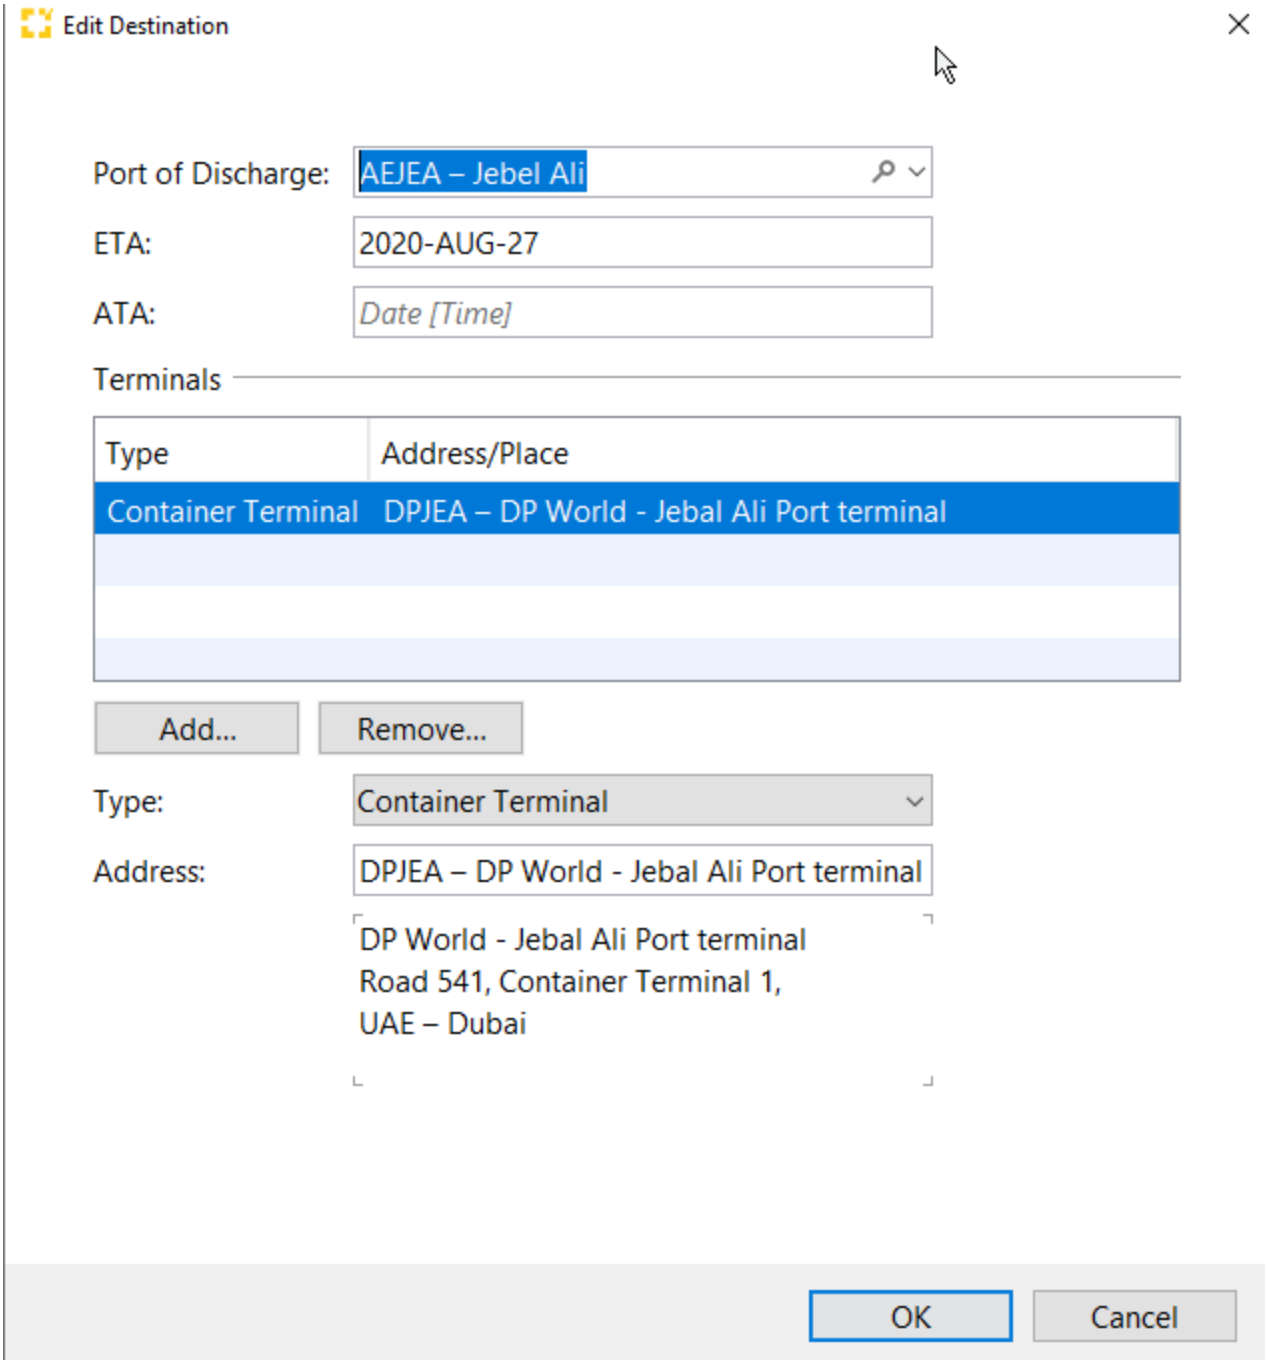
To create a new sailing schedule start the function from "Master Data \ Sea Freight \ Sailing Schedule" and use the option "New"
And enter the details are required.

Field	Explanation	Mapping required
Ocean Carrier	The SCAC code for the ocean carrier	✓
Liner Agent	The Agent responsible for handling the shipment (at arrival)	✓
Carrier Voyage Number	The voyage number as assigned by the carrier	
Rotation number	Vessel Rotation number as assigned by DP World	
SIS Number	Optional identification number of the vessel	
Vessel	The Name of the vessel	
IMO Number	Optional identification number of the vessel	
Departures	All Departure ports from this Voyage where shipments are originating from	
Destinations	All Destinations , however for DP World Manifest it should requires it to be AEJEA	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

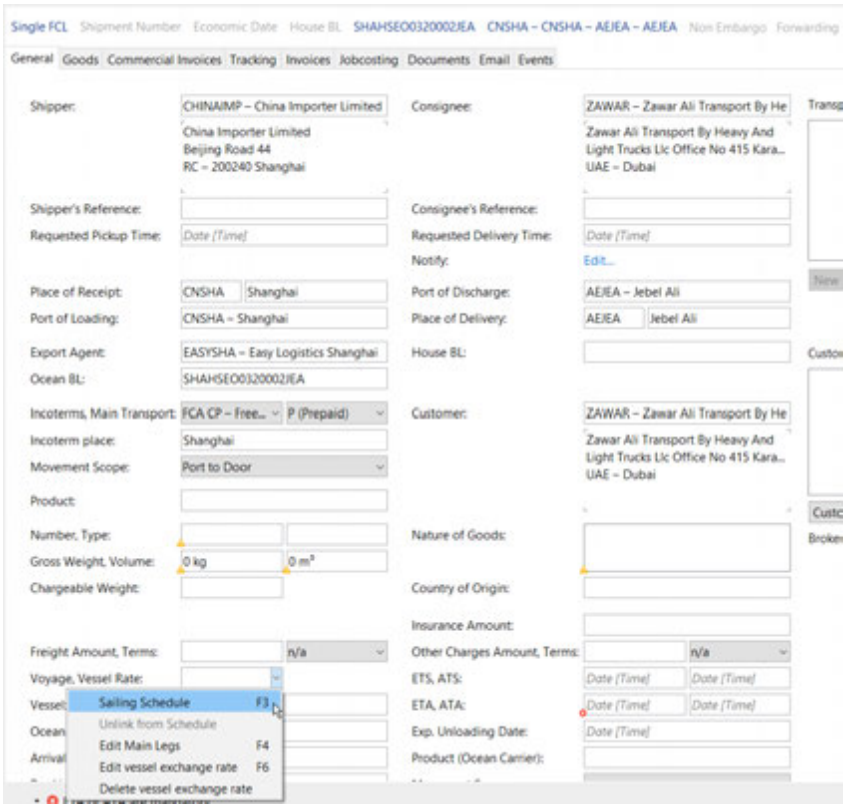


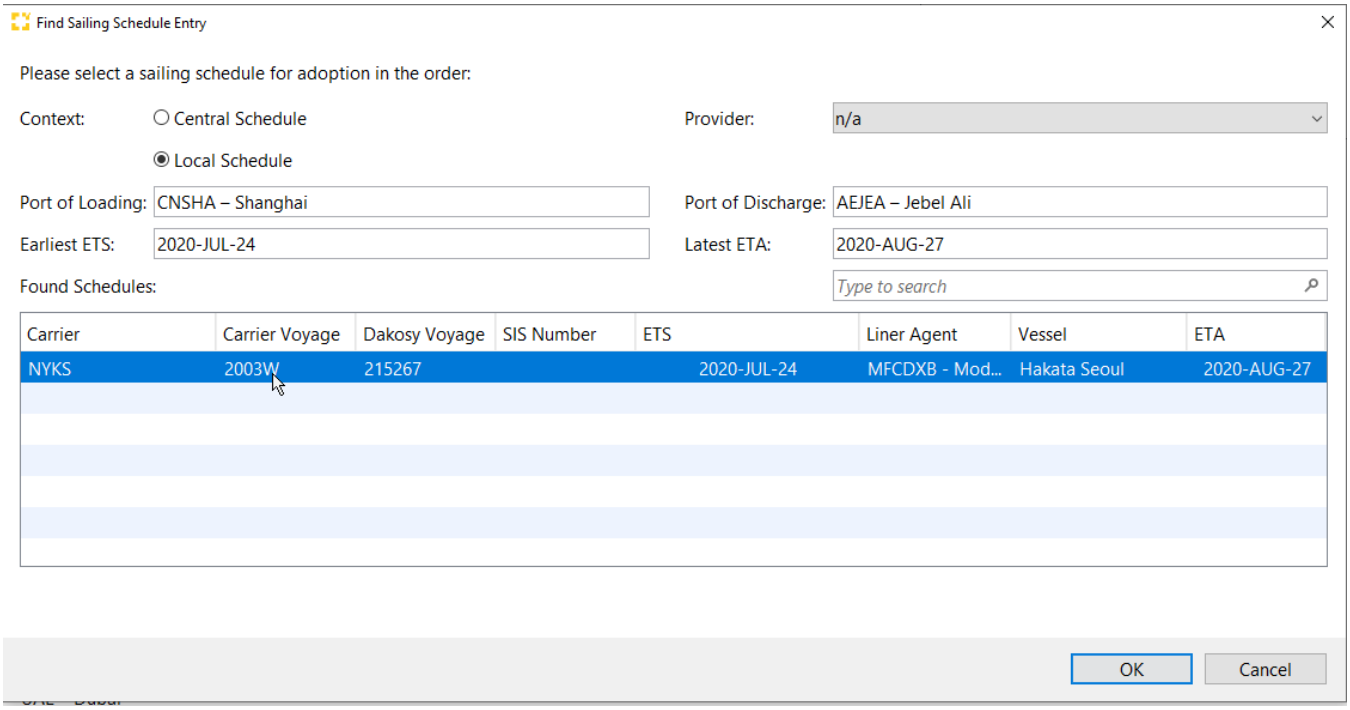
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Link Shipment to Sailing Schedule

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





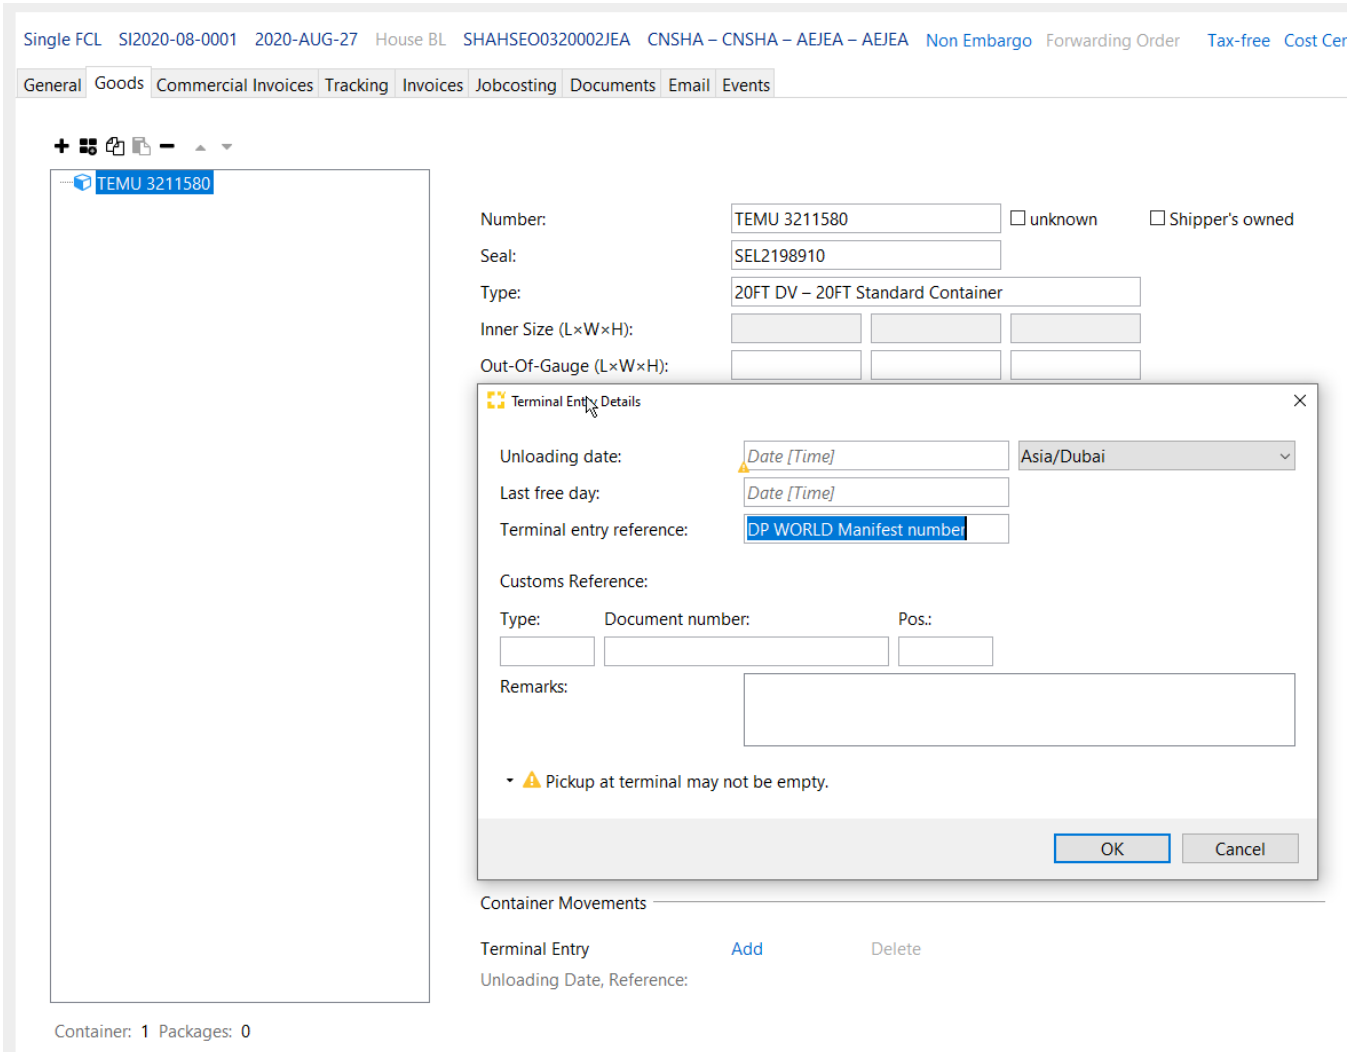
Shipment fields required for DP Manifest

below list with the shipments which needs to be populated, else the manifest can not be generated.

Field	Information
Ocean Bill of Lading number	Must be populated

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Liner Agent Handling vessel	May be defaulted from Sailing Schedule
Country of Origin	Country of Origin field in general tab
Packages Code	Translation in the EDI profile must be present
Container Tare weight	Weight of the container, can de defaulted from equipment
Packages Gross weight	Gross weight of the goods
Volume	Volume of the Goods
HS Code	HS code of the goods lines must be populated.
Terminal Registrator Entry	For Inbounds the Manifest Registration number as assigned by DP World Can be registered on the terminal Entry of the containers as per below screenshot.



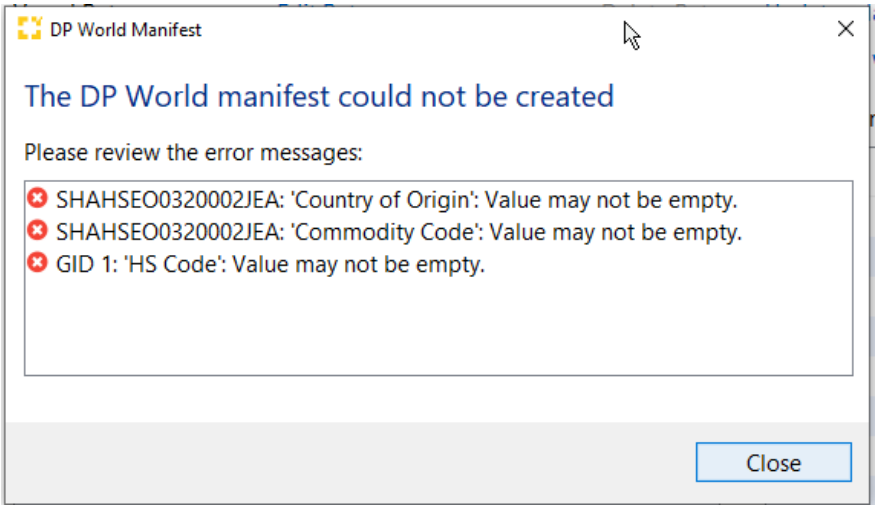
Generate the File

The DP World file is generated from within the sailings Schedule of the required Vessel / Voyage combination.

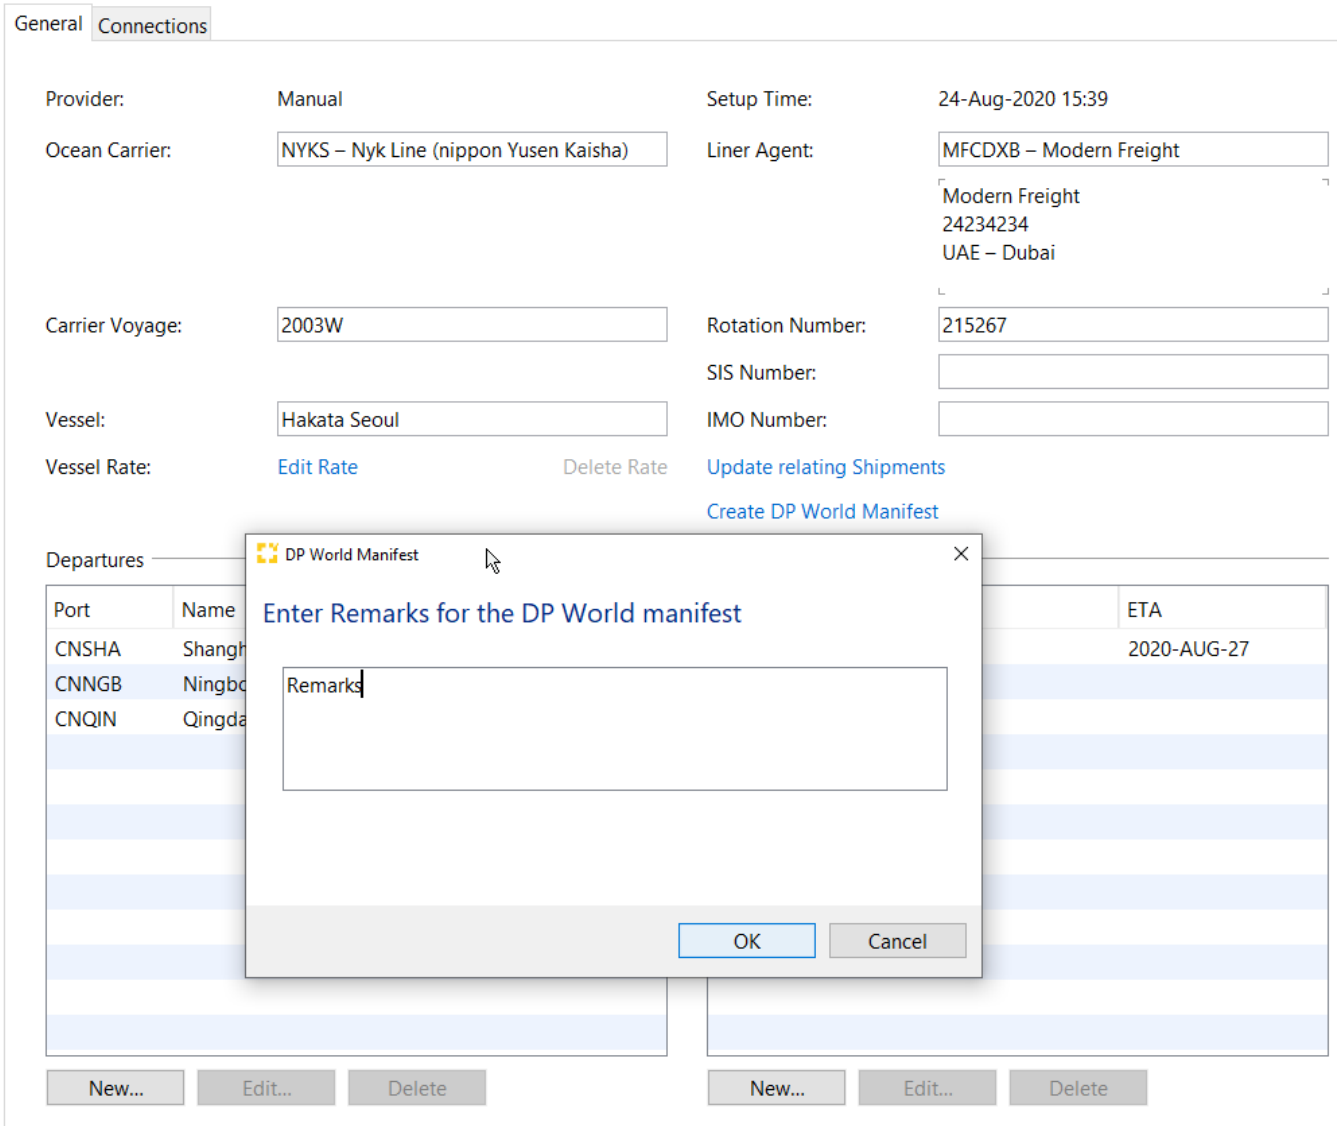
After using the Create DP World Manifest, a additional box for remarks is represented.

Next the data will be validated and missing data will be reported in a dialog.
This must first be corrected before the file is generated.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When no more validations errors are found the CSV file is created and opened in Excel.
It can saved and uploaded to DP World.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To Handling

- FAQ- How-To Handling - Arriving and Delivering
- FAQ How-To Tours - Multiple Pickup and Delivery Transport Order

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ- How-To Handling - Arriving and Delivering

- Arrive the goods
  - Registering the truck offload
  - Create the handling shipments
  - Add goods details and confirm the goods are arrived and as expected
  - "Finish" the Import Receipt
- Remove the goods from the warehouse
- Create a delivery order for the trucker
  - Creating a transport order

A handling shipment is a shipment that will arrive in the warehouse for:

- Storage
- Distribution

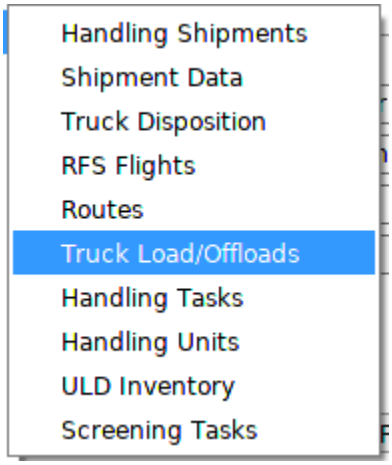
This workflow creates a handling shipment from the moment the truck arrives with the goods at the warehouse. It is also possible to register the goods before they arrive and then link them to the delivery when they are off-loaded from the truck.

Handling goods can also be delivered/picked-up from the warehouse.

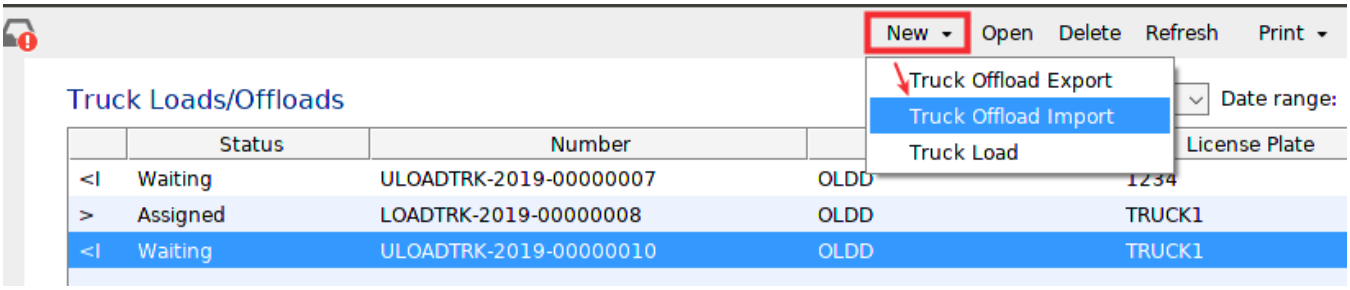
Arrive the goods

When the cargo arrives on the truck at the warehouse the first task is to create a Truck Offload:

From the handling menu select "Truck Load/Offload"



In the overview of Truck Loads and Offloads, choose "New" and then "Truck Offload Import"



Registering the truck offload

In the "Truck-Unloading" complete the details about the arriving truck as desired:

Note: Leave the following dates/times empty until the handling shipments have been created:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

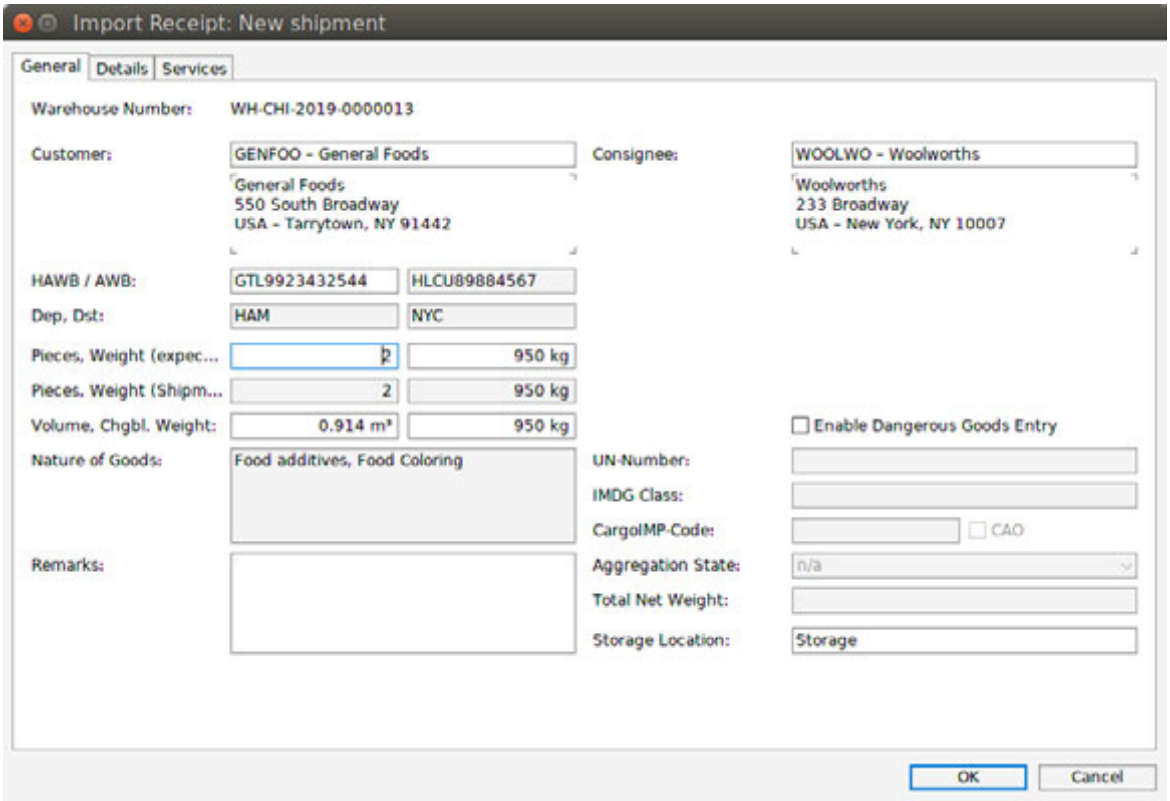
- End Offload
- Actual Truck Departure

Now click "Save" on the toolbar in order to create the handling shipments

Create the handling shipments

In the "Truck-Unloading" click "New Shipment (Forwarder)" at the bottom of the screen:

Enter the Customer and Consignee in the Import Receipt. Then enter the bills of lading, Scope will immediately try to match the bills of lading to the correct handling shipment:



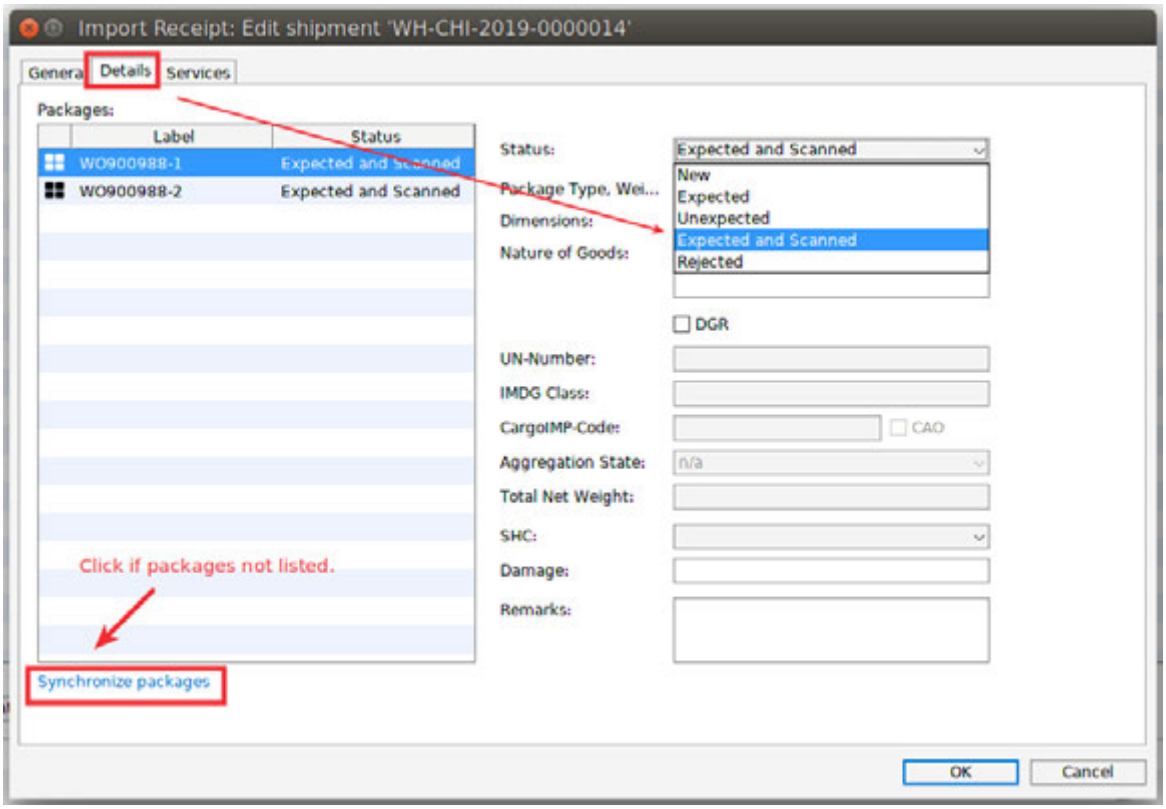
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Add goods details and confirm the goods are arrived and as expected

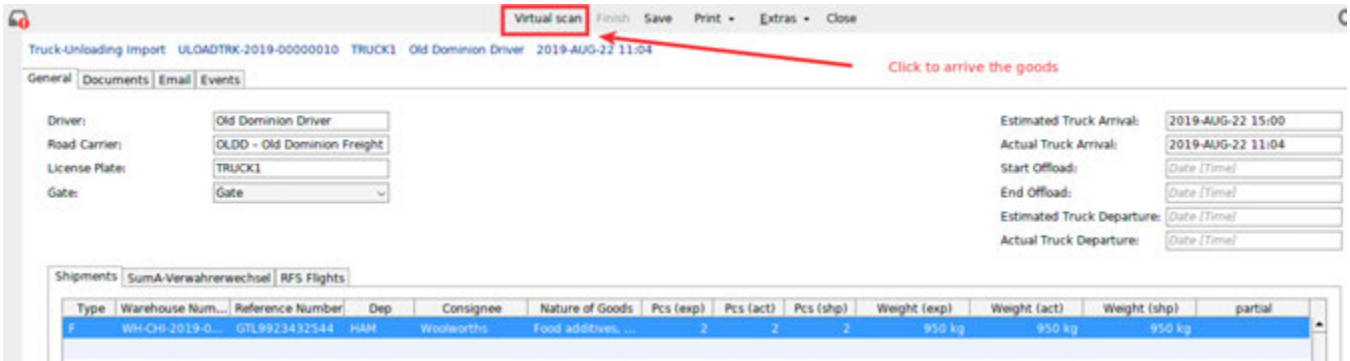
Click the "Details" tab of the import receipt and the expected goods will be shown, or click "Synchronize packages" to make them appear.

Further details for individual packages can be entered.

For each item, use the menu option to the right "Status" to select "Expected and Scanned" in order to show the goods as arrived in the warehouse:



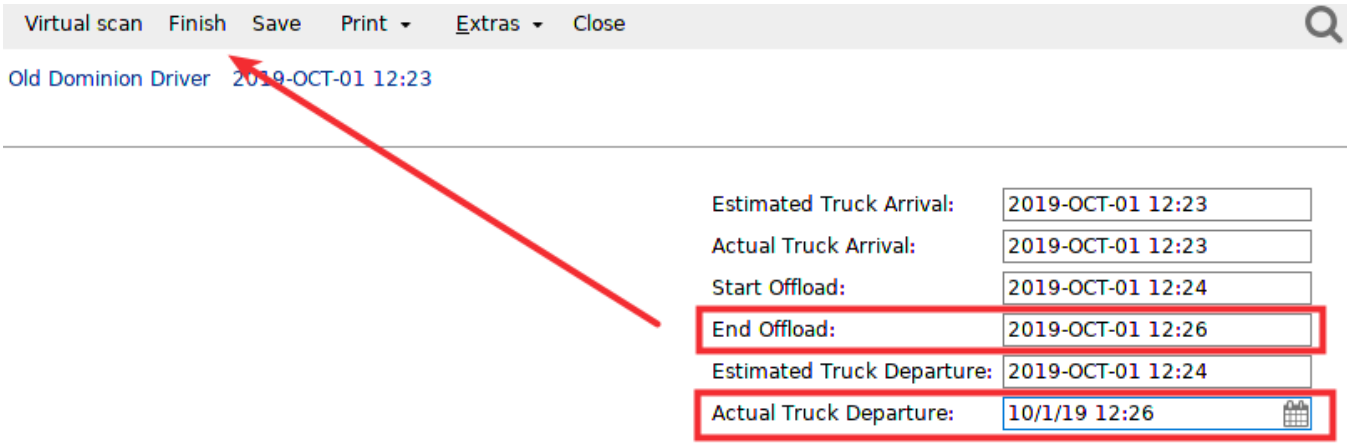
If there is no need to add details about the goods. they can be arrived in the warehouse by doing a virtual scan by clicking "Virtual Scan"



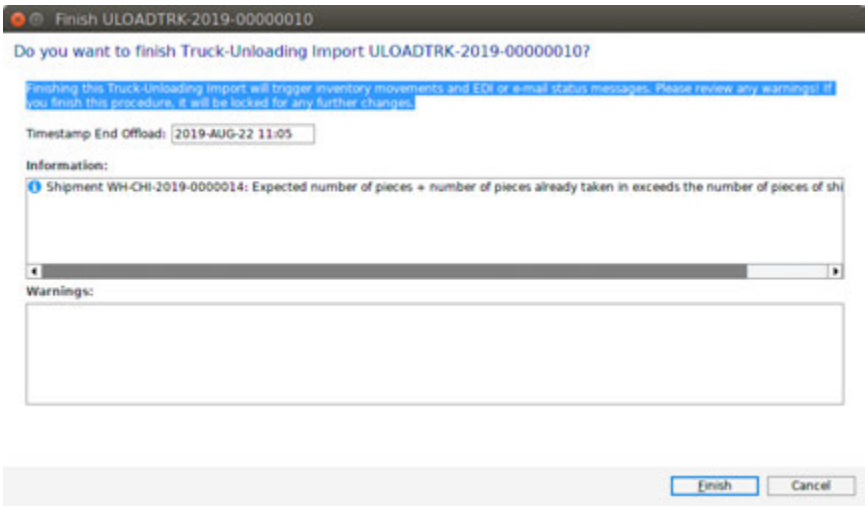
"Finish" the Import Receipt

In order to finalize the off-loading of the goods at the warehouse, the date and time of the end of the offload truck must be recorded and the date and time of the actual truck departure details need to be completed on the general tab of the Truck-Unloading.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

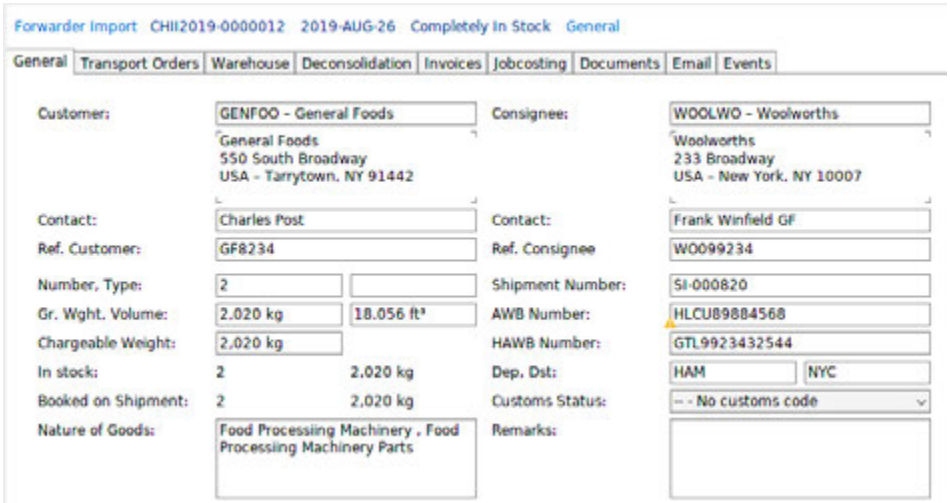


As soon as these details are entered, the "Finish" option on the menu bar become active, click this and then click "Finish" in the confirmation screen:



Now the handling shipment status will be updated to show this off-loading and the status becomes "Completely in stock" .

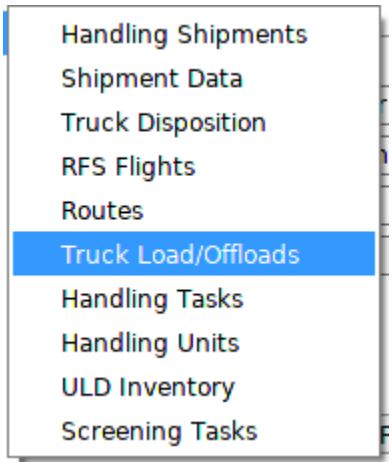
This new handling shipment will also now be visible in the "Handling shipments" together with its status



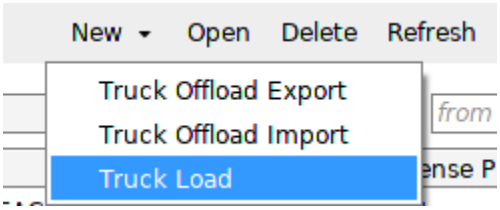
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Remove the goods from the warehouse

When it is time to distribute the goods from the warehouse go back to the "Truck Load/Offloads"



Create a new truckload:



Fill in the truck details and any of the following:

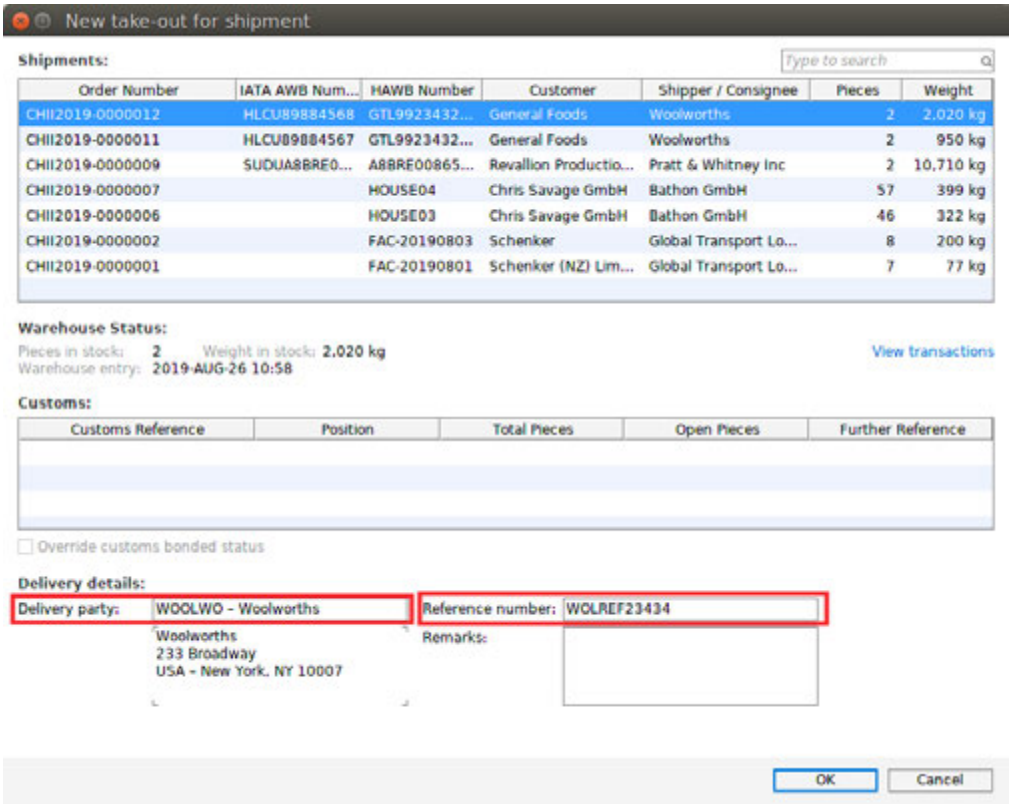
- Estimated Truck Arrival
- Actual Truck Arrival
- Estimated Truck Departure

If the truck is picking up a complete shipment, click "New Shipment Take-Out" at the bottom of the screen:

If the truck is picking up just packages (part-shipment), then click "New Package Take-Out"

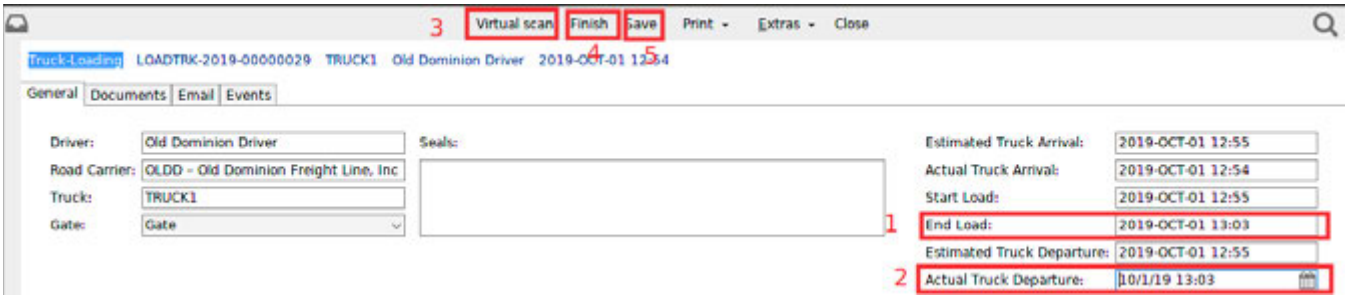
Select the shipment to be delivered and complete the Delivery party details and Reference number:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Now enter take the following steps:

1. Enter "End Load" date and time
2. Enter "Actual Truck Departure" date and time
3. Click "Virtual Scan"
4. Click "Finish"
5. Click "Save"



The goods will now be removed from the warehouse.

Use the "Print" option to print a loading list and warehouse labels.

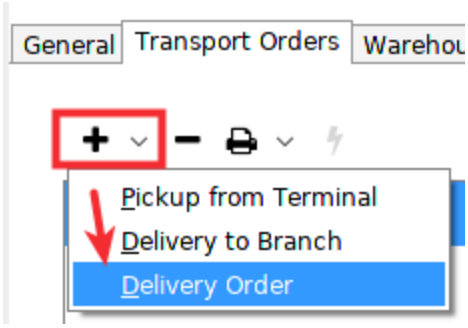
Create a delivery order for the trucker

In addition to removing the goods from the warehouse using the truckload shown above, you can also print a delivery note for the truck from within the handling shipment

Creating a transport order

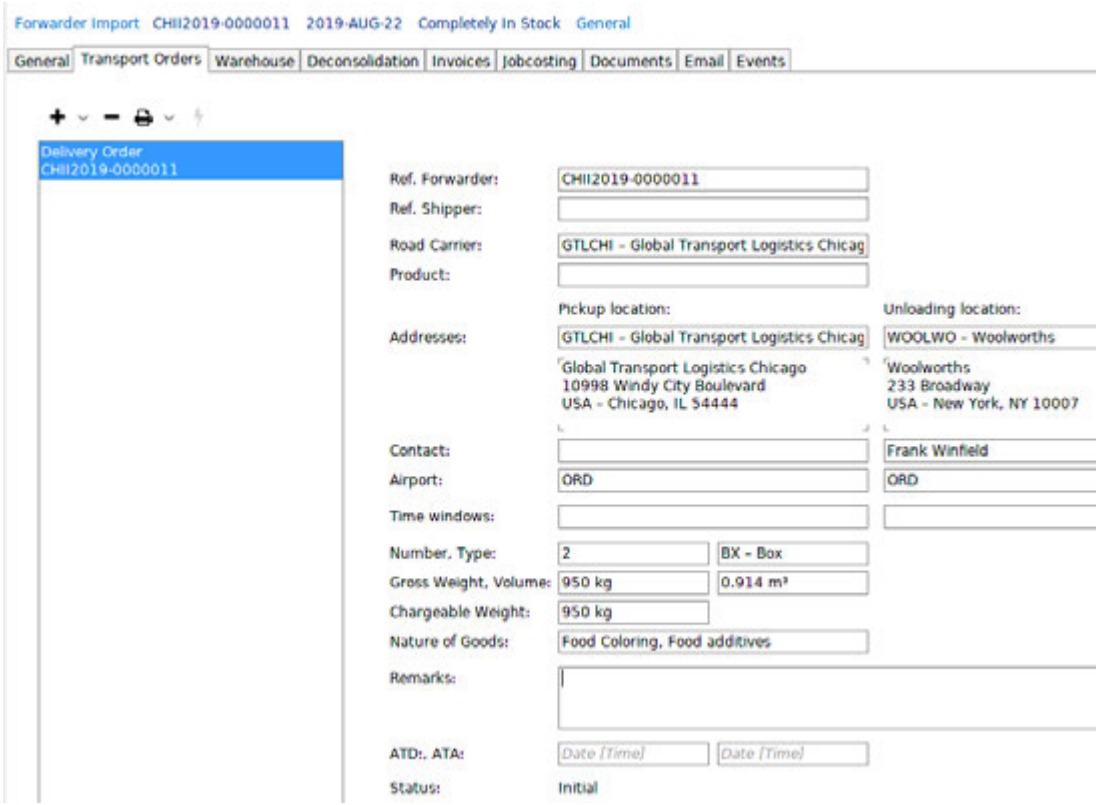
In the handling shipment, choose the tab "Transport Order" and select the plus symbol:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Choose "Delivery Order

Fill in the delivery order details:



When ready, select the printer Icon to print the delivery order.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To Tours - Multiple Pickup and Delivery Transport Order

- Prepare by first making a Route
  - Navigating to Route creation
- Creating a Transport Order that has multiple pickup and delivery addresses
  - Creating a Delivery Order for goods on a Tour
  - Completing the Tour and printing the Transport Order
  - Reviewing and printing the Transport Order

This How-To explains how to create a transport order where the truck will make multiple pickups (or a single one) and then go on to deliver these cargoes to multiple delivery addresses. In Scope, this is called a "Tour" .

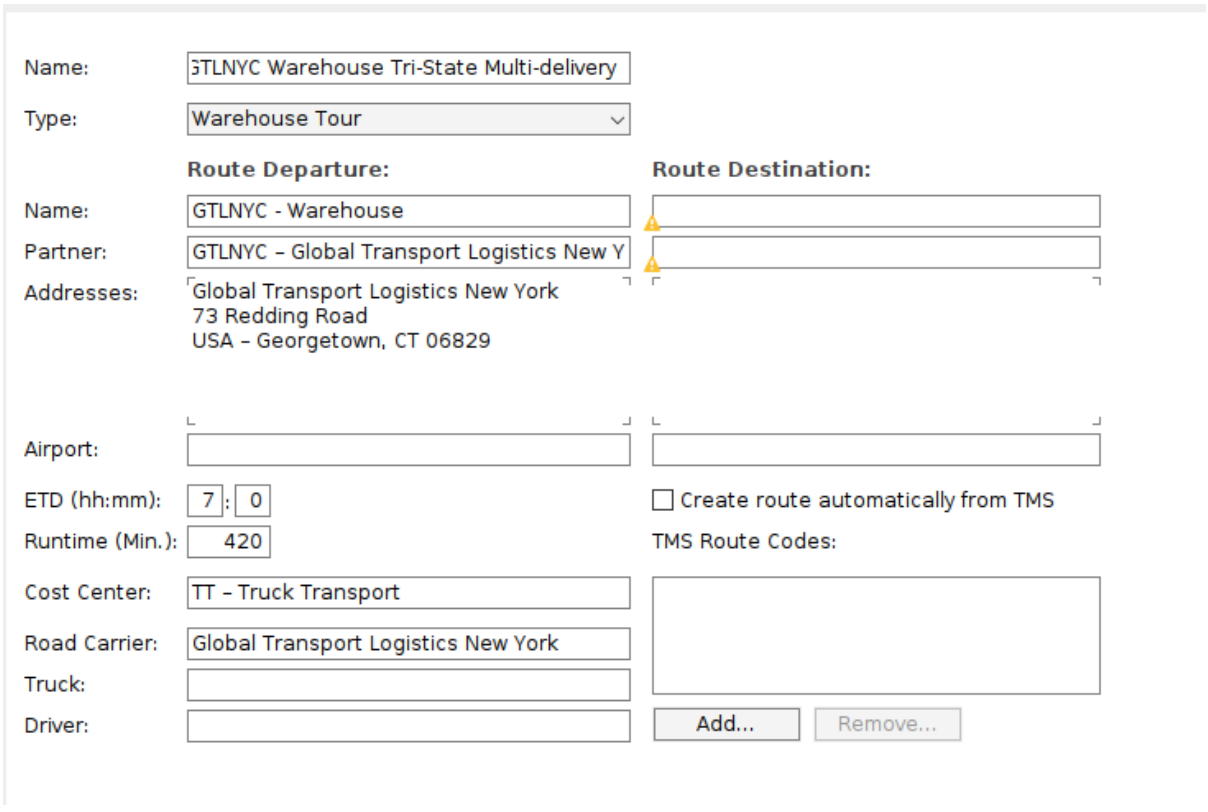
Prepare by first making a Route

Before a tour can be created, at least 1 "Route" must be created. A route allows you to store repeat information to be used in the transport order and in can describe the geographic location that the truck will deliver the cargo within. In this example a tour is created for regular air import shipment that are ready for pickup and delivery on Monday morning within the US Tri-State area (New York, New Jersey and Connecticut). A route can be very specific, or as in this example, very general.

Navigating to Route creation

1. From the main Scope menu choose "Master Data"
2. In the "Master Data" sub-menu choose "Handling"
3. In the "Handling" sub-menu choose "Route Template"
4. Creating a new route

The "Route Templates" will show an overview of any existing routes, select "New" from the tool bar at the top to make a new one:



- **Name** - give the route a name that is as descriptive of its purpose in as few words as possible. In the example the name is the GTLNYC Warehouse Tri-State Multi-delivery. This tells us it is a route created for the warehouse at the branch GTLNYC and will make multiple deliveries in the Tri-State area.
- **Type** - for a route that will be used with a "Tour" always choose the type "Warehouse Tour"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **Route Departure** - If the tour always picks up the goods from the same location, then this location can be given a name and a partner selected for the location. In this example, the goods are always picked up from the GTLNYC warehouse and so this is used as the name and the partner GTLNYC is used in the partner field
- **Route Destination** - If the tour always delivers all the goods to the same delivery address, then a name can be given to this delivery address and the partner for the delivery address can be entered. In this example the goods picked up from the GTLNYC warehouse are delivered all over the Tri-State area and so the Route Destination details are left blank.
- **Airport** - If the goods are always picked up or delivered to a specific airport, the pickup or delivery airport can be stored here. It may be left empty
- **ETD** - This is the estimate of when the tour typically departs, but it can be left blank
- **Runtime** - This the estimated time for the tour to be completed. It may be left blank
- **Cost Center** - Here the cost center to which any charges related to the tour must be applied. This field must be completed.
- **Road Carrier** - When there is a specific trucker who operates this tour, the trucker's partner details can be entered, in addition, if there is a specific Truck and Driver, these details can also be stored. In this example the partner for the branch GTLNYC is used, this will default to the transport order, but can be changed when the transport order is created if a different trucker is going to be used.

Click "Save" to store the new route

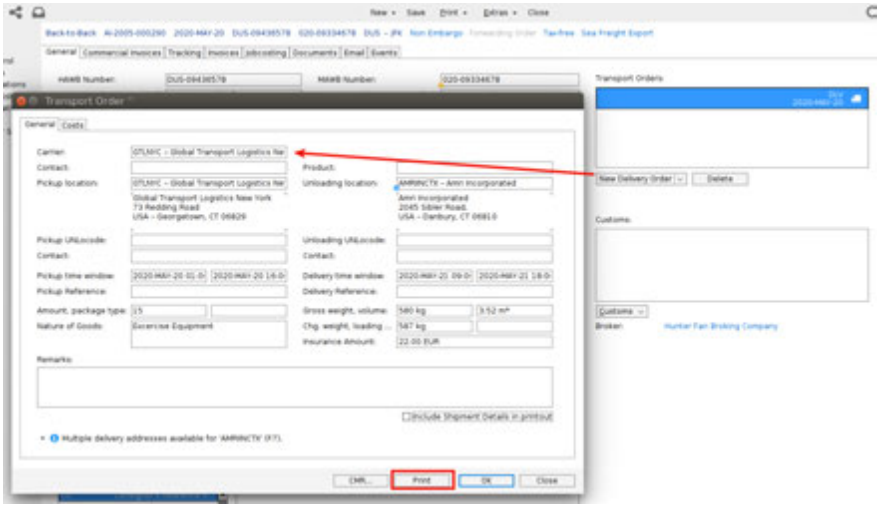
Creating a Transport Order that has multiple pickup and delivery addresses

In this example, our tour is for air import goods arriving at the GTLNYC warehouse that will then be picked up and delivered in the Tri-State area. Therefore the air import shipments are created in the normal way.

Creating a Delivery Order for goods on a Tour

Within the air import shipment, create a new delivery order in the normal way, but instead of entering the real trucker in the "Carrier" field of the delivery order, enter the partner address of the current branch. In this example "GTLNYC" is the partner for the current branch and this appears in the "Carrier" field of the delivery order.

Now press "Print" on the delivery order.



Create the delivery orders in the same manner for any other shipments that need to be added to the tour.

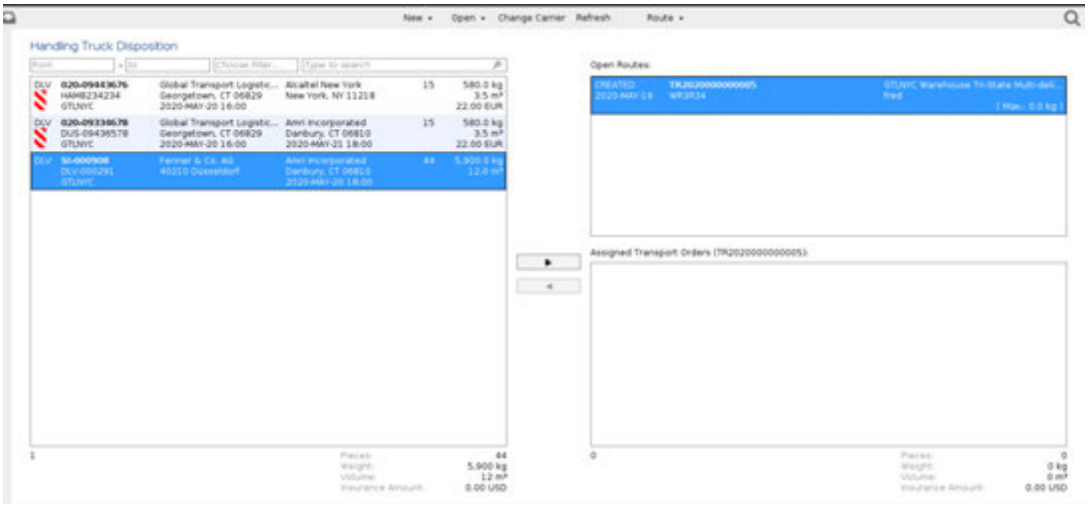
Completing the Tour and printing the Transport Order

Once all the delivery orders for the tour are printed as described above, open the "Truck Disposition"

1. From the main Scope menu choose "Handling"
2. From the "Handling" sub-menu choose "Truck Disposition"

The Handling Truck Disposition will appear with available cargoes shown in the left window. The "Open Routes" will appear in the top right window.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

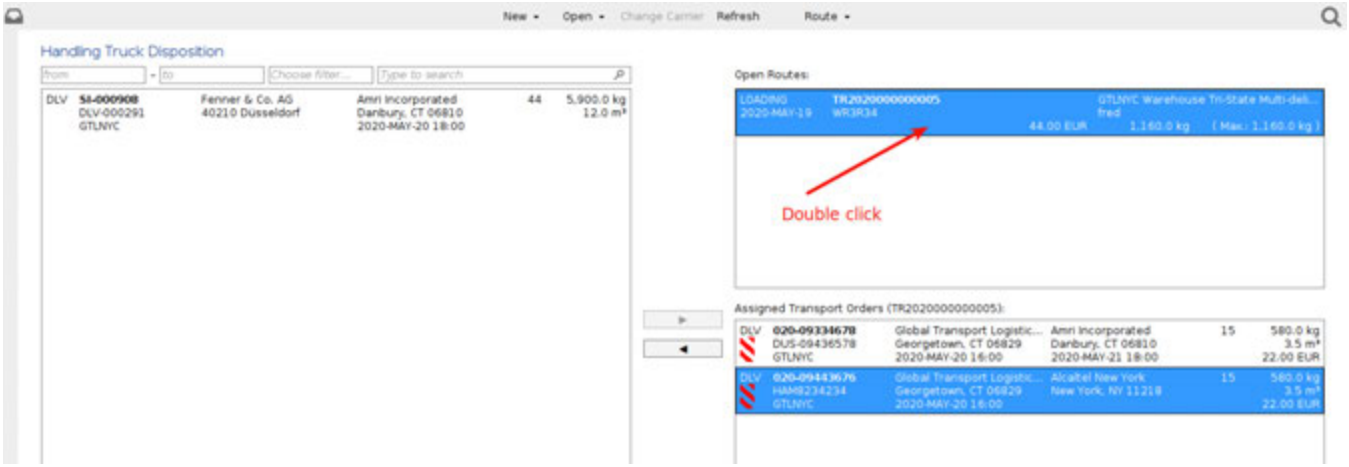


- Use the "New" option from the toolbar to add other routes
- Right click any route in the "Open Routes" to remove it

Use the left/right arrows in the center of the screen to add cargoes to the transport order (bottom right window) , or to remove them from this window.

Note that a delivery order from a sea import shipment has appeared in the left window, demonstrating that cargo from any shipment type may be added to a transport order

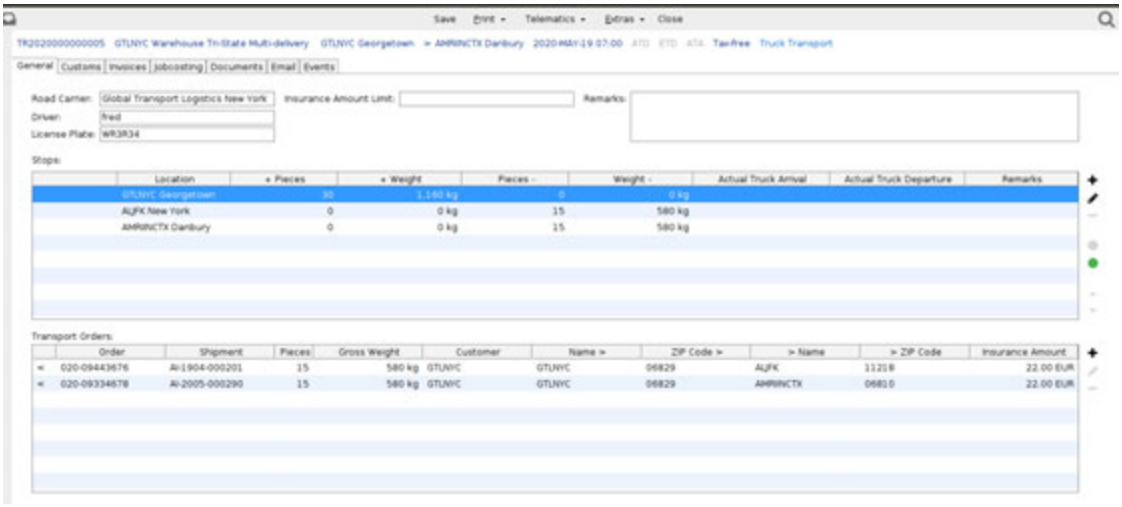
When the desired delivery orders are in the right lower window, double click the "open route" above to which they have been applied



Reviewing and printing the Transport Order

The transport order for the open route that has been clicked will appear. In the top section, the real road carrier can be entered together with any other transport details.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- **Stops** - The middle section of the transport order shows the first pickup location followed by the delivery locations in the order that they will be completed. The order can be changed by highlighting any stop and using the up/down arrows to the right to move the item up or down in the list. Double clicking the item opens it and ETD/ETA, ATA/ATD details can be entered to show the time the truck will arrive and depart for that item.
- **Transport Orders** - this will display the selected delivery orders or pickup orders. The individual details on these can still be changed by double clicking which will open the shipment where the delivery/pickup order was created so that changes to the delivery/pickup order can be made.

When all is ready for the transport order, use the "Print" option on the tool bar at the top and select the "Tour Transport Order".

FAQ How-To add charges to an air import arrival notice

When an import shipment arrives it may be necessary to include the charges the customer can expect to pay on the arrival notice. This How-To shows how to create these charges and include them on the arrival notice.

Step-by-step guide

1. Open the shipment
2. Go to the Jobcosting tab
3. 
4. Click on "New Income"
5. 
6. Complete the "New Income" window, using the name of the customer as the recipient
7. 
8. Add as many charges as required until the Jobcosting tab shows all the estimated income from the customer
9. 9. Now select "Notice of Arrival" from the print menu , and choose "Consignee" or "Customer"
10. The "Complete the Notice of Arrival!" editor will appear showing the estimated income to be included on the arrival notice.

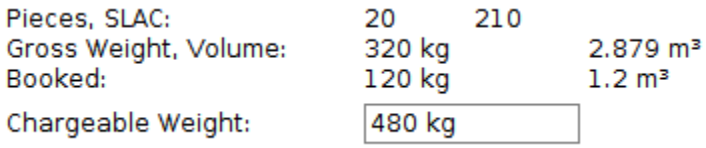
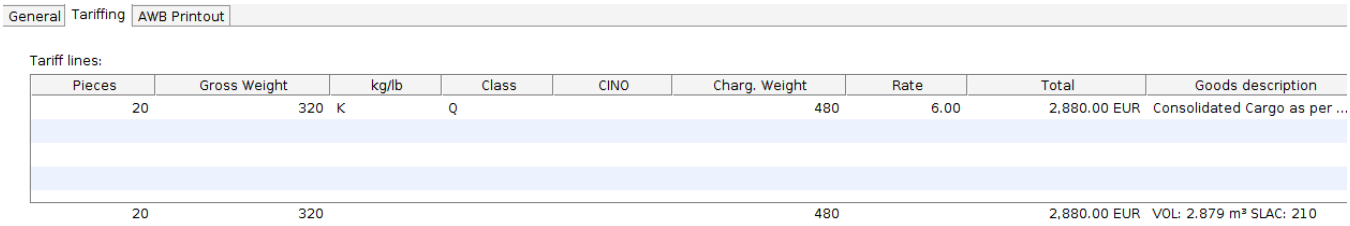
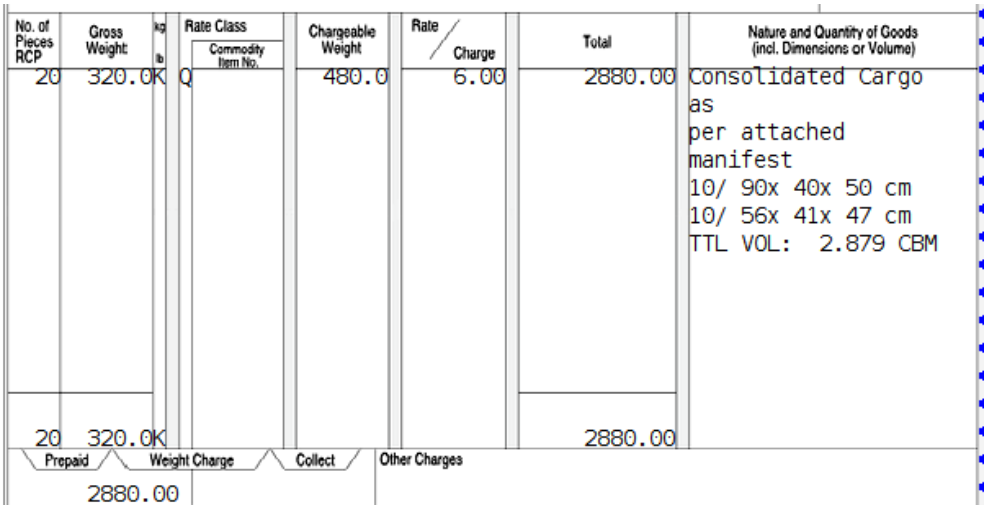
FAQ How-To adjust chargeable weight and DIMS on an AWB

1) Create the Master shipment on the normal way. On the general tab of the shipment, the charge weight will appear like the example below where we see a charge weight of 480 kg.



2) Now open the AWB editor, the charge weight on the "Tariffing" tab and the details in the preview of the AWB will be the same as shown in the shipment ie a charge weight of 480 kg.

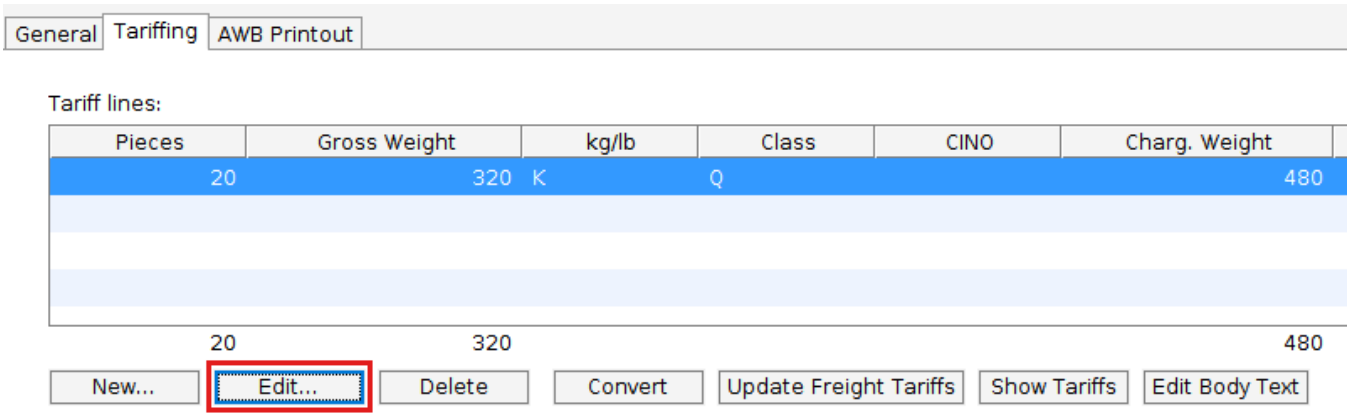




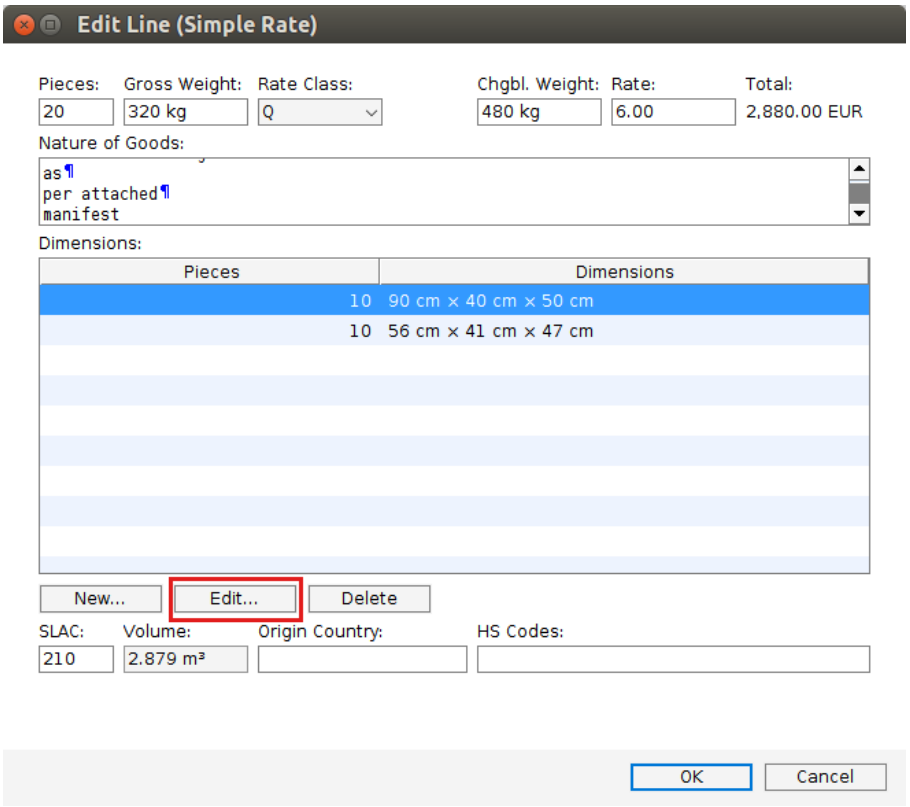
3) To adjust the dims and charge weight shown on the AWB, click the "Tariffing" tab.

4) Highlight the tariff line and then click "Edit"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

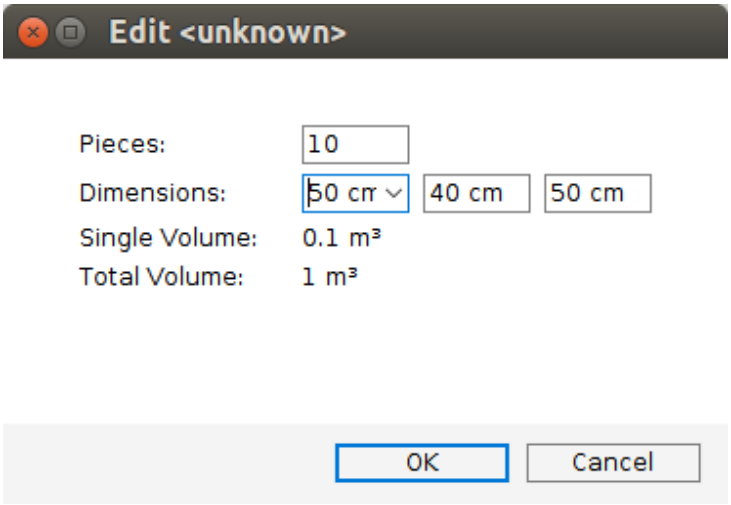


5) In the tariff line editor, highlight the dim that needs to be changed and click "Edit"

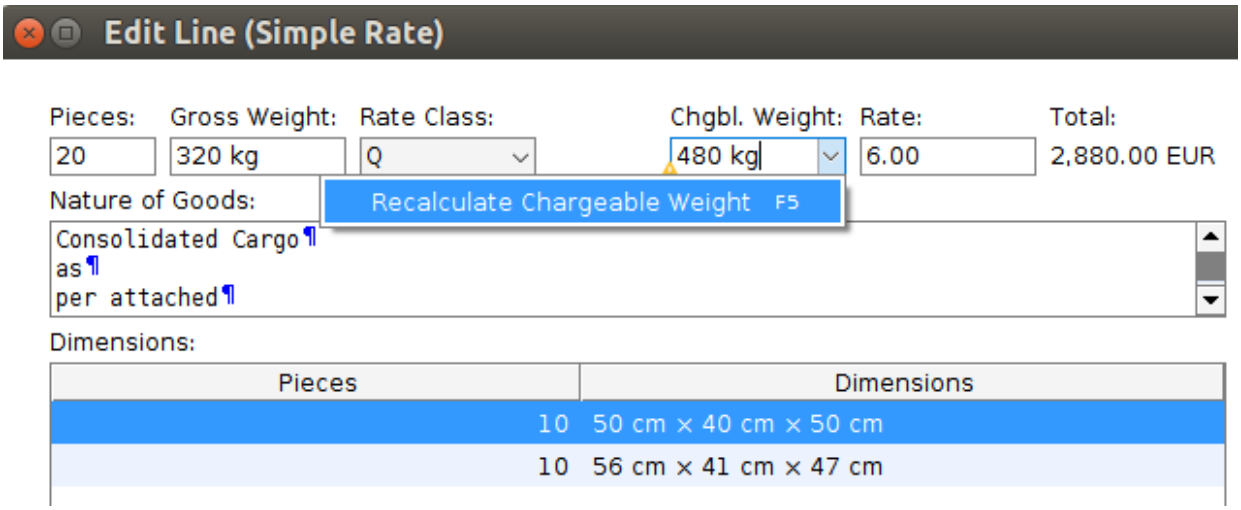


6) Edit the dim to the new size and click "OK"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



7) Back in the editor, use the drop-down menu to the right of the chargeable weight and click "Recalculate Chargeable Weight" (or press F5)



8) The new dims and chargeable weight will show up on the AWB.

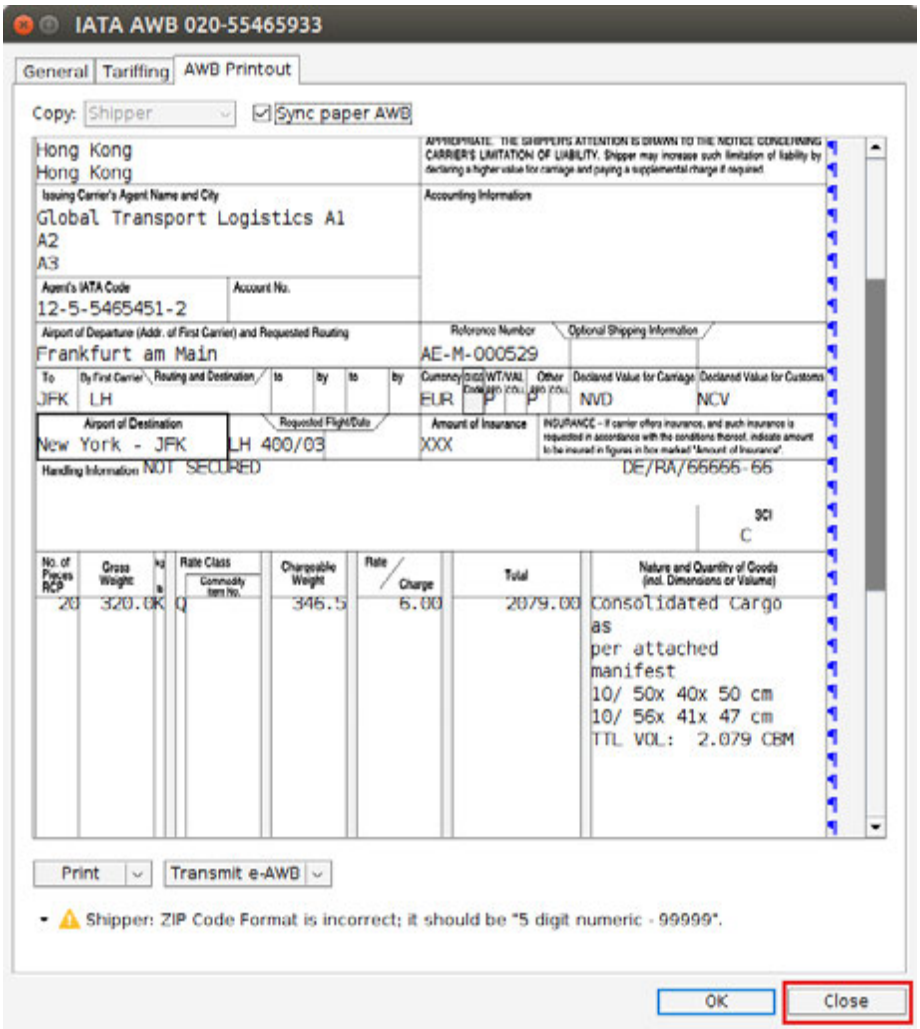
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

No. of Pieces RCP	Gross Weight	kg / lb	Rate Class / Commodity Item No.	Chargeable Weight	Rate / Charge	Total	Nature and Quantity of Goods (incl. Dimensions or Volume)
20	320.0K		Q	346.5	6.00	2079.00	Consolidated Cargo as per attached manifest 10/ 50x 40x 50 cm 10/ 56x 41x 47 cm TTL VOL: 2.079 CBM
20	320.0K					2079.00	

Prepaid	Weight Charge	Collect	Other Charges
	2079.00		

9) When returning from the editor to the shipment, be sure to choose "Close" and not "OK". This will preserve the difference between the AWB and the shipment.

If you forget this step, the charge weight in the shipment will match the AWB, simply replace the charge weight in the shipment with the original charge weight and save.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

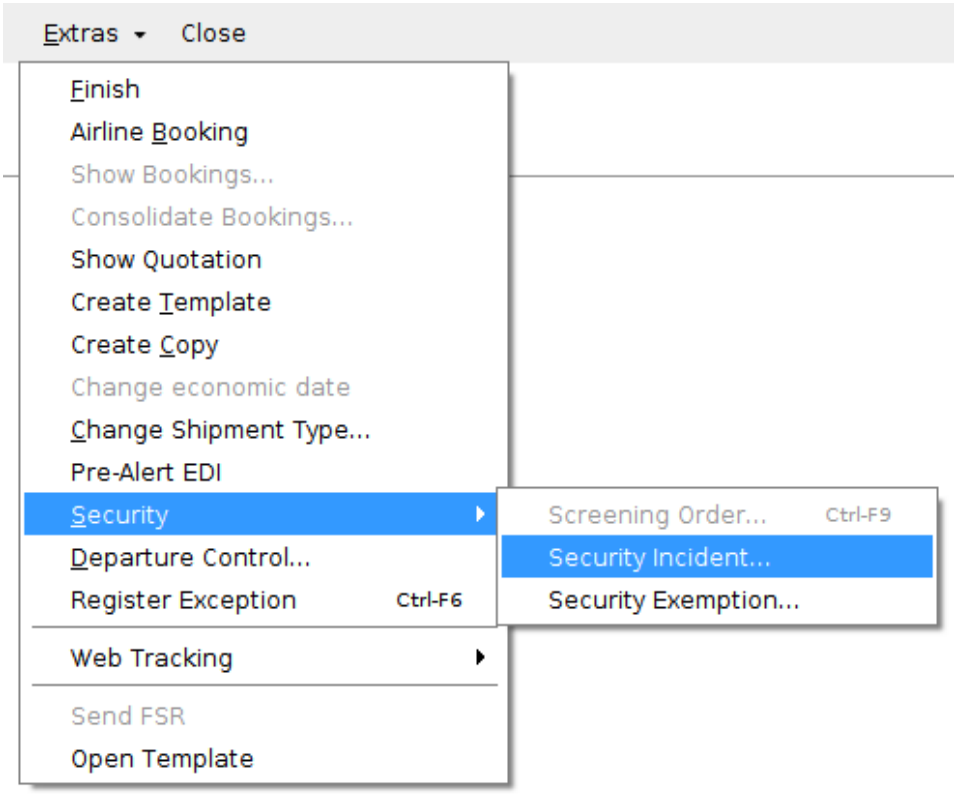
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To change an air export shipment from Known to Unknown Shipper

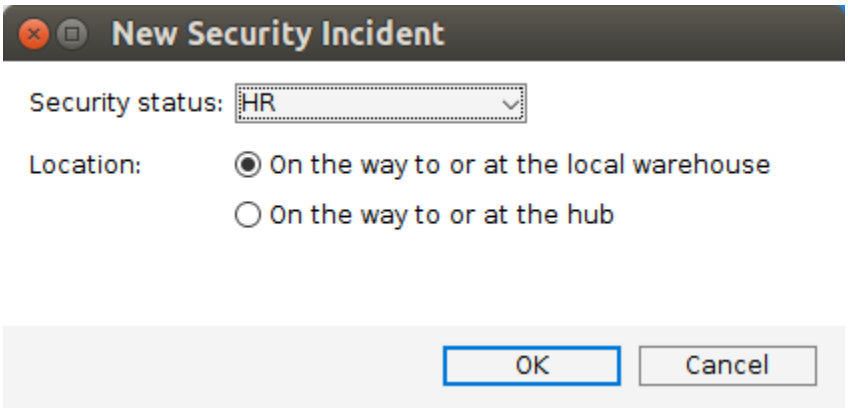
When an air export shipment is created, Scope checks the partners to determine if they are known or unknown and applies the known/unknown status to the shipment accordingly. But sometimes one of the partners used in the shipment is not stored in Scope, for example, the cargo delivery is arranged by the shipper using an unknown trucker and unknown pickup point. Since this pickup is not entered in Scope, the system has no way of knowing the correct status of the shipment. If the shipper is stored as a known shipper, the shipment may in fact appear as a known shipper when the reality is that since it was delivered from an unknown location, it is unknown.

Take the following steps to quickly change the status of a shipment from Known to Unknown:

1. Open the air export shipment
2. Select the "Extras" menu
3. Scroll down "Security"
4. Click the sub-menu "Security Incident"



The "New Security Incident" will open:



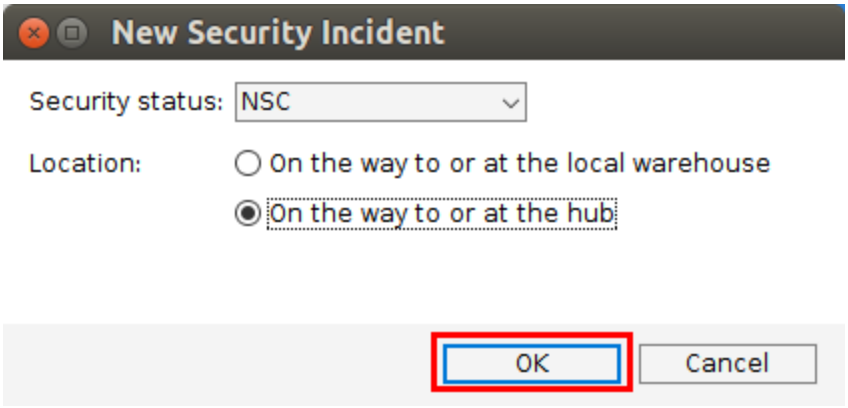
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Use the drop down menu in the field "Security status" to change the status from "HR" to "NSC"

Check off where the incident occurred:

- On the way to the local warehouse
- On the way to or at the hub

When ready, click "OK"



The security status on the shipment will immediatly change to "SCO Unknown Shipper"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To check the OAG flightschedule

- Introduction
- Status of the OAG flightschedule service + date of last update
- Number of data entries

Introduction

This is an internal, temporary documentation, how to check

- status of the OAG flightschedule service
- date of the last update
- if the update has been completed successfully

We will integrate the check in Grafana. Until then, please proceed as follows:

Status of the OAG flightschedule service + date of last update

Go to

http://oag.dev.riege.de:8080/health (for dev)
http://oag.riege.it:8080/health (for live)

and look at the webpage:

"Status" will tell you, if the service is currently available.

"lastUpdate" will tell you, when the service was updated.

Number of data entries

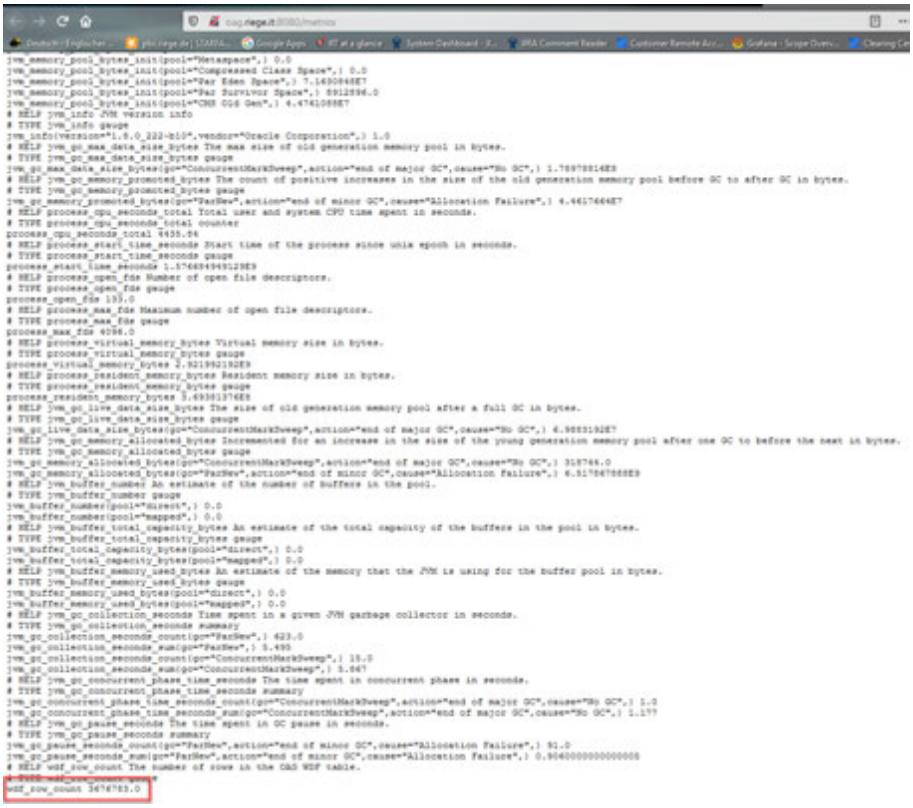
Go to

http://oag.dev.riege.de:8080/metrics (for dev)

http://oag.riege.it:8080/metrics (for live)

and search for entry of "wdf_row_count":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



If the value is more than 3,6 million, then everything should be okay.

If the value is less than 3.6 million, this could be an indication of missing data. However the data can vary depending on the update, so it is just an indication, not proof.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To consolidate an air export shipment

- Introduction
- Adding an air export house shipment to a MAWB consol in your own branch
  - Create the air export house shipment
  - Create the air export master shipment
  - Add air export house shipments to the local master consolidation
- Gateway adds an air export house from a remote branch to a consolidation
- Remote branch adds an air export house to a gateway consolidation
  - Adding a house to a remote gateway master

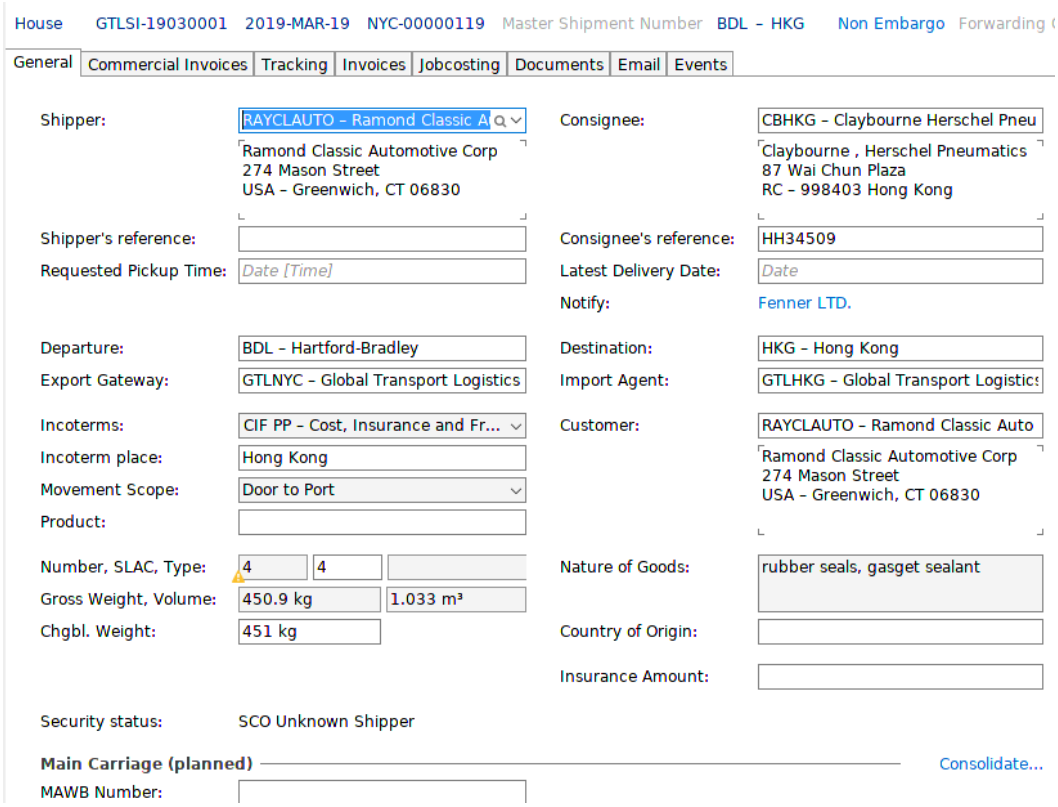
Introduction

- This guide will show you how to consolidate an air export house shipment onto a MAWB in your own branch
- The guide will also show how a consol department can act as a gateway and add shipments from other branches to a consolidation
- Finally, the guide will show how a user can add an air export house shipment onto a MAWB in a gateway branch

Adding an air export house shipment to a MAWB consol in your own branch

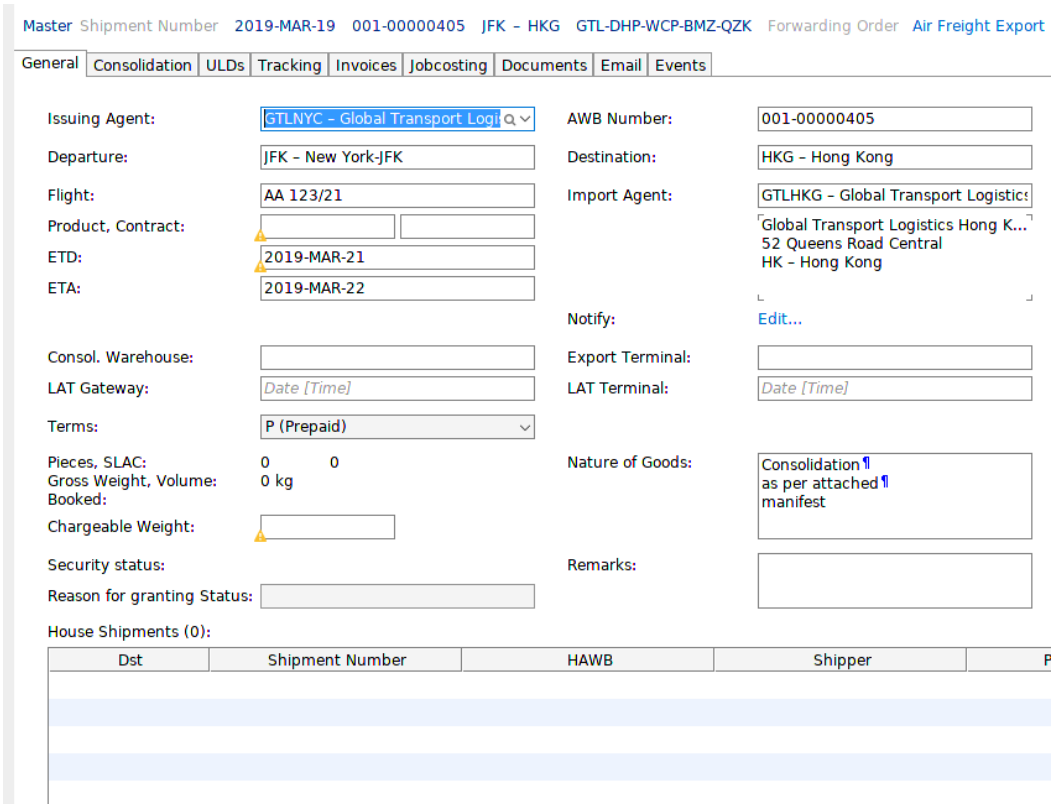
Create the air export house shipment

Create the air export house shipment (you can create the master shipment first, but this is not required)



Create the air export master shipment

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



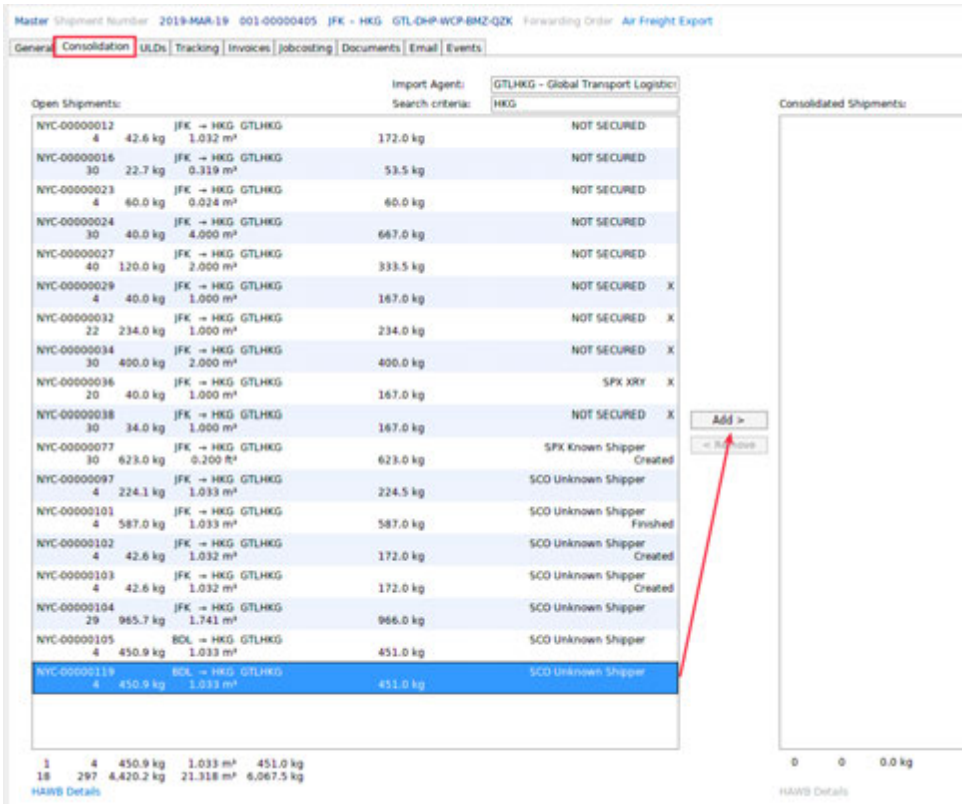
There are no house shipments on the consolidation yet and so Scope warns:

click on the "Consolidation" tab of the master to find house shipments to add to this master

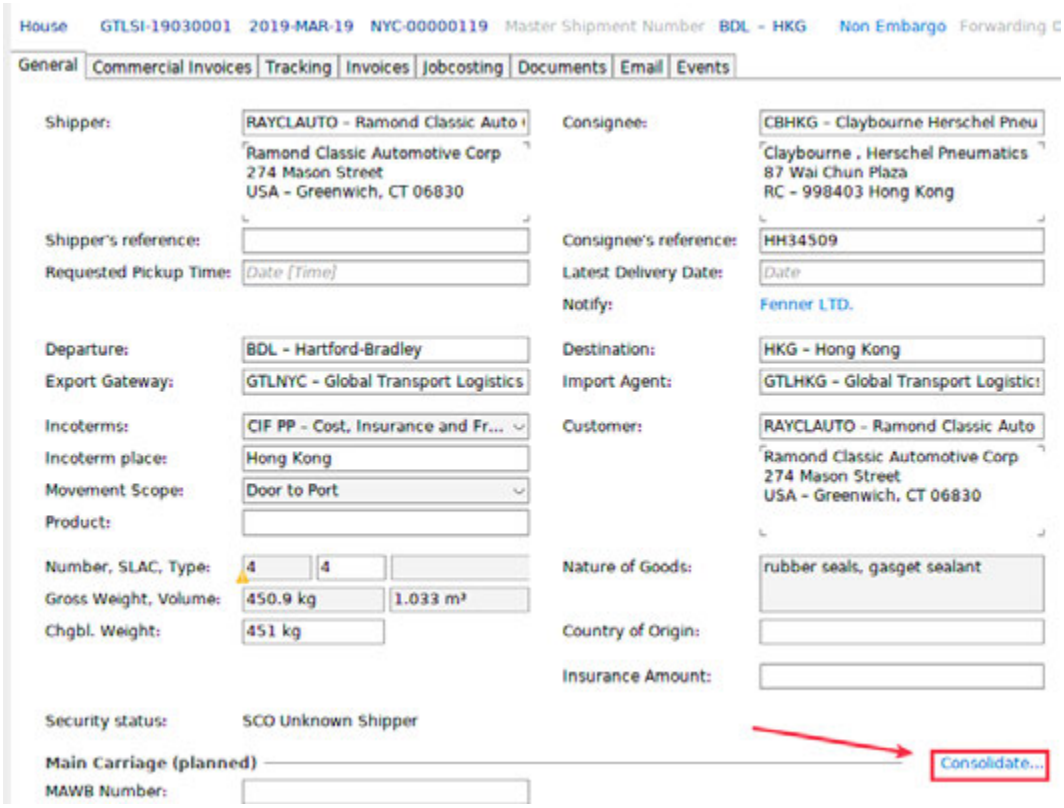
Add air export house shipments to the local master consolidation

On the consolidation tab of the master we can see the house shipment we just created. Use the "Add" button to add it to the master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

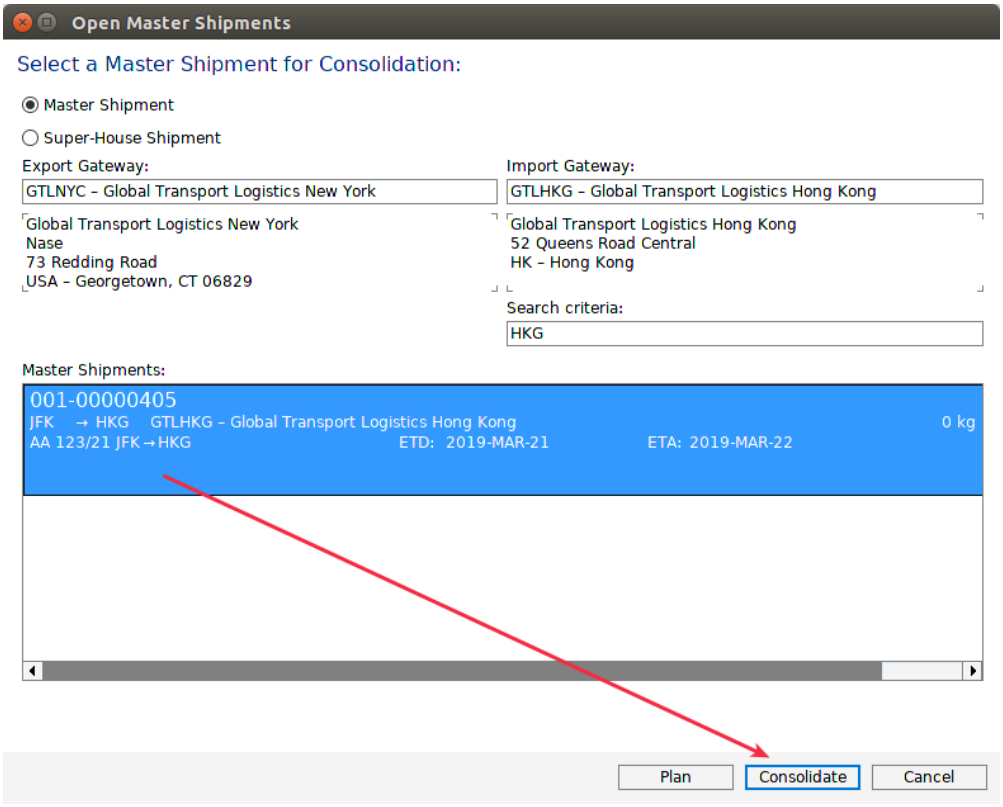


It is also possible to add the air export house to the master consolidation from within the house shipment. In the house choose the blue link near the bottom right called "Consolidate":



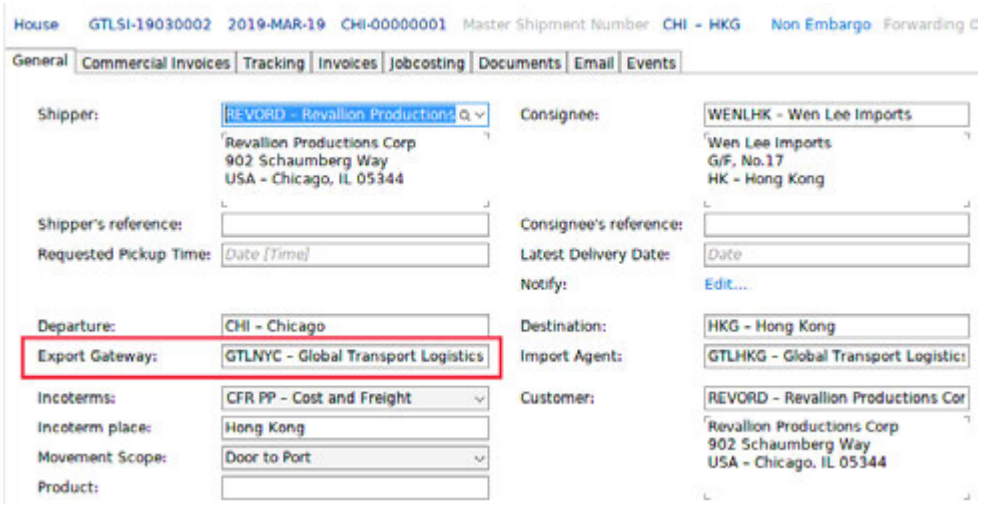
When you click "Consolidate", a list of available master shipments will appear. Select the correct one and click "Consolidate". The house is now on the master:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Gateway adds an air export house from a remote branch to a consolidation

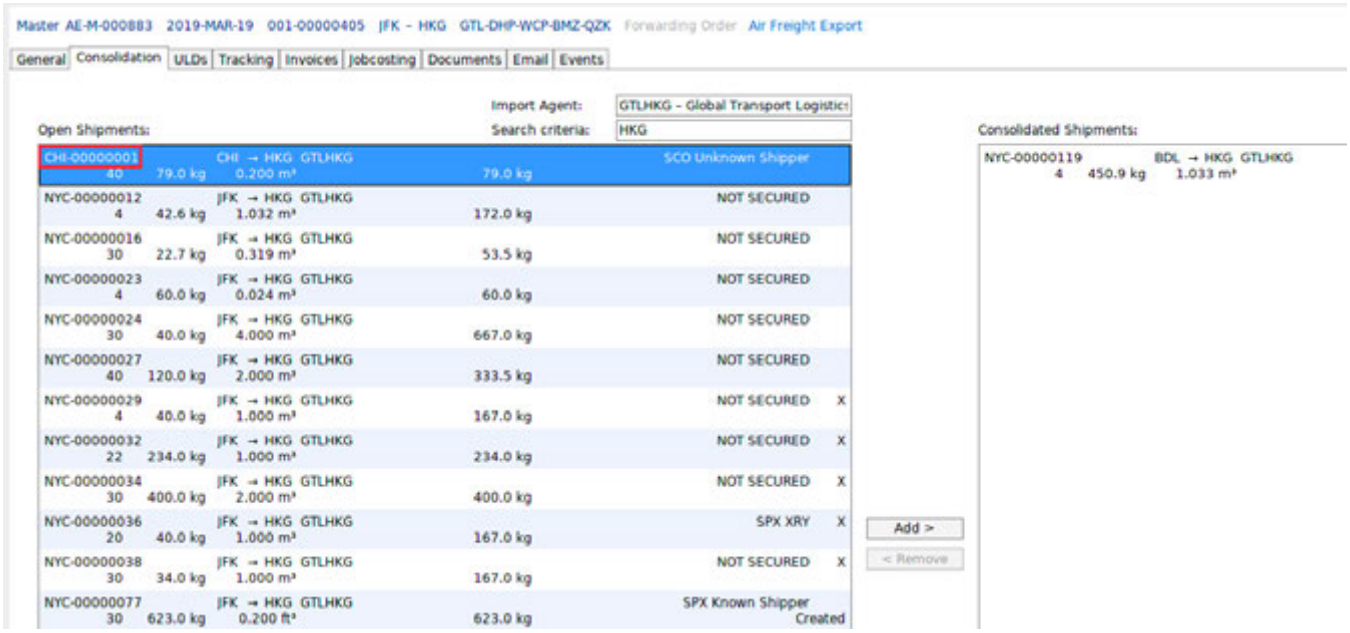
In order for an air export house to be visible to a gateway branch, when the house shipment is created, enter the correct gateway in the field



In the example above, the house shipment has been created in the Chicago branch, but the "Export Gateway" has been entered as "GTLNYC" which is the New York gateway.

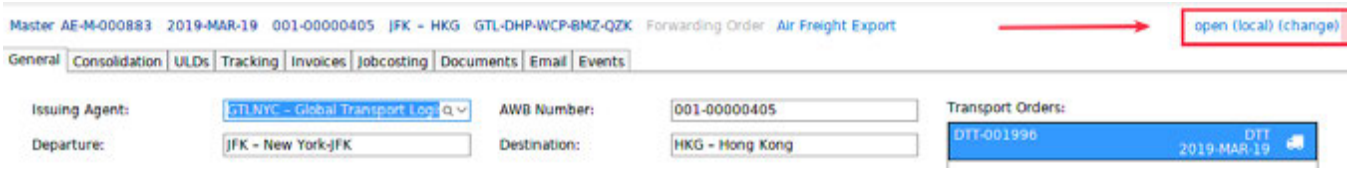
As a result of the above, when the consolidation department in New York creates their consolidation to Hong Kong, they can also see this shipment from Chicago is available:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

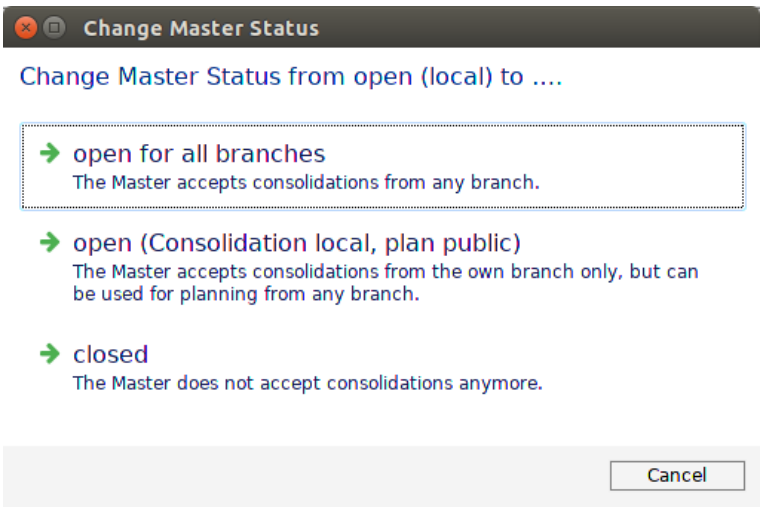


Remote branch adds an air export house to a gateway consolidation

In order for a remote branch to be able to see consolidations available at a gateway branch, the gateway branch must make their master consolidations visible to other offices:

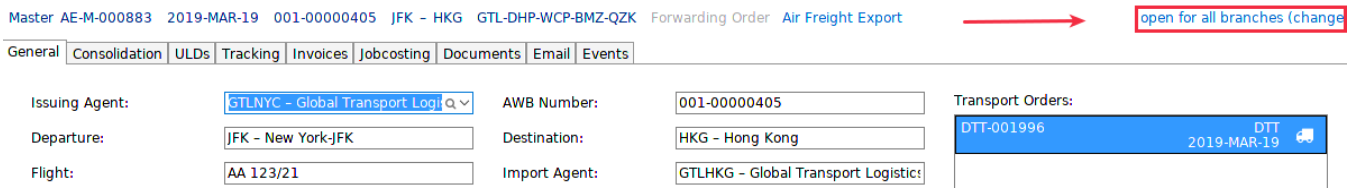


In the example above this master is only visible to the local office (NYC). By clicking the "open (local)" , this gateway can make this master visible to remote offices:



By choosing the first option above, this master is open to all branches.

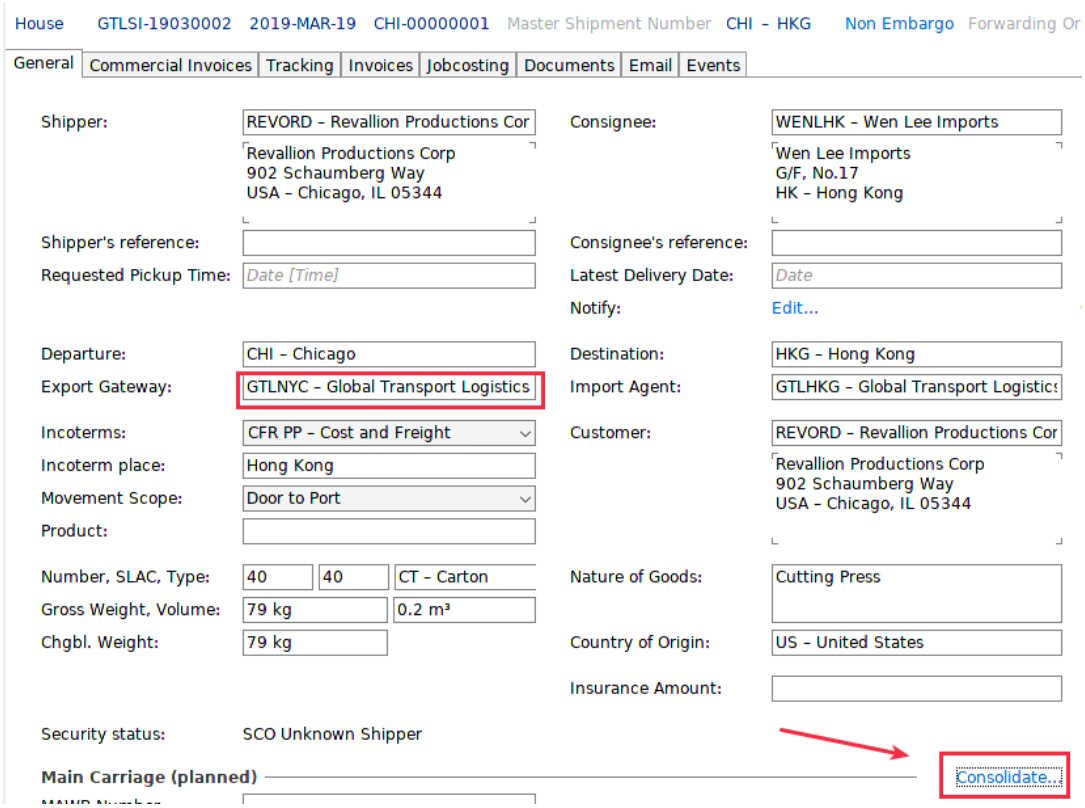
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Adding a house to a remote gateway master

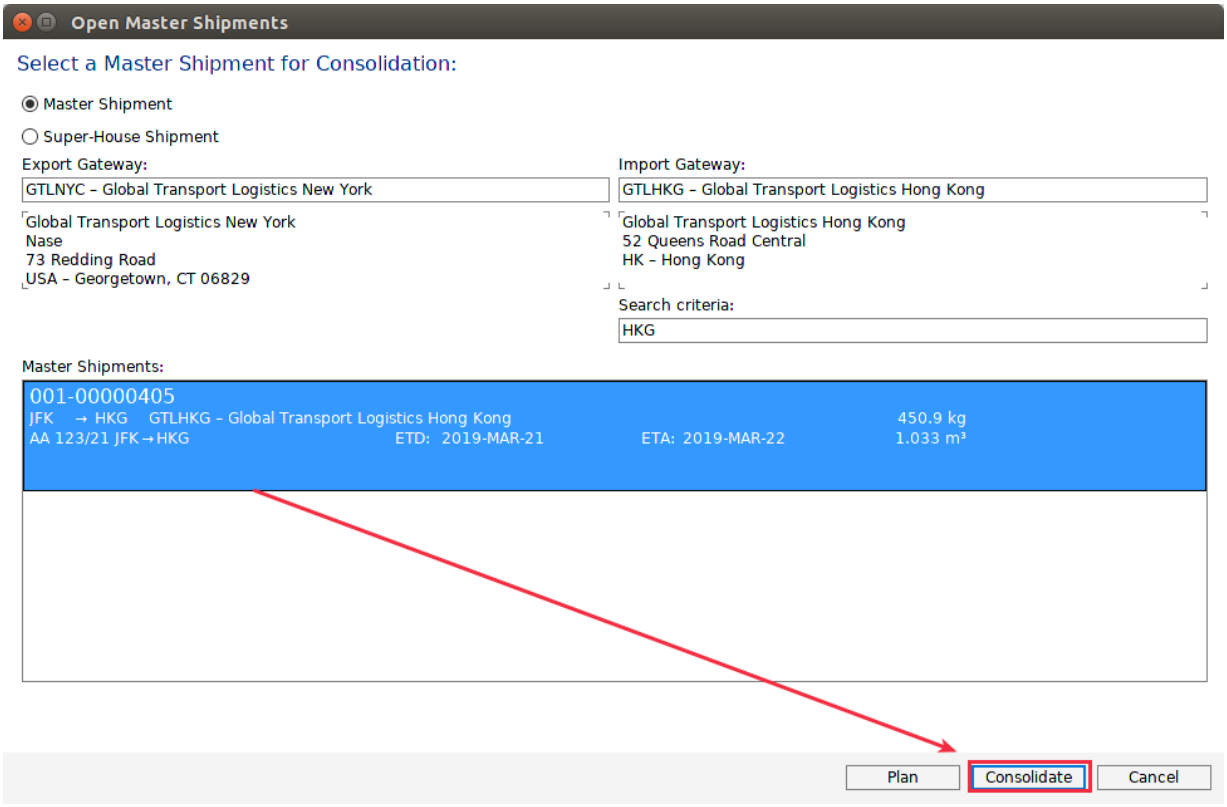
Now that the master is visible to all the remote office, a house shipment can be added to it from the remote office.

In the Chicago branch, we open the house shipment and click the "Consolidate" option as shown below:



A window will appear showing the available masters for this house including the master at the New York Gateway because the gateway for this house is GTLNYC.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To do Jobcosting in Air Exports

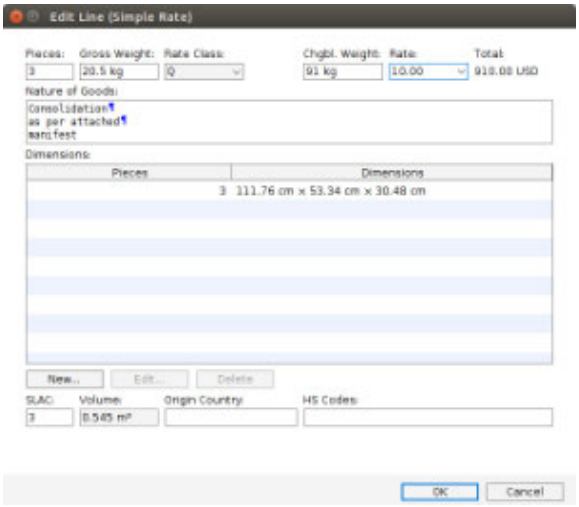
This how-to explains how the IATA cost (freight amount shown on the AWB), the net rate (Actual airfreight cost) and the selling tariff (cost to the customer), are managed when creating an air export shipment.

The IATA rate

If a rate is shown on the AWB, this is generally the official IATA rate. To print the IATA rate on the AWB:

- In the shipment, open the IATA AWB editor
- On the Tariff tab of the IATA AWB editor, enter the IATA rate for the AWB
- If an IATA tariff is maintained, then the correct IATA rate will automatically be entered on the AWB

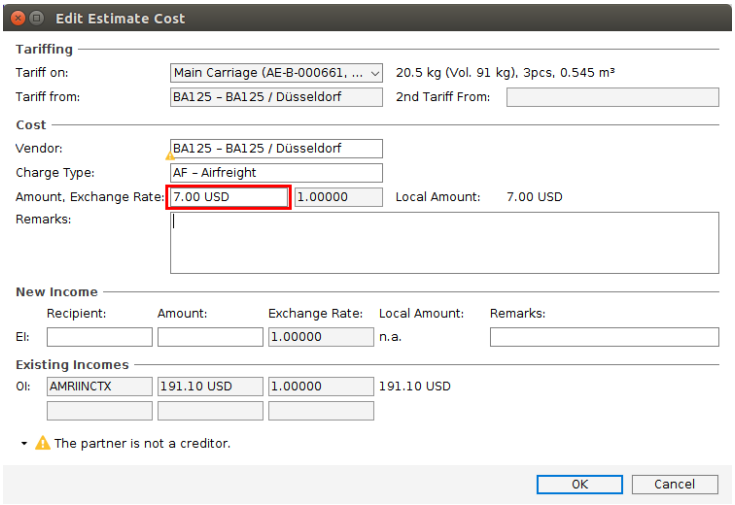
The amount entered will only appear on the AWB and will not appear in the jobcosting



The net rate

The net rate is the amount of airfreight actually charged by the airline for the shipment. There are 2 ways to enter the net rate:

- Enter the net rate directly into the job costing as an EP (Estimated payment). If activity types are correctly maintained and a tariff for the customer is available, this EP can be created automatically in the jobcosting
- The "Finish" option in the "Extras" menu. Beneath the "Print invoices" sectIon the "AF net rate" is shown, click to the right of this if the charge needs to be entered. The editor "Edit Estimate Cost" appears. Enter the amount as per the screenshot example below.



The selling rate

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

This is the air freight amount actually charged to the customer

- For a House shipment or a back to back shipment, the selling rate should be entered in the HAWB
  - Open the HAWB by clicking on "House-AWB"
  - In the HAWB editor, go to the "Tariffing" tab and click on the tariff line or use the "Edit" button.
  - Enter the rate - this is the charge to the customer. If a tariff is maintained for the customer, this rate should appear automatically
- For a Direct shipment, enter the rate directly into the job-costing as an estimated income or create an invoice to the customer for the amount. If a tariff is maintained for the customer, this rate should appear automatically

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To enter AWBs to Chinese destinations

When registering a shipment to China (Hong Kong excluded) Scope displays validations in the AWB editor to ensure all required data is entered.

The data can be manually entered per shipment or taken from master data maintenance.

- Master data
- Shipment entry and Validation
- FWB and FHL Output

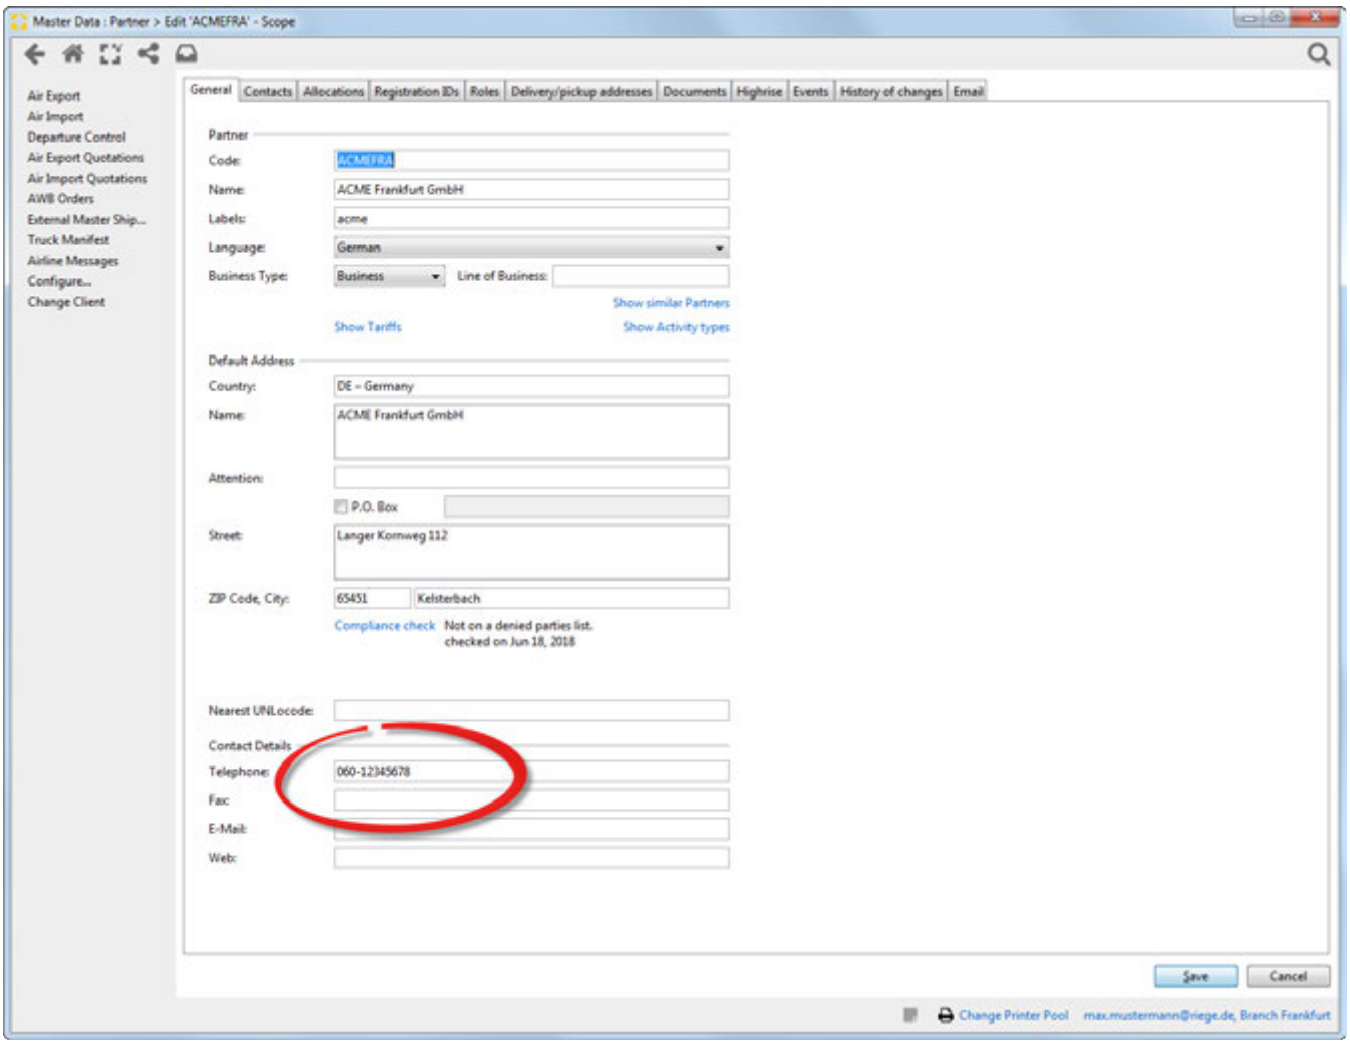
Master data

In Partners the following information can be maintained:

Shipper: Telephone number

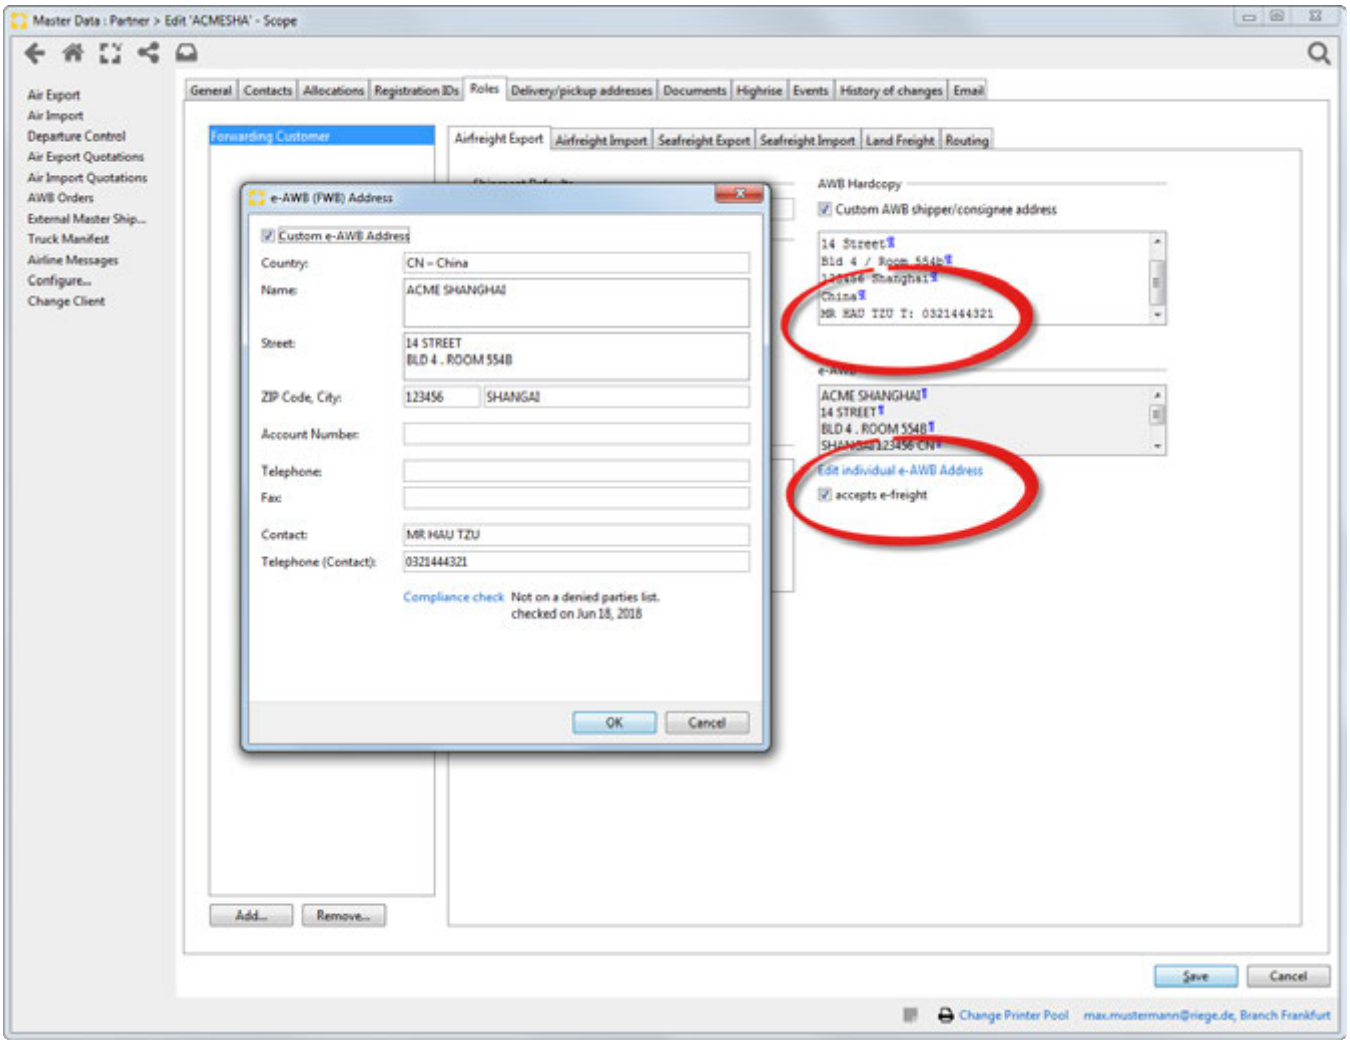
Consignee: Name of contact and telephone number

Telephone number is taken from tab "General" of the partner:



Name of contact is taken from role "forwarding customer" under action link "edit individual e-AWB -Address":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

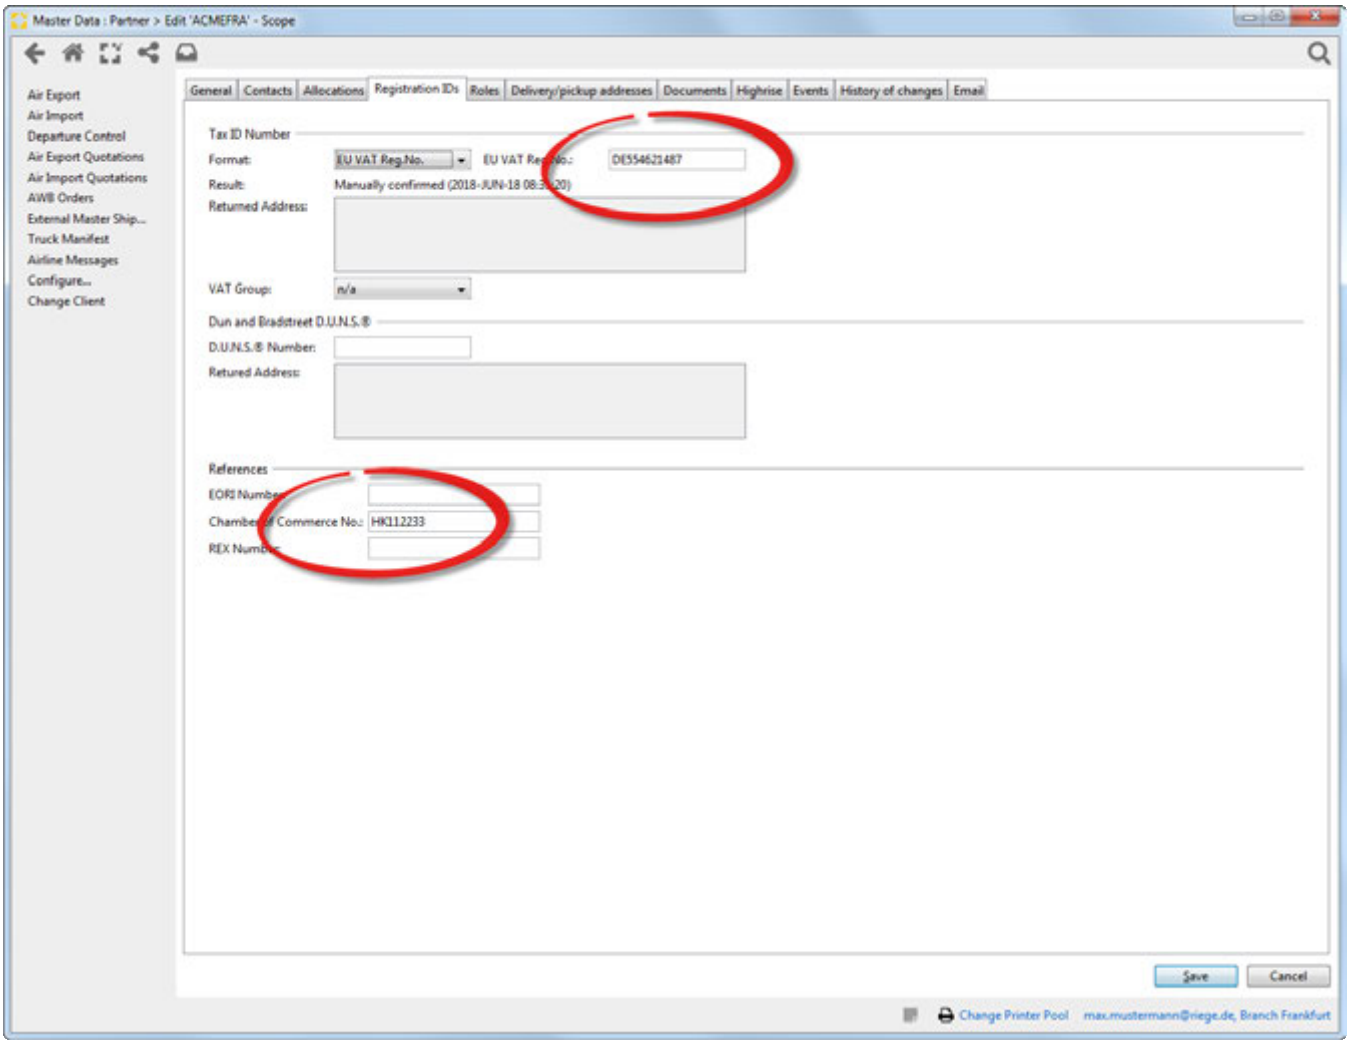


If name of contact and telephone number shall also be printed on the AWB the information can be added under "Custom AWB shipper/consignee address".

Identification number

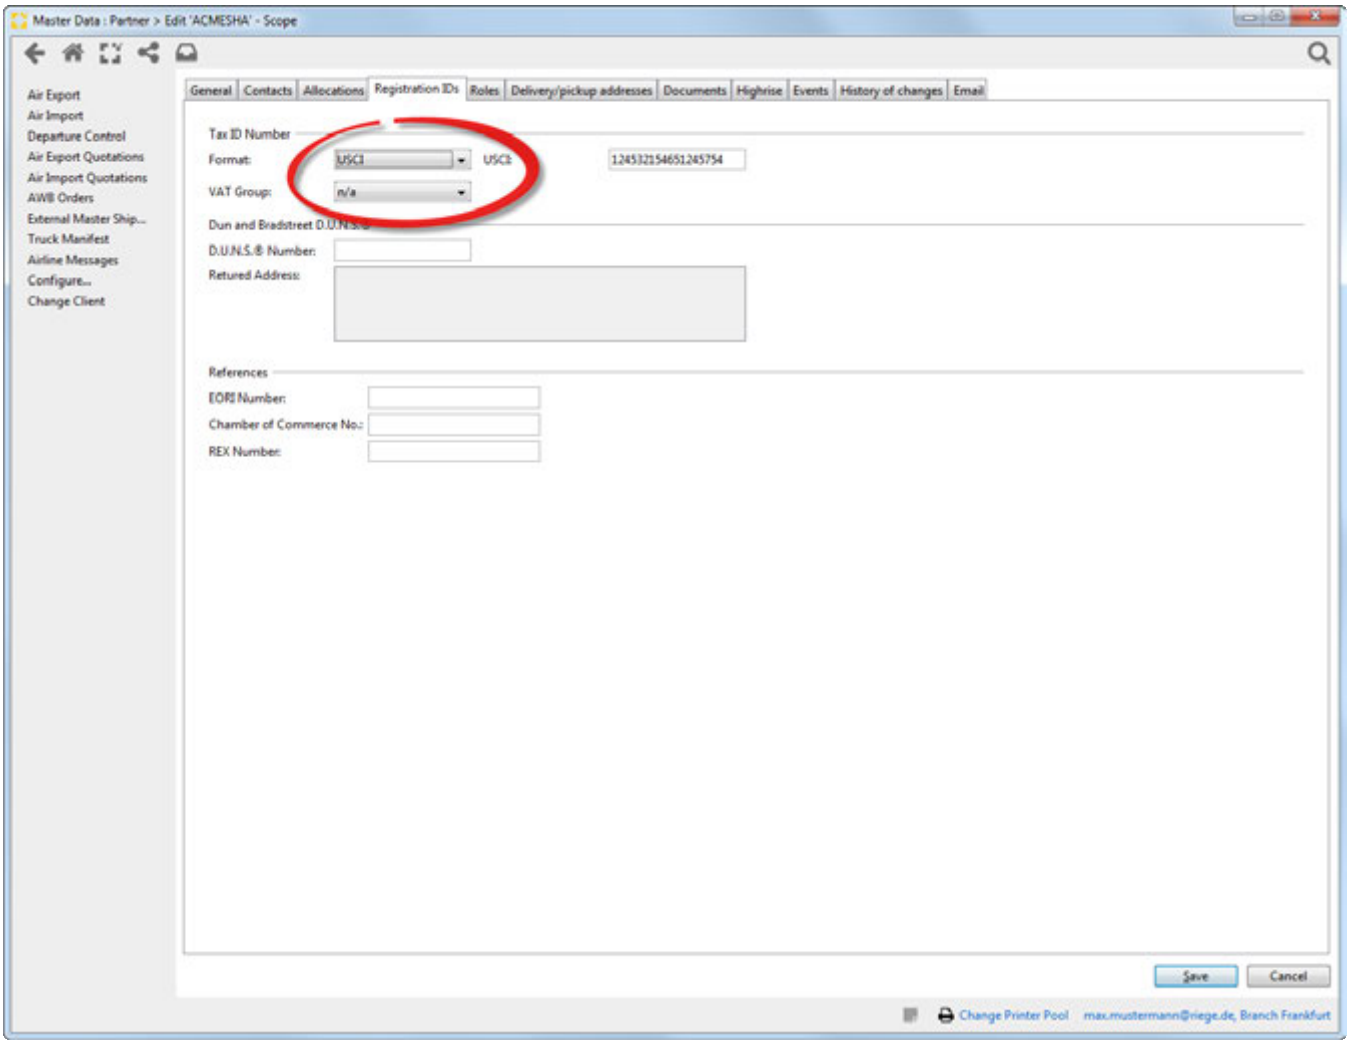
Depending on the country of the address there are different options: for EU addresses the EU VAT Reg.No and the Chamber of Commerce No. can be entered:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

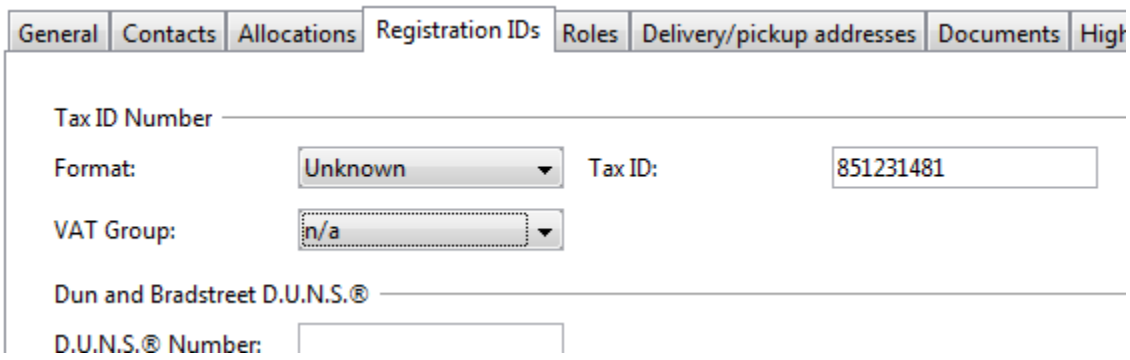


For Chinese addresses the USCI number can be entered:
Note: the USCI number is a 17 digit number and a check digit that will be validated. (total 18 characters)
If the Consignee does not have a USCI because it is a private person, the business type should be indicated as "private person", this will deactivate the validation.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



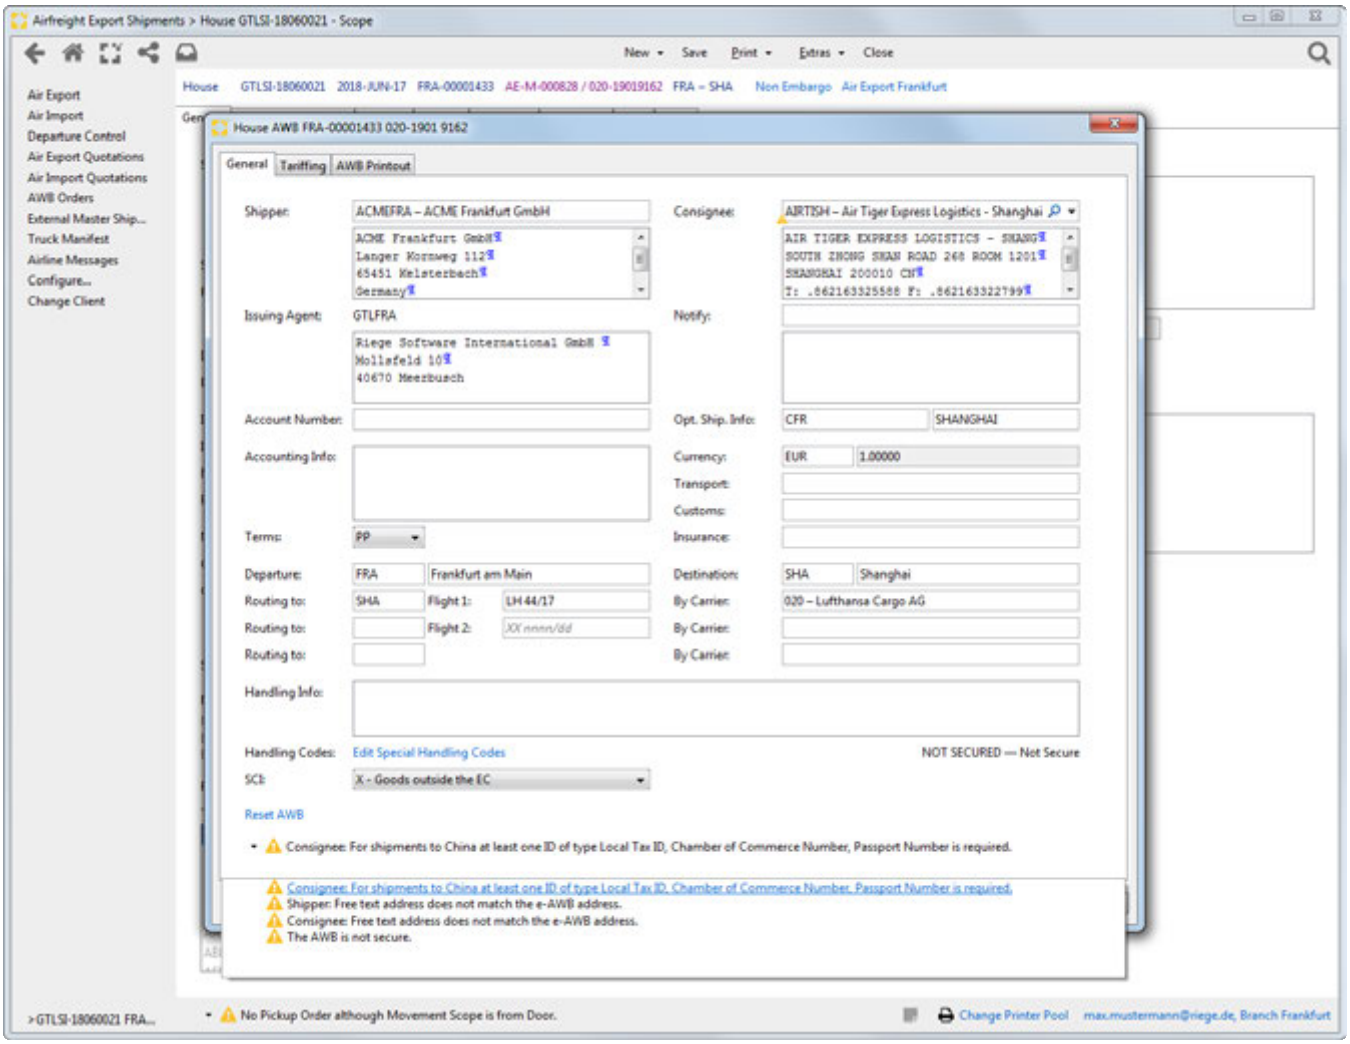
If Scope has no specific registration ID for a country, option "Unknown" can be used:



Shipment entry and Validation

When entering an export shipment with destination CN (exception: HK) Scope validates whether all required information is entered:

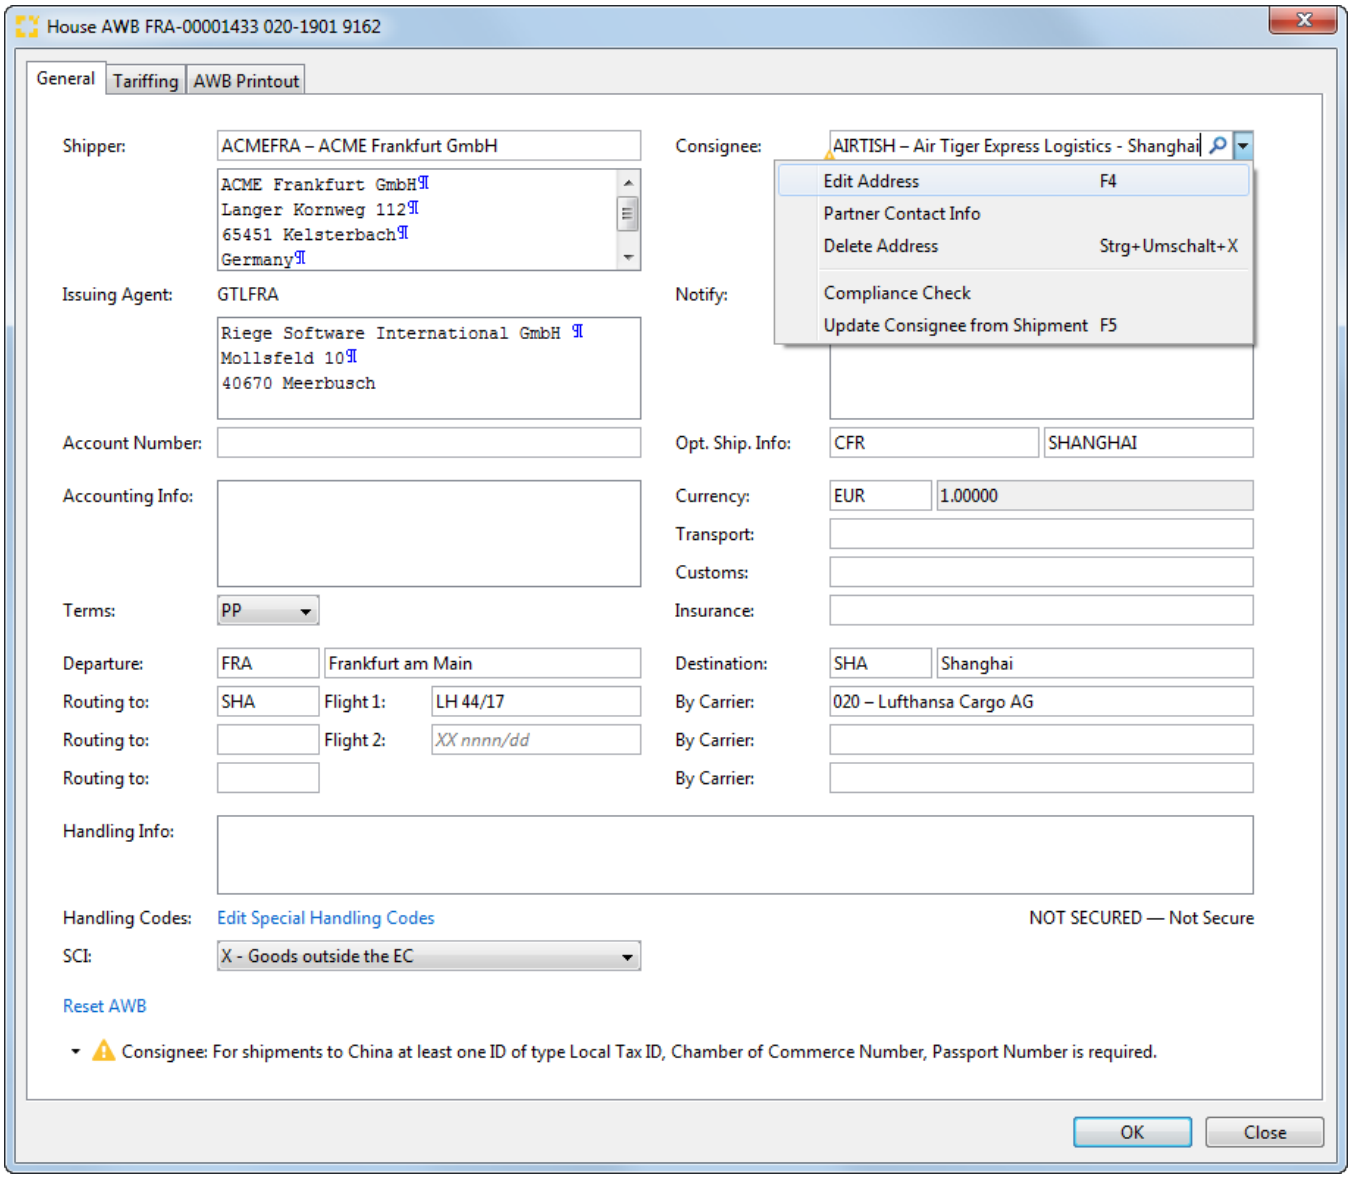
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Missing information can either be added to master data or entered directly in the AWB editor.

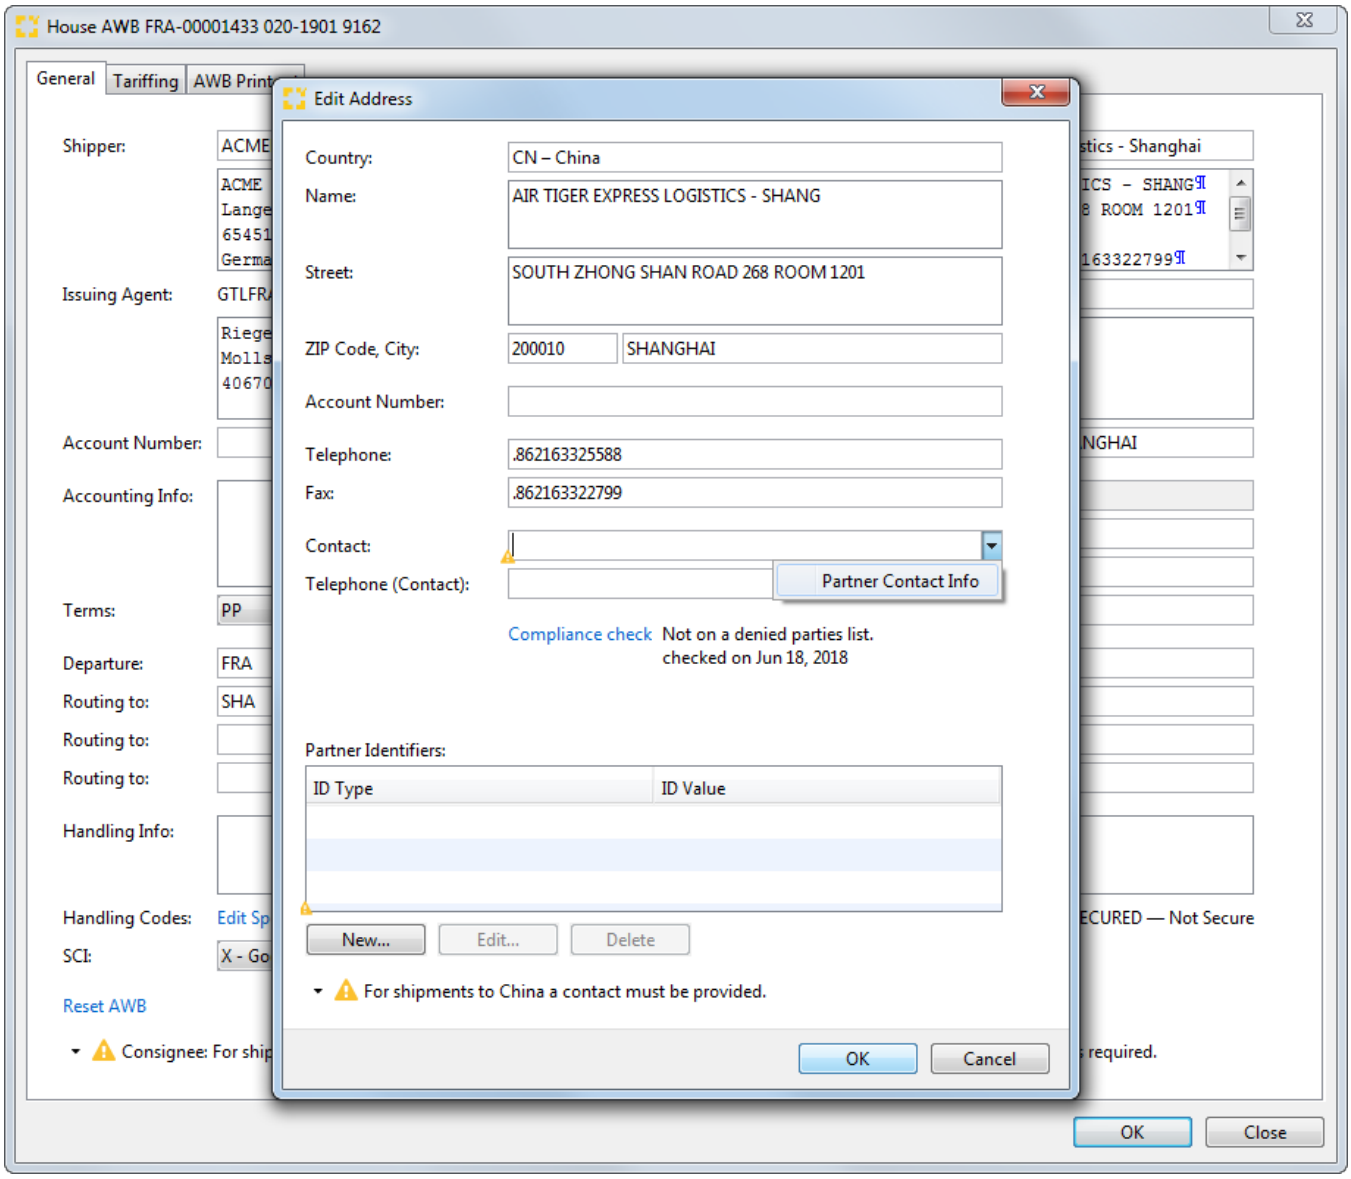
Pressing F4 or right-clicking with option "Edit Address" opens the FWB editor:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

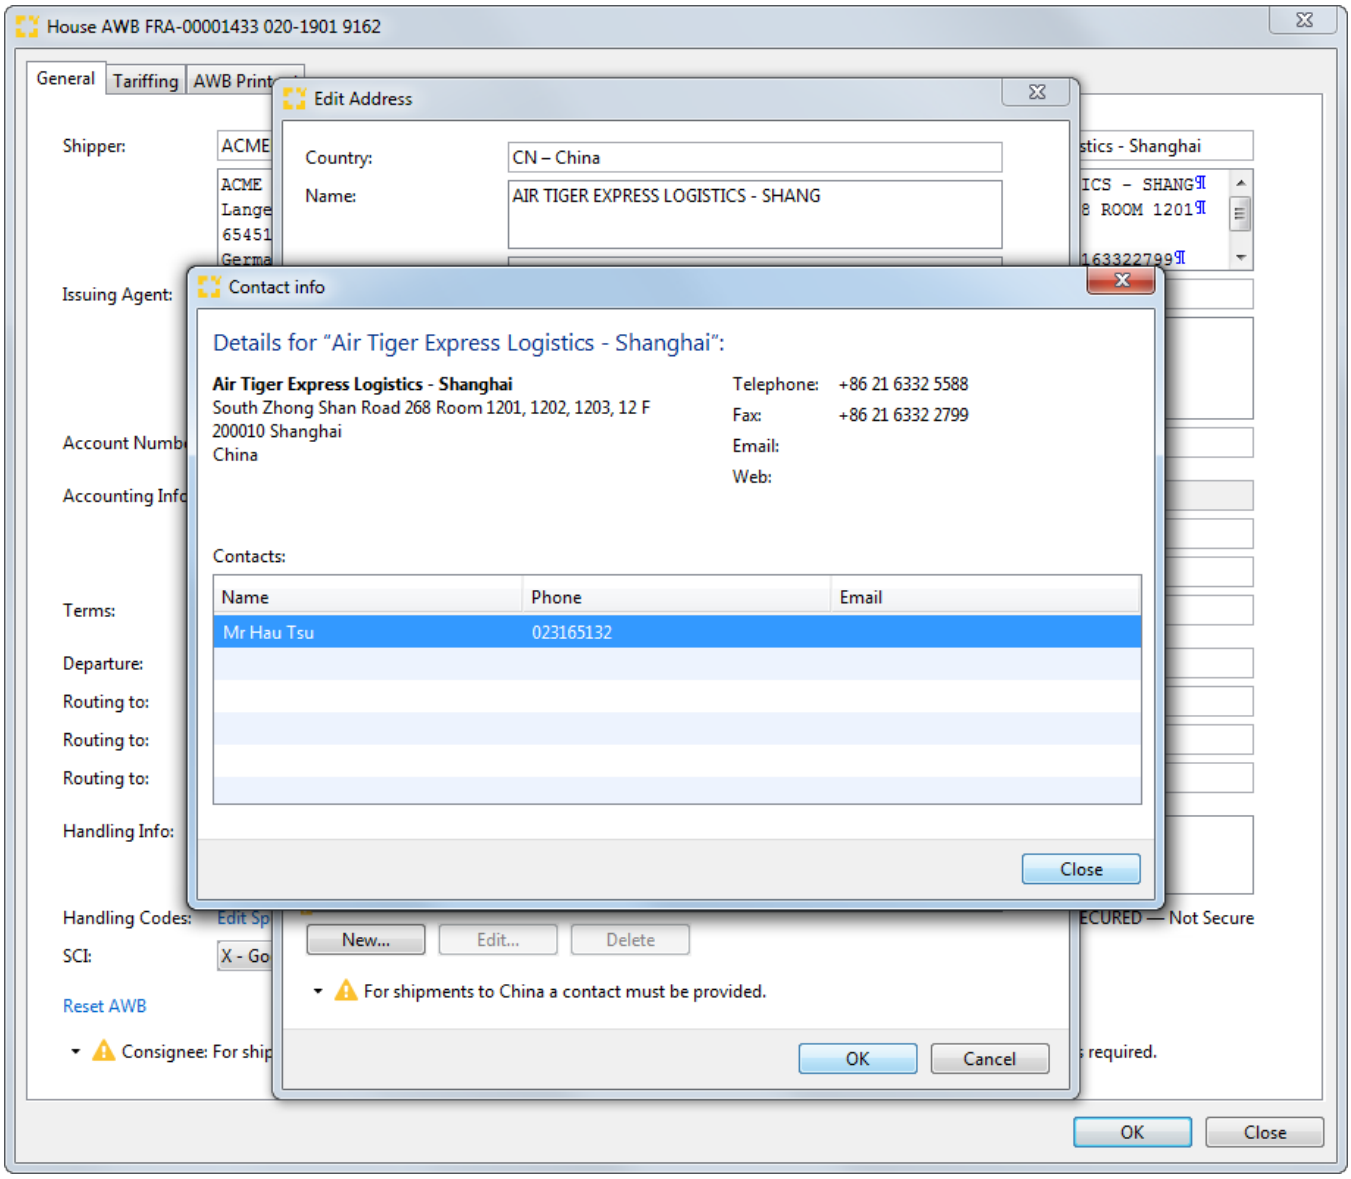


The missing data can be entered manually or in case of name of contact and telephone number can be taken from maintained contacts by doubleclicking the contact:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

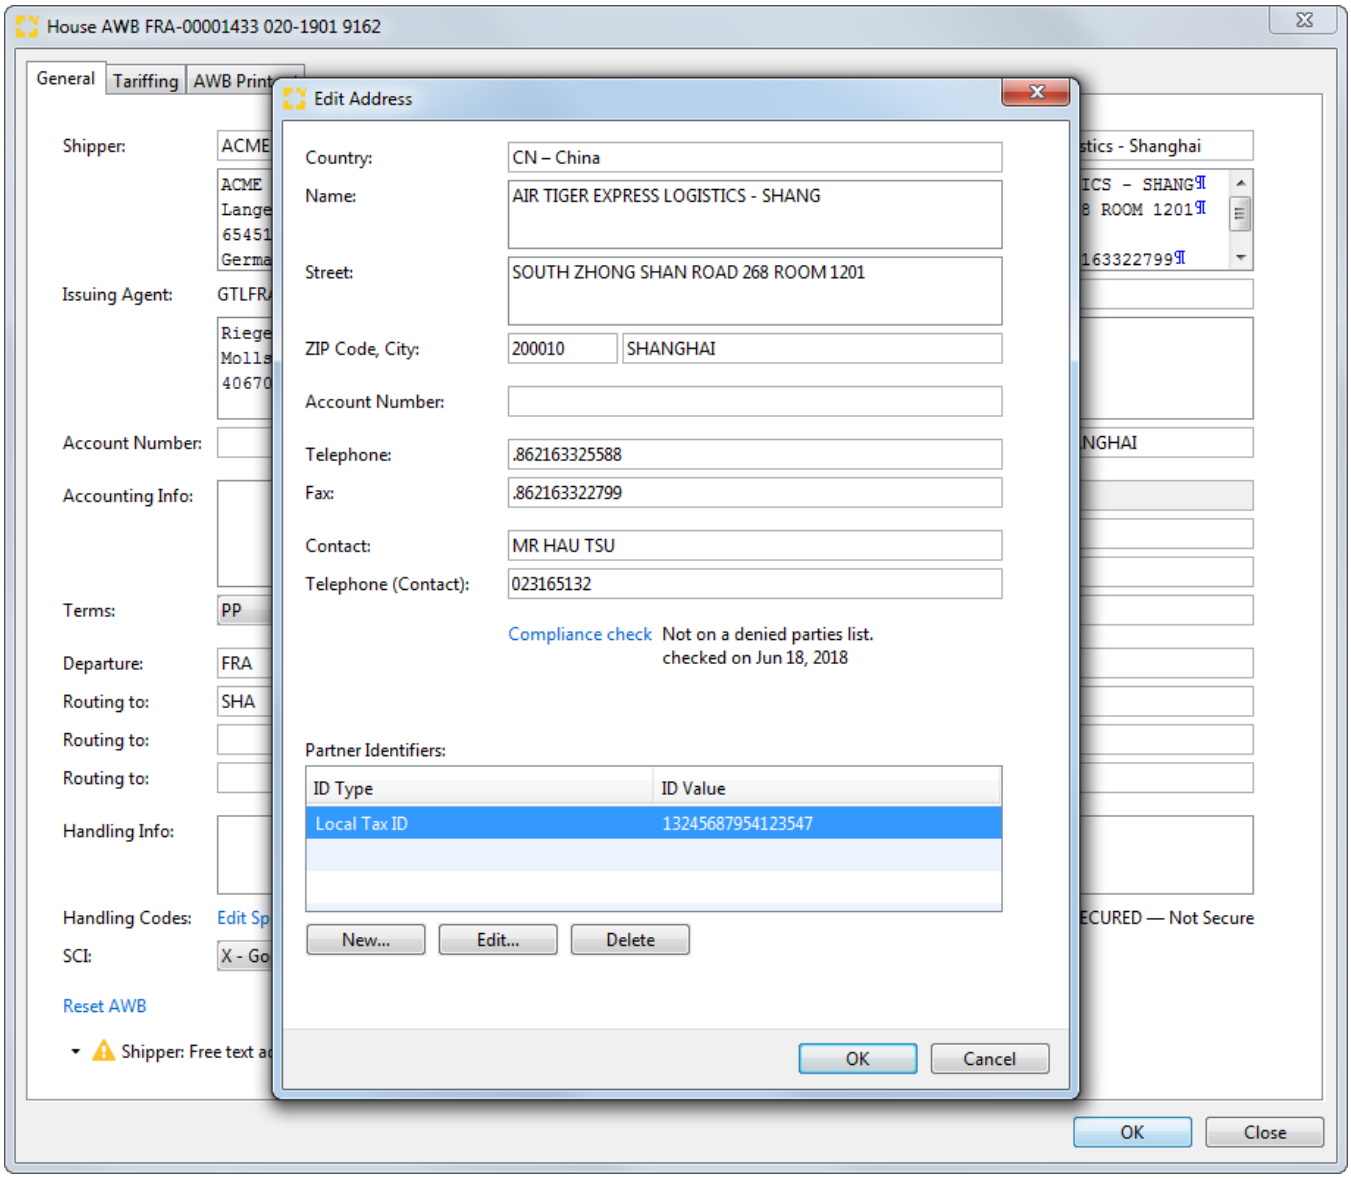


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The partner Identifier (registration number) can be added by clicking the "New.." button:

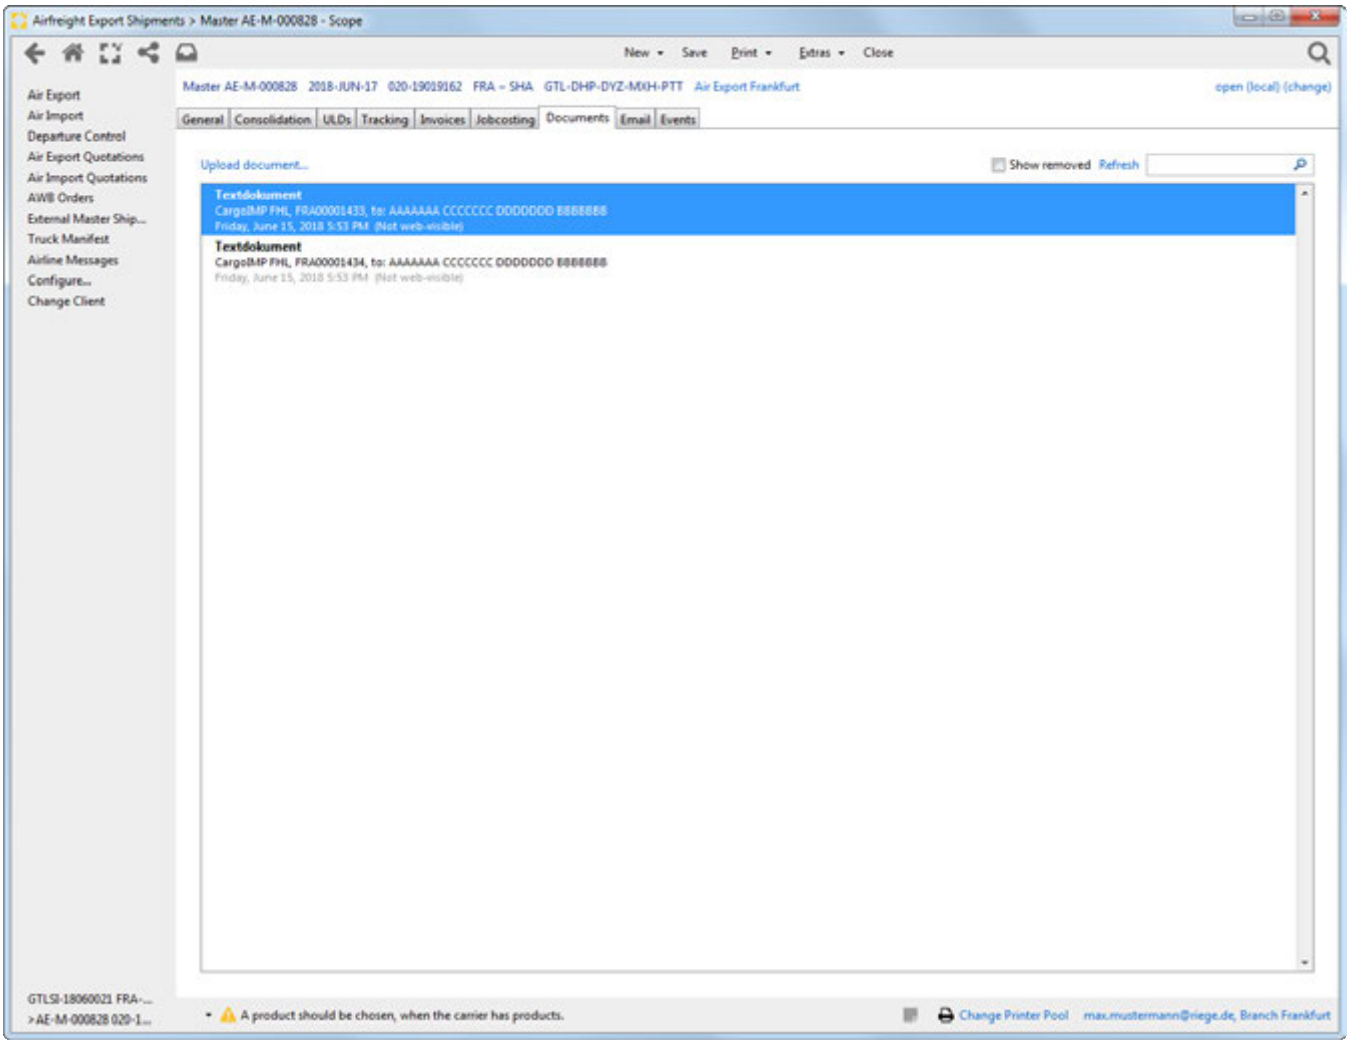
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



FWB and FHL Output

The resulting airline messages (received from our clearing center after sending AWBs (and manifests) can be viewed and opened from the Documents tab:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The files can be opened and checked:

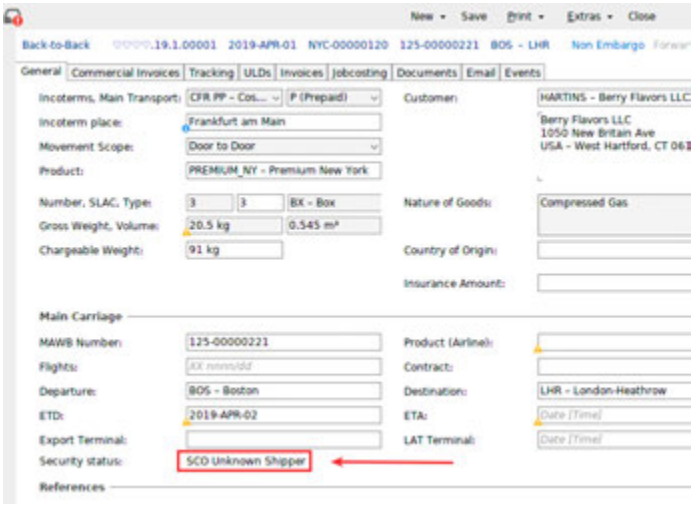
FAQ How-To make an Air Export a known shipper

In order for cargo to travel on a passenger aircraft, all the parties in the US export leg of the shipment must be known shippers. This How-to describes how to change a shipment from an "Unknown Shipper" to a "Known Shipper"

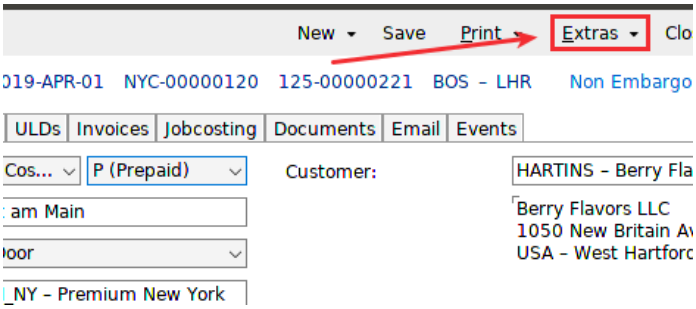
How do we know if the shipment is from a known or unknown shipper?

In the example below, we can see the Scope tells us this shipment is considered to be from unknown shipper:

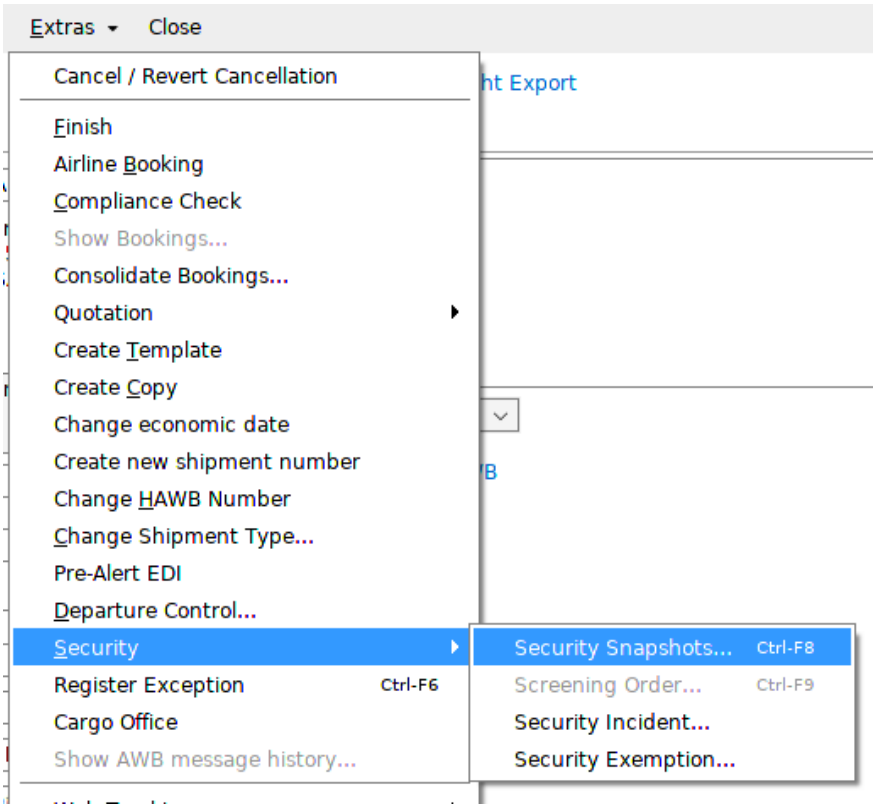


Why is the shipment from an unknown shipper?

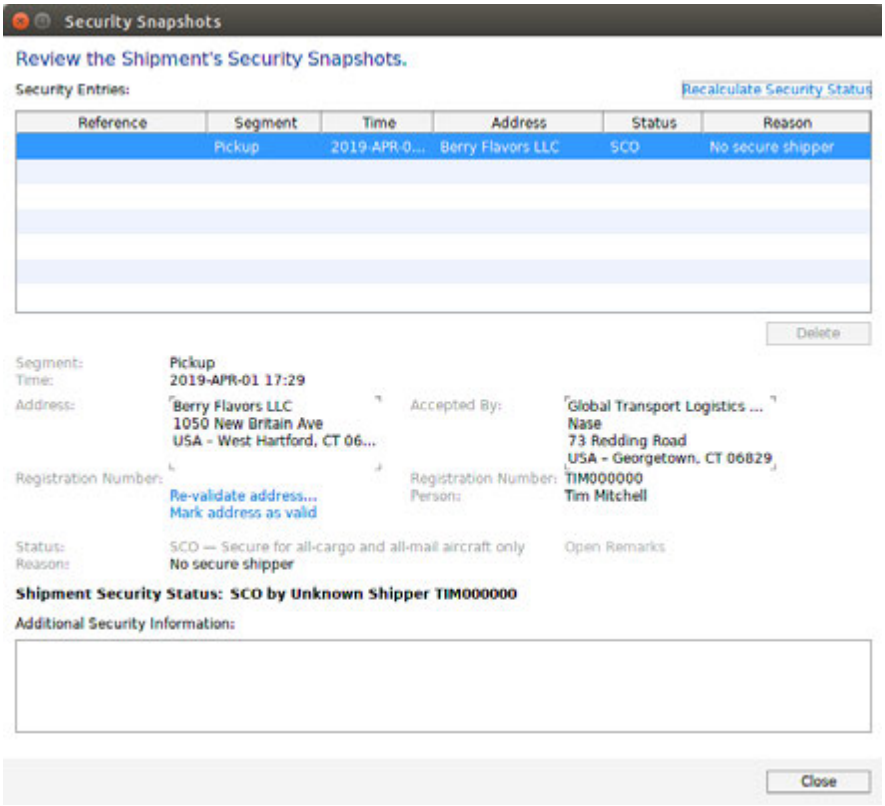
To see what is causing the shipment to be shown as from an "Unknown Shipper", we can go to the *Extras* menu of the shipment and then select *Security* and *Security Snapshot*:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The security snapshot shows us that the shipper, Berry Flavors LLC is not a secure shipper and so the shipment is not secure:



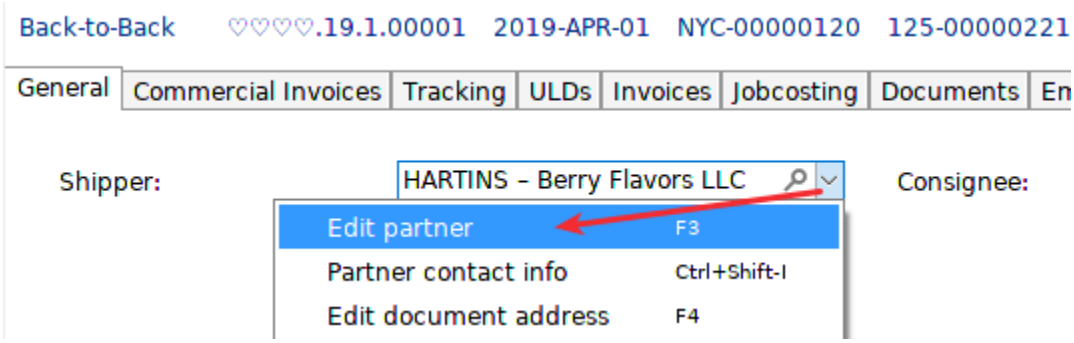
Any party who shows up in the security snapshot as a "No secure shipper" must be made a secure shipper in order for the whole shipment to become "Known Shipper"

How to make a party a known shipper

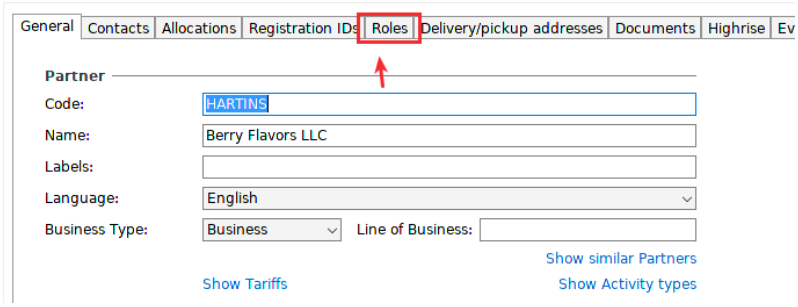
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

To make a party a known shipper, you need to go to the partner profile. You can do this from directly in the shipment. In the example below we will change Berry Flavors LLC to a known shipper.

In the "Shipper" field of the air export shipment, we click the drop-down menu to the right of the shipper and select *Edit partner*:



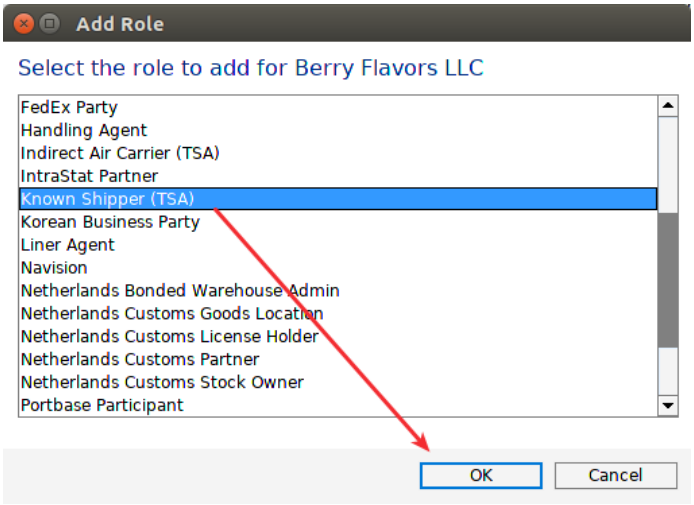
The partner will open. Select the *Roles* tab:



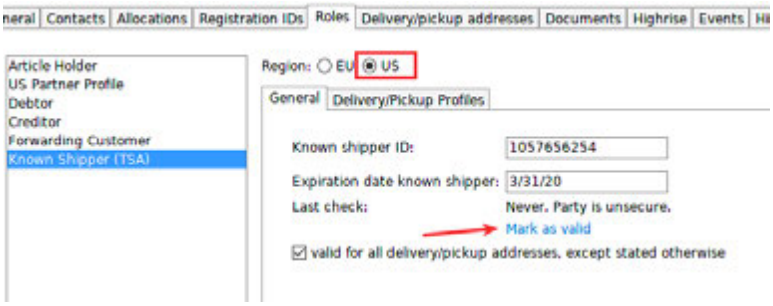
In the role tab we need to *add* a role :

From the list of roles choose "Known Shipper (TSA)" and click *OK* :

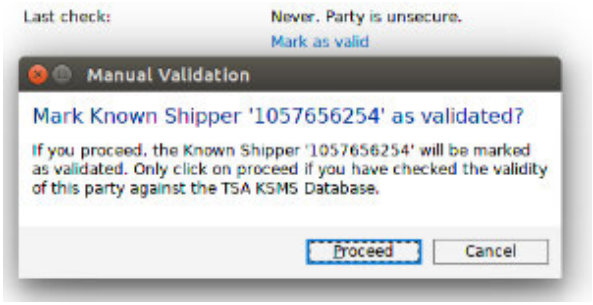
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



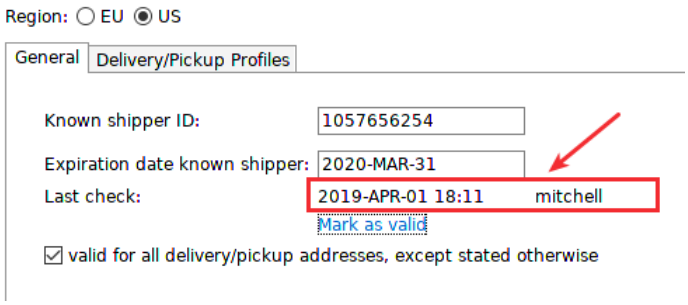
The role *Known Shipper (TSA)* will be added to the partner and this role will open:



1. In the role, make sure the region "US" is checked.
2. Add a Known Shipper ID number
3. Give the ID an expiry date when you would like to recheck this shipper's status
4. Check the box *"Valid for all delivery/Pickup addresses, except stated otherwise".* This means any address you pickup from for this shipper is also considered a known shipper address. If you want to list individual pickup addresses that are considered "Known" use the tab "Delivery/Pickup Profiles
5. Most important, click the blue link "Mark as valid". The party is not considered a valid known shipper until you do this.



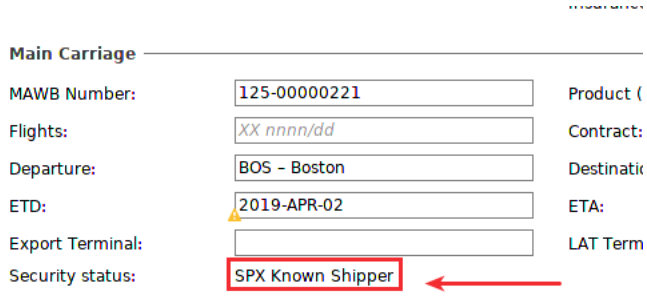
When you click "Mark as valid" , a manual validation appears for you to confirm with "Proceed" . The "Last Check" field will now show the date when you confirm this party to be a know shipper and the user who made this confirmation:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Now the party can be save and they will be a known shipper.

Scope will return you to the air export shipment and if all the parties in the US export leg are known shippers, the status will change to "*SPX Known Shipper* "



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

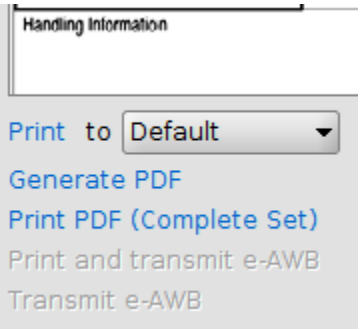
FAQ How-To print a single pdf containing the complete AWB set

When producing AWB's with a laser printer, the forwarder does not always need both the complete shipper's AWB set and the consignee's AWB set. With Scope 7.2 a single pdf is also produced that contains the essential AWBs from both sets

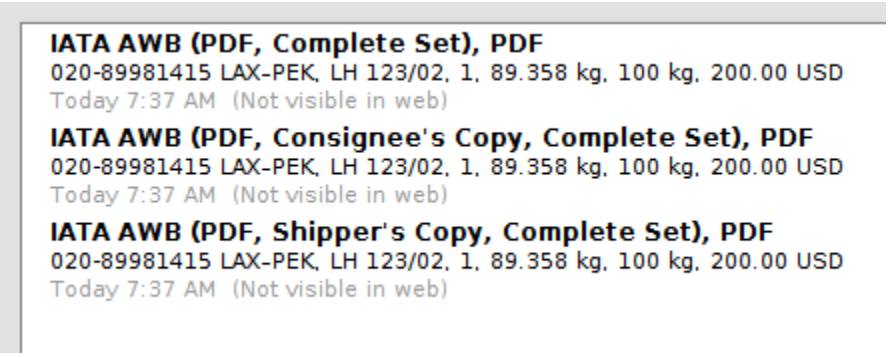
Step-by-step guide

Create the air export shipment

1. Open the AWB editor
2. Select the "AWB Printout" tab
3. Click the print option "Print PDF (Complete Set)"



Now go to the ""Documents" tab of the shipment. Note that 3 sets of PDF AWBs are produced. The PDF titled "IATA AWB (PDF, Complete Set), PDF" is a single PDF containing the essential copies from both the shipper and consignee's set.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

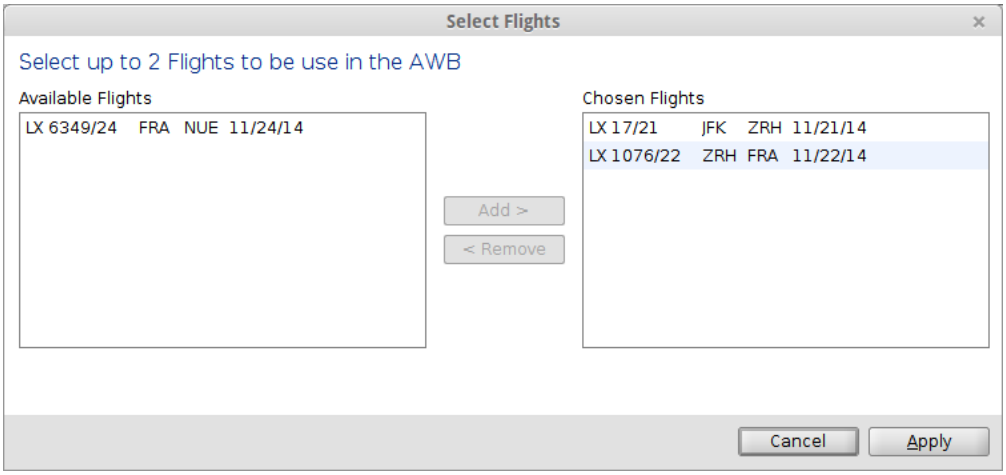
FAQ How-To select the flights to be shown on the air export AWB

When a shipment has more than 2 flight legs, you may want to select which flights to print on the AWB, since only 2 can fit in the space dedicated to flights on an AWB.

Step-by-step guide

Create an air export shipment

1. In the "Flights" field of the AWB, select the sub-menu option "Edit Flight Details"
2. Enter all your flights in the normal way.
3. Open either the House-AWB or IATA-AWB editor
4. Go to either the "Flight 1" or "Flight 2" field. Both of these now have a sub-menu option "Select flights from shipment"
5. Click on "Select flights from shipment" and simply select the flights that should appear on the AWB using the flight selector.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

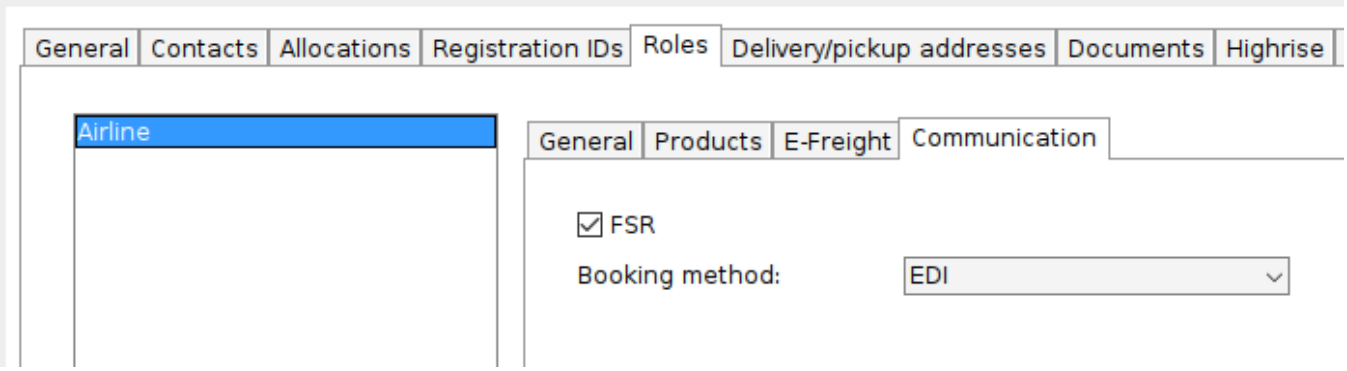
FAQ How-To send an FSR (Freight Status Request)

FSR's (freight status requests) can be sent from both air export and air import shipments. Normally this is not necessary in air exports because when an eAWB is created and accepted by the airline, FSU's (freight status updates) will automatically be sent by the airline. In the case of air imports, the exporting agent may not have created an eAWB or may not be connected electronically to the import agent, therefore the import agent needs to send an FSR to the airline in order to acquire an FSU from the airline

FSR Setup

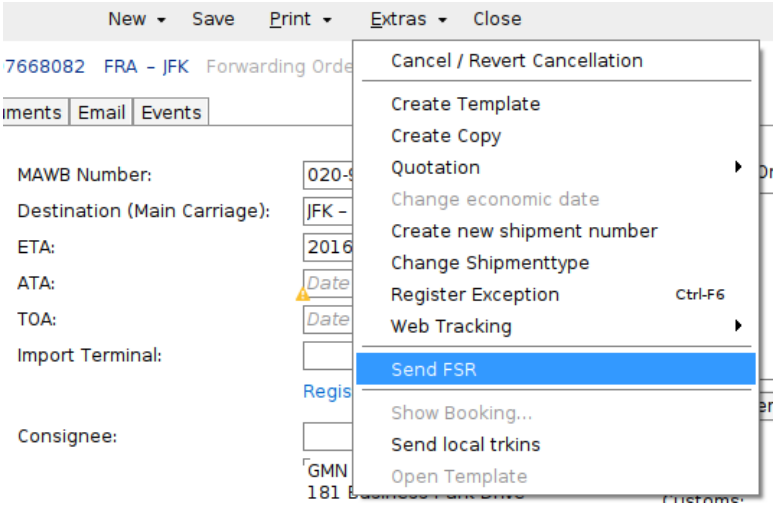
In order to be able to send an FSR to an airline, it is necessary to indicate within Scope that the airline accepts FSRs. The FSR feature in Scope is activated as follows:

1. Find the airline within Scope partner maintenance
2. go to the "Roles" tab of the partner
3. Click on the role "Airline"
4. Within the "Airline" role, go to the last tab "Communication"
5. In the "Communication" tab, check the box "FSR". It is also necessary that communication in general is activated with the airline.



Sending an FSR

1. Open an air import or air export shipment where the airline is activated for FSR
2. In the shipment, click on the "Extras" tab on the toolbar
3. From the list of options click "Send FSR" and an FSR will immediately be transmitted



How often must an FSR be sent?

- In the case of a shipment where the export agent has transmitted an eAWB, there is no need to send an FSR because the airline will automatically send FSU's whenever the shipment has a new status

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- If the export agent transmits the air export shipment to an import agent who also uses Scope, the FSUs for the export agent are also automatically transmitted to the import agent and the import agent should not need to send an FSR
- Where the export agent has not created an eAWB or is not connected to the import agent electronically, the import agent will have to send the FSR as described above. The airline will only transmit the current status and the import agent needs to send further FSRs at regular intervals to acquire further status updates.

FAQ How-To sent data to airline via FHL, if I do an assembly business by creating a super-house shipment with consolidated sub-houses?

Which data will be sent to the airline via FHL, if I do an assembly by creating a super-house shipment with consolidated sub-houses?

Does the FHL contain the Superhouse-data or/and the Sub-Houses?

The FHL-data in Scope is created by each Sub-HAWB. This adjustment is based on the documentation of U.S. Customs and Border Protection - http://www.cbp.gov/linkhandler/cgov/trade/trade_outreach/advance_info/air_faq_cargo.ctt/air_faq_cargo.doc

13. Consolidated Shipments

Q. Does CBP require a separate air waybill record for each shipper/consignee relationship? In other words, if a freight forwarding agent arranges transportation for a single consignee to import merchandise from multiple vendors, suppliers or manufacturers, may the freight forwarding agent be listed as the shipper on a single air waybill or must there be a separate air waybill record for each vendor/supplier/manufacturer?

A. CBP requires detailed shipper information on each air waybill record for the purposes of targeting high-risk shipments. If a freight forwarder or other consolidator receives merchandise from multiple foreign vendors and arranges for such transport to the United States, listing the freight forwarder as the shipper would not provide sufficient information for CBP to conduct its targeting. Air AMS does not have the capability of accepting multiple shippers or consignees for a single air waybill record, nor could it be readily adapted to so accept multiple shippers/consignees.

Regarding the structure of FWB / FHL no recursion is possible, only one shipper can be named on FHL. There is no possibility to match the AMS requirements (mention each shipper) without creating the FHL on Sub-HAWB.

The specification regarding HAWB is mentioned below:

16. House Air Waybill Format

Q. Can Air AMS accept sub-house air waybill records associated with a house air waybill record?

A. A sub-house air waybill refers to multiple house air waybills that are consolidated into a single (consolidated) house air waybill record. The sub-house air waybill would contain the identity of the shipper and consignee while the consolidated house air waybill record may only list the consolidator/forwarding agent as the shipper or consignee.

Since Air AMS can only accommodate one level of house air waybill identification, the Air AMS participant must report the sub-house air waybill information in the house air waybill field. The consolidated house air waybill information need not be reported.

Based on above mentioned requirements the Sub-HAWB data will be send by FHL to airline.

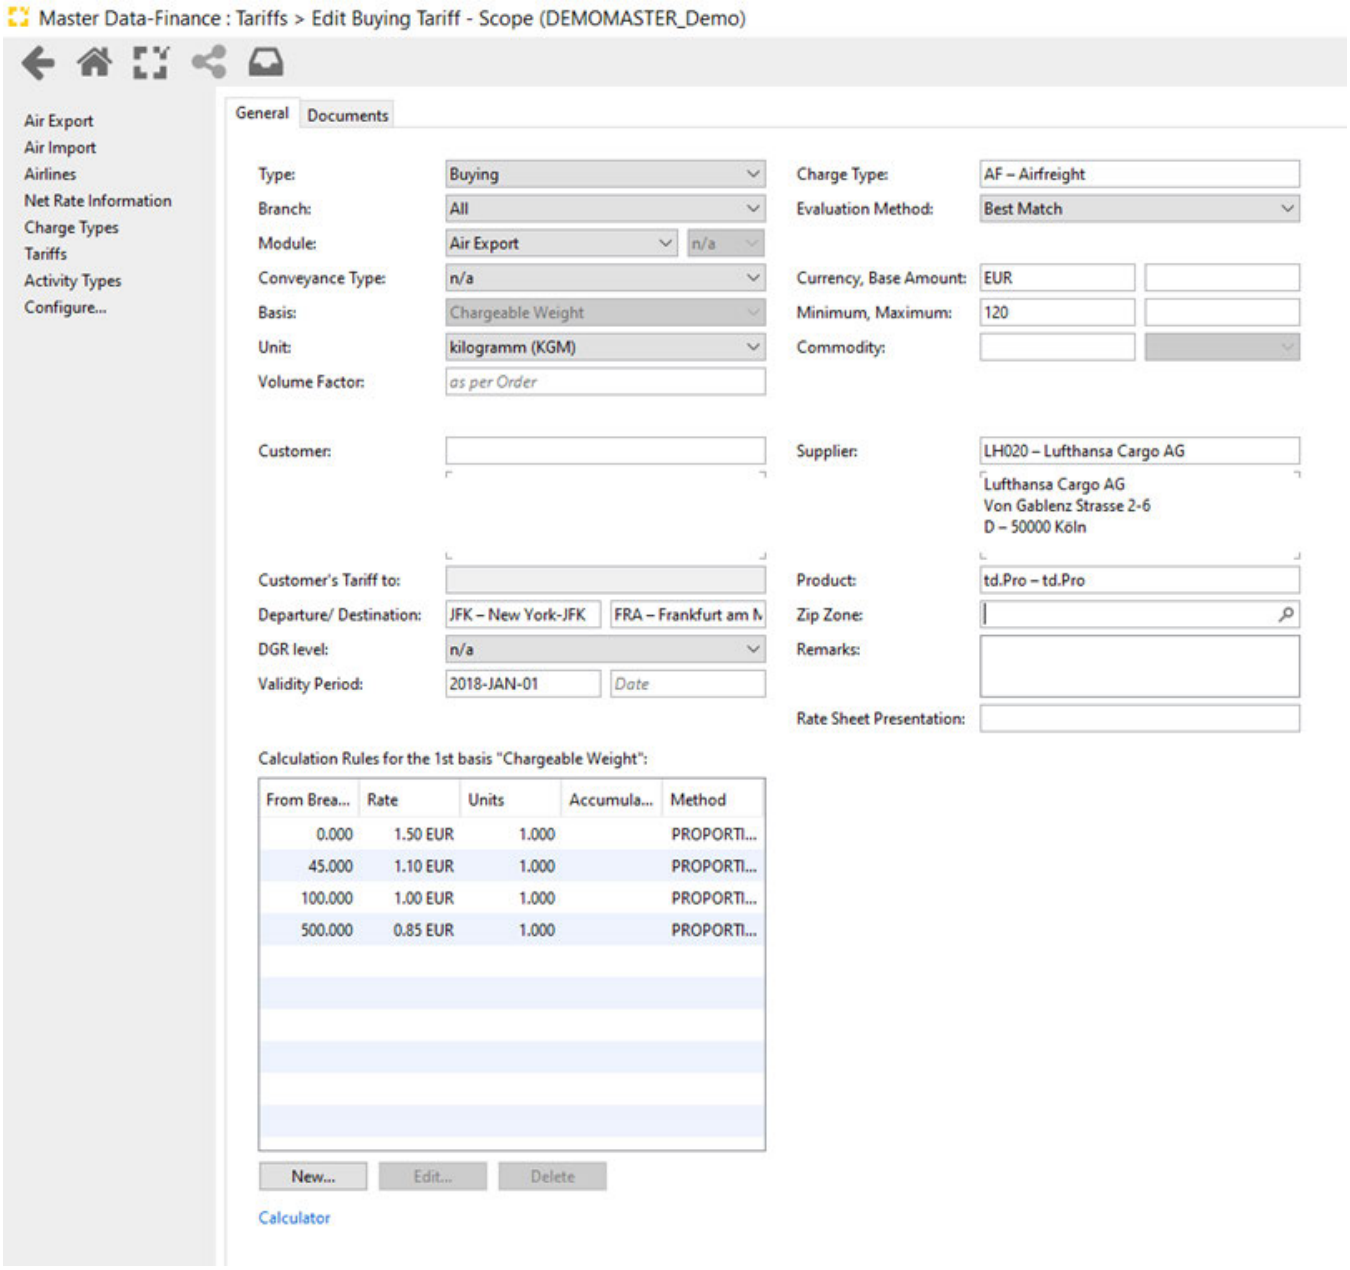
FAQ How-To set charge type/ tariffs for different carriers for automatic calculation

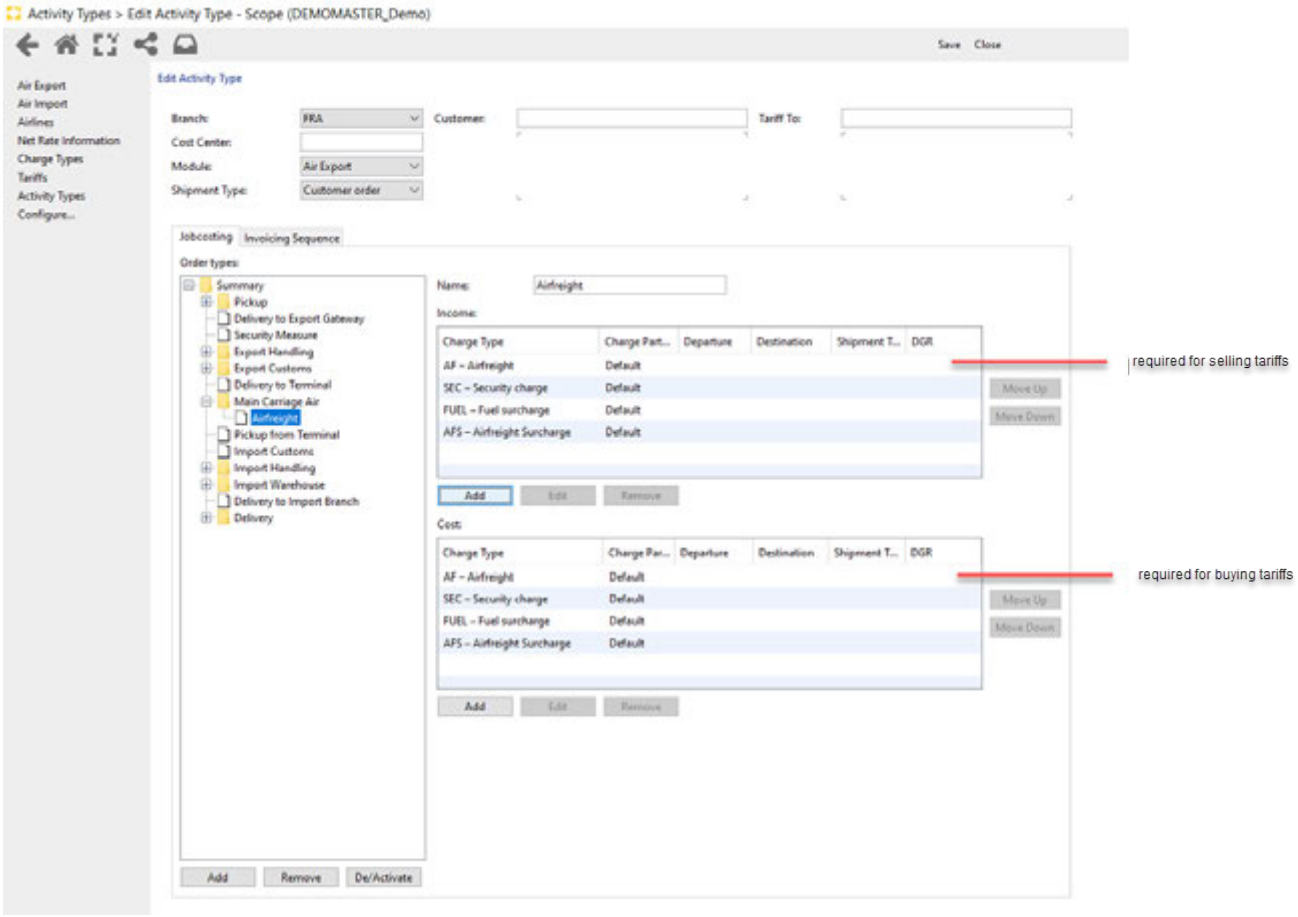
You can set different kind of tariffs (buying / selling) for carriers/airlines at Tariff-Editor. To built up a new tariff you need to fill in different data like charge type (e.g. Airfreight – AF), basis (e.g. chargeable weight), supplier (e.g. LH020 / Lufthansa Cargo), destination/departure (e.g. from JFK to FRA) and calculation rules (e.g. z.B. +45 1,10 USD / +100 1,00 USD / +500 0,85 USD). Additionally you can add Minimum, Product, DGR-Level and Validity Period.



For automatic calculation you have to set an activity type at activity types maintenance application. You can choose a branch, order group (air export) and context (master, house, direct). Choose order type „*Main Carriage Air*“ and add your favorite charge type at “*income*” and/or “*cost*”-window.

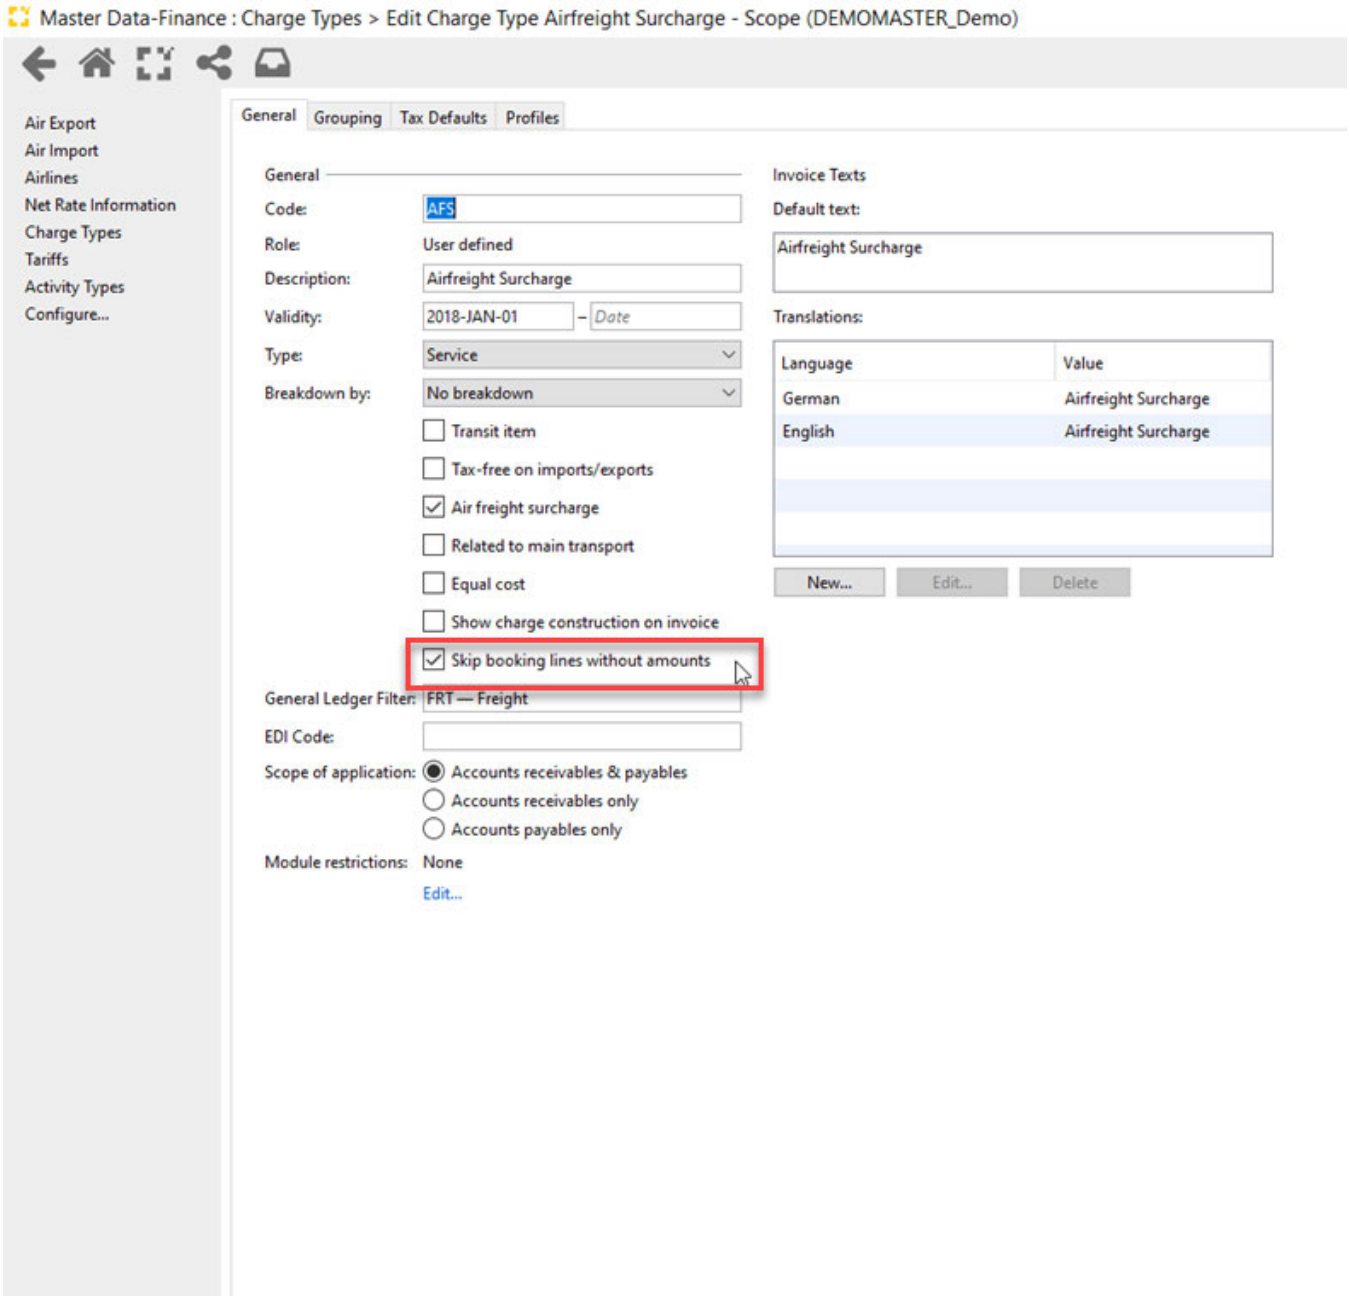
Example: Choose Airfreight / Fuel Surcharge / Security Surcharge (general surcharges) and special surcharges of some supplier like airfreight surcharge, supplementary surcharge, period peak surcharge.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Above mentioned special surcharges could not be applicable for all carriers so you have to setup the charge type as well. Go to "*Charge Type Maintenance* " and choose your charge type. Now you choose "„Buchungszeilen ohne Beträge auslassen" and Scope will use this charge type if there is tariff for it - otherwise the charge will not be chosen.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Example: Airfreight Surcharge (AFS) is only applicable by carrier LH020 and you have saved a tariff for AFS, for supplier AC014 AFS is not applicable. Go to your shipment file and choose tab "*Jobcosting*" and press „*calculate jobcosting*". If you have booked with carrier LH020 there will be mentioned charge type AFS with your individual tariff. If you have booked with AC014 there will be no AFS mentioned in the jobcosting. All other general surcharges will be mentioned as well.

If *Jobcosting* is not working, it could depends on the following adjustments:

- missing destination/departure (tab general)
- missing movement scope (tab general)
- supplier from your tariff and supplier in your shipment are not the same (tab general)
- missing product (tab general)
- validity of tariff is expired

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

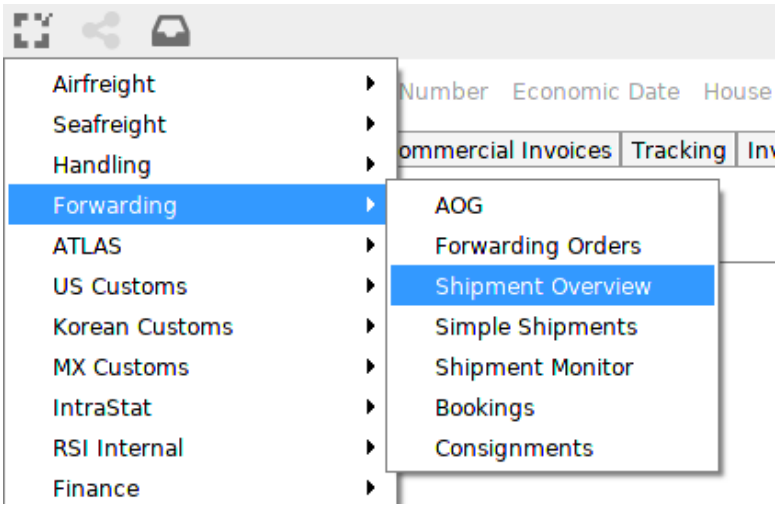
FAQ How-To view the profit on an Air Export Consol

In an air export master shipment, the Jobcosting will always pro-rate all master income and costs to the houses and so you cannot see in the master Jobcosting how much profit was created for the complete consol. This How-To describes how to easily check the total profit on your air export consolidations.

Step-by-step guide

Navigate to the Shipment Overview

1. Select the Scope menu
2. Select *Forwarding*
3. Select the sub-menu *Shipment Overview*



Select the desired Air Export Master shipment

In the shipment overview:

1. Select *Air Export Master* from the drop-down list of shipment types at the top of the overview
2. In the date field, make sure the dates cover the period of the MAWB you are looking for
3. Next, enter the Air Export Master shipment number or MAWB in the search field

The desired Air Export Master shipment should now be visible in the overview.

Print a Consol Profit report

Click on either of the report options at the bottom right:

- Consol (PDF)
- Consol (Excel)

A report will open showing you the profit for this master shipment

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

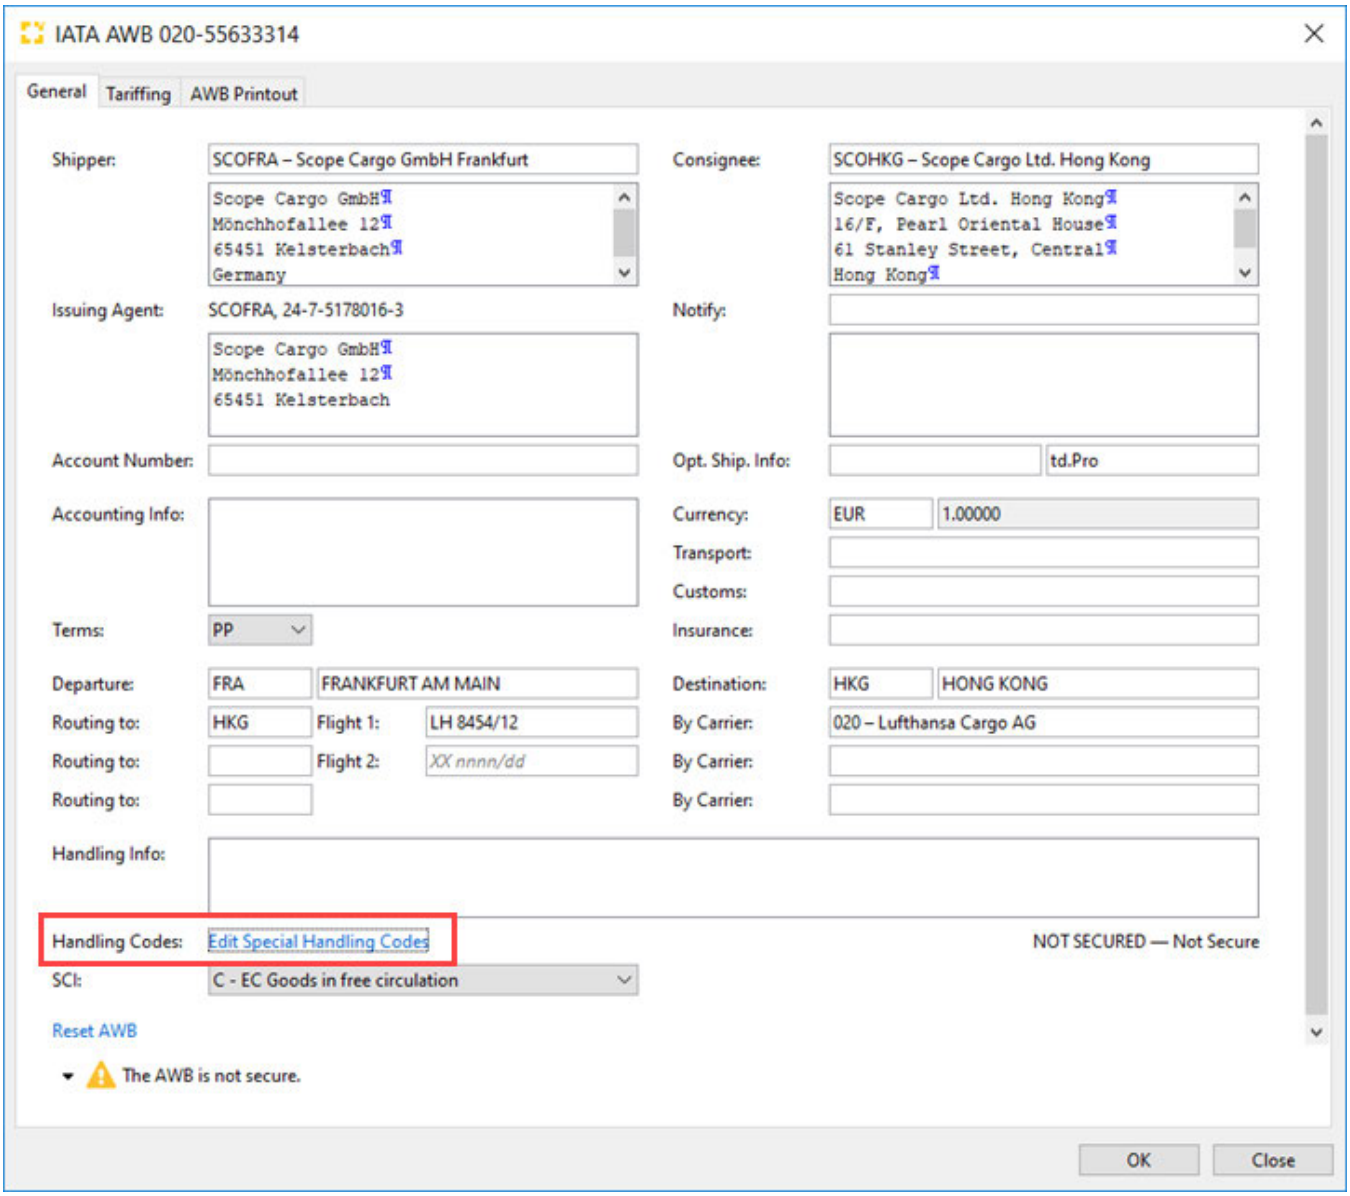
How-to EAW / EAP?

The abbreviatons EAW / EAP are a kind of e-freight-messages respectively Special Handling Codes.

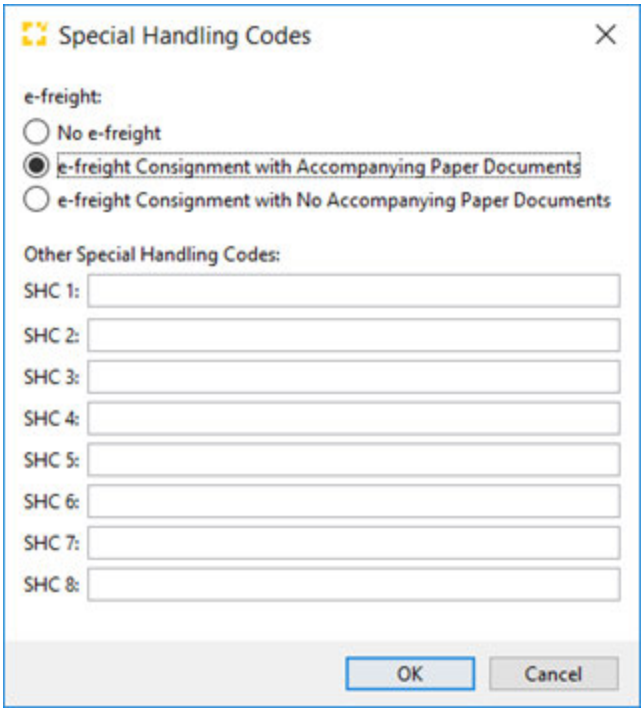
EAW = "e-freight Consignment with No Accompanying Paper Documents": e-AWB data will be transfered to airline, no shipping documents (e.g. invoice, packing list, Certificate of Origin) will be delivered with the shipment. No need to print the AWB.

EAP = "e-freight Consignment with Accompanying Paper Documents": e-AWB data will be transfered to airline, additionally other shipping documents (e.g. invoice, packing list, Certificate of Origin, Dangerous Goods Declaration) will accompany the shipment. No need to print out AWB, only to add e-Pouch with documents to the shipments.

Notes: Please check with airlines in advance, which kind of e-freight is allowed at place of departure/arrival.



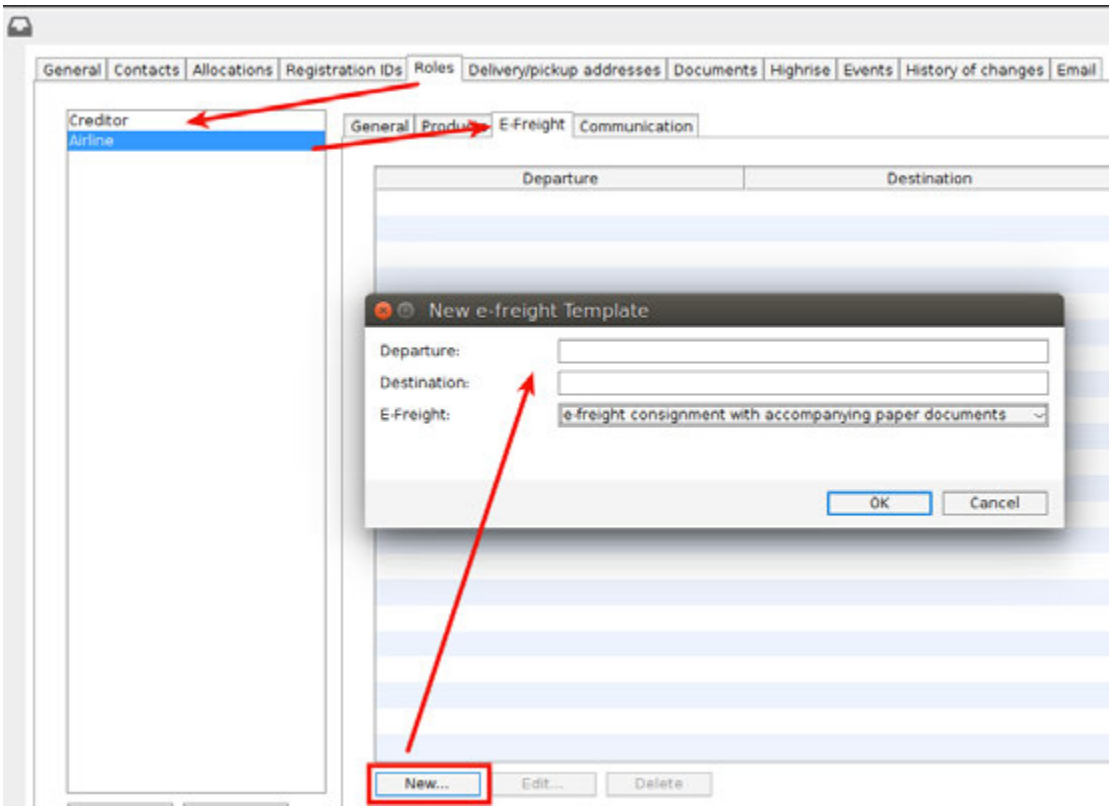
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Note that when a special handling code is applied to an AWB, this indicates the AWB is an eAWB and it is not possible to manually edit the AWB in the AWB editor. This is because any manual edits on the AWB will not be transmitted to the airline.

Permanently saving the special handling codes for an airline

Special Handling Codes can be added manually at AWB Editor for each shipment or automatically by airline / departure / destination. To set up the Scope automation switch to Masterdata - Partners - role airline and add the routing (EAW / EAP / Departure / Destination) at tab E-Freight.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To manage your Airlines and Airway Bills

- Introduction
- Stored airlines
- Customizing the airline details
- Creating a pool of AWB numbers

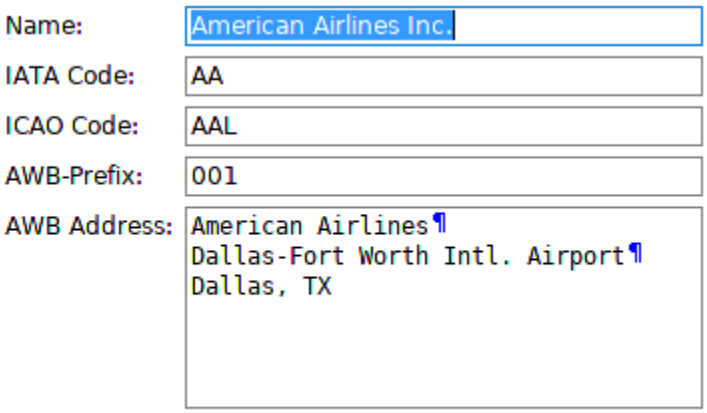
Introduction

This how-to will explain how to maintain in Scope the airlines you use and manage the airway bills they may issue you

Stored airlines

All the basic details for all airlines are already stored in Scope, so you should be able to create shipments for any airline at any time.

The screenshot below shows the basic data stored for all airlines.



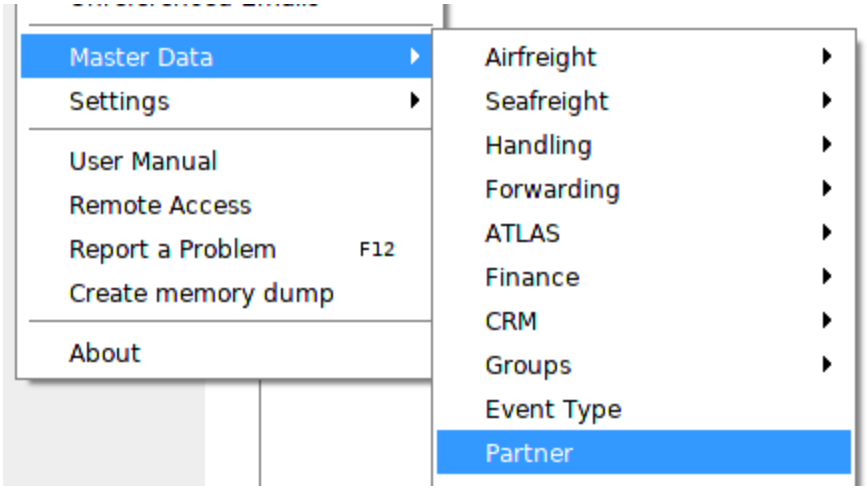
If you cannot find an airline in Scope, create a ticket giving the details of the airline you need, and Riege Software will create it.

Customizing the airline details

Often you will need to change the airline details so that for example the airline address uses the local address you use in your branch office. In order to do this, you need to link an airline to a partner.

Go to the Scope menu and choose "Master Data" and then "Partner".

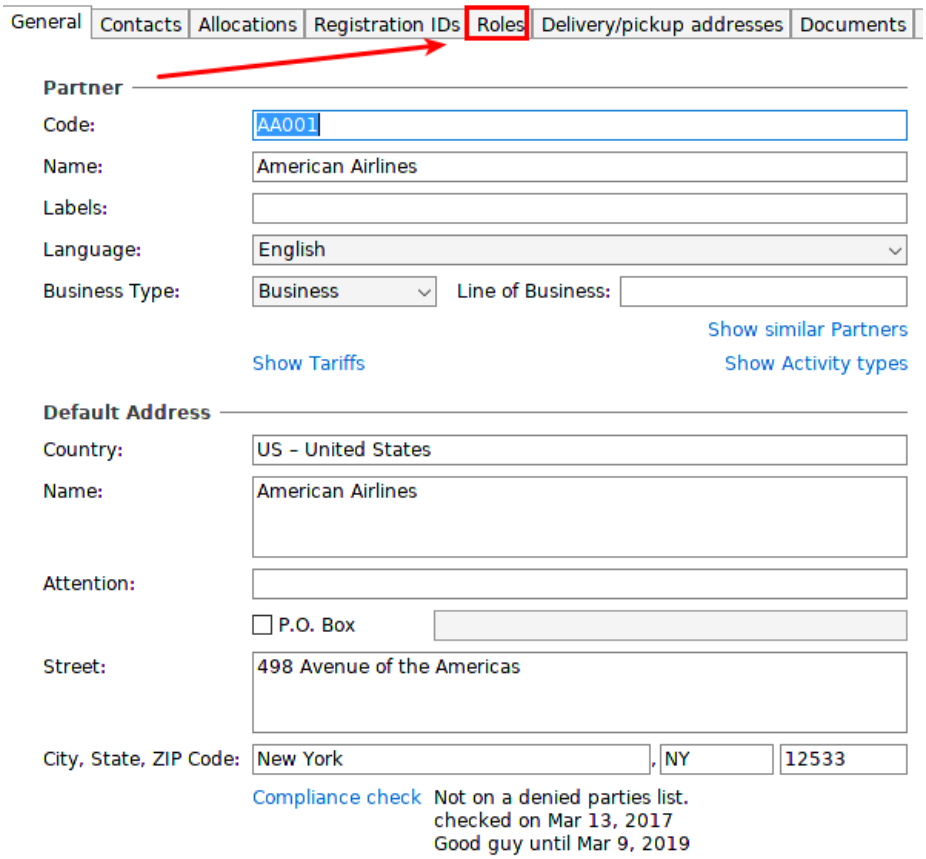
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the partner maintenance, create a "New" partner.

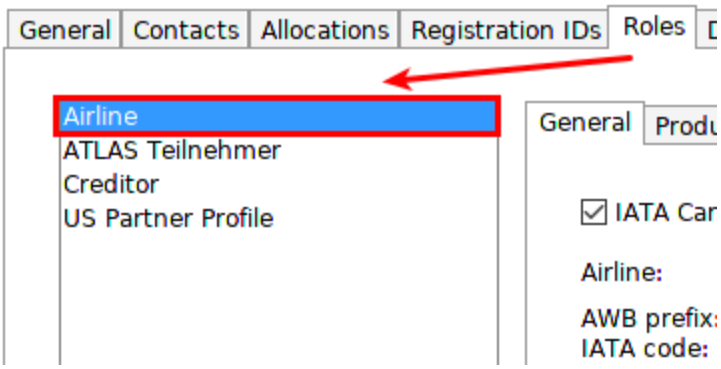
In this new partner use the local address and contact details for the airline you need to create.

Next click on the "Roles" tab of this new partner:



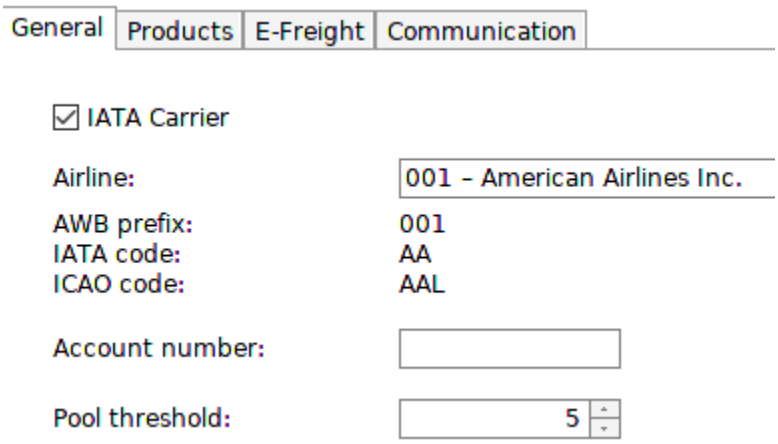
In the "Roles" tab, add the role "Airline"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



On the "General" tab of the airline role, complete the following details:

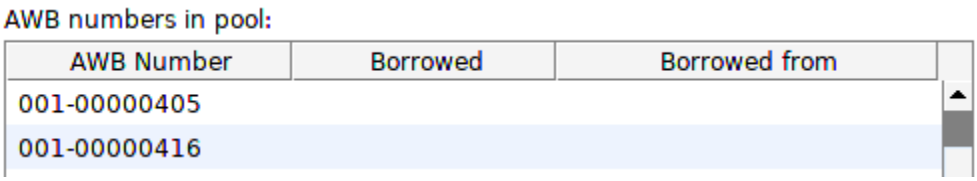
1. If the airline is an IATA carrier, check the box "IATA Carrier"
2. In the box "Airline", type in the 3 digit AWB prefix or the airline name and select the correct airline from the list
3. Add an account number for the airline if you have one
4. Use the "Pool threshold" field to indicate how many AWB should remain in the AWB pool before you are warned that you need to apply to the airline for a new stock of AWBs



Creating a pool of AWB numbers

If the airline has issued you a block of AWB numbers, you can store these in Scope.

On the "General" tab of the role "Airline", you will see in the lower section of the screen a window "AWB numbers in pool:"

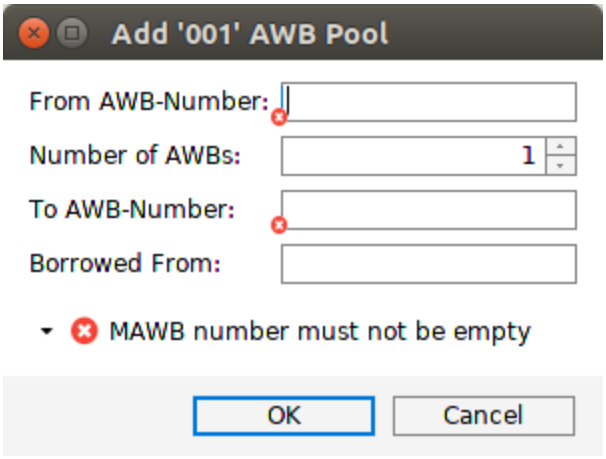


At the bottom of this window you will have an "Add.." and "Remove..." option. Click "Add..."

A window will open where you can enter:

1. The starting AWB number
2. The total number of AWBs issued to you by the airline
3. The last AWB number (you can use either the number of AWBs or the last AWB number to fill the pool)
4. If the AWB is borrowed from another branch or agent, you can indicate who is is borrowed from
5. Click OK and the pool will automatically fill.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Once a pool of AWB numbers is stored, when creating a shipment, only the first 3 digits of the awb need to be entered in the AWB field and Scope will automatically pull the next available AWB number from the AWB pool

FAQ How does the automated exchange rate import work in Mexico

- Introduction
- Description

Introduction

In Scope you have the option to transfer exchange rates of the currencies USD, EUR, CAD, JPY and GBP from the bank of Mexico automatically each day when activated.

Description

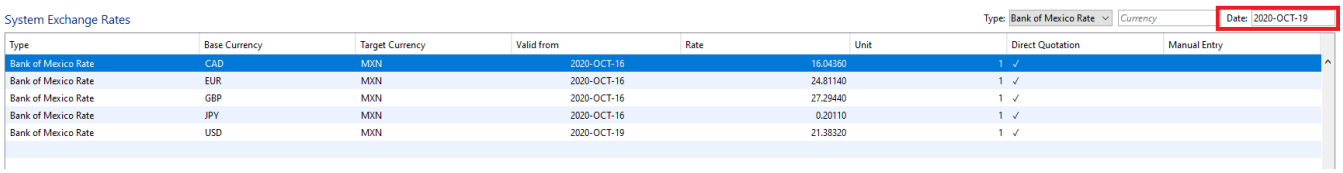
You can choose, for which the following exchange rates the BoM exchange rate should be used and updated automatically on a daily basis:

- Day rate
- Buying rate
- Selling rate
- Bank of Selling Rate

Hence you can choose the exchange rate types, you can not choose the currencies: once activated, Scope will upload the corresponding rate of all available currencies from the Bank of Mexico at 02:00 am (CST) daily, if available.

Please also be aware, that the Bank of Mexico officially only publishes the latest rate they have for each of these currencies: some state the rates for today, some for tomorrow depending on the currency: eg EUR and GBP rates will always be published for the same day (= today's rate) on weekdays, whereas USD rates will be published for the next day (= tomorrow's rate) by BoM.

So after using the download action, you might have to change field "Date" in order to see all downloaded rates via Master data Finance System Exchange rates:



Type	Base Currency	Target Currency	Valid from	Rate	Unit	Direct Quotation	Manual Entry
Bank of Mexico Rate	CAD	MXN	2020-OCT-16	16.04360	1	✓	
Bank of Mexico Rate	EUR	MXN	2020-OCT-16	24.81140	1	✓	
Bank of Mexico Rate	GBP	MXN	2020-OCT-16	27.29440	1	✓	
Bank of Mexico Rate	JPY	MXN	2020-OCT-16	0.20110	1	✓	
Bank of Mexico Rate	USD	MXN	2020-OCT-19	21.38320	1	✓	

Sometimes the exchange rates will not be available at 02:00 am (CST) by the Bank of Mexico. In those cases you have to manually maintain rates in the system via Master data Finance Exchange rates for the day or wait for the next day to be uploaded for the new day.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How fields Customer and Invoice Recipient are defaulted

- Introduction
- Description
  - Export-Shipments
    - Default "Customer"
    - Default "Invoice recipient"
    - Evaluation of "Tariff to" in Activity types:
    - Evaluation of "Tariff to" for Selling tariffs (= income):
  - Import-Shipments
    - Default "Customer"
    - Default "Invoice recipient":
    - Evaluation of "Tariff to" in activity types:
    - Evaluation of "Tariff to" in Tariffs:

Introduction

The customer is the orderer of the shipment, regardless of incoterms and movement. The purpose of the field is to default activity types, tariffs and invoice recipient depending on its value.

Description

Depending on the shipment type (Export or Import) + Incoterm + Movement the fields "customer" and "Invoice recipient" for accounts receivables are defaulted, as well as charges maintained in activity types and tariffs. For that, each order/shipment is divided into the following segments:

Pre-Carriage

All order types with charges, which can be maintained in Activity types, until segment "Main Carriage" are included:

- Pick up
- Delivery to Export Gateway
- Security Measure
- Export Handling
- Export Customs
- Delivery to Terminal

Main Carriage

The main carriage consists of the following order types:

- Main Carriage Air
- Main Carriage Sea
- Main Carriage Road

On-Carriage

All order types with charges, which can be maintained in Activity types, from segment "Main Carriage" on are included:

- Pick from Terminal
- Import Customs
- Import Handling
- Import Warehouse
- Delivery to Import Branch
- Delivery

Export-Shipments

Customer, Invoice receiver and "tariff to"

The focus is on the main carriage for export shipments, which was brought by the customer.

In Tariff maintenance and in Activity types there is an option to maintain the "customer" and "Tariff to", to depend on the default for shipper or consignee. Scope is taken those entries into account in the following order:

1.) If an entry exists with a matching customer and "Tariff to" partner value

2.) If an entry exists with a matching customer and no "Tariff to" partner entry

3.) A general match without customer and "Tariff to" entry

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Example:

> *Airfreight Export - House shipment with Incoterm CC (= EXW): Scope defaults the customer field to the import agent as he is responsible to collect the money from the consignee. The system will check for the collect charges whether an activity type and tariffs are matching for customer (= Import agent) AND "Tariff to" partner (= Consignee). If not existing, the system will check, if an activity type is maintained for the customer (= Import agent) AND no "Tariff to" partner (= must be blank). If not, then the general activity type (no entry in customer AND tariff to) is taken into account.*
>
> *An activity type maintained for the "consignee" is not taken into account, unless the consignee is maintained as a customer in the shipment entry as well as in the activty type maintenance and Tariffs.*

Default "Customer"

Export shipment type	Incoterm	Default Customer
House	PP	Shipper
House	CC	Import-Agent • Exception: if the flag "Uses as orderer in collect shipments" in role "Forwarding customer" of the consignee partner is marked Customer will default to the Consignee partner then
House	CP	Import-Agent • Exception: for incoterm "DAF (CP)" the customer is defaulted to the shipper partner
Direct	PP	Shipper
Direct	CC	• Import-Agent (if field "Import Agent" is maintained in the shipment and its value does not equal the consignee partner) • Consignee (if field "Import Agent" is not maintained or if the flag "Uses as orderer in collect shipments" in role "Forwarding customer" of the consignee partner is marked)
Master	--	There is no field "Customer"

Default "Invoice recipient"

Incoterm Freight	Incoterm due Agent Charges	Invoice recipient for Pre-Carriage charges	Invoice recipient for Main carriage	Invoice recipient for On-carriage (only for Incoterms DAP/DDU/DDP)
Prepaid	Prepaid	Customer Exception: if the customer equals Import agent, then the shipper partner is defaulted	Customer	For incoterm DDU = customer Exception: the customer equals import agent, then the shipper partner is defaulted
Prepaid	Collect	-- Only theoretically as no incoterm like this exists	--	--
Collect	Prepaid	Shipper	Import Agent	--
Collect	Collect	Import Agent	Import Agent	--

Evaluation of "Tariff to" in Activity types:

Note: if the value of field "tariff to" equals the customer, the "tariff to" is not taken into account in this case, so that only value of the customer partner is considered:

Incoterm Freight	Tariff to

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

P	Shipper
C	Consignee

Evaluation of "Tariff to" for Selling tariffs (= income):

Note: if the value of field "tariff to" equals the customer, the "tariff to" is not taken into account in this case, so that only value of the customer partner is considered:

Incoterm Freight	Incoterm due Agent Charges	Pre-Carriage	Main Carriage	On-Carriage (only for incoterms DAP/DDU/DDP with movement (X to door)
Prepaid	Prepaid	Shipper	Shipper	Shipper
Prepaid	Collect Only theoretically as no incoterm like this exists	Consignee	Shipper	--
Collect	Prepaid	Shipper	Consignee	--
Collect	Collect	Consignee	Consignee	--

Import-Shipments

The focus is on the on-carriage for import shipments as the main carriage is already done by export.

Default "Customer"

The **consignee partner** defaults to field "Customer", except for the following cases:

Incoterm	Movement	Default customer
• CIF • CPT • CIP • DES • DEQ • DDU • DDP • DAP • DAT	x to Door	Export Agent
• CIF • CPT • CIP • DES • DEQ • DDU • DDP • DAP • DAT	x to Port	Consignee
• EXW • FCA • FAS • FOB • CFR • DAF	does not matter	Consignee

Default "Invoice recipient":

Incoterm Freight	Incoterm due Agent Charges	Invoice recipient - Pre-carriage (only for movement "From door to x")	Invoice recipient - Main carriage	Invoice recipient - On-carriage

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Prepaid	Prepaid	--	--	Customer Exception: **Export agent** for incoterms DDU, DAP or DDP with movement "X to door" (as the seller is taken care of the costs according to those incoterms)
Prepaid	Collect	--	--	Customer
Collect	Prepaid	--	Customer	Customer
Collect	Collect	Customer	Customer	Customer

Evaluation of "Tariff to" in activity types:

Note: if the value of field "tariff to" equals the customer, the "tariff to" is not taken into account in this case, so that only value of the customer partner is considered:

Incoterm Freight	Movement	Tariff to
P	x to door	Shipper
P	x to Port	Consignee
C	x to door	Consignee
C	x to Port	Consignee

Evaluation of "Tariff to" in Tariffs:

Note: if the value of field "tariff to" equals the customer, the "tariff to" is not taken into account in this case, so that only value of the customer partner is considered:

Selling (= Income)/ Buying (= Costs)	Incoterm Freight	Movement	Tariff to
Buying	P	x to door	Shipper
Buying	P	x to Port	Consignee
Buying	C	x to door	Consignee
Buying	C	x to Port	Consignee
Selling	P	x to door	Consignee Exception: **Shipper** for incoterms DDU, DAP or DDP for on-carriage

FAQ How-to activate transfer of payments from Quickbooks to Scope

- How to activate the feature for QuickBooks Online customers
  - Accounting Settings
  - Payment Module Settings
- How it works

How to activate the feature for QuickBooks Online customers

Accounting Settings

To activate this feature for an existing QuickBooks Online customer, the Payment module itself should be activated first.
So go to *Finance->Payment->Maintenance->Settings* and activate the Payments module for the legal entity.
Make sure to select "QuickBooks Online" as "Interface format".

Using the *Maintenance->Init* action to add Payments for invoices that were already printed can be done, but with a *BUT*.
Right now we will *NOT* be able to get Payments from QuickBooks Online back to Scope when the 'lastUpdateTime' in QBO is older than **30 days**.
So when using the *Init* action in Scope, this has to be taken into account, and a proper threshold date should be selected.
Otherwise there will be many entries for invoices that will not be closed by the payments synchronization.

After the Payment module has been activated, go to *Settings->Finance->Accounting*.
There should be a new action link *Link Payment Types with QuickBooks Online*.
This can be used to link QBO's payment methods with the corresponding payment type values available in Scope.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When that has been done, use *Edit Accounting System Settings*, select the "QuickBooks Online" entry, then switch to the new "Payments Synchronization" tab.
There you can activate (or deactivate, if it is already activated) the synchronization of payments between QBO and Scope.

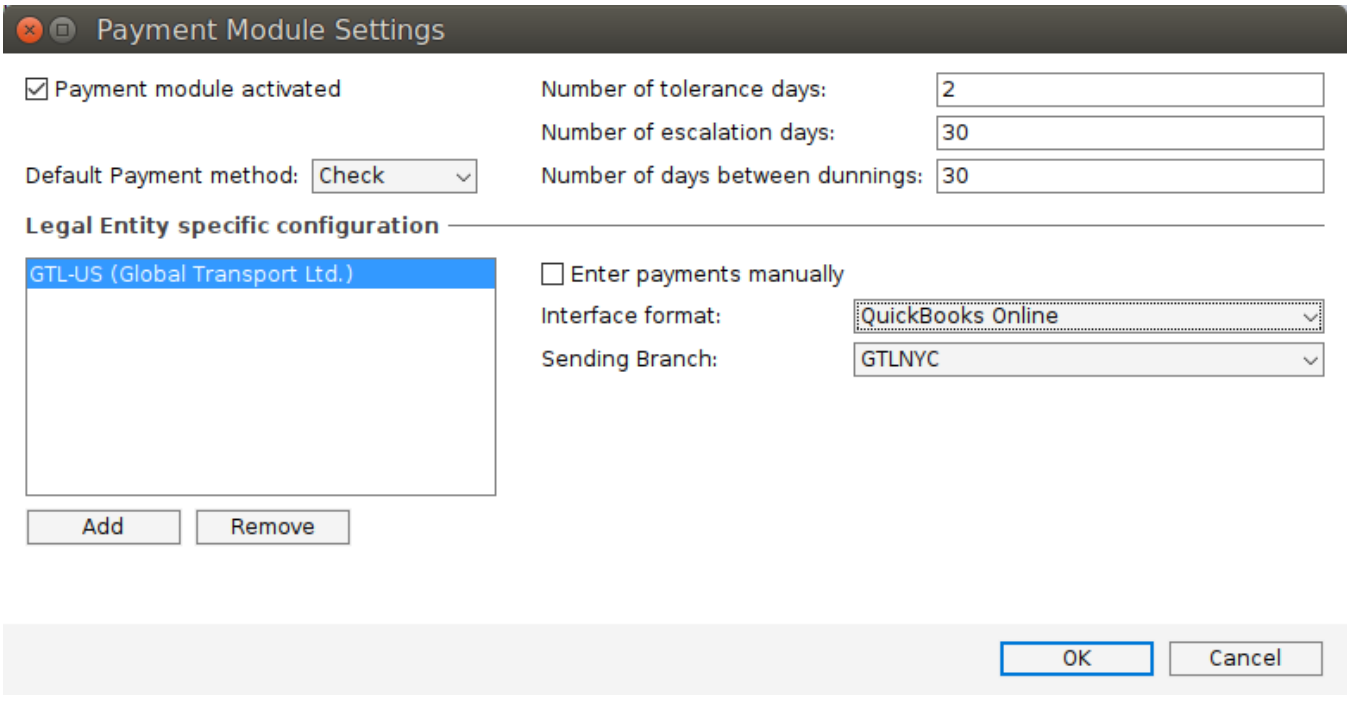
When doing so, you will need to specify the timpoint since when payments should be imported into Scope.
That timepoint will in the end be used by QBO to compared it against the 'lastUpdateTime' values of its Payments and BillPayments.
As a basic rule, the timepoint entered here should match the date chosen when an *Init* was performed in Scope's payment module.
If no *Init* was performed, the timepoint can just be left as its initial value.

After that, close the dialog with "OK" to store. (Duh!)

Payment Module Settings

Once the accounting settings are complete, enter the payment module details

- From the Scope menu select "Finance" "Payments (Invoices)"
- In "Payments(Invoices)" select "Maintenance" "Settings" from the toolbar
- Make sure the "Payment module activated" checkbox is active
- Choose the default payment method and the days allowed for "Tolerance", "Escalation" and days between dunnings
- Make sure the correct legal entity is selected
- "Enter payments manually" must be empty, this is only active if corrections need to be made to payments"
- Choose the correct format - Quickbooks Desktop or Quickbooks Online
- Choose the branch that send the payments.



How it works

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Scope will call QuickBooks Online's "Change-Data-Query" endpoint every 15 minutes (this is fix and cannot be changed right now), and will ask for all Payment and BillPayment that changed since the last call.
Scope will remember the time of the last call by storing the timepoint in its settings; you can view that timepoint in the same tab where you activated the synchronization.

The XML returned by the API is automatically imported via the usual way.
An entry for each payment import done this way can thus be found in the *Finance->Payments Import Protocol* appliance.

Scope will only be able to link received payments to the correct invoices in Scope if Scope initially sent that invoice to QuickBooks Online.
Otherwise Scope will not have the required 'TxnID' for the invoice to appropriately link payments to it.
(In the XML, all linked invoices for each payment are referenced by their 'TxnID'.)

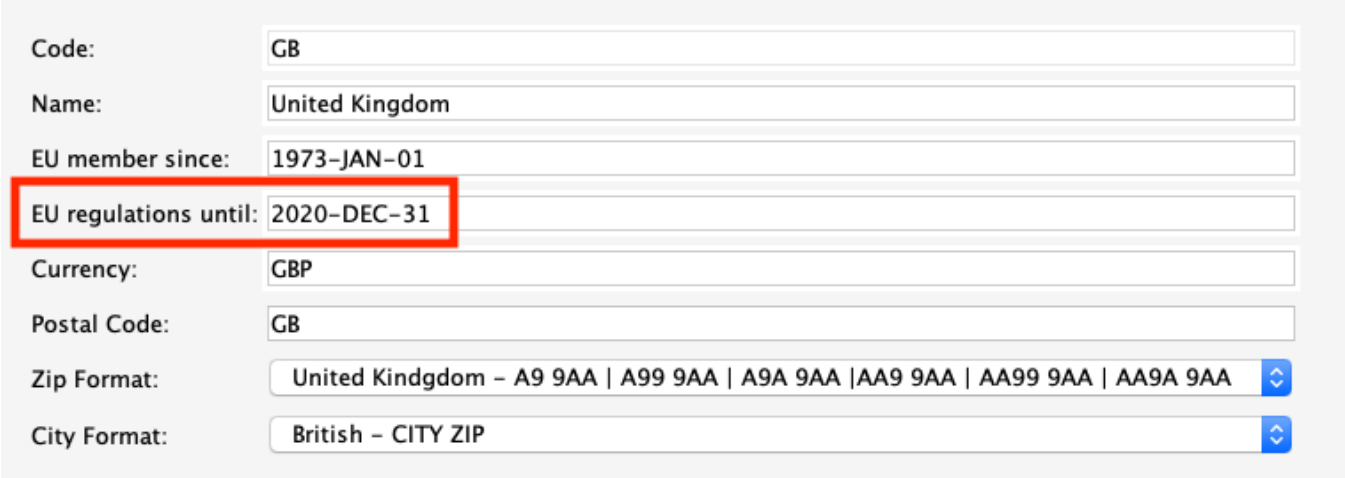
FAQ How-to Brexit Invoicing Changes for EU entities as of 2020-JAN-01

After Great Britain left the EU (Brexit) on January 31st 2020, the transition period ended on December 31st 2020. New regulations have been negotiated between Great Britain and the EU that are valid from January 1st 2021.

This How-to informs you on the most important changes in the **invoicing process** of Scope dealing with Brexit and the transition period ending.

Country Master Data

The Riege Team took care to maintain the special field in the country maintenance of Great Britain (GB) the defines when the transition period has ended.



Please note that this field has been updated automatically for all Scope systems before December 31st 2020.

VAT ID

VAT IDs for Great Britain are formatted with the prefix 'GB'. These IDs will still be maintainable in the partner master data of Scope, as they are still needed to correctly invoice services that have been supplied **before** December 31st 2020.

Please note that the EU-VAT-ID validation check in Scope for VAT-IDs from Great Britain will be deactivated from January 1st 2021 onwards – as we cannot ensure it will be properly working in relation to the Scope connection to VIES: FAQ How-to check EU-VAT-ID validation

The newly added VAT-ID prefix 'XI' has been introduced by the EU for trading of goods with Northern Ireland.

> However, the new prefix 'XI' is currently **not** supported by Scope as most of the time **services** are being invoiced, not **goods**.

Invoicing

Scope invoicing is based on an internal logic which decides the taxability of a service based on different settings:

- The invoice issuer
- The invoice recipient
- The type of service
- The economic date of the service

As the transition period for Brexit has ended on December 31st 2020, all services from an EU entity (for example Germany) to a company based in Great Britain will be taxed in the same way as a service to a non-EU entity like Switzerland, China or the United States.

This means that the services billed to invoice recipients in Great Britain will no longer be billed taxable with the tax reason code 'Reverse Charge EU' but will be billed taxfree service with reason code '3C – Third Country'.

> **Applicable Date for Services**
>
> The relevant date to determine the taxability of a service is the **economic** date of the invoice / corresponding shipment.

Payables

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Payables received in 2021 with an invoice date in 2021 might still refer to services provided in late 2020. Charges for these services need to be registred with the old EU-reason codes ("NT" for taxfree and "RC" for taxable reverse charge). As Scope detrmines the initial economic date of an invoice from the invoice date only the new non-EU-reason codes are available in the header. There are two way to resolve this.

1. You manually change the economic date of the invoice to a date in December 2020. You can then enter the respective taxable and taxfree amounts of the invoice with the correct EU-reason codes upfront.
2. You register your taxable and taxfree amounts irgnoring the displayed non-EU-reason-code. When adding the respective shipments (with economic date in 2020) on a chargeline, Scope will automatically adjust the economic date of the invoice and toggle the non-EU-reason codes used so far to their EU-equivalent.

The outcome is always a correctly registred payable with the correct reason codes applied. Initially available reason codes are based on the assumed economic date. In case a change of the economic date implies a change in the validity of reason codes these are changed throughout the entire payable.

Summary

To summarize the above changes in short:

- Great Britain transition end date 2020-DEC-31 for Brexit has been maintained by the Riege Team in all Scope systems
- GB VAT-IDs are still valid but will no longer be verified against the EU VIES Service
- When invoicing taxable services from an EU entity to an entity in Great Britain, the billing will change from taxable with reason code 'Reverse Charge (EU)' to a taxfree with reason code 'Third Country (3C)' for all services with an economic date 2021-JAN-01 or later

For further reference we have added this declaration by German taxauthorities regarding the UK.

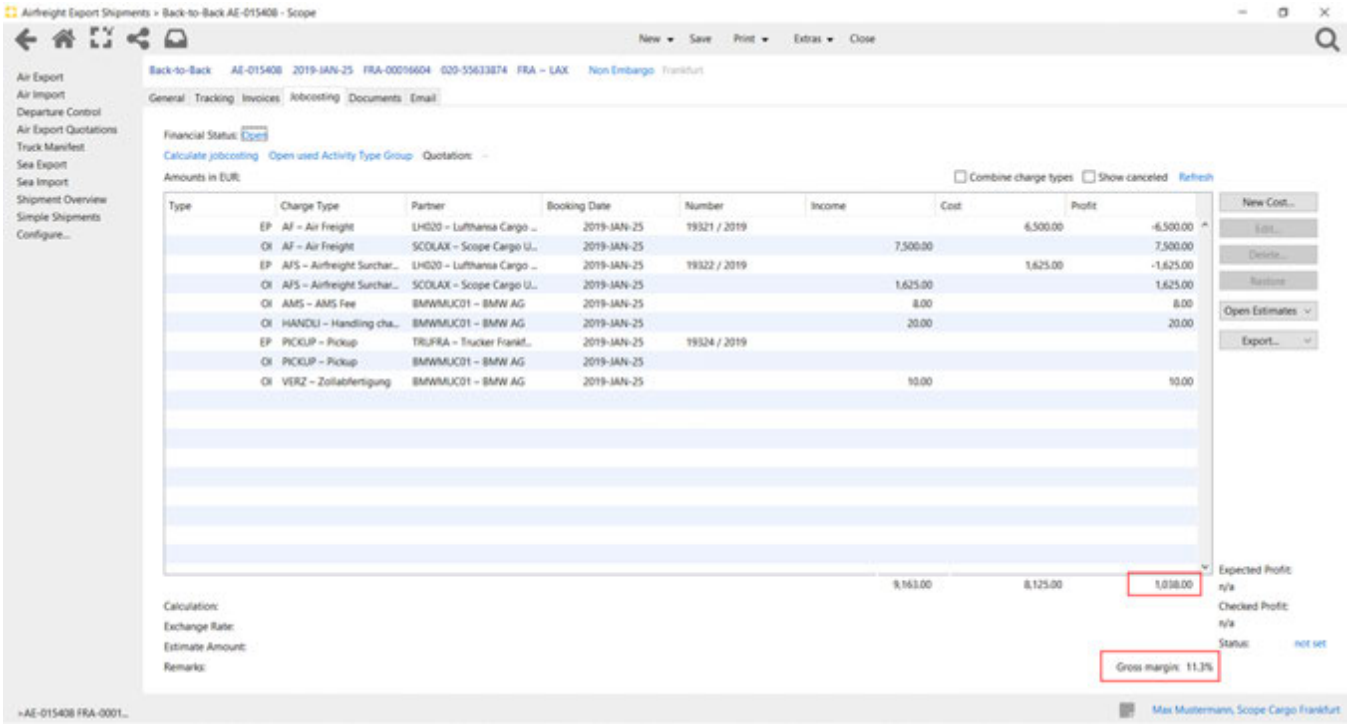
FAQ How-to calculate gross margin at tab Jobcosting

Scope is calculating gross margin as below mentioned:

Profit (without duty + taxes + transit items) Income (without duty + taxes + transit items)	x	100	=	gross margin

example:

1.038,00 9.163,00)	x	100	=	11,33%



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-to check EU-VAT-ID validation

For EU-VAT-ID validation Scope revert to a web-service:

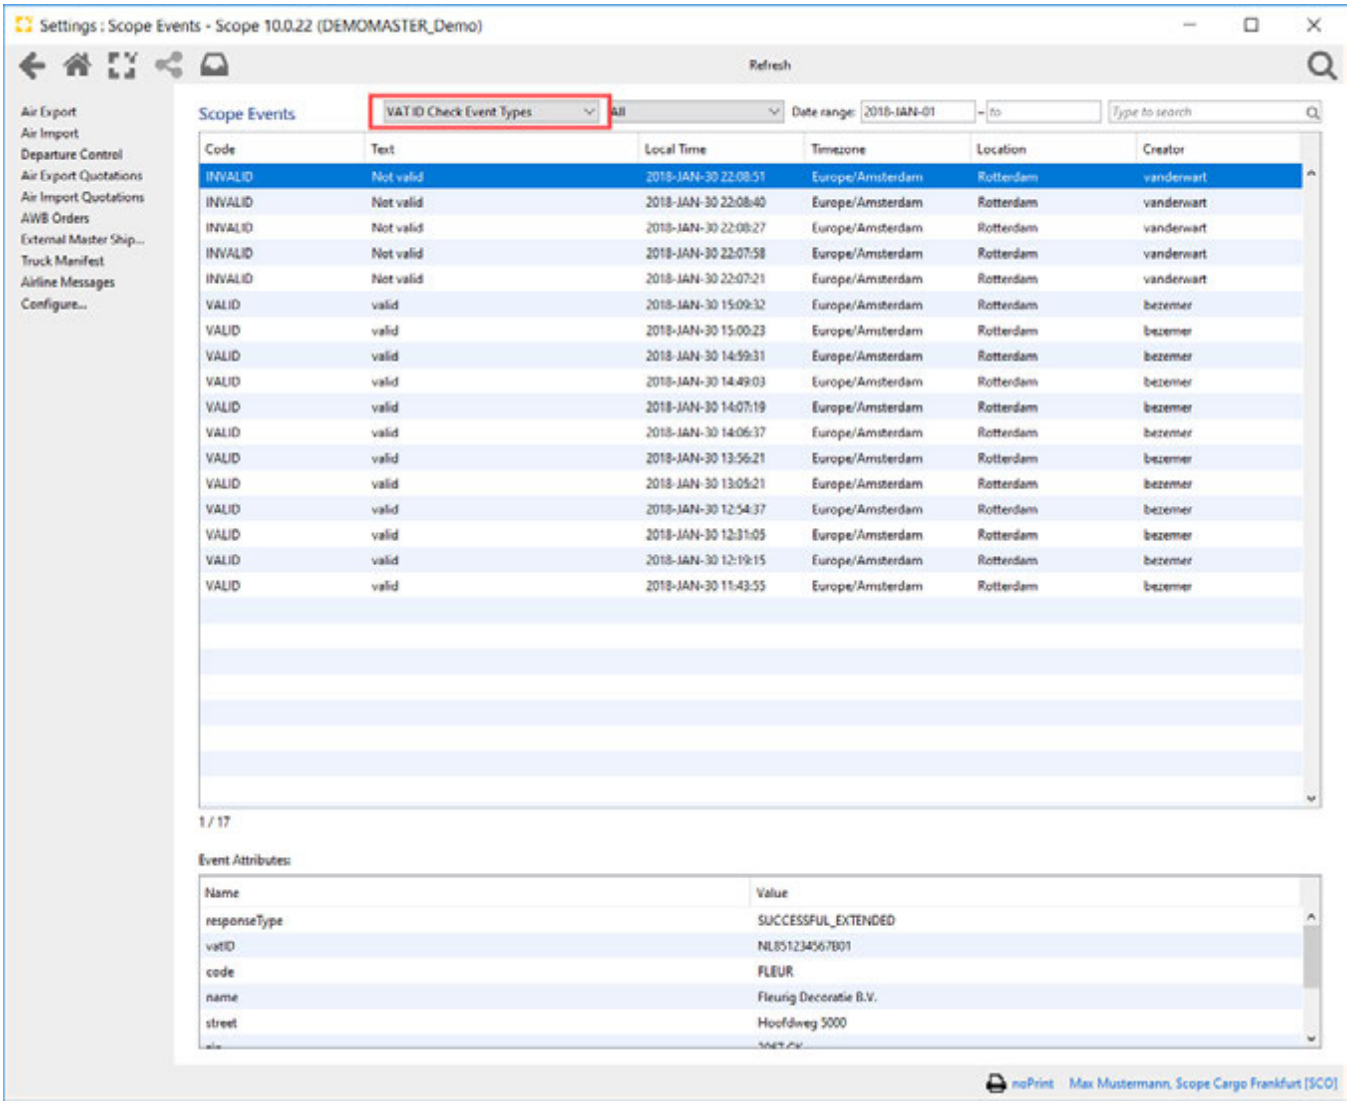
http://ec.europa.eu/taxation_customs/vies/

If this page/service is unavailable, Scope will view a popup "Read time out".

To validate EU-VAT-ID different settings can be done:

- automatic validation of EU-VAT-ID by activating the option "Validation of EU-VAT-ID with every voucher of payments receivable" - please contact Scope Helpdesk to activate this option
- manual validation of EU-VAT-ID (EU-VAT-ID is still valid and no automatic validation at background)

At Scope application (*Settings - Scope Events*) you can create an overview of EU-VAT-ID validation (filter: VAT ID Check Event Types)

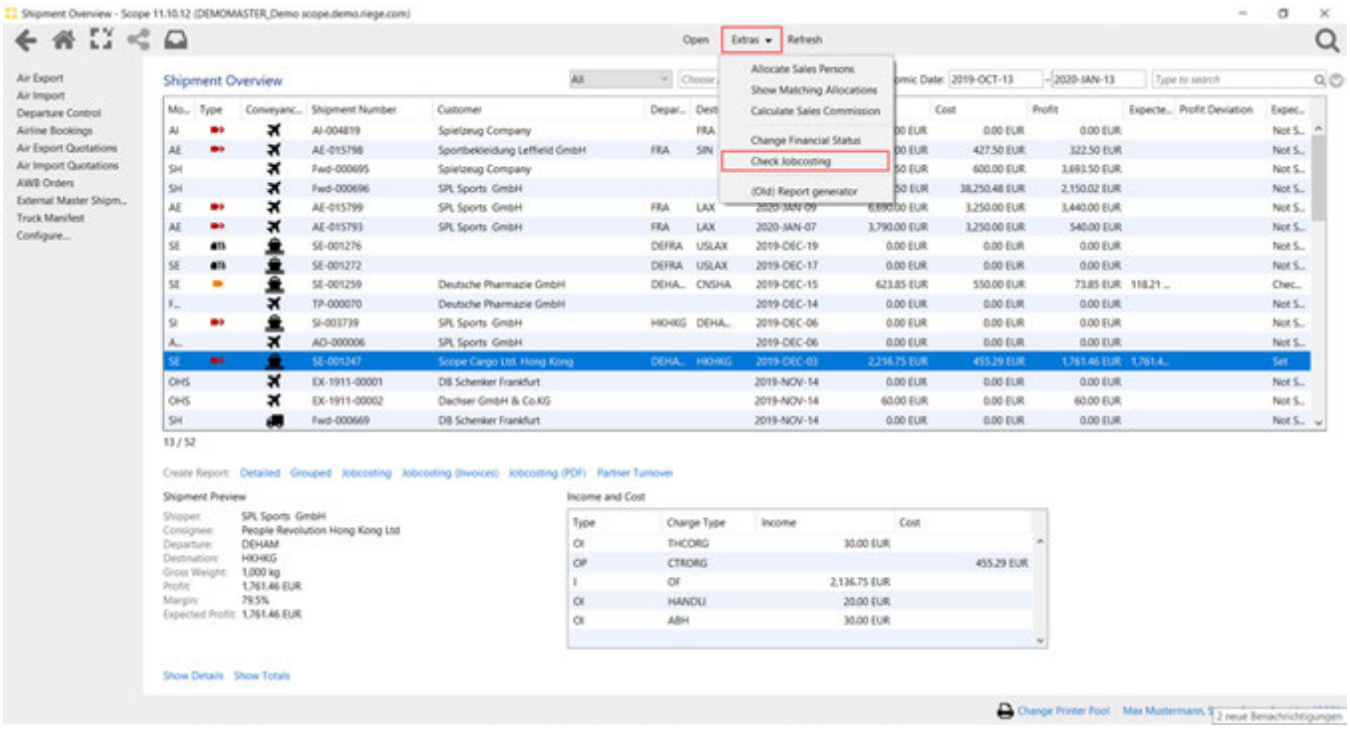


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

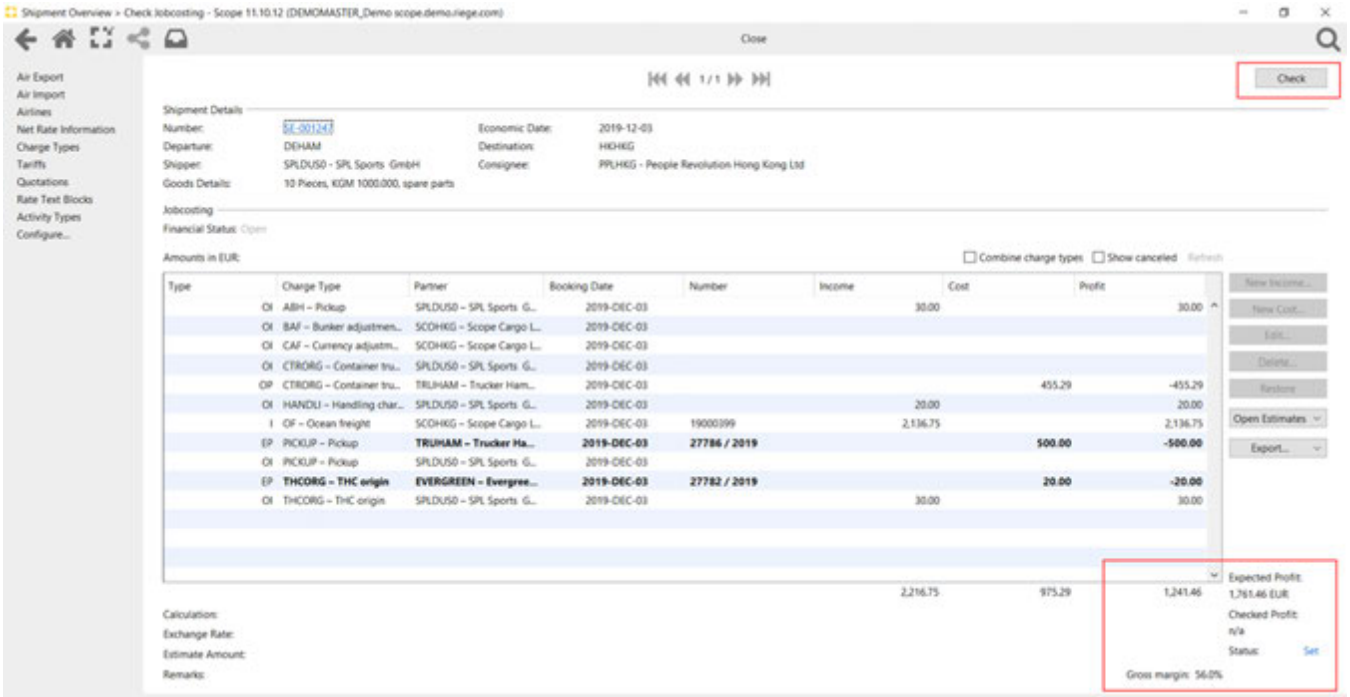
FAQ How-to check expected and actual profit

Scope offers a function to check the jobcosting of each shipment.

Switch to Forwarding - Shipment Overview - Extras - Check Jobcosting.

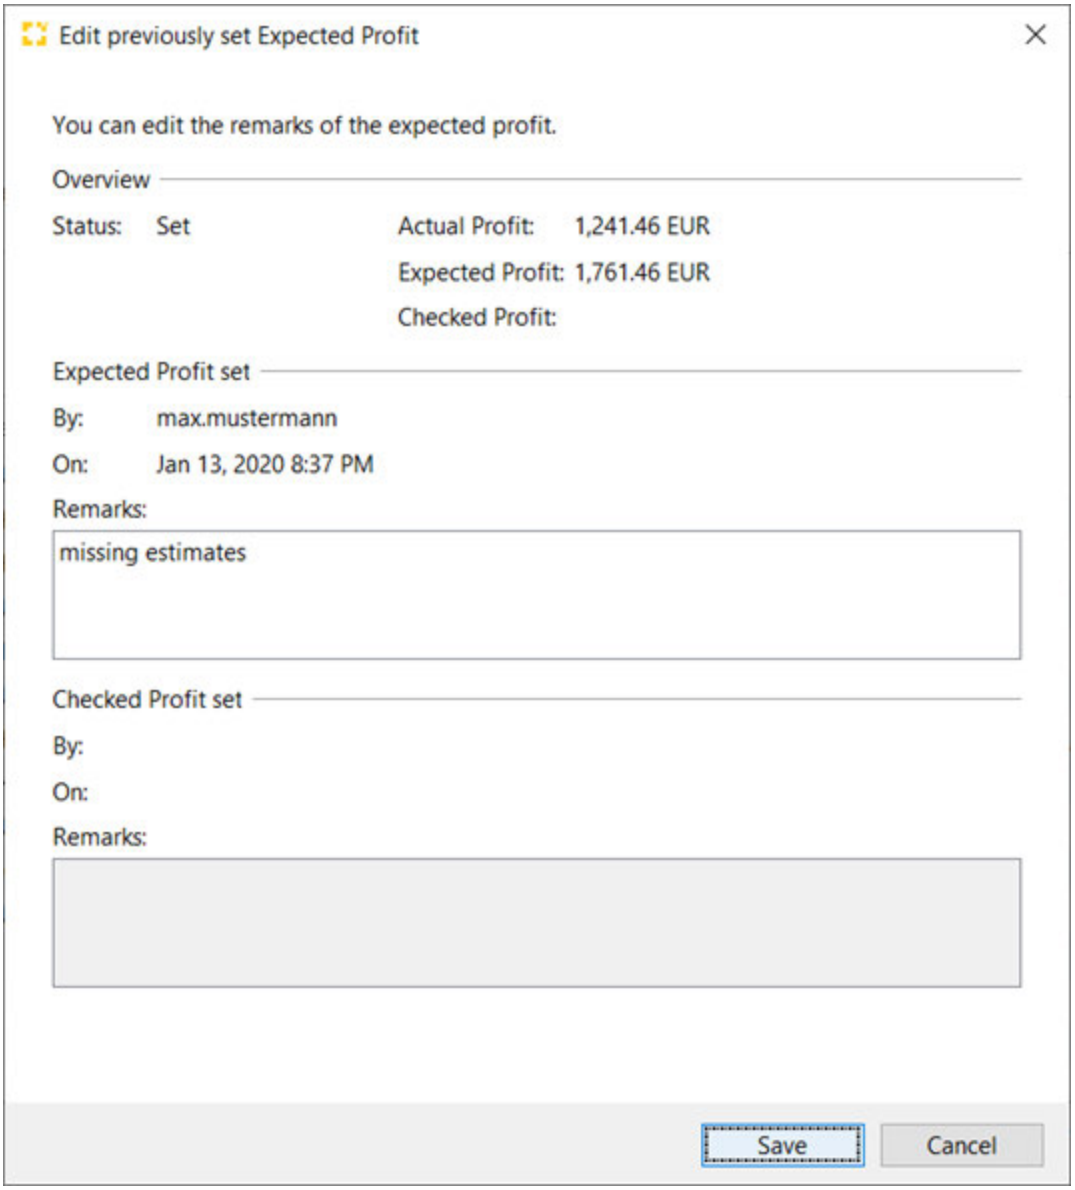


After choosing "Check Jobcosting" a new window opens and you can choose the shipment which have to be checked. At the overview you can see the screen of jobcosting with income, cost, profit, expected and actual profit



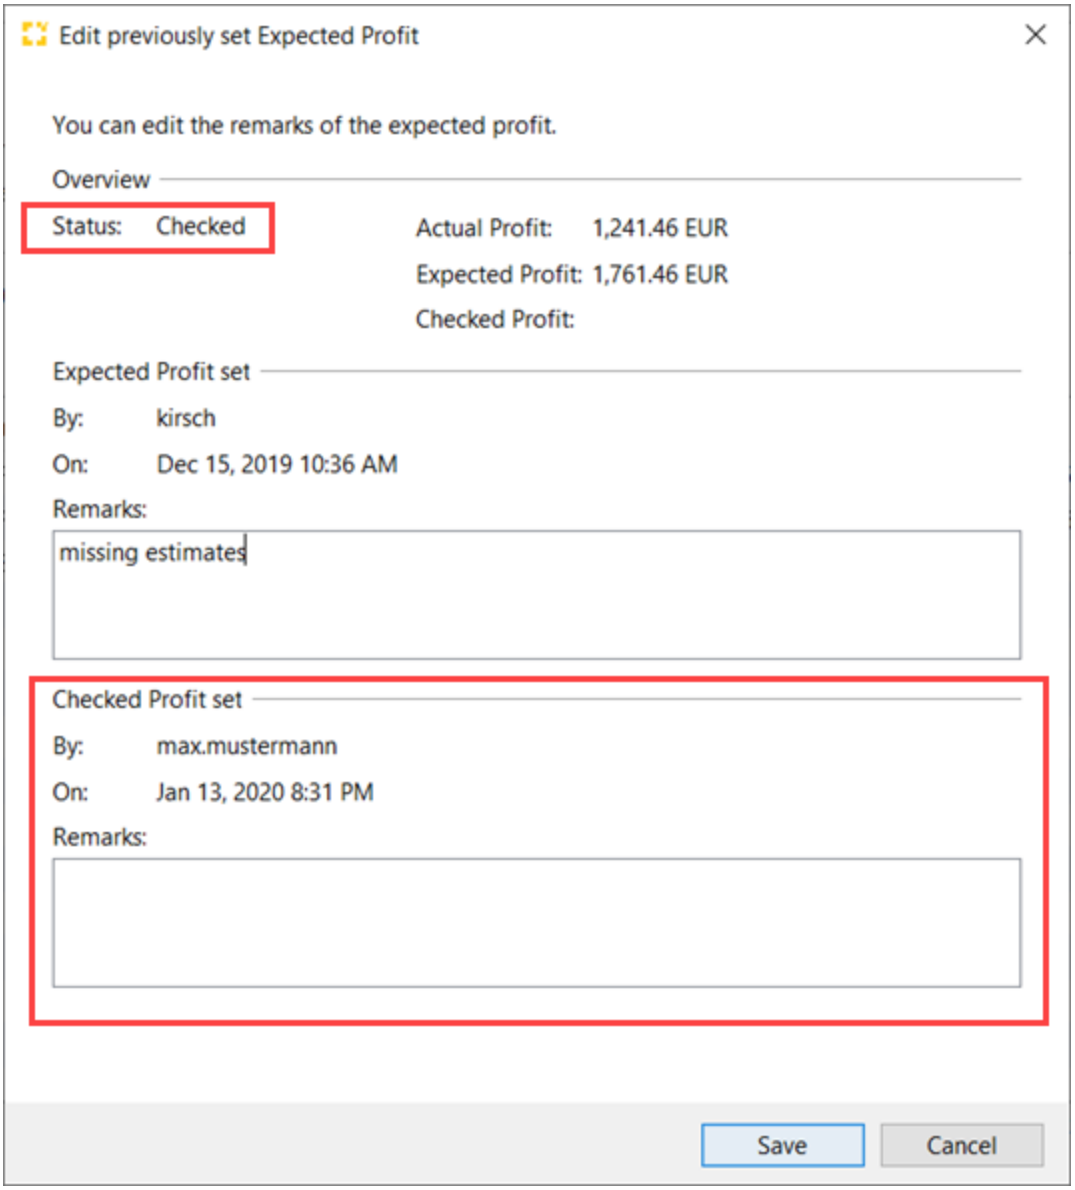
By choosing Status "Set" you can see the remarks of the expeted profit.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



By choosing Button "Check" at Overview Screen you can change status to "Checked"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



note: Setting profit and checking jobcosting cannot be done by the same user!

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To check if an “Estimate” is dissolved completely or if there was a difference between estimates and incoming invoices

Estimates will be dissolved by an incoming invoice, but there can be a difference between the estimates and the incoming invoice. To check the original estimates and the difference amount you can go to application “*Estimates*” (Finance – Estimates)

Choose Status “*Resolved*” and click on “*Report*” above. Additionally you can use different filters as well. At the exported sheet you can see the columm “*am ount*” (of original estimate) and “*charge line amount*” (amount of incoming invoice). If you compare both amounts you can see the difference. By the way you can check other values, like “who has created the estimate? Who has worked on the estimate last?”

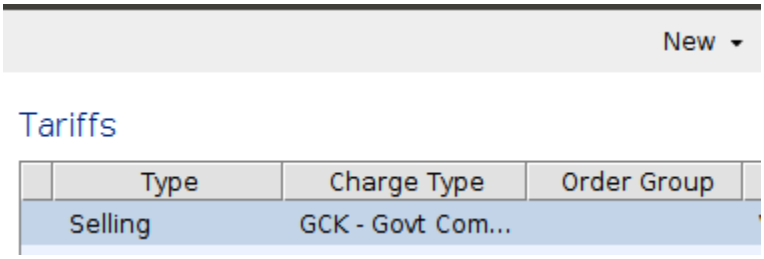
FAQ How-To create a basic tariff

This How-To shows how to navigate to the tariff maintenance and create a simple air import fuel surcharge tariff

Navigating to tariffs

From the Scope button, drop down to "Maintenance". Within "Maintenance" select "Finance" and within "Finance" select "Tariffs.

Making a new tariff



The tariff application will show all existing tariffs. To make a new tariff, select "New" from the menu bar and then select the type of new tariff to be created:

- Selling Tariff
- Buying Tariff
- IATA Rate
- Internal Tariff
- Agent Tariff

Entering the new tariff details

The example below shows a simple air import fuel surcharge tariff

Type: This is automatically set to "Selling"

Charge Type: This is set to "Fuel Surcharge" since the tariff will apply to this charge type

Branch: This is set to the local branch since it does not apply to the forwarders other branch

Evaluation Method: Uses the default "Best Match" since this is the usual method for calculating a tariff.

Order type: Set to "Air Import" because this tariff will only apply to air import shipments

Basis: "Chargeable Weight". Since this is a freight related tariff, the method for calculating such tariffs is to use the chargeable weight of the shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Currency: "USD" which is the local currency

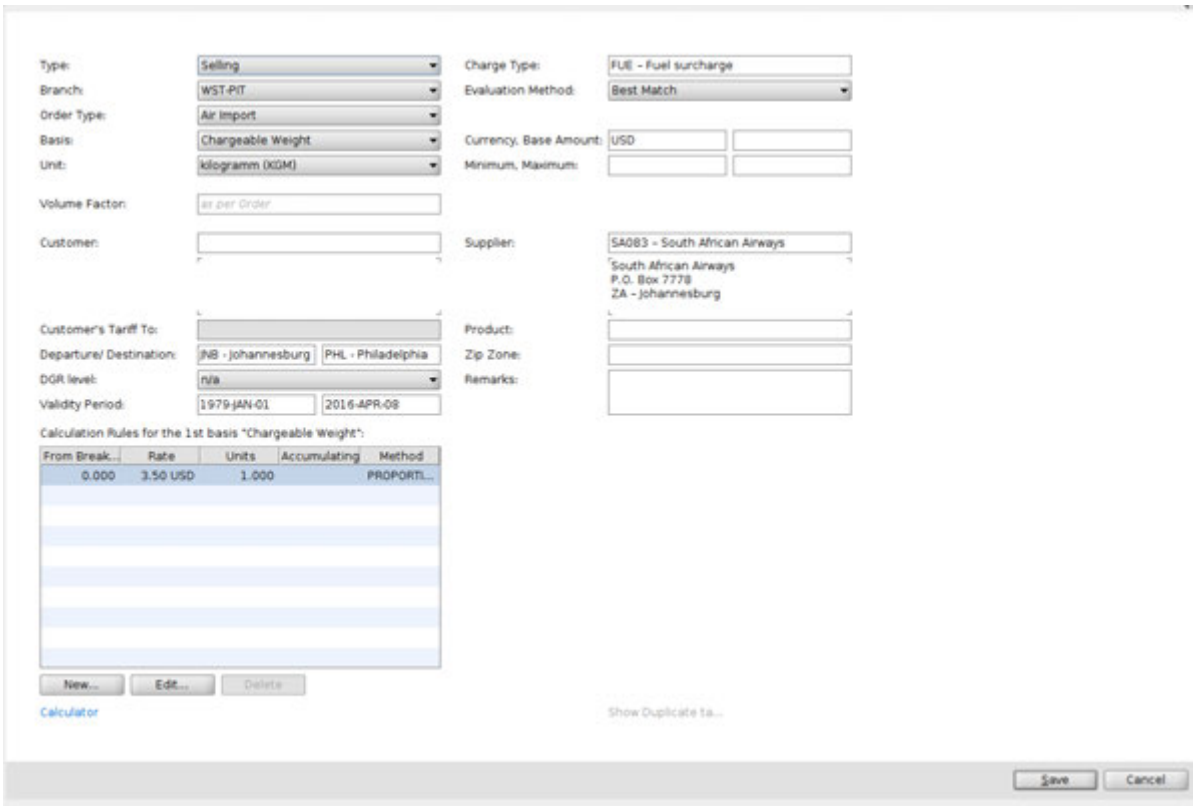
Unit: Use KGs since this is how chargeable weights are calculated in airfreight

Supplier: The airline "South African Airways" is shown as the supplier in order to apply this tariff only to this shipments arriving via this airline.

Departure/Destination: In order to restrict this tariff to a port pairing, the departure airport "JNB" and destination airport "PHL" are entered to restrict this tariff to flights between Johannesburg and Philadelphia

Validity Period: These fields are used to specify the period for which the tariff is active.

Calculation Rules: The tariff calculates $3.50 per Kg (Chargeable weight). Use the "New" button to enter new breakpoints and the "Edit" button to adjust an existing breakpoint.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To delete an „Estimates“, which were not part of a shipment?

Estimates, which were not dissolved by an incoming invoices completely or were not part of a shipment can be deleted on different ways

a) Take the number of the estimates and search for it at „*Estimates-Application*“. Choose the estimate and delete it

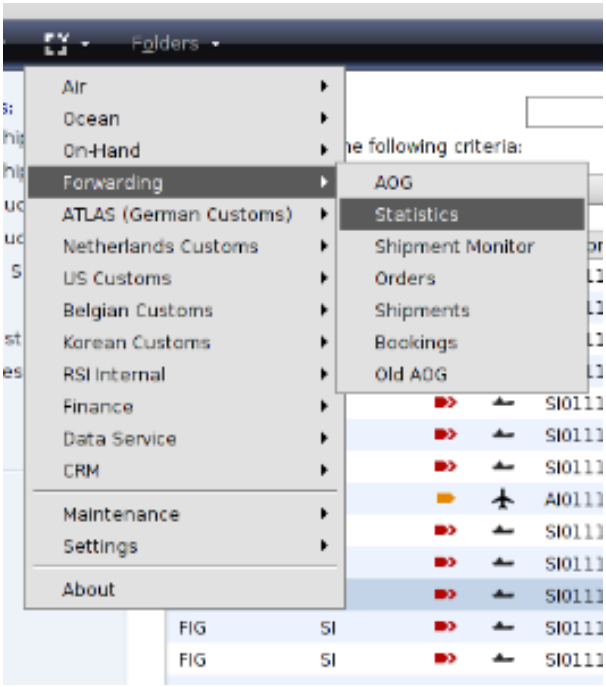
b) You can delete an estimate on the shipment as well. Go to tab Jobcosting, choose the estimate and delete it with button on the right side

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

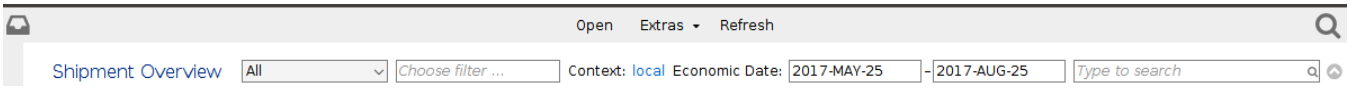
FAQ How-To do job costing by user

Statistics Appliance

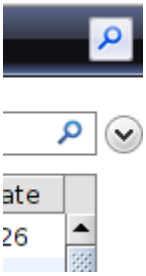
from the menu, select the "Statistics appliance



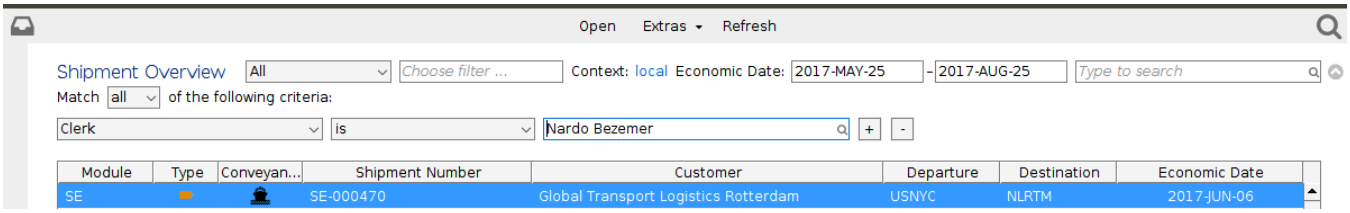
Enter the dates and branches for the report



To the right of the search field, click the down arrow button.



This allows you to apply a filter. Int he example below we choose "Clerk" "is" and the clerks name which can be searched for.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Now from the menu choose "Reports" and pick "Jobcosting". The report will open on the desktop.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To do open shipment, profit and invoice reporting in Scope

- Introduction
- Navigating to Shipment Overview
- Generating reports with Shipment Overview
- Applying filters to the report
- Open shipment reporting
- Changing the column display
- Generating a spreadsheet
- Saving a filter

Introduction

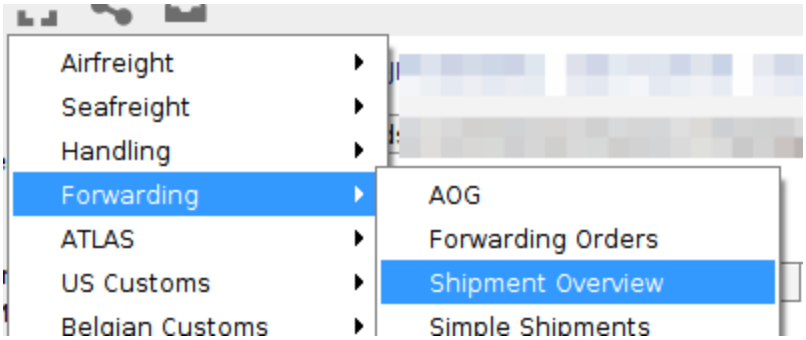
This how-to explains how to check shipments have been invoiced, vendors costs have been accounted for and the profit generated for each shipment.

Navigating to Shipment Overview

The shipment overview is where most shipment reporting can be done including profit reporting.

Navigate to the shipment overview:

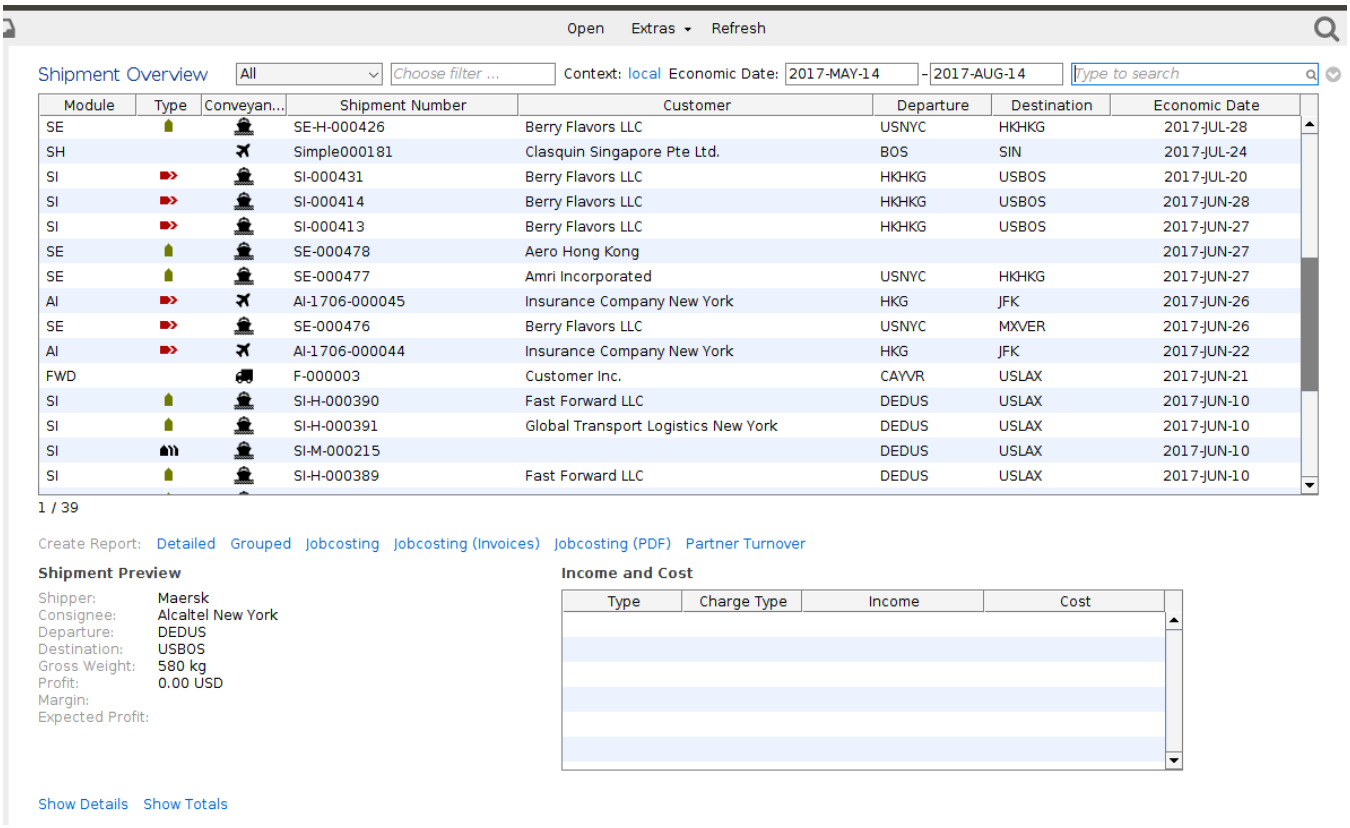
1. From the main Scope menu select "Forwarding"
2. In the "Forwarding" sub-menu, select "Shipment Overview"



Generating reports with Shipment Overview

When the shipment overview opens, it will display all shipments in the last 4 months for all branches that the user has access to:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Applying filters to the report

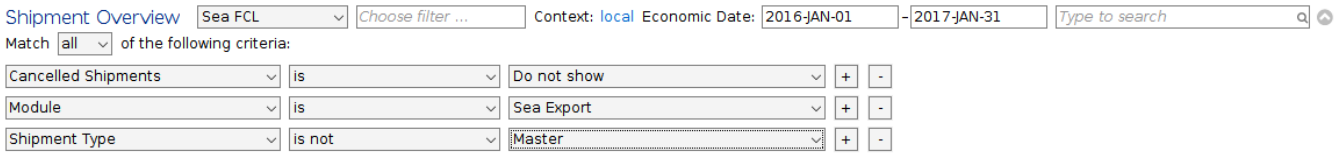
In this example we will do profit reporting for a seafreight export manager in the New York branch:

- First, in the filter options at the top of the report, we change from "All" to "Sea FCL". This restricts the view to only Sea FCL shipments.
- Note that the context is "Local". This means only shipment from the current branch are shown. Click the blue "local" field if you need to include other branches in the report.

- Use the date range fields to select the period for the report

- Use the additional filters button to add more filters to the report

- In the example below, filters have been added:
  - Remove cancelled shipments
  - Show only Sea Export Shipments
  - Don't show master shipments



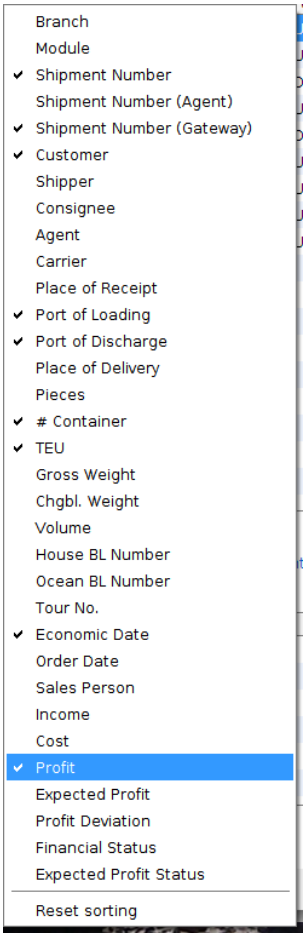
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Open shipment reporting

Open shipments are those whose financial status is still open. This means reveivables still need to be billed for these shipments, or payables are still not fully accounted for. To filter these shipments in the report, simply use the filter shown below which restricts the list of shipments to only those whose financial status is still open.

Changing the column display

Hover the cursor on any of the title cell of any of the columns and right click. A long drop down menu will appear and the desired columns can be added or removed from the on-screen report:



- In the example below, the agent and gateway shipment numbers are removed and "Profit" is added.

Type	Shipment Number	Customer	Port of Loading	Port of Discha...	# Container	TEU	Economic Date	Profit
	SE-000441	Aero Hong Kong	USBOS	HKHKG	1	1	2017-JAN-23	0.00 USD
	SE-000427	Aero Hong Kong	USBOS	HKHKG	2	2	2016-OCT-08	0.00 USD
	SE-000392	Lifeware New York	DEHAM	USNYC	1	2	2016-JAN-26	0.00 USD
	SE-000394	Lifeware Dusseldorf GMBH	USNYC	DEHAM	1	2	2016-JAN-26	0.00 USD
	SE-000408	Lifeware New York	DEHAM	USNYC	1	2	2016-APR-21	0.00 USD
	SE-000393	Lifeware Dusseldorf GMBH	USNYC	DEHAM	1	2	2016-JAN-29	0.00 USD
	SE-000429	Lifeware Dusseldorf GMBH	USNYC	DEHAM	1	1	2016-OCT-13	0.00 USD
	SE-000428	Lifeware Dusseldorf GMBH	USMNH	DEDUS	0	0	2016-OCT-13	0.00 USD
	SE-000420	Syrus Bondini Cargo	USNYC	SGSIN	1	1	2016-JUL-11	0.00 USD

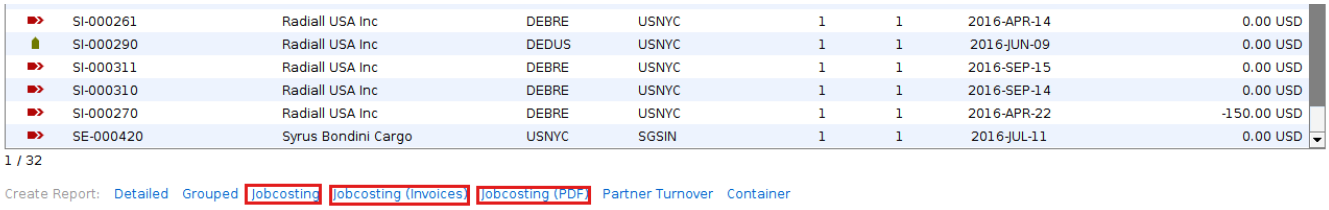
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Generating a spreadsheet

So far, we have described how to get the right results on screen. These results can also be output to a spreadsheet

Below the list of results, there are 3 profit specific reports:

- Jobcosting
- Jobcosting (invoices)
- Jobcosting (PDF)

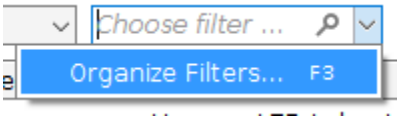


Saving a filter

Above, there are quite a few steps required to arrive at the desired results in the report. If the report needs to be run regularly, these steps can be saved by storing them as a saved filter.

In the field "Choose filter":

Use the drop-down menu to select "Organize Filters"



Now select the desired filters and save them for easy reuse as a saved filter

This how-to provides full details of saving filters: How-To save a filter

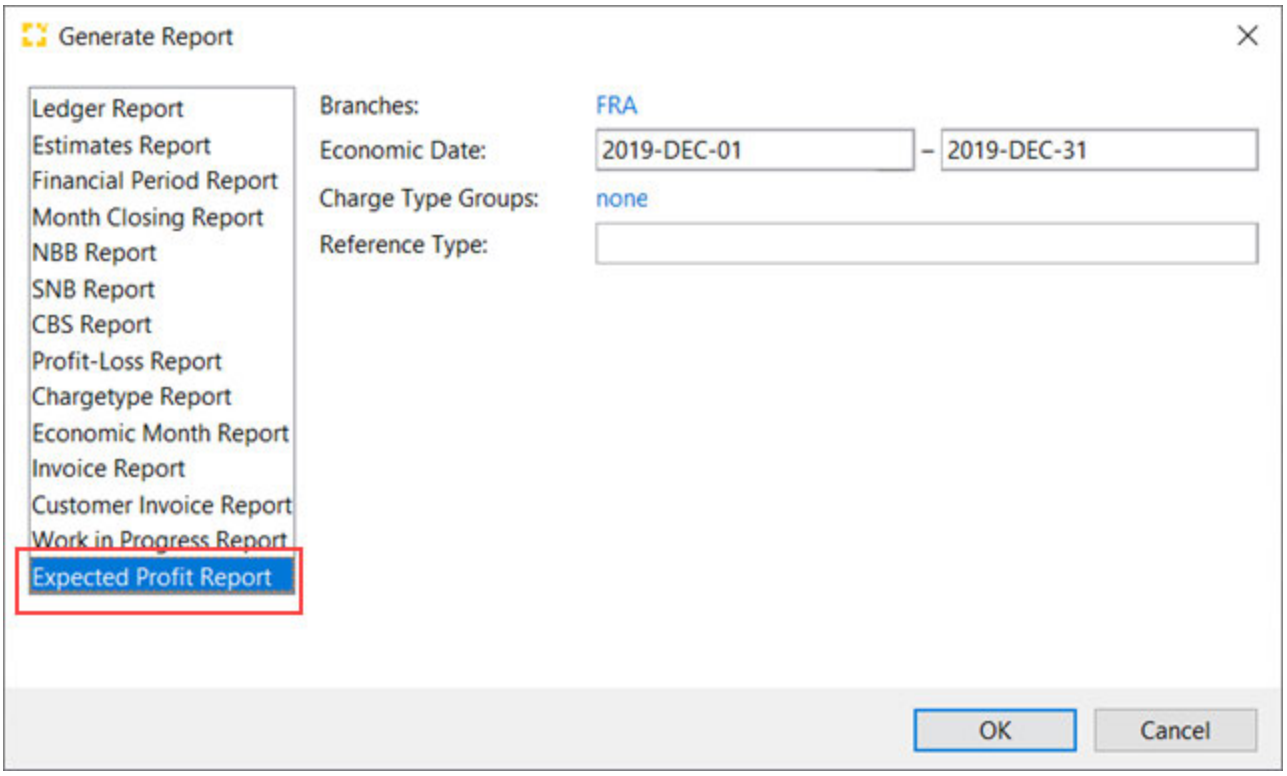
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-to generate an Expected Profit Report

Go to application Finance-Reporting and generate a new report called "Expected Profit Report". You can choose the following data:

- Branches
- Economic Date
- Charge Type Groups
- Reference Type

By confirming the date a report will be generated.



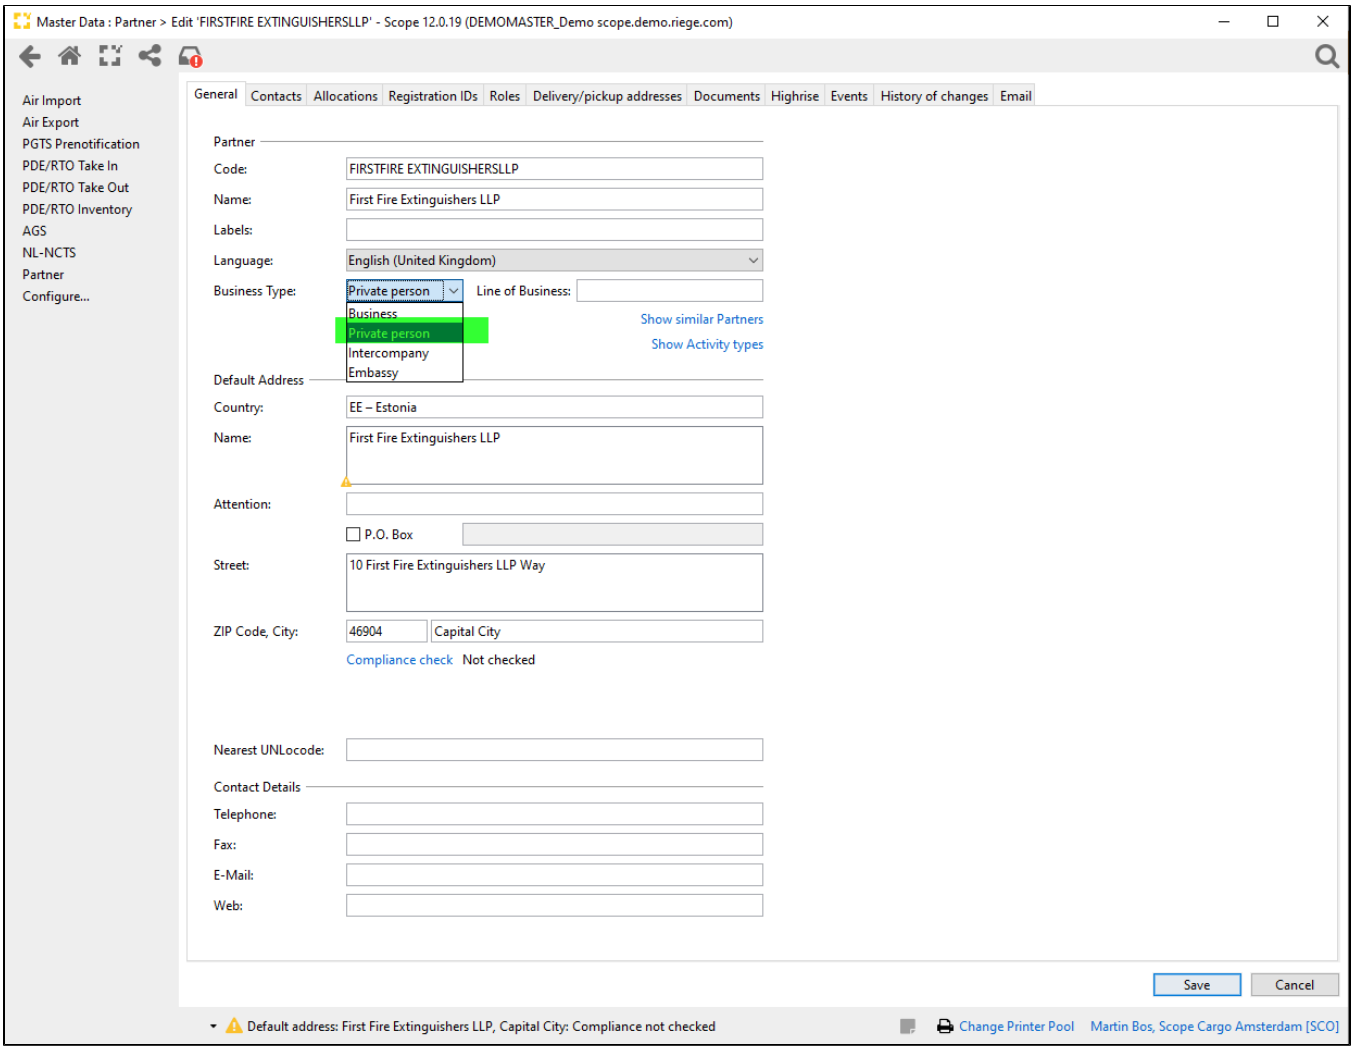
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-to invoice an EU customer without valid VAT number

Some EU customers do not have a valid VAT number or do have a VAT number which is valid for domestic use only.

In Scope you can mark a EU VAT Number as valid for domestic use only, but during invoicing, when the customer is in a different country, it will block the invoicing and give a validation error on the VAT number.

To enable invoicing to such customers you should mark these customers in the Partner table as Private Person and leave the VAT number field empty. This will make that Scope does not print the VAT number on the invoice and VAT is charged and printed.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

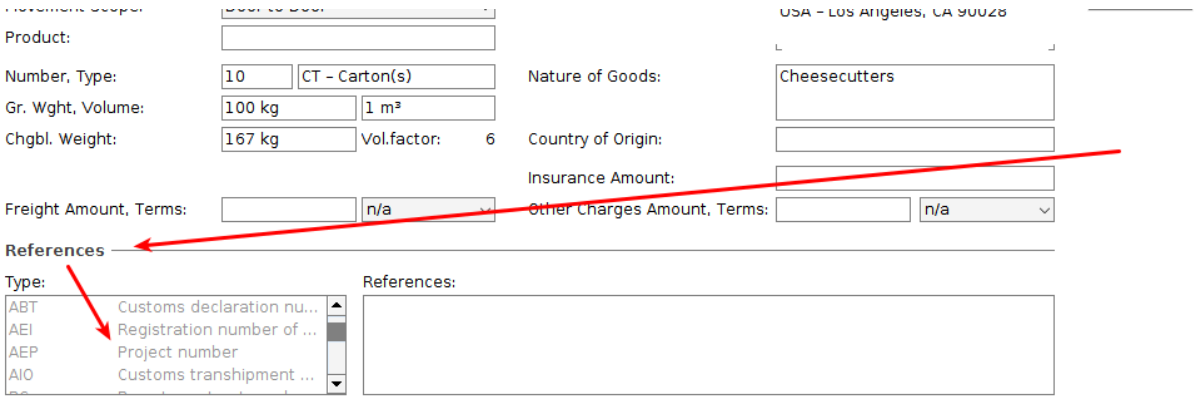
FAQ How-to link project shipments and run project finance reports

Introduction

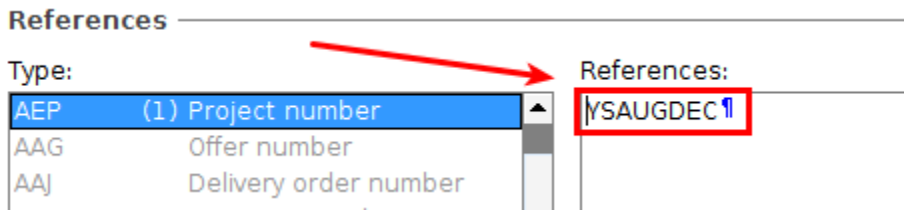
A forwarder might have multiple different shipments which are all part of a single project. These shipments may be of any type; air, sea, import or export. This howto explains how to group them under the same project number and then run finance reports on these shipments.

Adding the Project Number to the Shipment

Once the shipment has been created, go to the "References" at the bottom of the general tab and scroll down the references until you see "AEP Project number"



Now click on "AEP Project number" and in reference field enter the project number to be used for this project. In the example below the project number is going to be "YSAUGDEC"

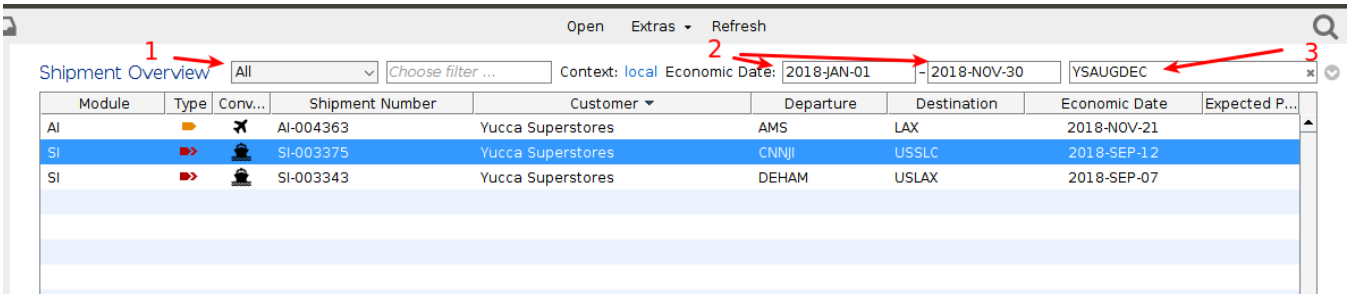


Finding the correct shipments using the project number

From the main menu choose the "Forwarding" option and then choose "Shipment Overview"

The "Shipment Overview" program opens, to filter the correct project shipments:

1. Make sure the correct type of shipments are selected, us "All" if in any doubt.
2. Make sure the date range is wide enough to encompass all the shipments for this project
3. Enter the project number in the search field, in this case it is "YSAUGDEC"

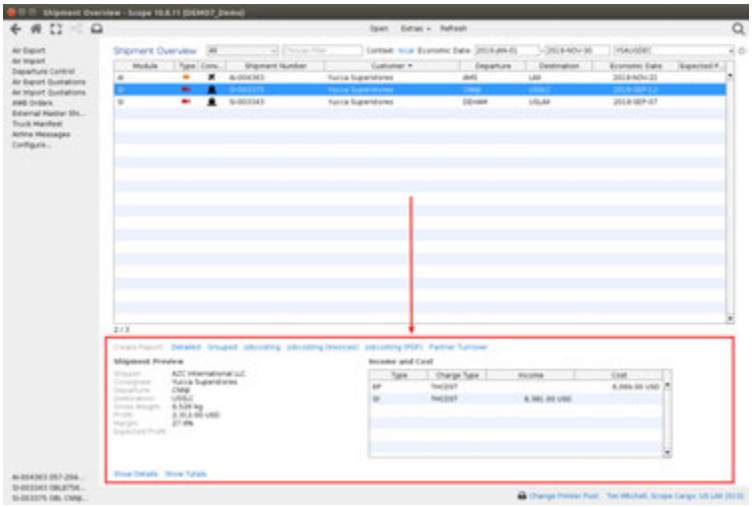


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the example above the search finds 1 air import shipment and 2 sea import shipments for this project number

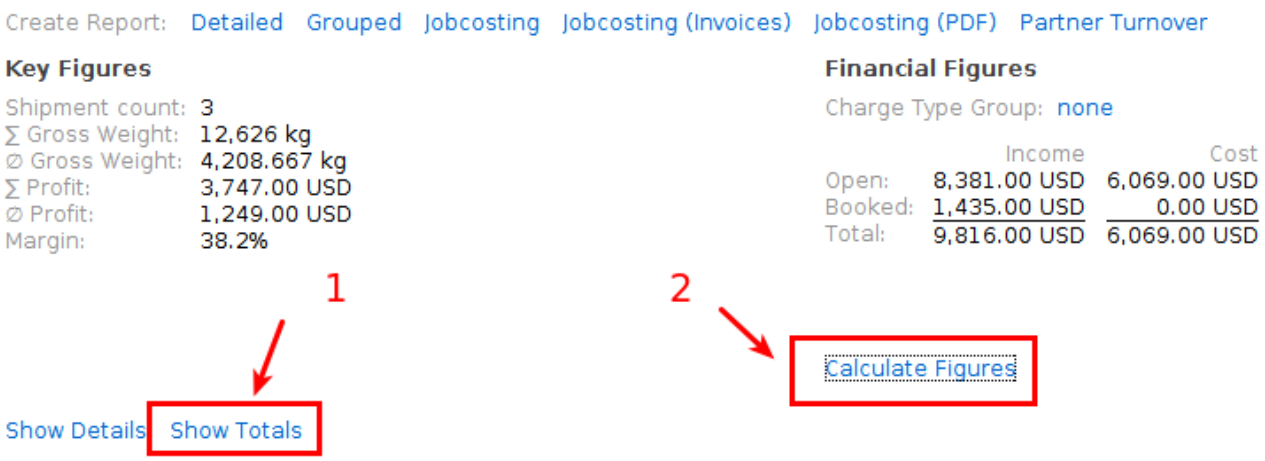
Running reports on the project shipments

Now that the correct shipments are showing in the shipment overview, you can run finance reports on them. For an immediate view of the figures, go to the lower part of the shipment overview:



This lower area will show the figures for the individual shipment highlighted in the list. To change this:

1. click on the option at the bottom "Show Totals"
2. Now click the option "Calculate figures'



Now the totals of all the shipments will appear in the "Key Figures" and in the "Financial Figures"

You can also output the figures to a spreadsheet or PDF by choosing any of the available reports:

1. Jobcosting
2. Jobcosting (Invoices)
3. Jobcosting (PDF)
4. Partner Turnover

You can also use the detailed reports and custom reports can be designed for this. The Grouped reports will also work.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

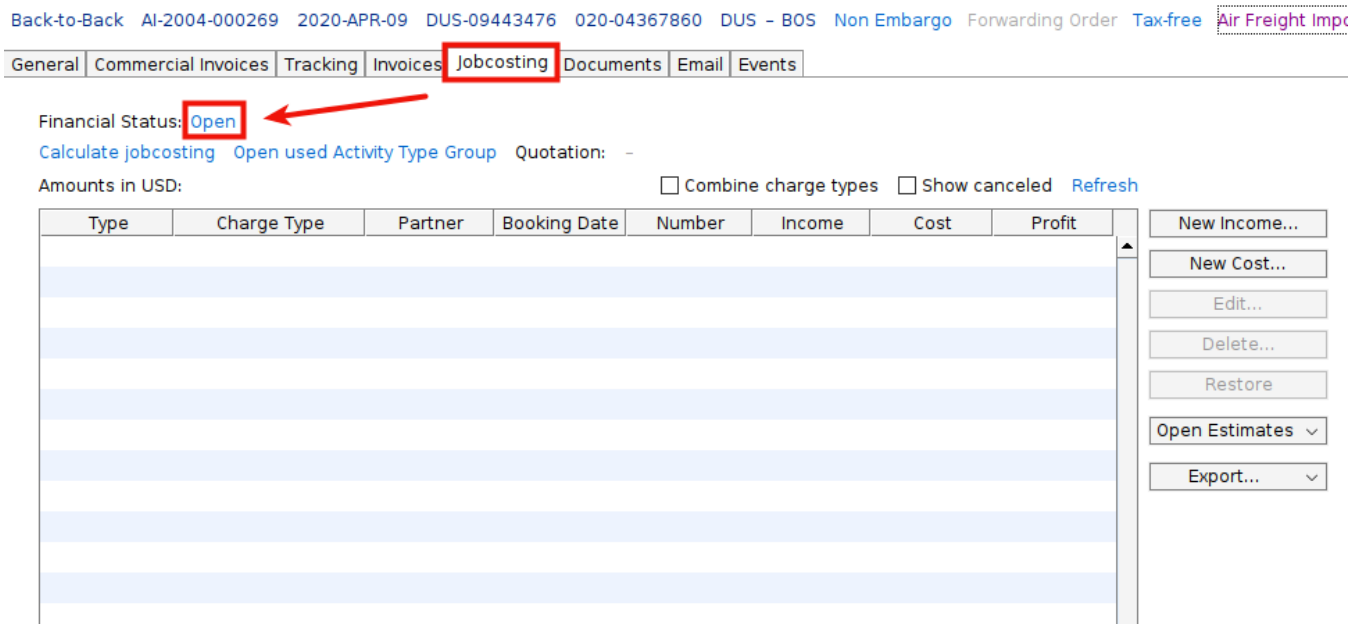
FAQ How-to manage financial status of shipments

All shipments in Scope will have one of the 4 financial status' listed below:

Status	Description
Open	When a shipment has "Open" status it may not have any estimates, income or payables registered, or it may have a variety of these. With this status more estimates may be added, invoices may be created and existing estimates may be converted to payables.
Pre-Billed	A shipment can have "Pre-billed" status. This is only used in conjunction with printed cost specifications. It is applied when a cost specification has been printed for any open invoices and there are no estimates remaining on the shipment
Billed	"Billed" status is applied when invoices have been completed. There may still be estimates on the shipment
Closed	When all billing is complete, any estimates have been converted to payables and any other payables have been completed, the shipment can be marked as "Closed". With this status it is expected that no further charges, either incoming our outgoing will be added to the shipment and the final profit is set.

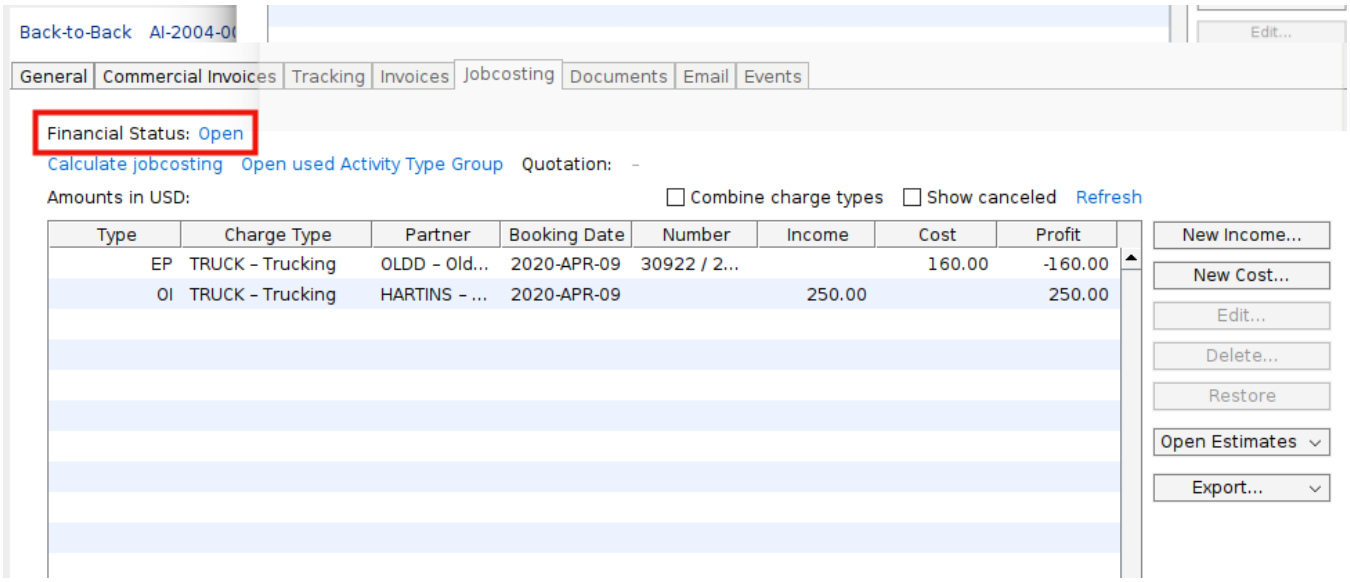
Open Status

When a shipment is first created, the initial status "Open" is automatically applied and this can be see on the jobcosting tab of the shipment:



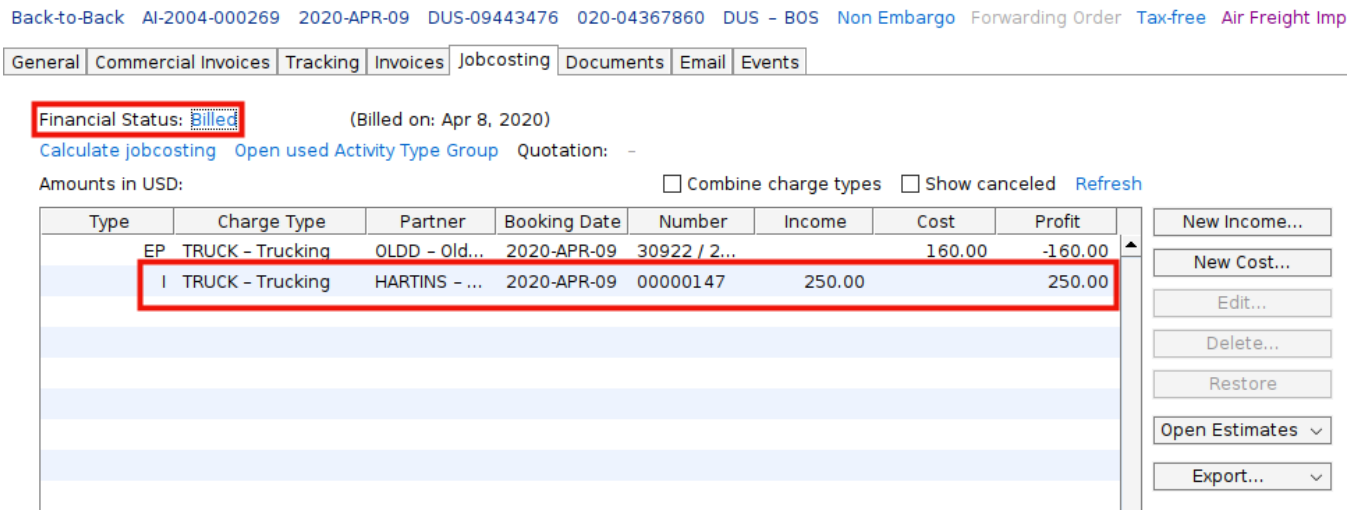
as estimates and open invoices are added, the status remains "Open":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Billed Status

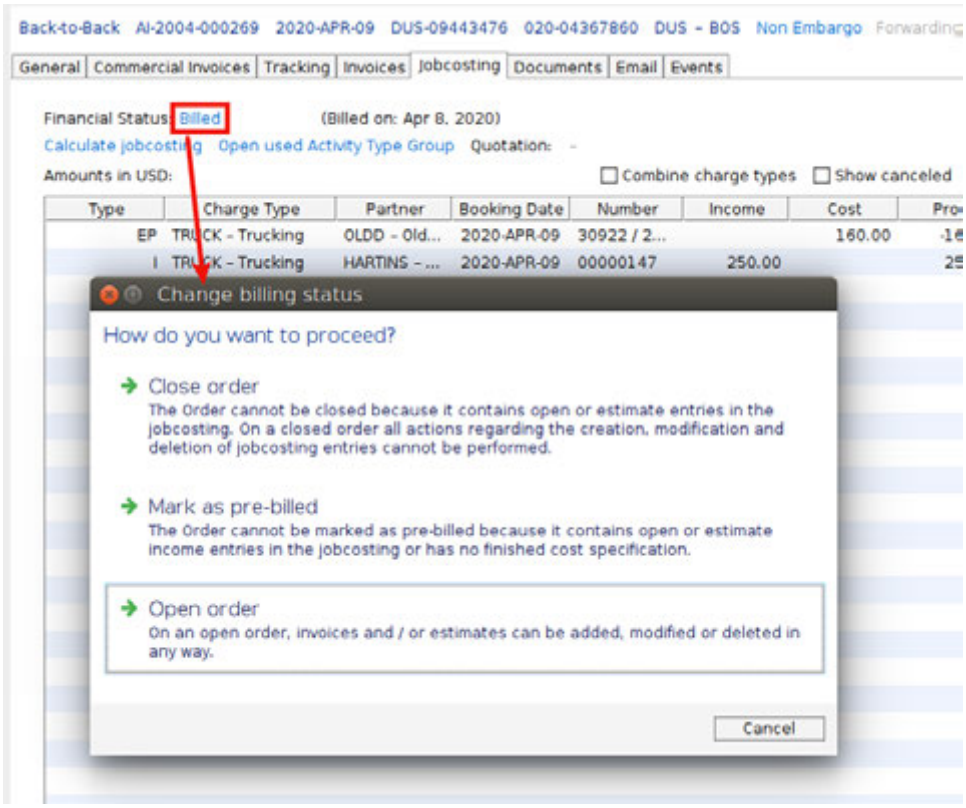
As soon as the first invoice is issued for the shipment, the status automatically changes to "Billed":



Changing the Status

To change the financial status of a shipment click the current status. The the example below, when the blue "Billed" status is clicked, a dialogue appears where a new financial status can be chosen. In this case the shipment can only be changed back to open. It cannot be "Closed" because there are still open reserves on the shipment:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

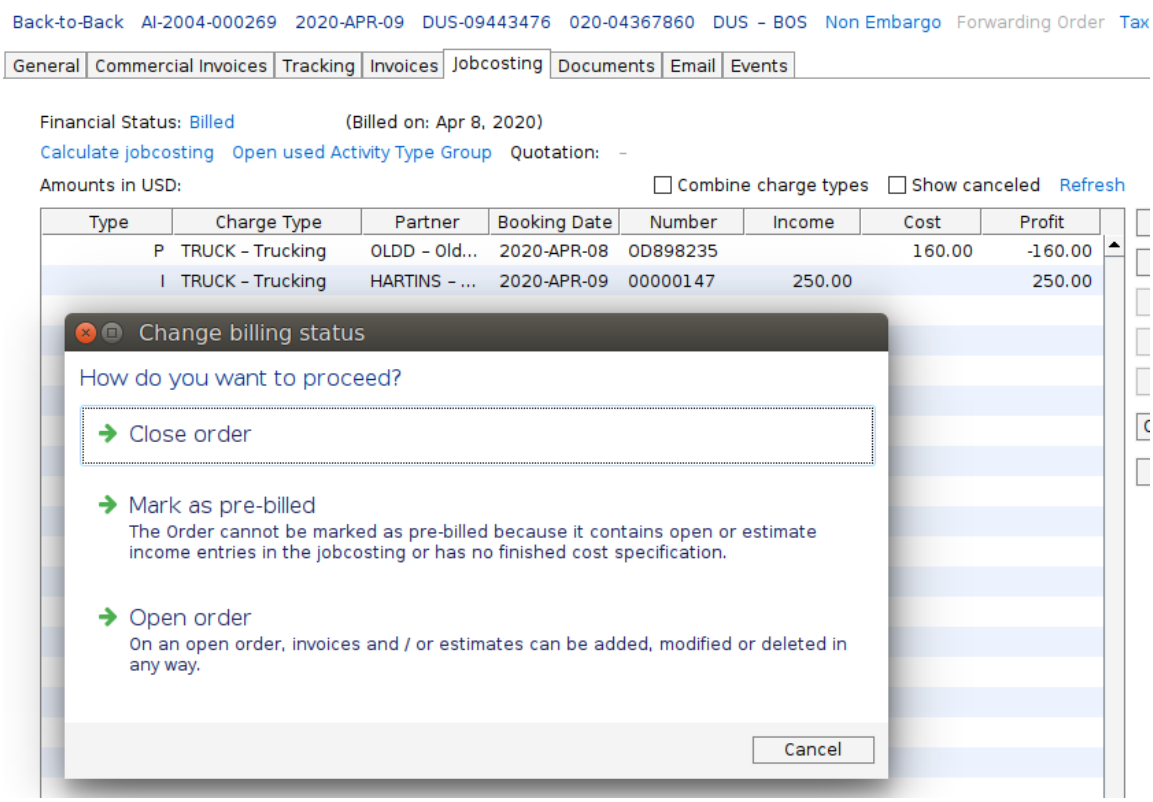


Closed Status

Once all the invoices have been completed and any estimates have been converted to payables and all payables have been applied, it is time to change the financial status of the shipment to "Closed'. This means no more charges are expected to be applied to the shipment, both incoming and outgoing.

The closed status must be applied manually by clicking on the current status and selecting "Close order" from the options:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Reporting

When the financial status of shipments is maintained, reports can be generated based on the financial status'.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To merge and attach documents to an emailed invoice or general email

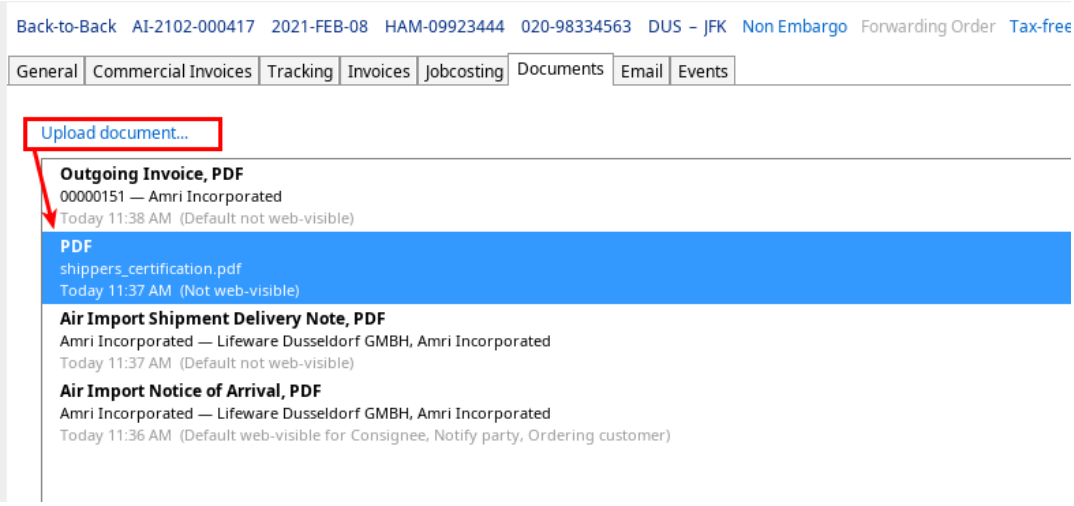
- Creating or uploading documents within a Scope shipment
- Merging Documents
- Automatic merging for email invoices
  - Setup of the partner profile to automatically include specific documents and merge them when sending invoices
    - The Invoice recipient
    - The invoice email setup
  - Attaching and merging documents when emailing an invoice

Within a Scope shipment there can be both Scope generated documents and uploaded documents. When the time comes to create the invoice and email it from Scope, or send any email from the shipment, any of these documents can be attached to the to the email. These documents can also be merged into a single pdf attachment.

Creating or uploading documents within a Scope shipment

When any document is generated within a shipment by Scope, the document will automatically appear as a pdf on the documents tab in Scope. From here it can easily be opened and printed or it can be attached to an email within Scope

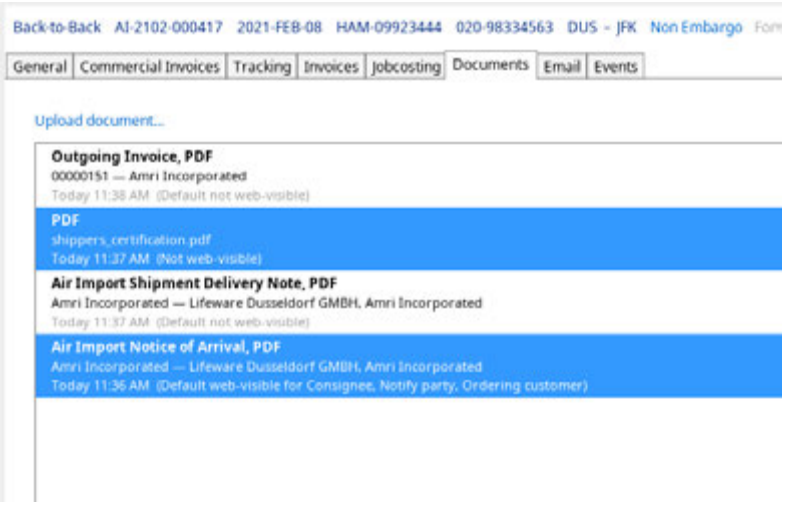
Documents that are not created by Scope can also be uploaded into the documents tab if the shipment by either dragging and dropping them into the documents tab or by using the "Upload document" option which is shown in the example below



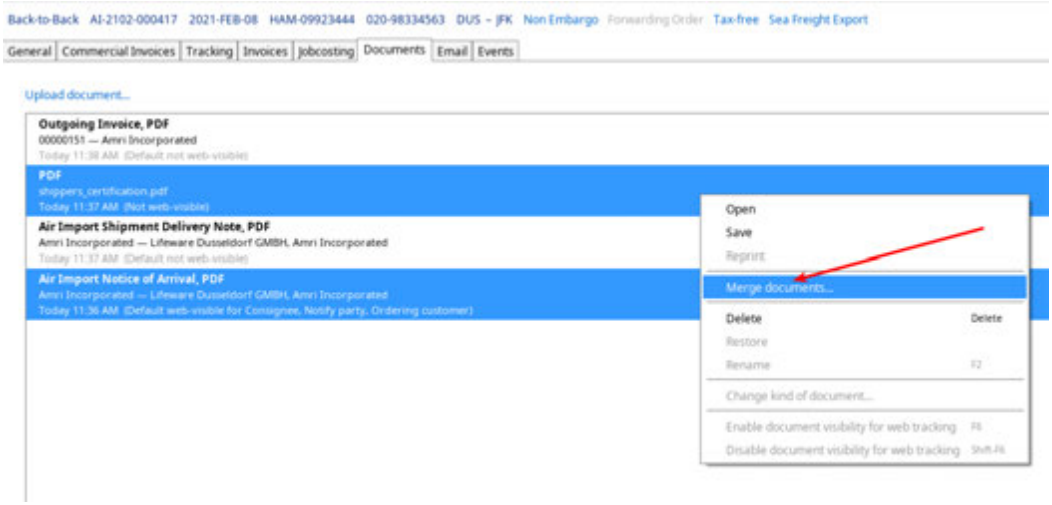
Merging Documents

In the documents tab, highlight the documents that are to be merged, in the example below, an uploaded "Shippers_certification" and the "Air Import Notice of Arrival" are selected

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

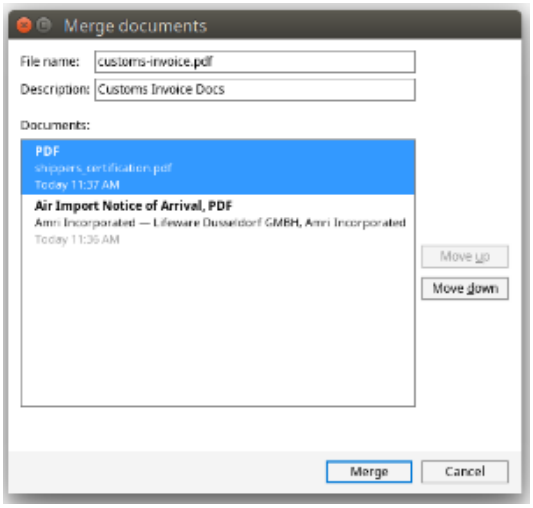


Next, put the cursor on one of the highlighted docs and right click:



As the example above shows , a sub-menu appears and offers the option to "Merge documents".

Now the "Merge documents" assistant appears. Give the merge docs a file name, then add a description of the merged docs. This description will be seen by the recipient and helps them identify what the pdf contains. Highlight any of the documents in the merge list and use the "Move up" or "Move down" buttons to change the order in which the merged docs will appear in the new pdf:



Click the "Merge" button when ready

Now the newly created pdf that contains the merged documents will also appear in the documents tab and will have the description provided earlier.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When an email is sent from Scope, this merged document can be attached.

Automatic merging for email invoices

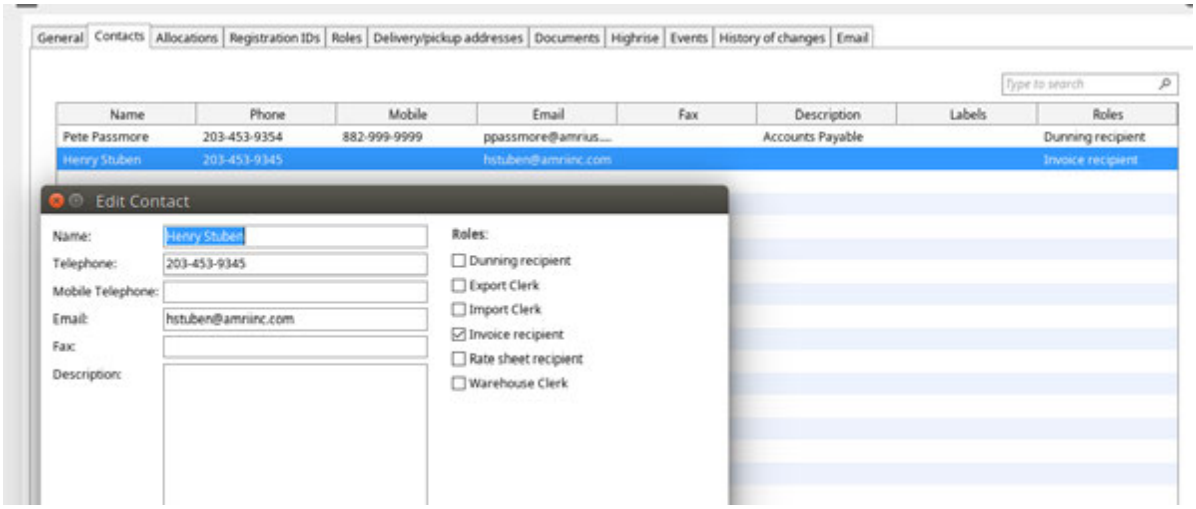
A customer may require that specific additional documents must be attached to invoices and they may even require that these should be merged into a single pdf. This can be setup on the partner profile

Setup of the partner profile to automatically include specific documents and merge them when sending invoices

Open the partner profile of the partner who will receive any invoices

The Invoice recipient

In the "Contacts" tab of the partner profile, make sure there is at least one contact who has an email address and who has the role "Invoice recipient"

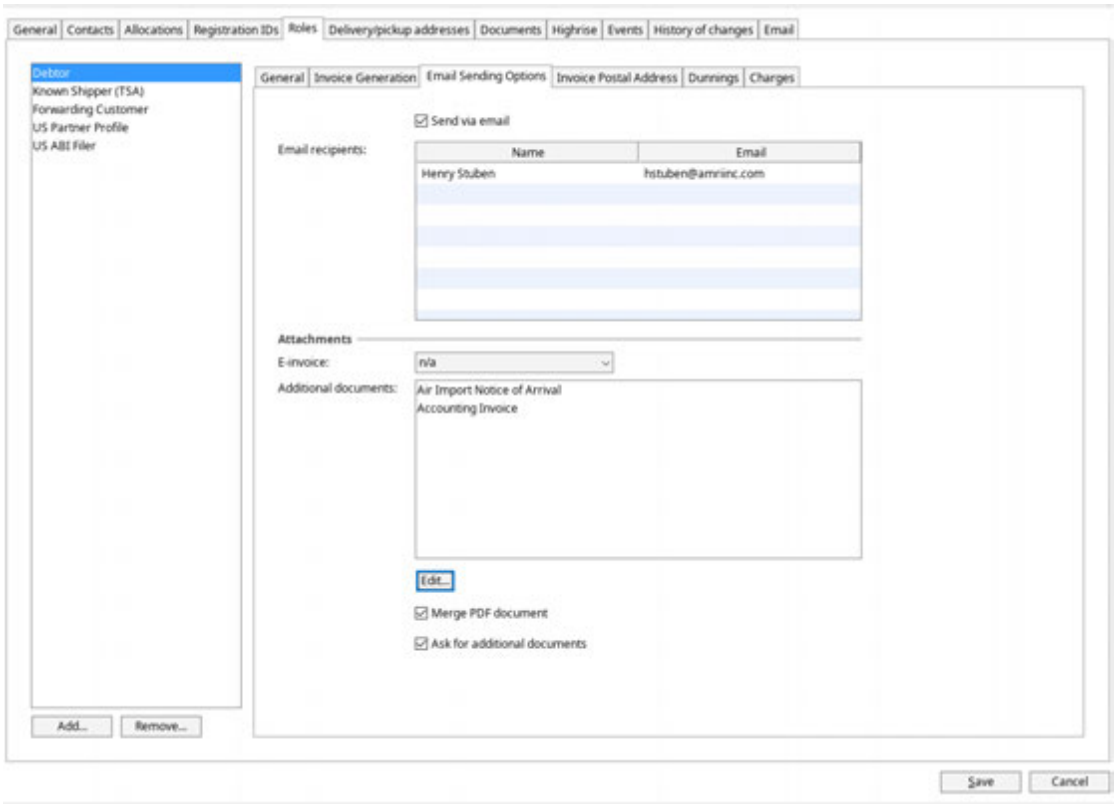


The invoice email setup

In order to receive invoices, the customer must have the debtor role and the general tab of the debtor role must be completed with standard information like the account number etc. of the debtor.

Once the general tab of the debtor is correctly completed, click on the "Email Sending Options" tab within the debtor role

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



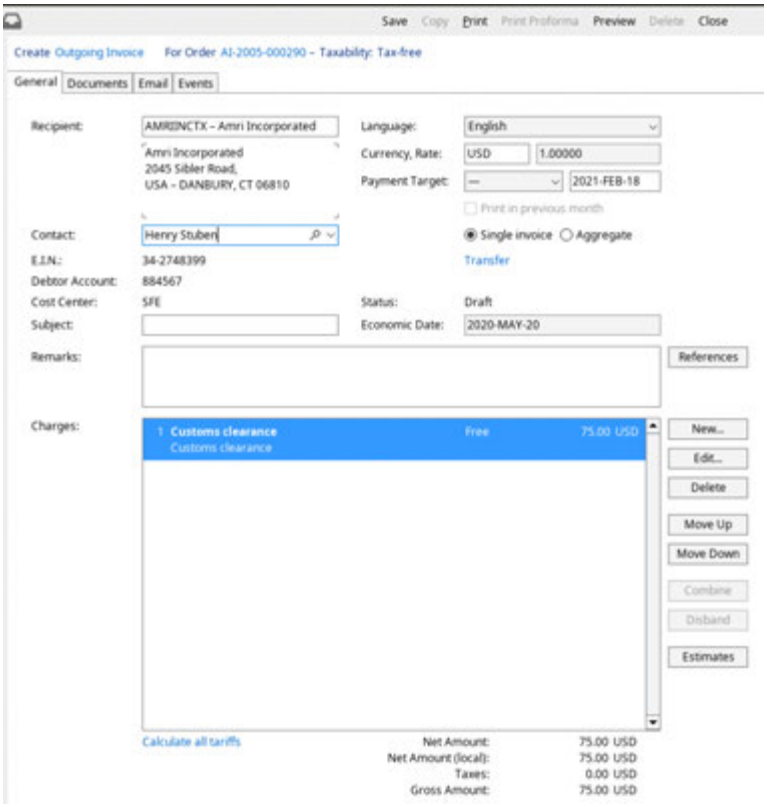
- Check the box "Send via mail"
- Any contact who has the role "Invoice recipient" should automatically appear in the list of email invoice recipients
- In the "Attachments" section, use the "Edit" button to choose the documents to be automatically included with the email invoice
- Check the box "Merge PDF document" to automatically merge the additional docs into a single pdf
- Check the box "Ask for additional documents" to be able to add further docs to the emailed invoice

Save when complete

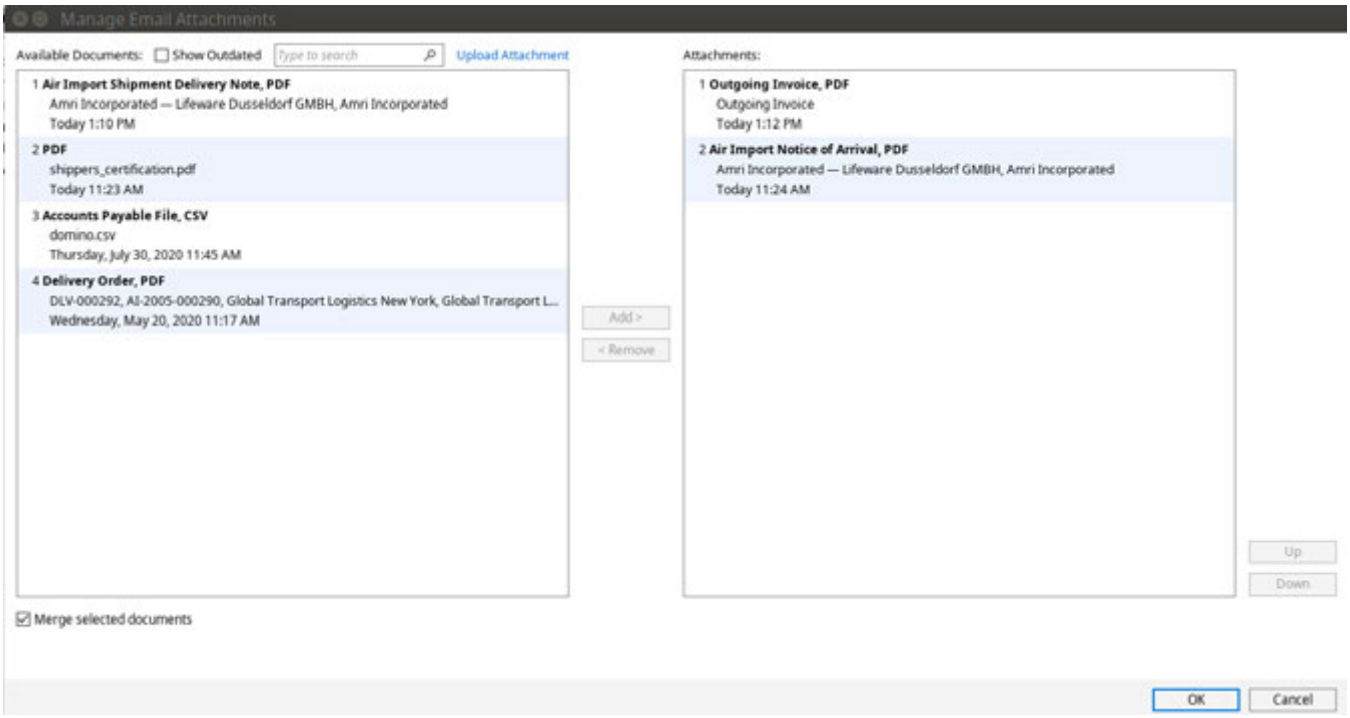
Attaching and merging documents when emailing an invoice

The outgoing invoice is created in the normal way:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the "Print" button is clicked, the "Manage Email Attachments" screen will appear:

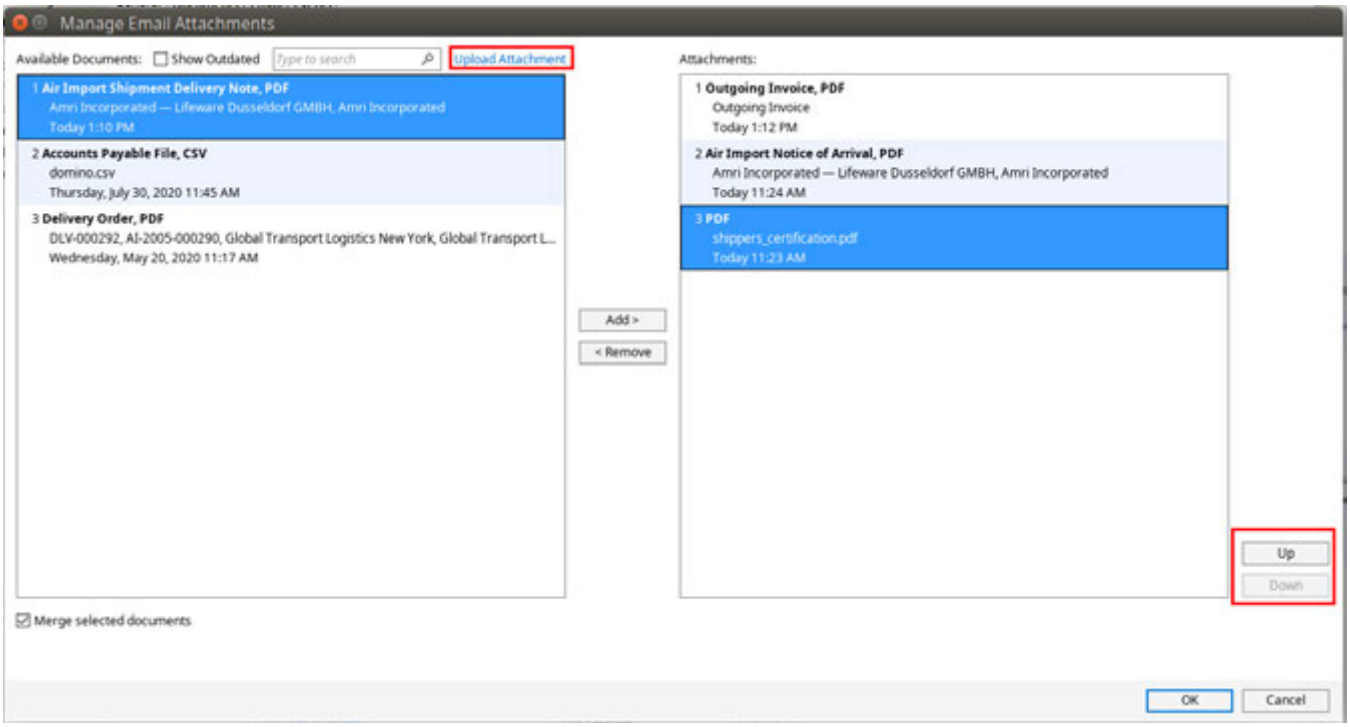


Any Scope documents that have been printed for the shipment will automatically appear in the right-hand "Attachments" window. Note that the "Merge selected documents" box is checked and this means all the attached docs will be merged into a single pdf

Further documents can be added, and in the example below, an uploaded "Shippers_certification" has been added to the attached list. Even at this late stage further documents can be uploaded and attached using the "Upload Attachment" option at the top.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The "Up" and "Down" buttons can be used to change the order in which the attached documents are merged into the final pdf



The the "OK" button is clicked, the email with the invoice and merged documents will automatically be sent to the invoice recipient.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To process payables

- Introduction
- Entering Costs - estimates
  - Manually entering an estimate cost
  - Costs created by cost tariffs
- Converting the estimate payable to a confirmed cost
- Finishing the incoming invoice
  - Incoming Invoice options
    - On Hold
    - Save
    - Export
    - Print
    - Finish
    - Delete
    - Close
- Creating Incoming Invoices outside of shipments

Introduction

When a shipment is created in Scope, there will be costs associated with this shipment. This how-to explains how these costs are entered in Scope and processed so that these costs are paid and are accounted for in the shipment resulting in an accurate final profit or loss figure for the shipment

Entering Costs - estimates

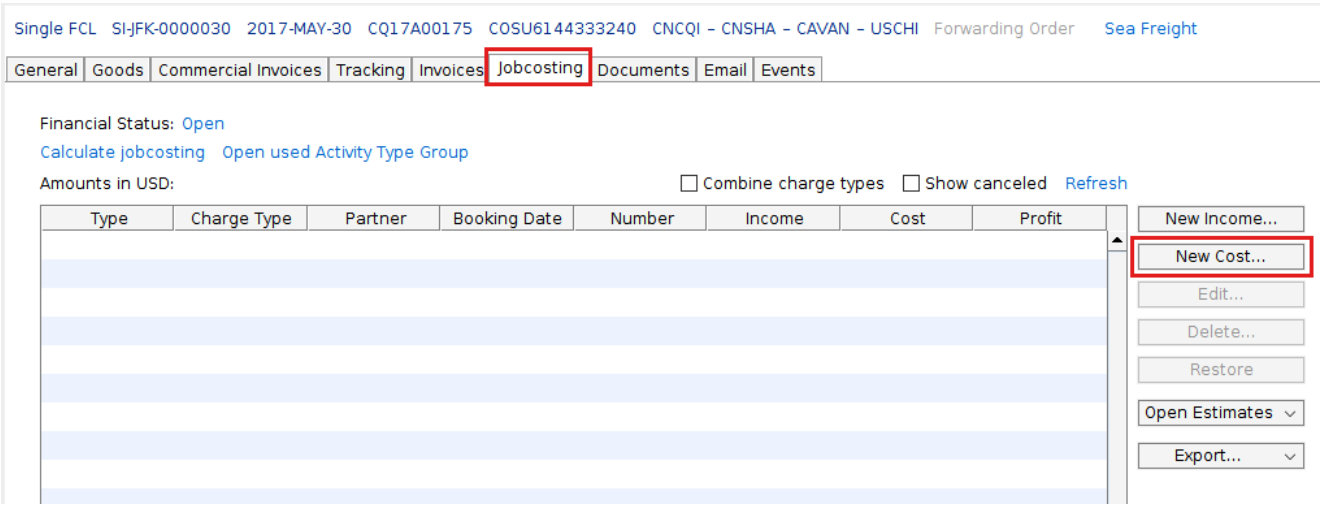
When the shipment is created, costs can be entered as estimates, this is also known as "protecting" the costs. These estimates are created because while an invoice for a cost is expected from the vendor, it may not yet be on-hand.

There are 2 ways estimate costs can be entered:

1. Manually entered in the job-costing screen
2. Automatically created by a cost tariff

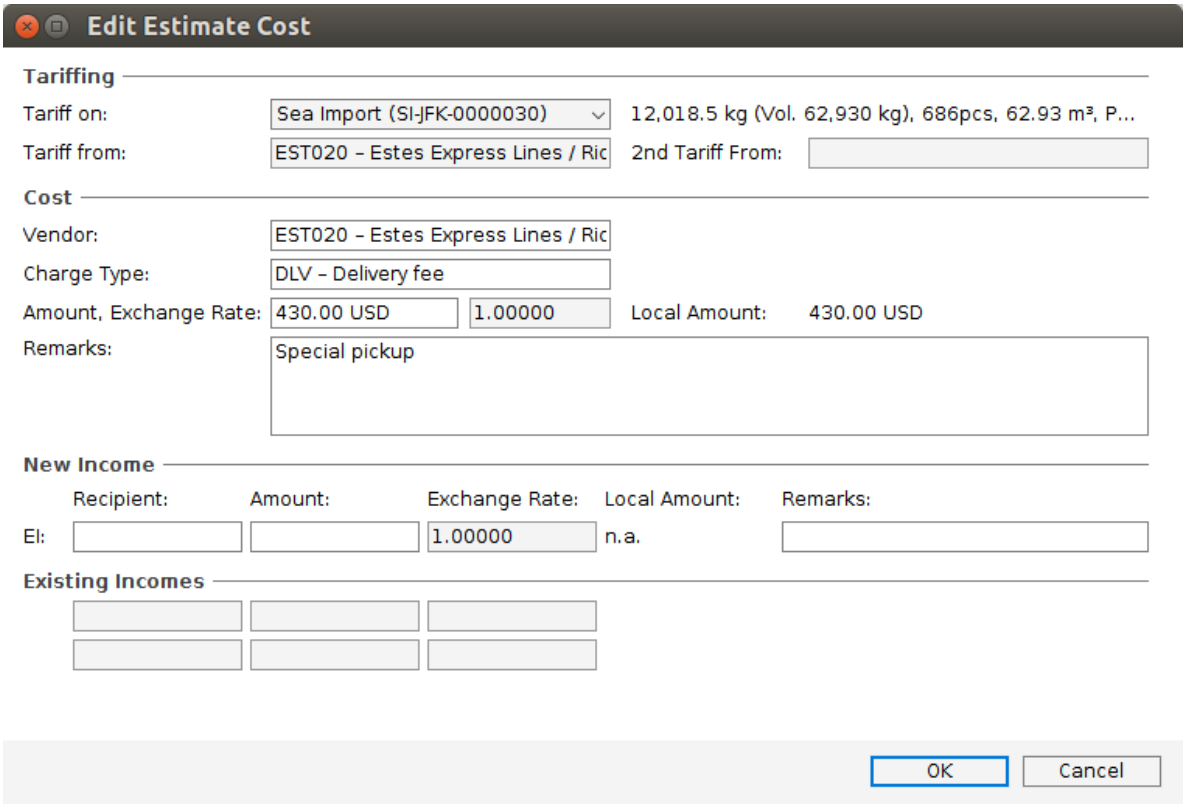
Manually entering an estimate cost

1. Open the shipment
2. Go to the Jobcosting tab
3. From the right hand action buttons select "New Cost..."



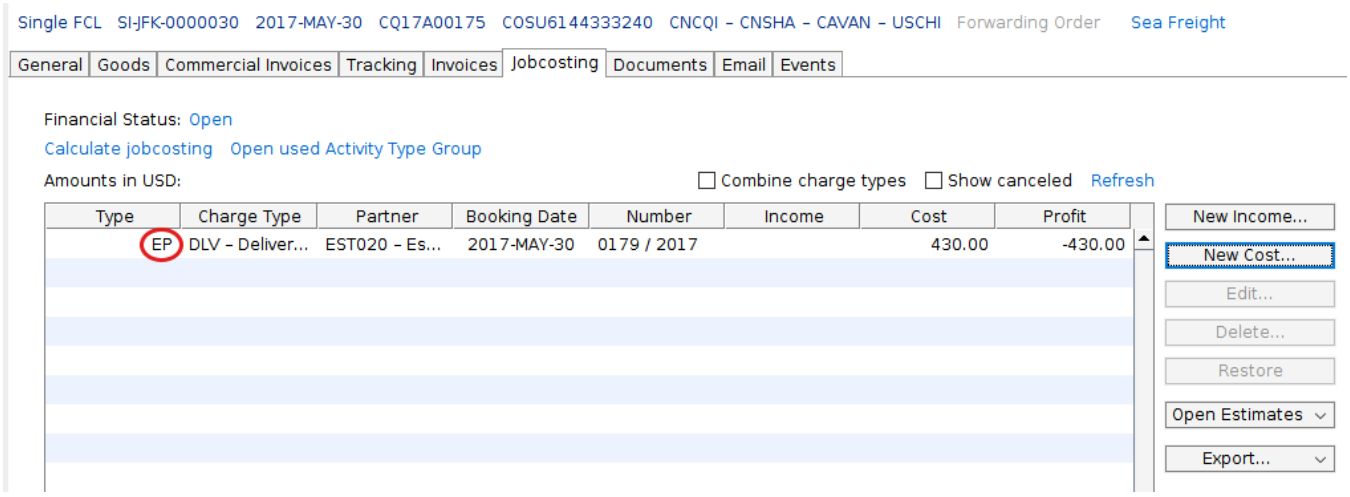
The "Edit Estimate Cost" application will appear:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- **Tariffing section** - if there is a tariff that can be applied, it will automatically inserted
- **Cost section** - the following information about the cost must be provided, other fields are optional
  - Vendor - the partner who will be billing for the cost
  - Charge Type - the type of charge that will be billed
  - Amount - the amount that will be billed
- **New Income** - details of any estimated income related to this cost - optional

Click "OK" when the cost details are entered and the Jobcosting screen will return. As shown in the example below, the new estimate cost appears as the type "EP" which means "Estimate Payment".



Costs created by cost tariffs

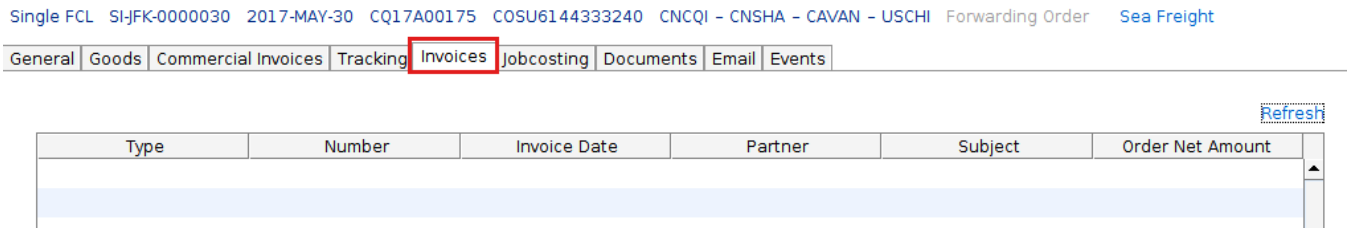
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If a tariff exists for a cost and it applies to the shipment, then the steps above will be automatically completed by the tariff. There is a separate How-To on creating tariffs.

Converting the estimate payable to a confirmed cost

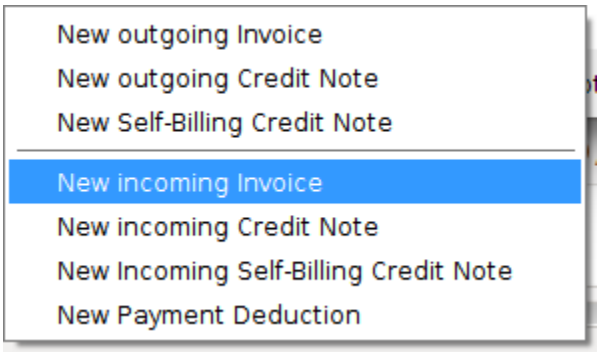
When the vendor, in this case "Estes Express Lines" sends their invoice finalizing the charge for the Delivery Fee, we must convert the estimate payment into a confirmed payment.

Go to the "Invoice" tab of the shipment:



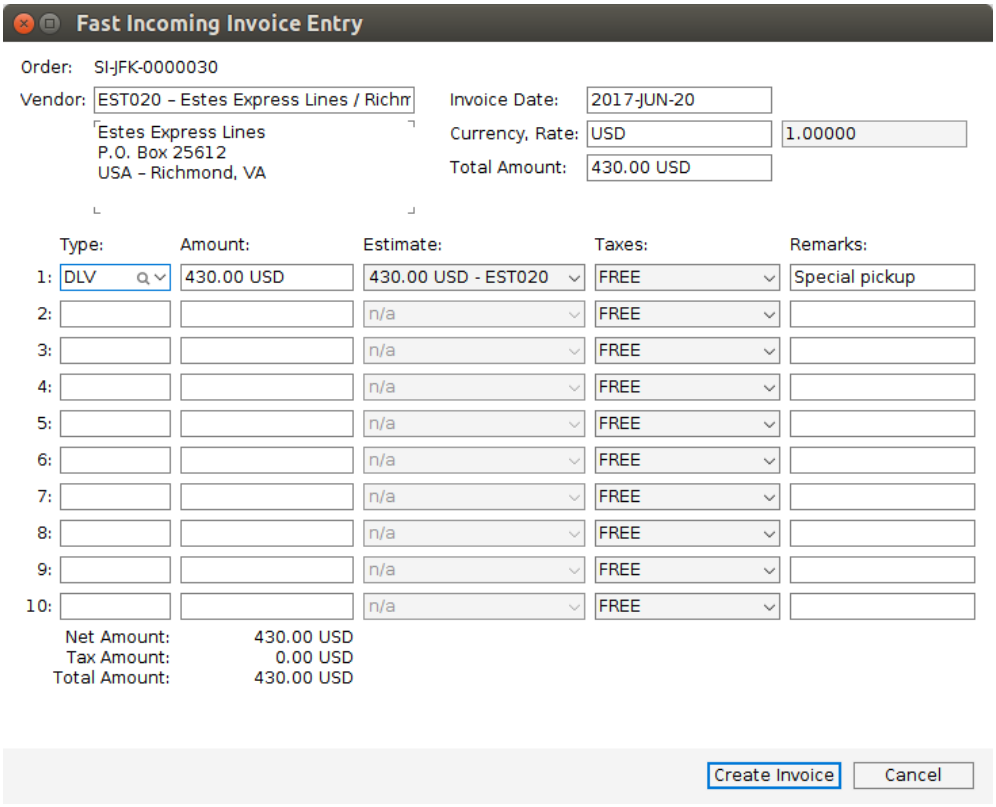
Click on the "New" button at the bottom of the Invoices screen:

From the drop-down menu choose "New Incoming Invoice":



The "Fast Incoming Invoice Entry" will open:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Enter the following in the header of the order:

- **Vendor** - The vendor address
- **Invoice Date** - the date of the vendors invoice
- **Currency** - This will default to the system currency
- **Total Amount** - Total amount on the vendor's invoice

If the vendor's invoice has more than 1 charge line, these can be entered in the charge lines. At lease 1 charge line must be entered.

When the "Type" of charge is entered, Scope will try to match it to an amount already entered in the Jobcosting screen for this vendor. In this example, as soon as charge type "DLV" is entered, the figure of $430.00 is found in Jobcosting and automatically appears in the "Amount" field.

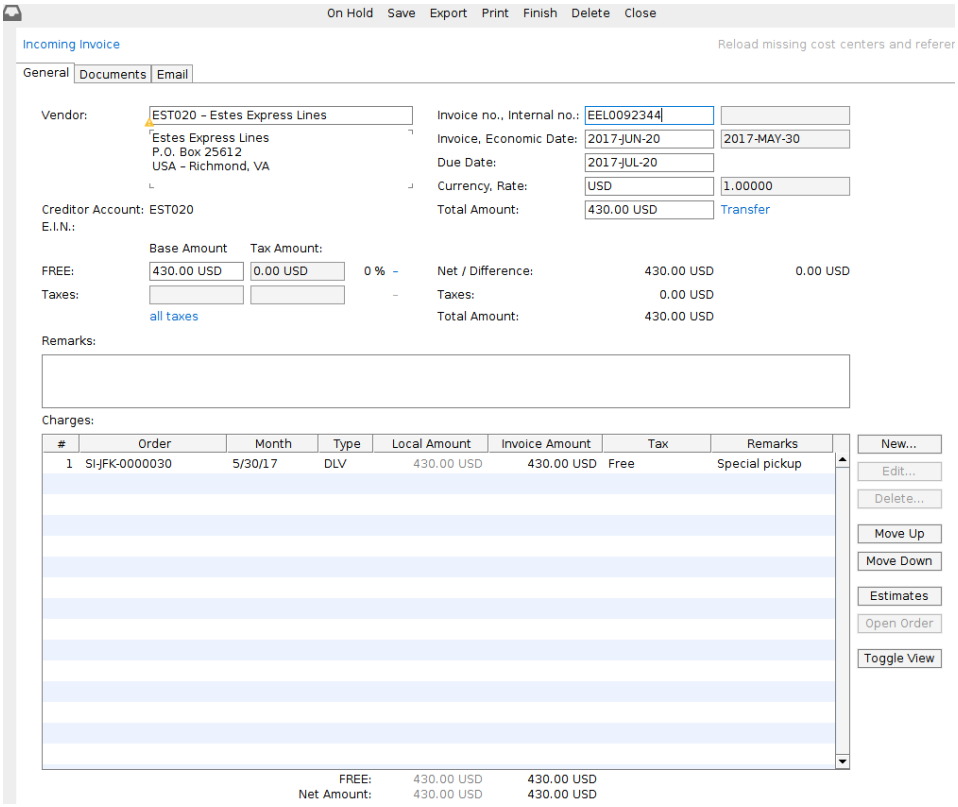
The total of the amounts entered in the charge lines must match the total amount shown in the "Total Amount" of the header, in this case $430.00.

When all details have been entered and the total of the charge lines and the total amount match, click "Create Invoice" at the bottom to finalize these charges.

Finishing the incoming invoice

On clicking "Create Invoice" the incoming invoice application opens:

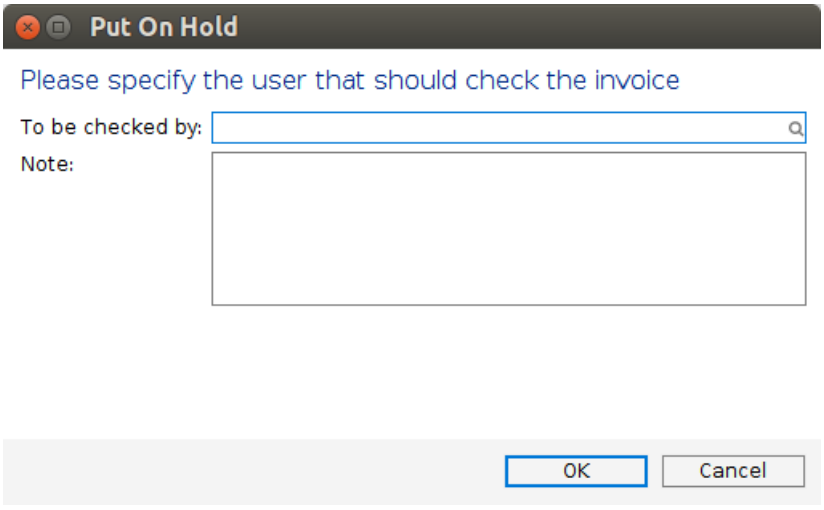
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



All of the details previously entered will automatically appear in the new incoming invoice. Only the "Invoice No." needs to be entered. This is the vendor's invoice number.

Incoming Invoice options

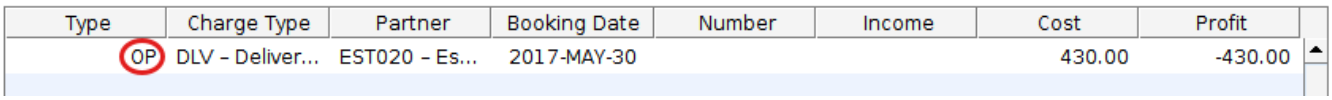
On Hold



If the incoming invoice needs to be checked and confirmed by a different user, then the users name can be entered in the "To be checked by;" field and any notes to this user about the invoice can be made in the "Note:" field

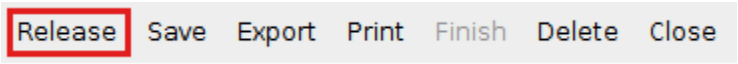
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

On clicking "OK" the incoming invoice will now change to an "Open Payable" in the jobcosting screen. This is type "OP"



Type	Charge Type	Partner	Booking Date	Number	Income	Cost	Profit
OP	DLV - Deliver...	EST020 - Es...	2017-MAY-30			430.00	-430.00

When the user authorized to check the invoice, opens the invoice, the menu bar options will change:



The checking user must select "Release" to confirm the payable is good. Once this is done, the "Finish" option is active.

Save

Use the save option to save all work done to-date on the incoming invoice.

Export

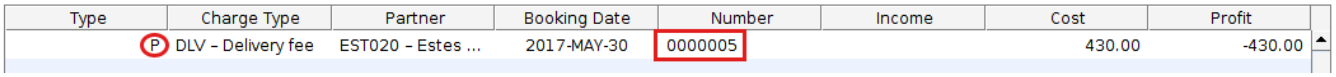
This option will open the incoming invoice as a spreadsheet

Print

This option will produce a PDF copy of the invoice

Finish

If the incoming invoice is correct and complete, click finish. The incoming invoice will now appear as an incoming invoice in the jobcosting, it will be type "P" (paid) and will have an internal invoice number.



Type	Charge Type	Partner	Booking Date	Number	Income	Cost	Profit
P	DLV - Delivery fee	EST020 - Estes ...	2017-MAY-30	0000005		430.00	-430.00

Delete

If the incoming invoice has not been finished, it can be deleted to remove it.

Close

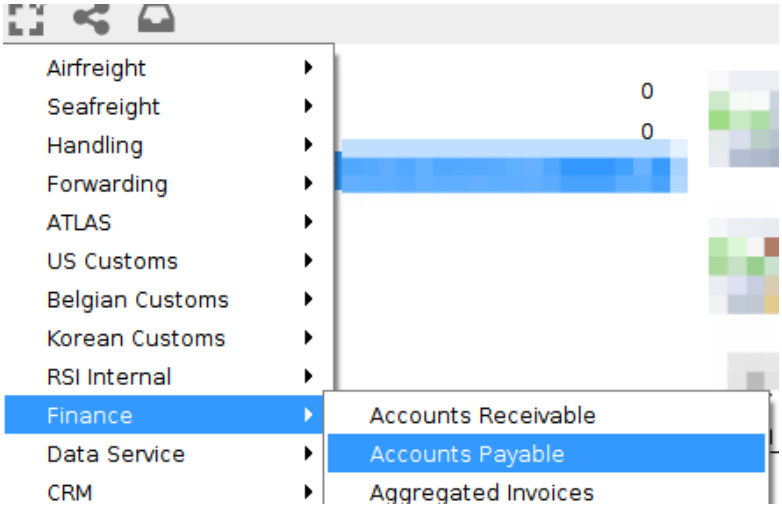
The close options will close the incoming invoice.

Creating Incoming Invoices outside of shipments

The process above describes creating and processing incoming invoices within a shipment. It is also possible to create an incoming invoice outside of shipment, this is especially useful when incoming invoices refer to multiple shipments.

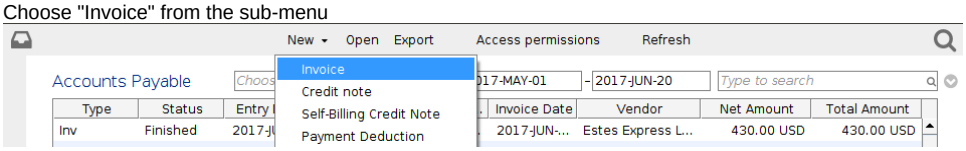
1. From the Scope menu choose "Finance"
2. From the "Finance" sub-menu choose "Accounts Payable"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



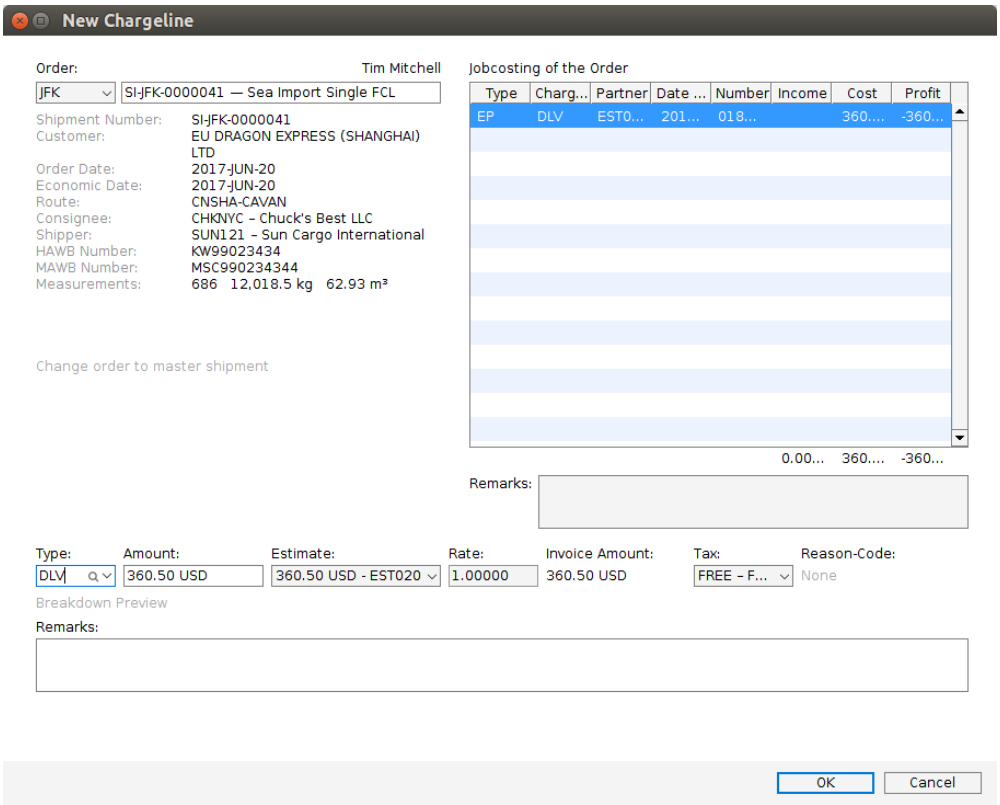
The Overview of account payable will appear:

1. From the menu bar choose New
2. Choose "Invoice" from the sub-menu



The incoming invoice application will appear. This is the same as shown above

When a new line is added to an incoming invoice, the "New Chargeline" application appears:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The user can search for the shipment by entering the branch code and then typing the shipment number or some part of the shipment such as a partner name or address or vessel name etc.

Once the desired shipment is located, estimate payables on the shipment will appear in the right hand window called "Jobcosting of the Order". This provides easy reference to the estimates on the shipment.

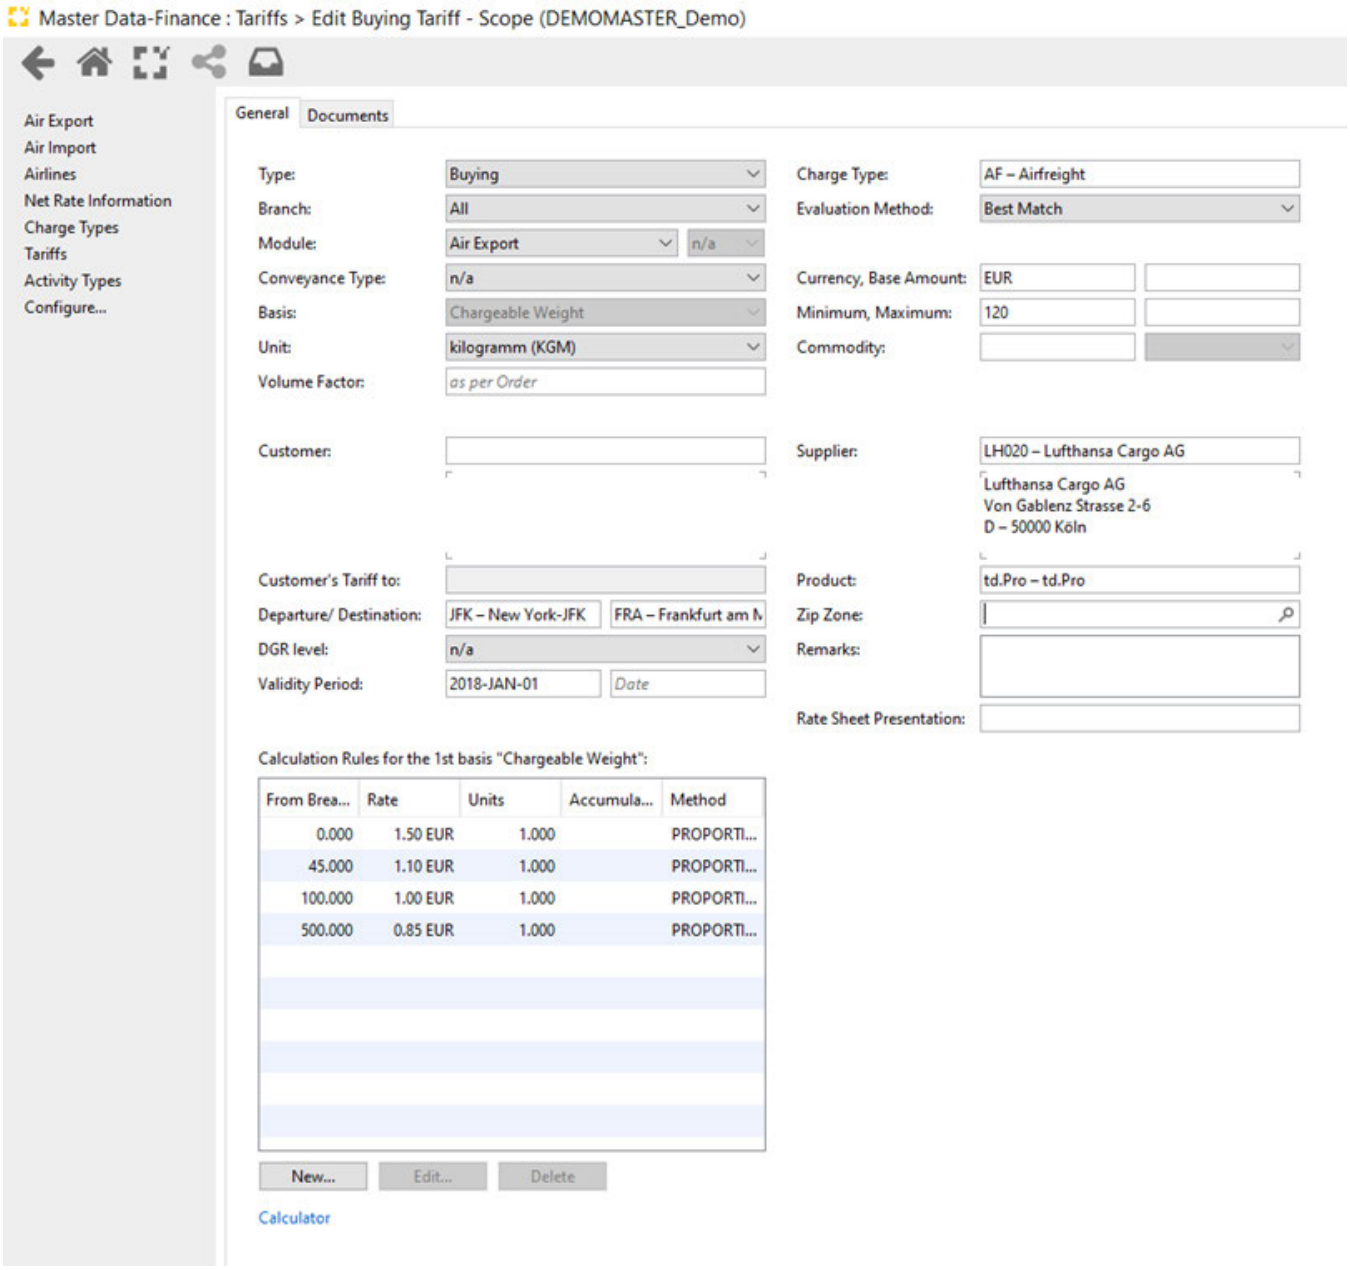
When a charge type is entered in the "Type" field, if this matches an estimate in the shipment, the amount is automatically populated from the shipment. Adjust this amount as required.

When complete, click "OK" and proceed to the next charge line.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To set charge type/tariffs for different carriers for automatic calculation

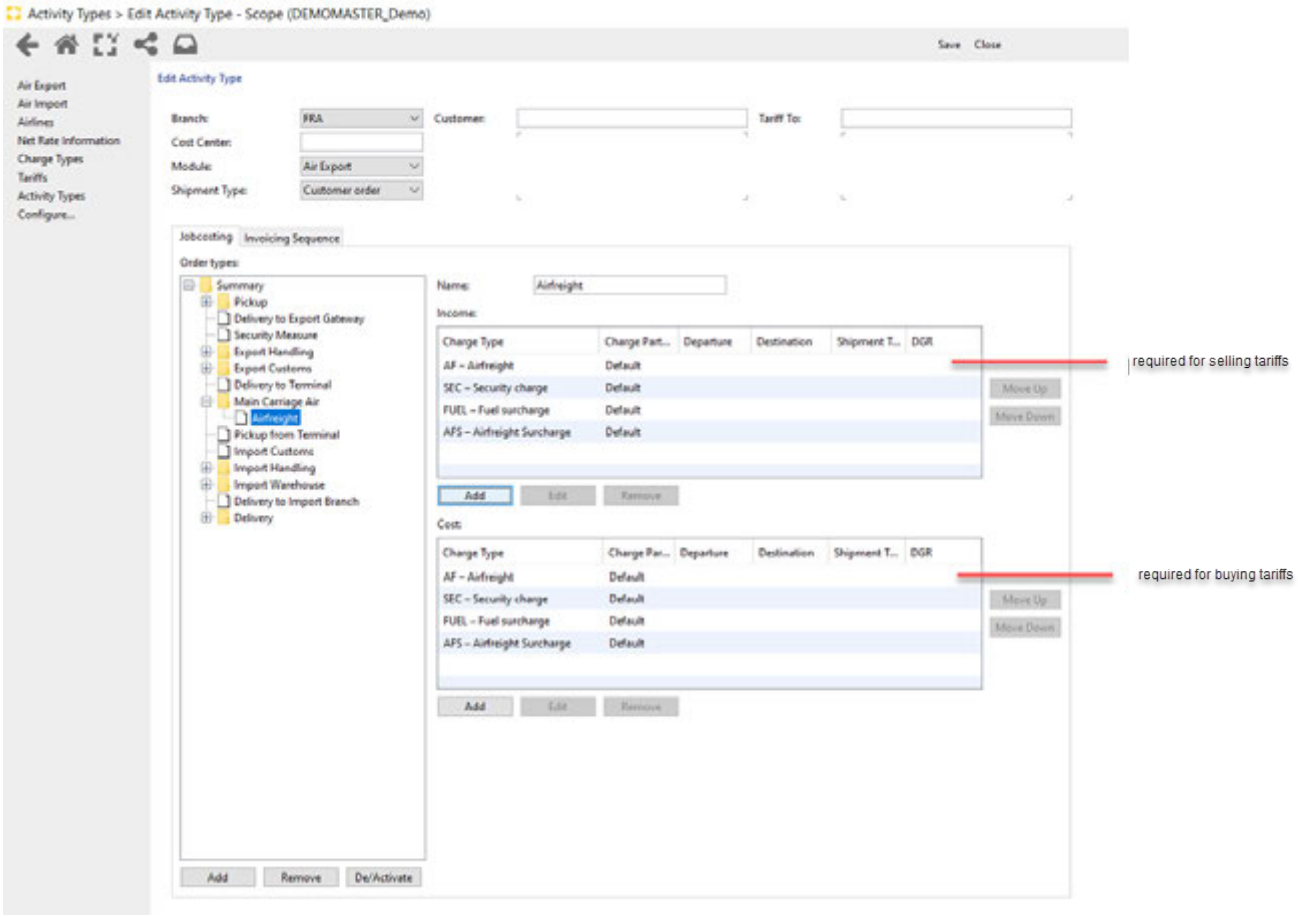
You can set different kind of tariffs (buying / selling) for carriers/airlines at Tariff-Editor. To built up a new tariff you need to fill in different data like charge type (e.g. Airfreight – AF), basis (e.g. chargeable weight), supplier (e.g. LH020 / Lufthansa Cargo), destination/departure (e.g. from JFK to FRA) and calculation rules (e.g. z.B. +45 1,10 USD / +100 1,00 USD / +500 0,85 USD). Additionally you can add Minimum, Product, DGR-Level and Validity Period.



For automatic calculation you have to set an activity type at activity types maintenance application. You can choose a branch, order group (air export) and context (master, house, direct). Choose order type „*Main Carriage Air*“ and add your favorite charge type at “*income*” and/or “*cost*”-window.

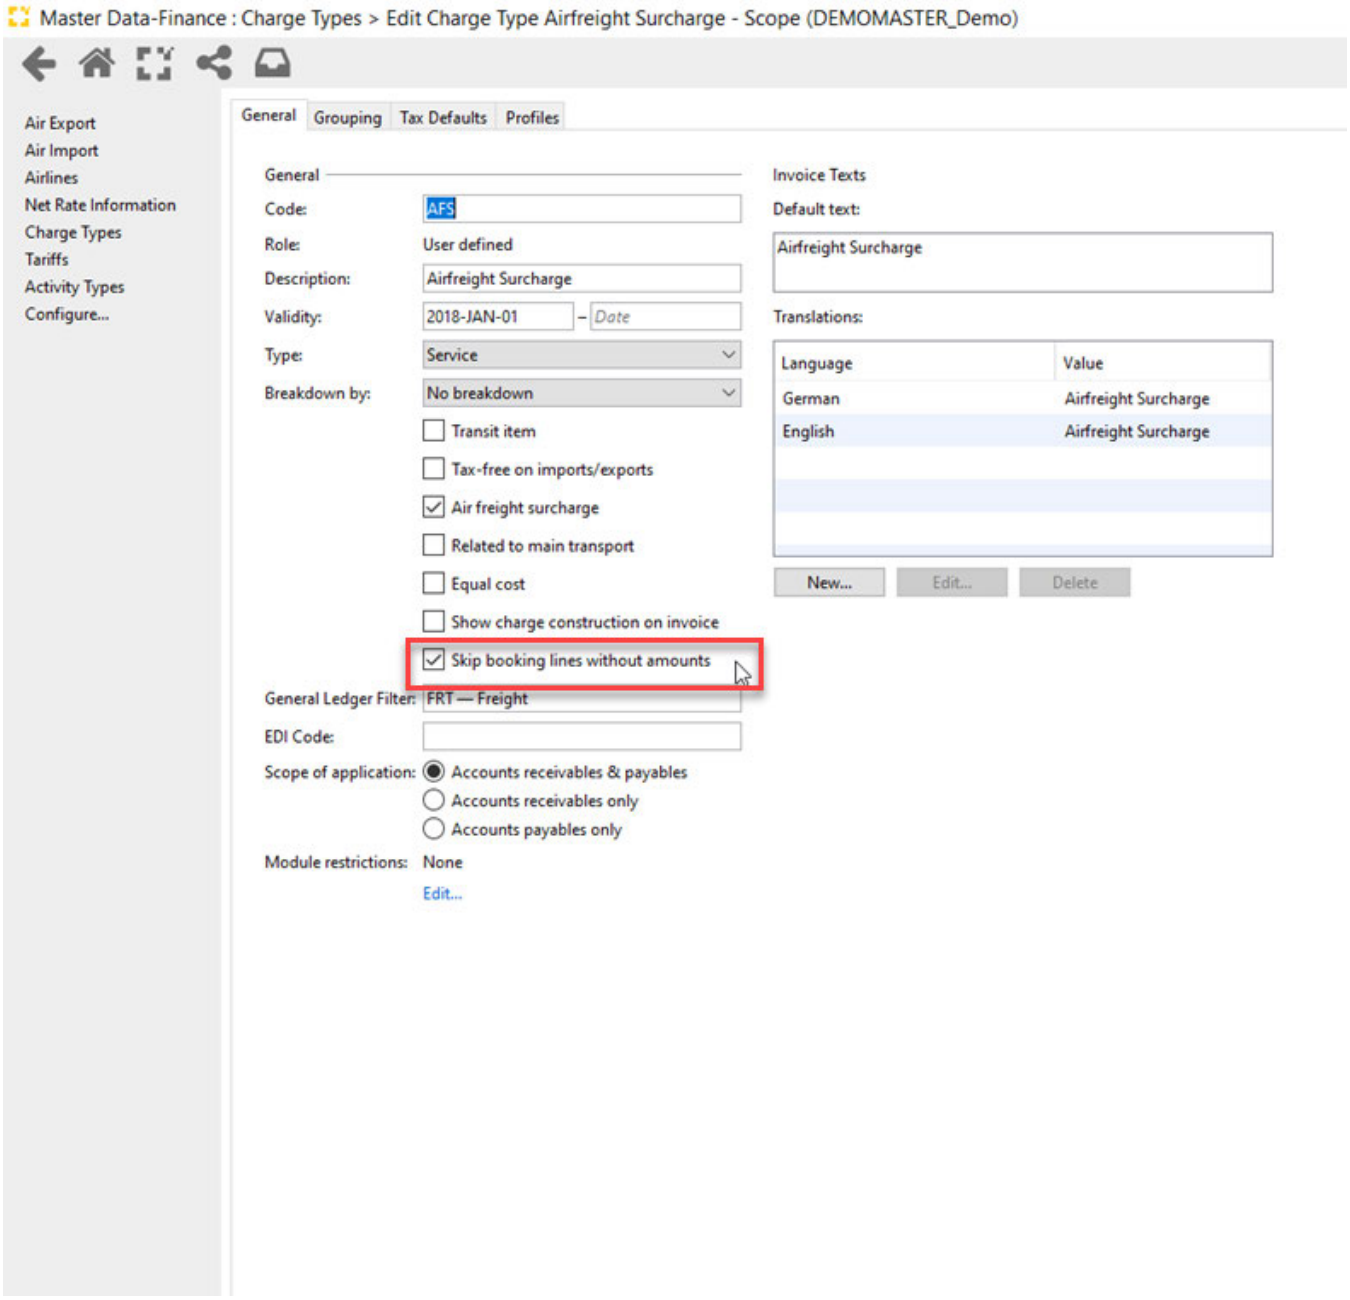
Example: Choose Airfreight / Fuel Surcharge / Security Surcharge (general surcharges) and special surcharges of some supplier like airfreight surcharge, supplementary surcharge, period peak surcharge.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Above mentioned special surcharges could not be applicable for all carriers so you have to setup the charge type as well. Go to "*Charge Type Maintenance* " and choose your charge type. Now you choose "Skip booking lines without amounts" and Scope will use this charge type if there is tariff for it - otherwise the charge will not be chosen.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Example: Airfreight Surcharge (AFS) is only applicable by carrier LH020 and you have saved a tariff for AFS, for supplier AC014 AFS is not applicable. Go to your shipment file and choose tab "*Jobcosting*" and press „*calculate jobcosting*". If you have booked with carrier LH020 there will be mentioned charge type AFS with your individual tariff. If you have booked with AC014 there will be no AFS mentioned in the jobcosting. All other general surcharges will be mentioned as well.

If *Jobcosting* is not working, it could depends on the following adjustments:

- missing destination/departure (tab general)
- missing movement scope (tab general)
- supplier from your tariff and supplier in your shipment are not the same (tab general)
- missing product (tab general)
- validity of tariff is expired

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To setup a debtor for automatic email invoicing

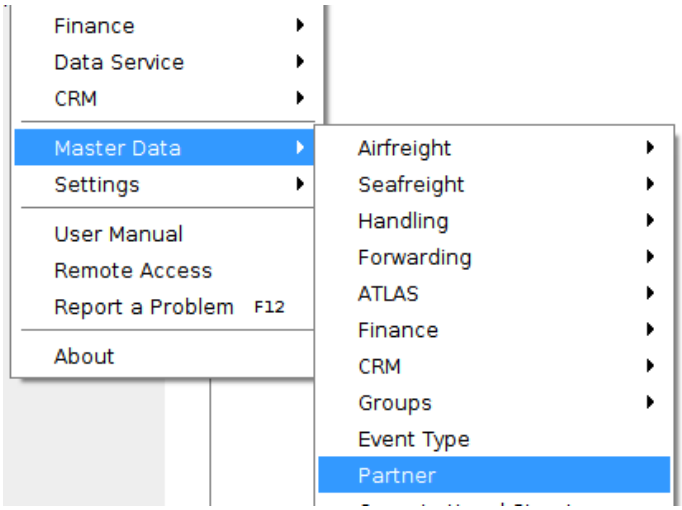
- Introduction
- Partner Maintenance - Contacts
- Partner Maintenance - Debtor role
- The Email and sending the Invoice

Introduction

This guide describes how any debtor can be setup to receive invoices via email. This means that when the "Print" button is selected in the invoice, the invoice will immediately be transmitted to the customer by email.

Partner Maintenance - Contacts

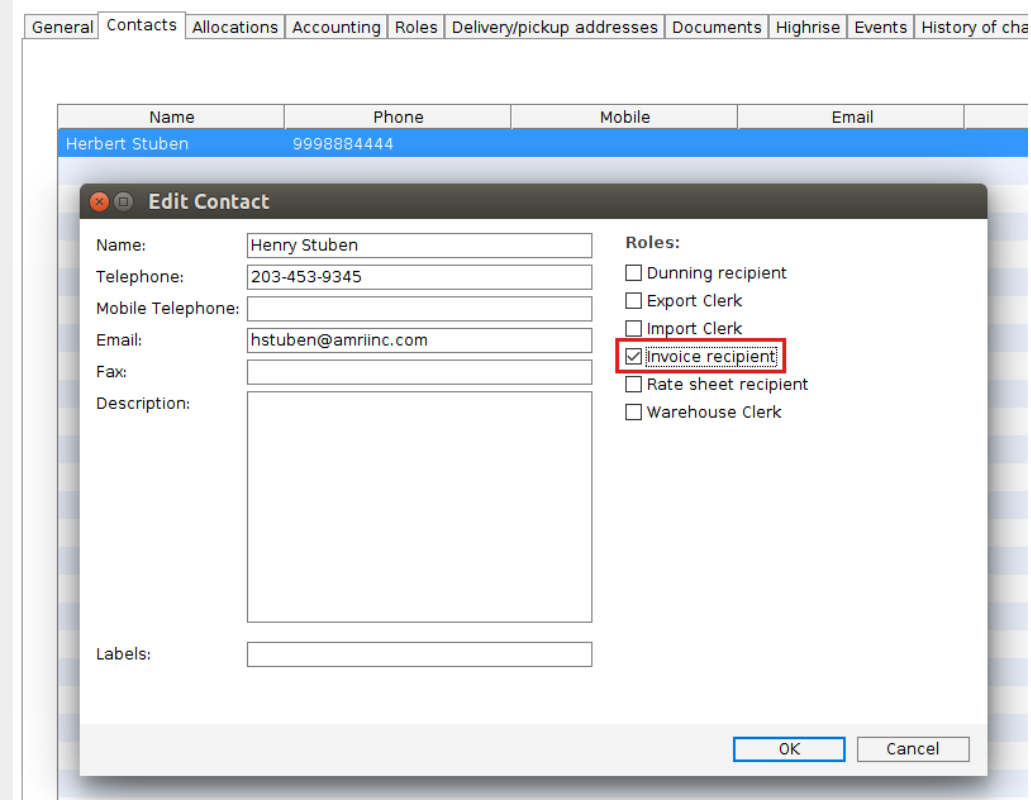
Find the partner who is to receive email invoices in partner maintenance:



Go to the "Contacts" tab of the partner and add the name and details of the contact at the debtor who will receive the invoices

- Be sure to enter an email address
- Be sure to check the box "Invoice recipient" for this contact

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

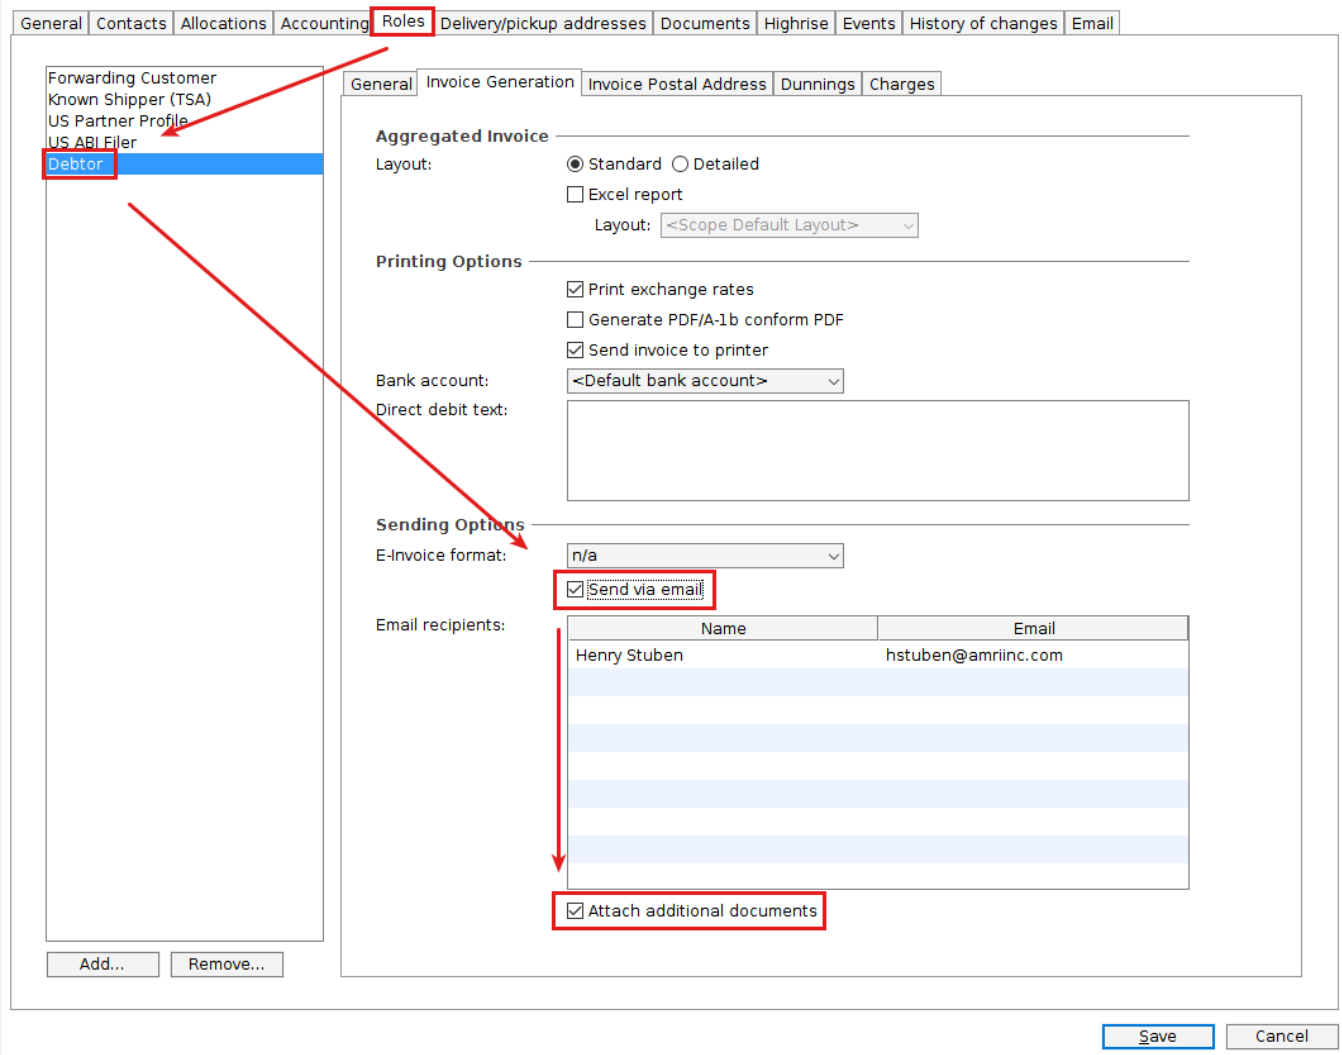


Partner Maintenance - Debtor role

Now go to the tab "Roles for the partner and click on the "Debtor" role and do the following

- In the debtor role check the box "Send via email" - The party/s created as invoice recipients in the contacts will appear.
- If you need to include additional documents, check the box "Attach additional documents"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The Email and sending the Invoice

When invoices are created for this debtor, as soon as the "Print" button is selected, the invoice will be attached to an email and sent to the recipient specified in the contacts tab of the debtor.

If the "Attach additional documents" has been checked, a pop-up will appear prior to sending that will allow the desired documents to be selected and attached to the invoice.

The sent email will appear the the "Email" tab of the shipment.

The Subject line and the standard message in the body of the invoice can be customized. Contact your Riege Support Desk to have these details customized to your requirements.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Activity Types

Sea Imports

Activity types typically go in Import Handling or Main Carriage Sea

Air Imports

Activity types typically go in Import Handling

Air Export

Activity types typically go in Main Carriage Air

Sea Exports

Activity types typically go on Main Carriage Sea

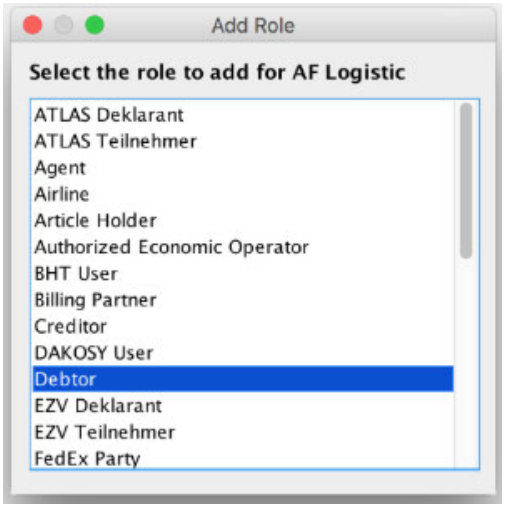
How-To Create a Customer in QBO from Scope

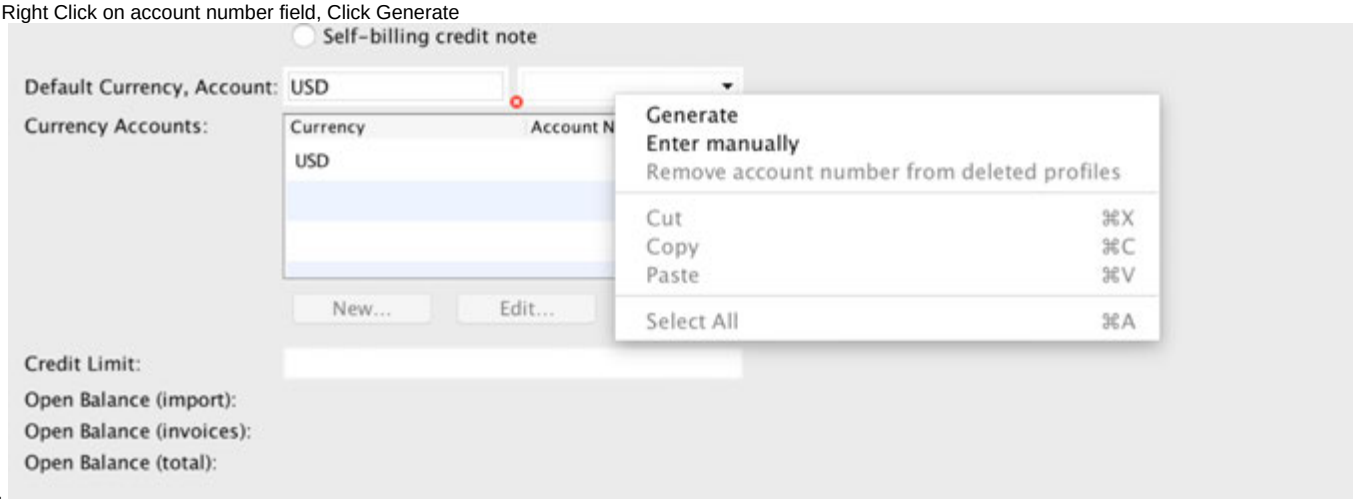
“How To” Create a Customer in QBO from Scope

1. Go to the partner
   a. 
2. Copy the Primary Partner Name
   a. 
3. Select Roles
   a. 
4. If the debtor profile does not exist exists Go to Step 5 (If it does go to Step 6)
   a. 
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

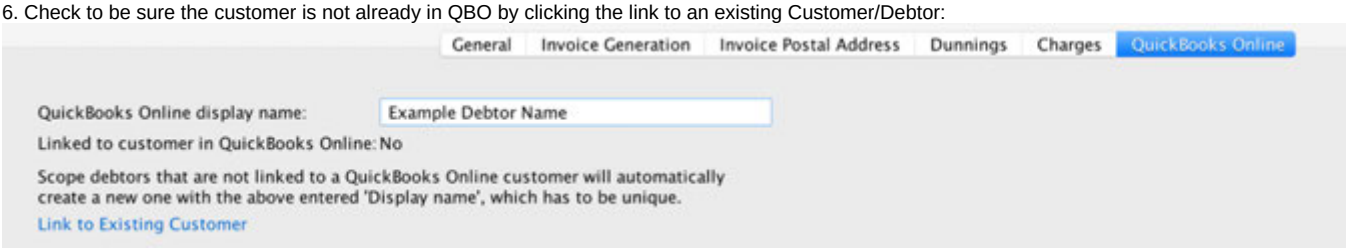
5. Select Add Role
a. Add Debtor then click OK



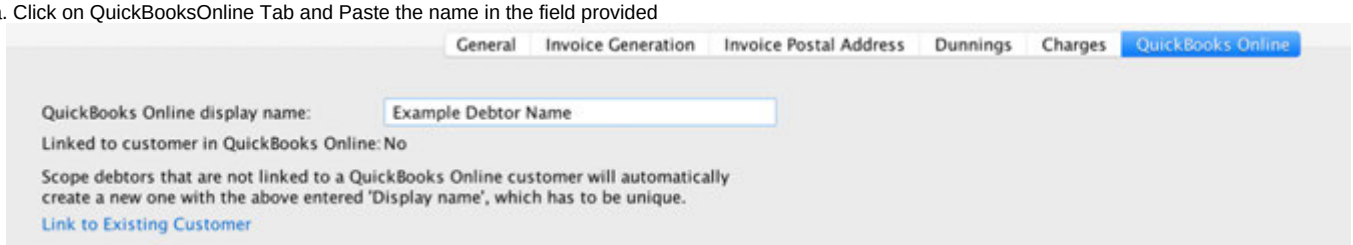
i.
b. Generate Account number
i. Right Click on account number field, Click Generate



1.
6. Check to be sure the customer is not already in QBO by clicking the link to an existing Customer/Debtor:

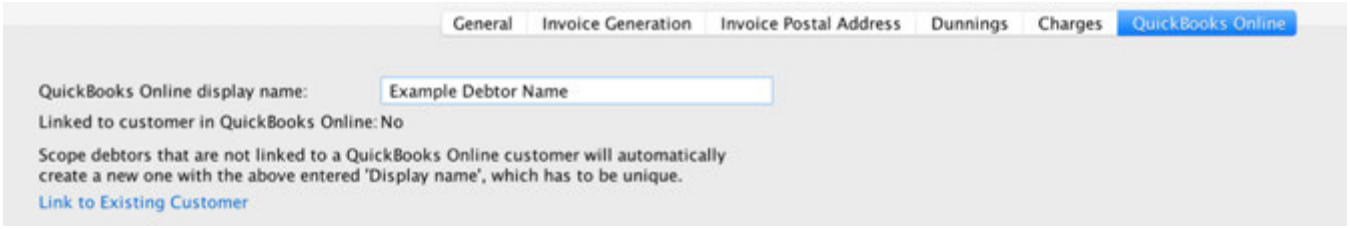


a. Click on QuickBooksOnline Tab and Paste the name in the field provided



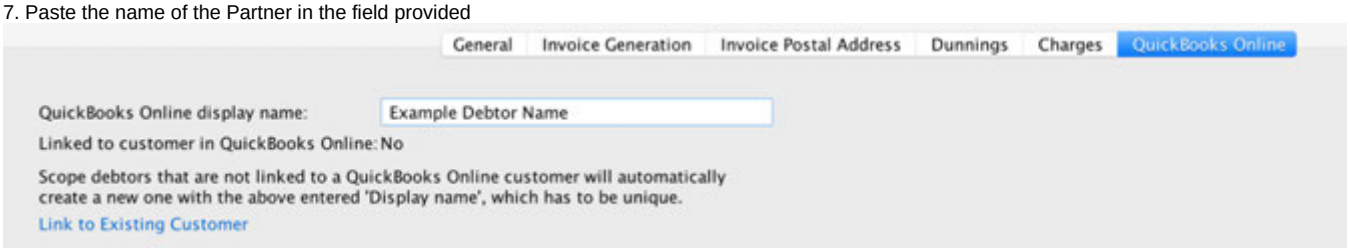
i.
b. If a match exists and it is correct click save, if not continue to Step 7
c. Return to the Partner, Role, Debtor, Validate Link
d. Add the account number reference as a suffix to the name

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



e. Done

7. Paste the name of the Partner in the field provided



a. add/type in the suffix (D/######) the ###### should be the account number generated in the debtor role

b. Click Save

8. Re-Select Partner, Select Roles, Go to QuickBooksOnline Tab, verify you see the link confirmation between Scope and QuickBooksOnline

9. After applying the link between the partners in Scope and QBO Online, if there is a transaction that as halted (AR/AP) Due to the partner not being linked, re-send it to QBO. Please see the “How To: Use the Accounting Appliance to ReSend Items to QBO”

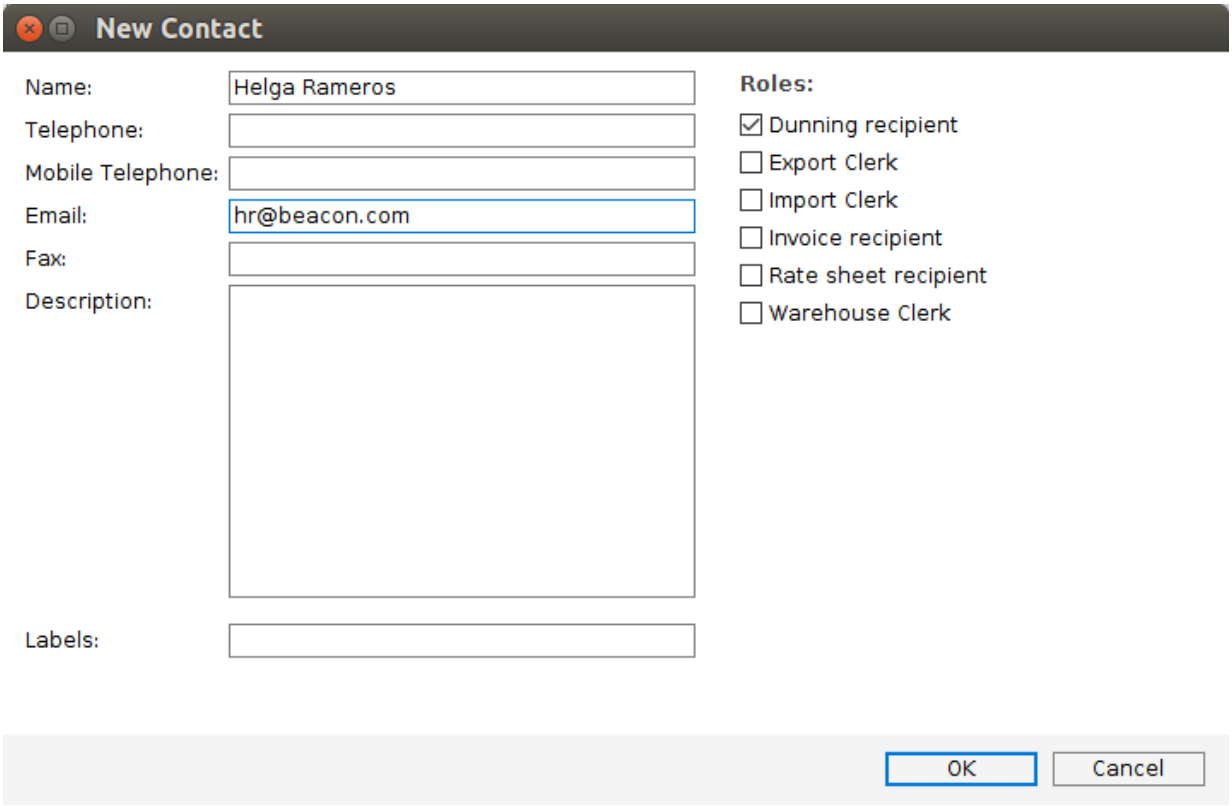
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Create Customer Statements and Dunning Statements

- Add a Contact with the role Dunning Recipient
- Open the Payments Module
- Select the Debtor
- Choose from the Statement options
- Viewing Statements and Dunning Statements

Add a Contact with the role Dunning Recipient

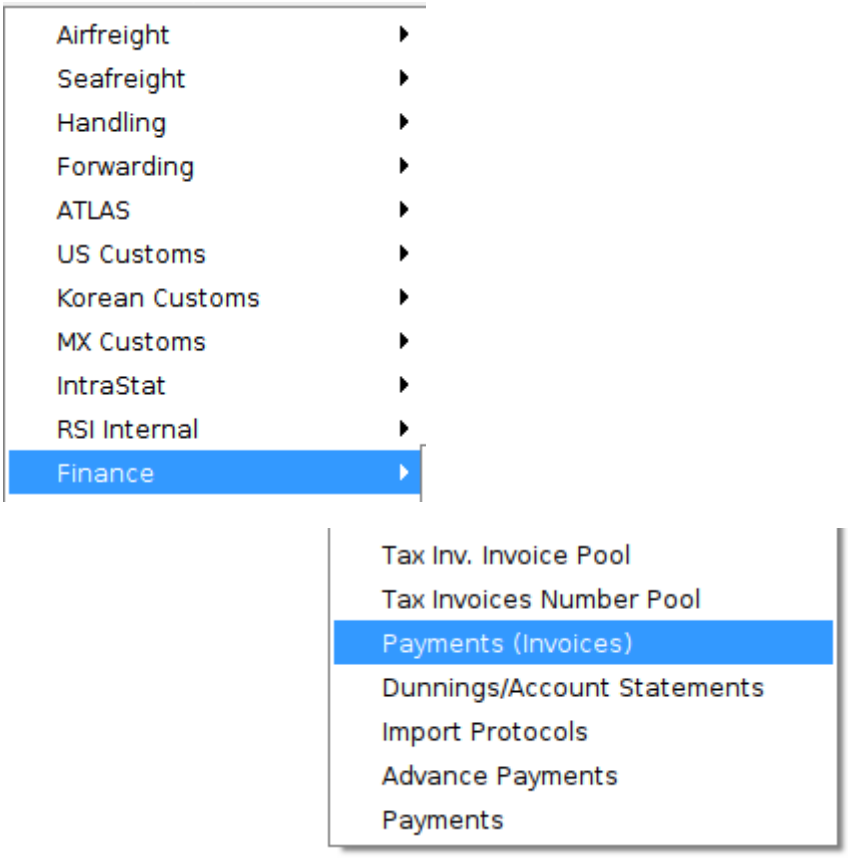
Before running a statement or dunning statement, open the partner who will receive the statement and make sure that in the "Contacts" tab that there is a contact entered who has the role "Dunning recipient" and a valid email.



Open the Payments Module

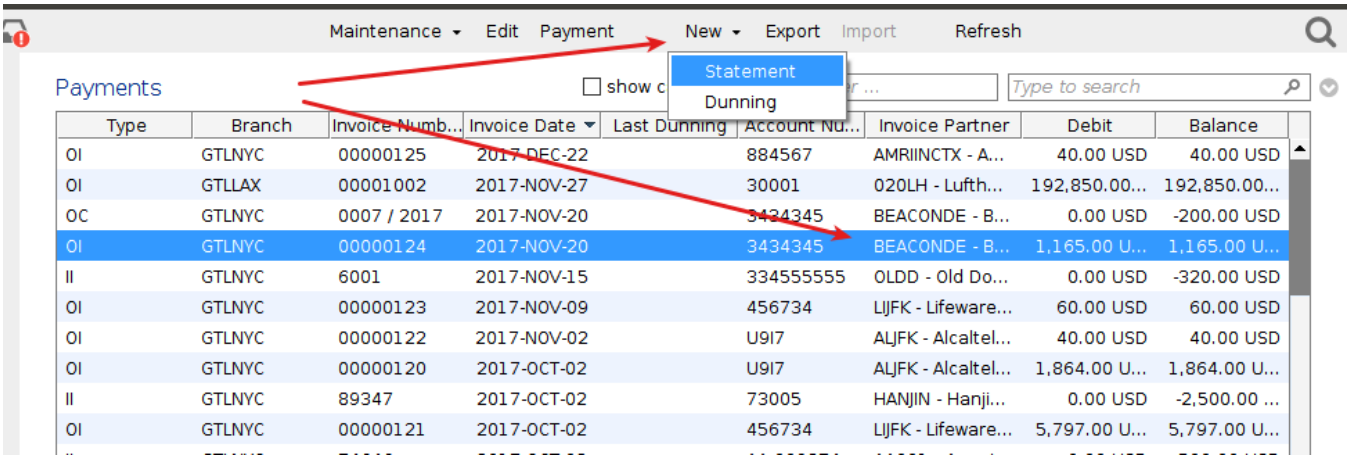
Navigate to the Payments (Invoices) Module and open it:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



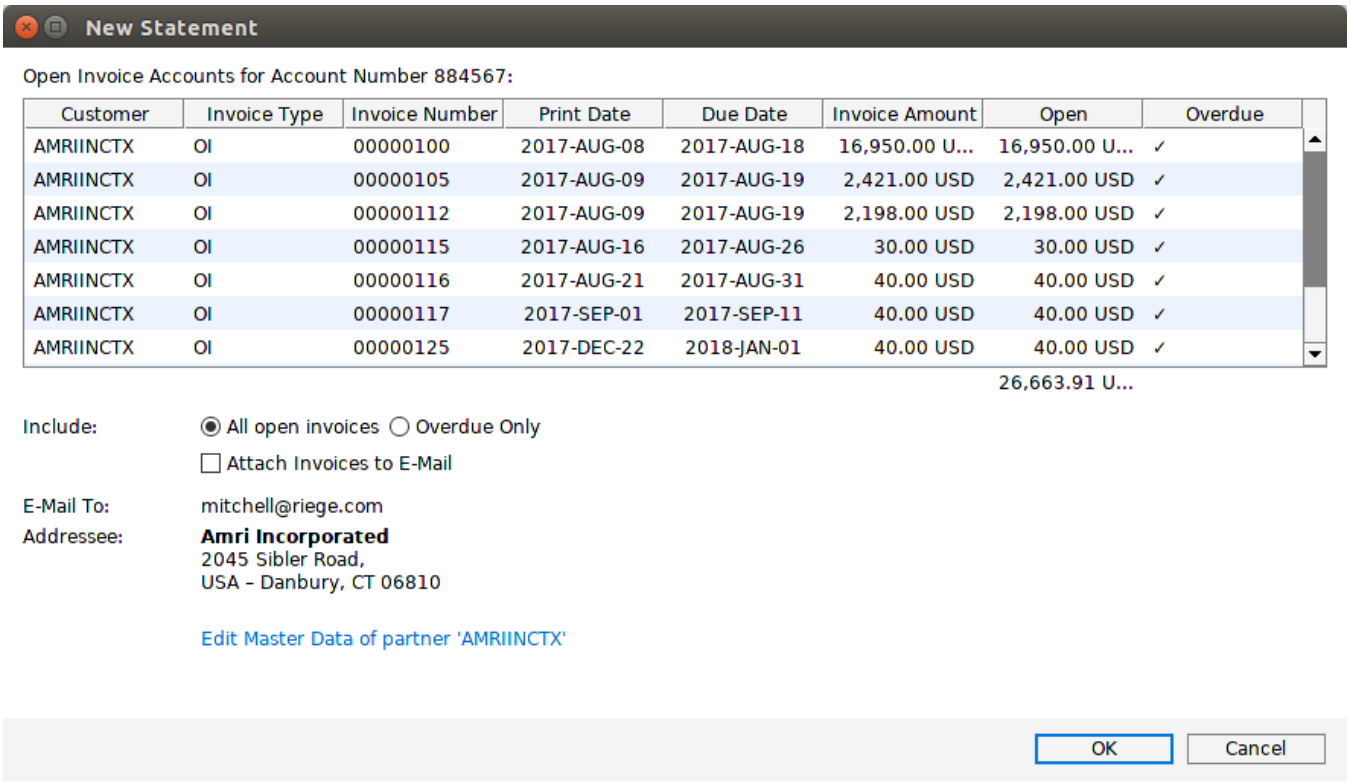
Select the Debtor

1. In the payments overview, select the debtor you wish to create a statement or dunnings statement for by highlighting them in the overview.
2. Next, click the button on the menu bar labeled "New".
3. Now, select either a "Statement" or a "Dunning"



Choose from the Statement options

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

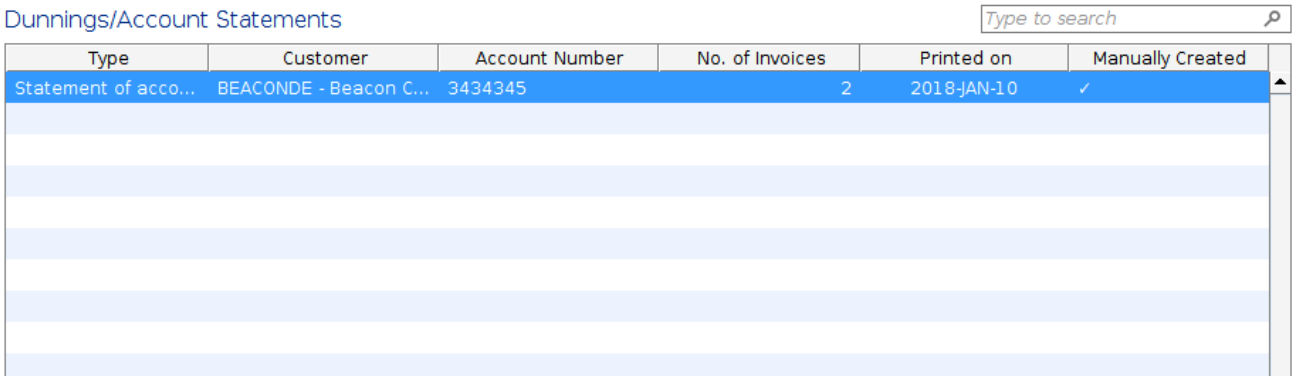


Click "OK" to generate the statement and this will be emailed to the contact listed in the first step above.

Viewing Statements and Dunning Statements

In the "Finance" sub-menu, open the module "Dunnings/Account Statements"

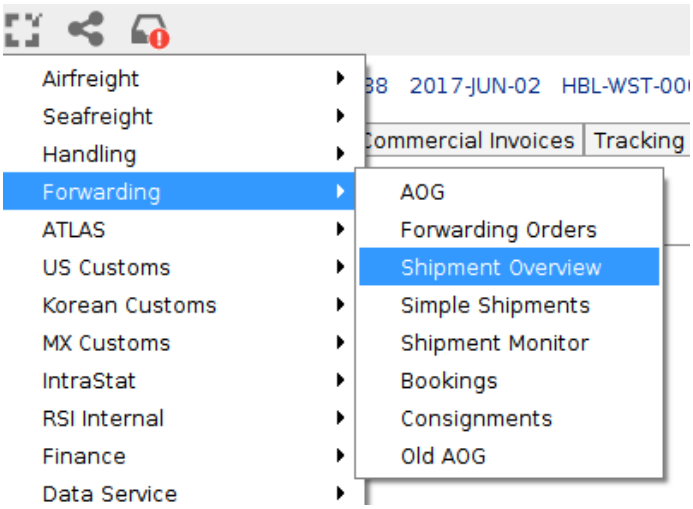
This will show an overview of all statements produced by the above process:



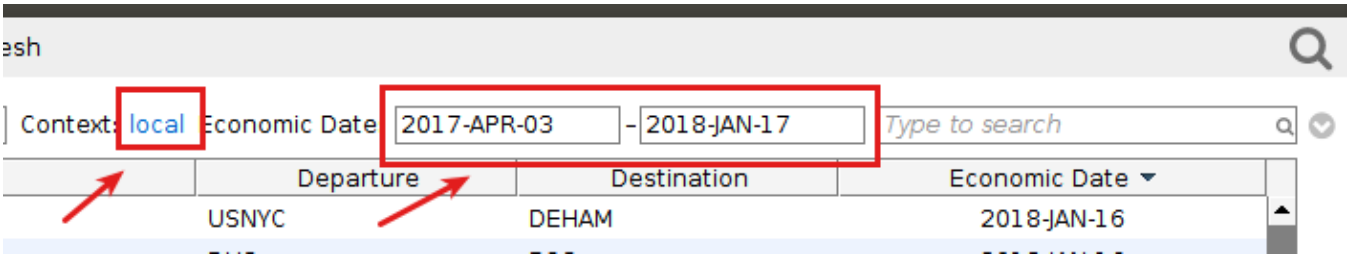
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To do a customer turnover report in Scope

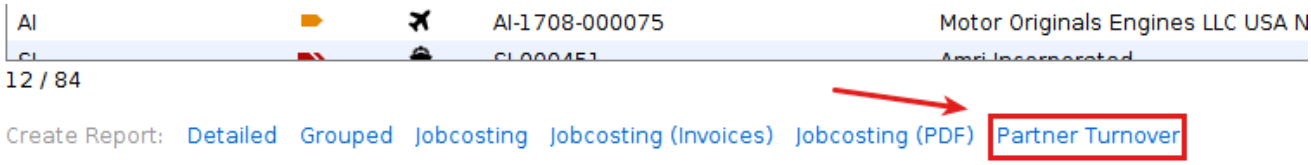
Navigate to the shipment overview



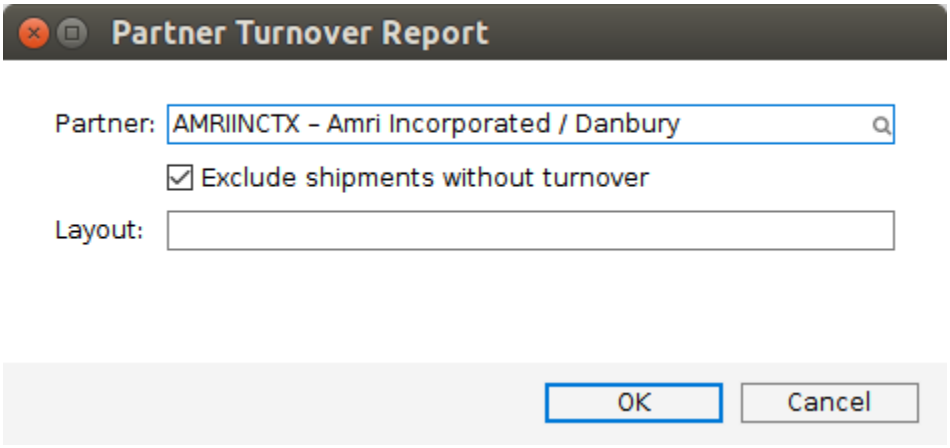
In the Shipment overview chooses the branches you want to include (context) and the date range



Now, at the bottom of the screen, choose the report "Partner Turnover"



A pop-up window will appear. Enter the partner whose turnover you would like to report on



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

You can design a layout for the partner use the layout tool. If you do not have a layout, leave this field blank and the standard report will be used.

Click "OK" and the report will be generated as a spreadsheet.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To use AP Imports

- What is AP Imports ?
- Creating a layout for the vendors spreadsheet
  - Navigating to the Accounts Payable Layouts
  - Creating a new layout
    - General tab - General section
    - Data columns
    - Additional parsing information
    - Reference columns
  - Charges tab
- Importing vendor's payables from a spreadsheet
  - Navigating to AP Imports
  - Importing a CSV file

What is AP Imports ?

Normally when a vendor submits an invoice for a service, a user will have to manually enter the invoice into Scope to convert any estimated payments from the vendor into final payments. Entering vendors costs is critical for accurate job-costing, establishing the total profit on the job and keeping track of vendors charges. However, manually entering vendors invoicing is time consuming. This manual entry of vendor invoices can be avoided if the vendor can supply his charges in spreadsheet format as these can then be imported into Scope automatically applying the vendors charges to the correct shipments.

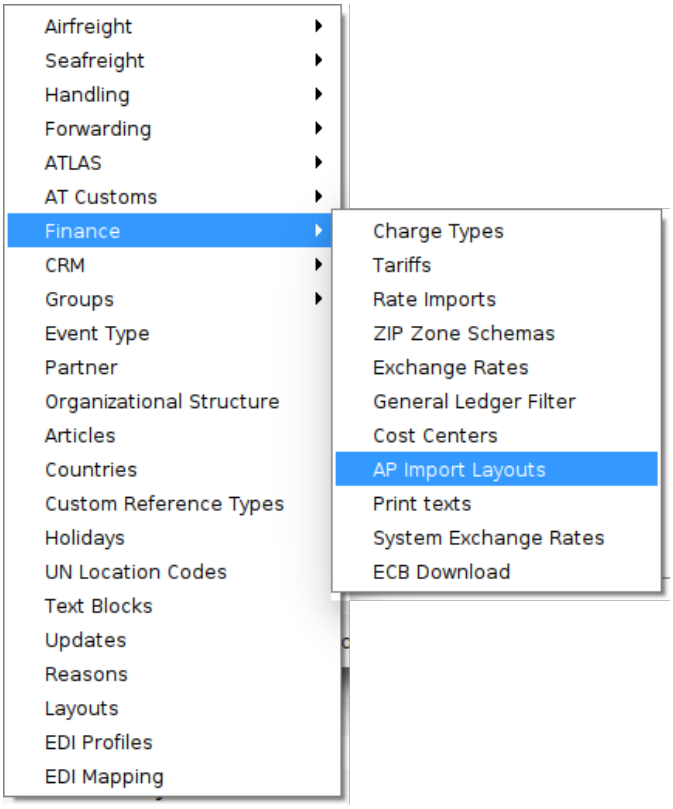
The AP Imports module is used to import charges provided by vendors in spreadsheets

Creating a layout for the vendors spreadsheet

In order to be able to import a vendor'd payables spreadsheet into Scope, a layout needs to be created in Scope that tells Scope what is in the vendors spreadsheet, for example Scope will need to know which column has the shipment number to which the cost applies, Scope will also need to know which column in the spreadsheet has the cost of the service provided by the vendor. These details and more and stored in the a vendor's layout and these are created in the "Accounts Payable Layouts"

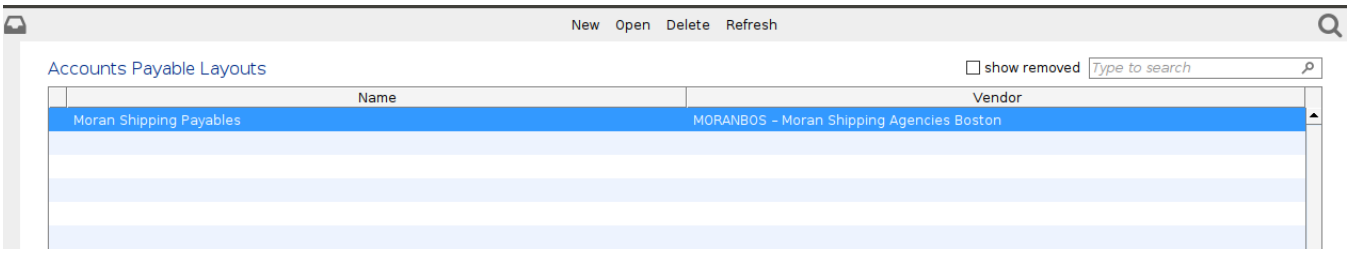
Navigating to the Accounts Payable Layouts

From the main Scope menu choose "Master Data" and in this menu choose "Finance", then in the Finance sub-menu choose "AP Import Layouts"



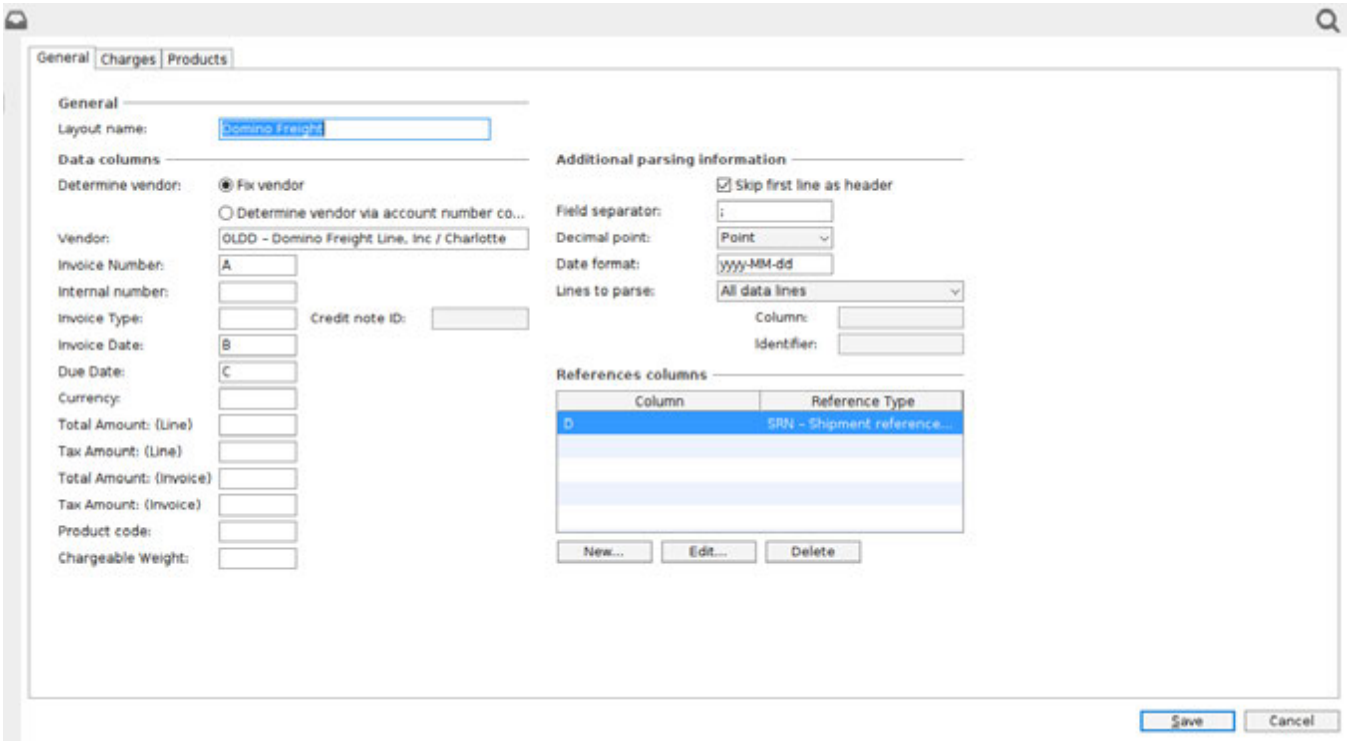
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The overview of Accounts Payable Layouts will show any exist layouts



Creating a new layout

From the toolbar at the top of the overview select the "New" option



In the example above, a basic layout has been created with the following elements:

General tab - General section

- **Layout name** - if there are many vendor layouts we need to give this new layout a name that helps us to easily identify it when we need to use it, so this one is called "Domino Freight" because it is used for payables received from the vendor called "Domino Freight"

Data columns

- **Determine vendor** - here we have the option to use a fixed vendor. The option "Determine vendor via account number column" means the vendor's spreadsheet contains their account number and this can be used to identify the vendor. In this example, since this layout will only be used when we know the vendor is "Domino Freight" they are a fixed vendor and their partner details are entered in the "Vendor" field
- **Vendor** - since this is a layout for a fixed vendor, the partner details are stored in the vendor field
- **Invoice number** - We have put "A" in this field which means that column "A" of the spreadsheet will container the vendors invoice number
- **Invoice type** - If credit notes will be imported, their values should not be negative, but it needs to be specified by a value in a column in the input file that it concerns a credit note. The value of this code is be provided in the field Credit note ID.
- **Invoice date** - here we indicate that column B has the date of the vendor's invoice
- **Due date** - column C has the date the vendor's invoice is due

Additional parsing information

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **Skip first line as header** - checking this box indicate the first line of the CSV to be imported will contain header information such as the titles of the each column and should therefore be skipped.
- **Field separator** - in CSV files, special characters are used to separate the fields. Here we indicate that in our CSV the semi-colon will be used to separate the fields
- **Decimal point** - a decimal point can be represented either by a point (period) or a comma. Choose the method found in the spreadsheet.
- **Date format** - check the way the vendor expresses dates in the CSV and input the same format in the "Date format" field so that the import routine can correctly process dates.
- **Lines to parse** - In a simple CSV file, it may be sufficient to parse (read) "All data lines". But it there is data that should be excluded, then the desired lines can be identified by choosing "Identify lines by column value". Alternatively, lines can be excluded by choosing "Skip lines by column value". If either of these latter options are chosen, the following field "Column" and "Identifier" are used to create the filter.

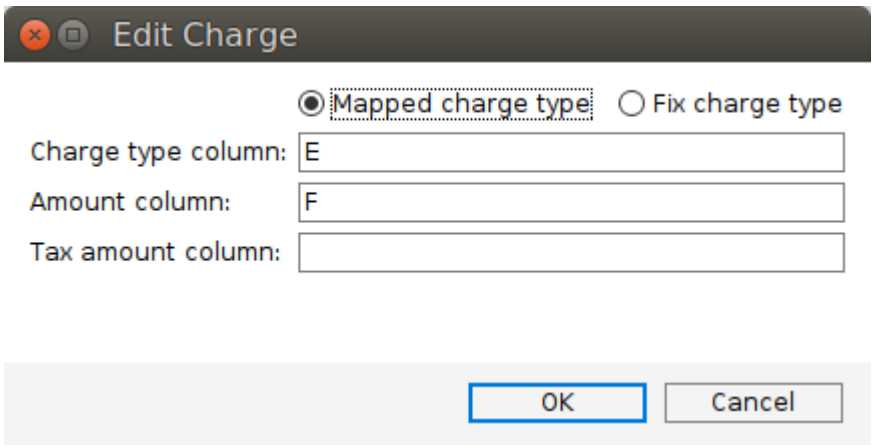
Reference columns

Shipments in Scope can contain an extensive list of references, for example; shipment numbers, purchase order numbers, suppliers references and many more. These references are critical in applying the incoming vendors charges to the correct shipment and therefore the "References columns" is used to identify which columns have the references that links a charge to the correct shipment. At a minimum the shipment number is provided to the vendor as the reference to use when billing for a service and therefore in the example the reference type "SRN" is used since this represents the shipment number. In the example it is also indicated that this reference is in column D.

Charges tab

Once the "General" tab of the layout is complete, the "Charges" tab must be completed. This tab is comprised of the "Charges" window and the "charges type mappings" window

- **Charges** - use the charges window to indicate which columns hold the charge type and the column holding the amount of the charge. Use the "New" button to insert these details. A charge editor appears when the charge details are entered



- **Charge type mappings** - There are two options. If the CSV file uses Scope charge codes, then no mapping is needed. It is more likely that the vendor has their own charge codes and these need to me mapped to the corresponding Scope charge code. In the example, the vendor's charge code "DTC" is the same charge and the Scope charge code "TRK". Similarly, the vendor's charge code "DHC" is the same charge and the Scope charge code "SP1".

below is a snippet of a CSV file that should be successfully imported by the above layout

	A	B	C	D	E	F	G	H	I
1	InvoiceNumber	InvoiceDate	DueDate	ShipmentNumber	ChargeCode	Net	Tax	Total	
2	47110815	2020-07-29	2020-08-29	AI-2005-000290	DTC	100	0	100	
3	47110815	2020-07-29	2020-08-29	AI-2005-000290	DHC	300	0	300	
4									
5									

Importing vendor's payables from a spreadsheet

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

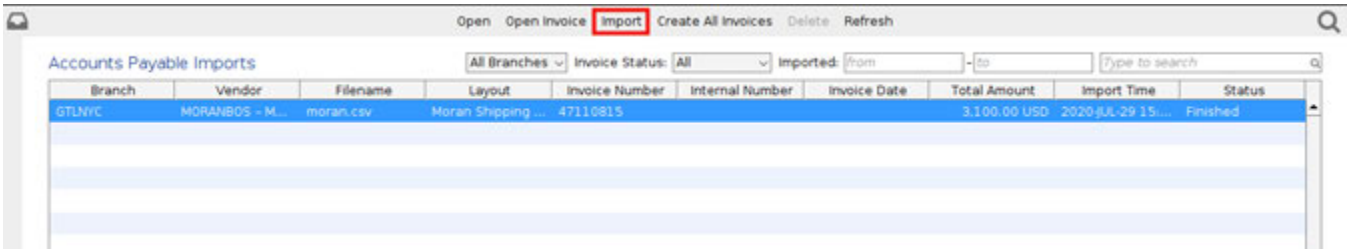
Once a layout has been defined that matches the spreadsheet provided by the vendor, a spreadsheet from the vendor can be imported into Scope to automatically update shipments with the vendors charges and convert any estimates charges to full payables.

Navigating to AP Imports

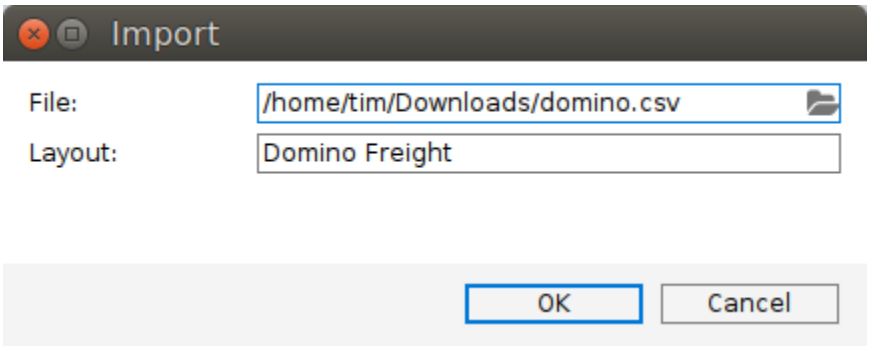
From the main Scope menu choose "Finance" and in the "Finance" sub-menu choose "AP Imports". This will present a view of all AP imports in progress or completed. The tool bar at the top of the overview shows the actions that can be taken in the module

Importing a CSV file

From the tool bar at the top of AP Imports, choose "Import"



An "Import" dialogue will appear

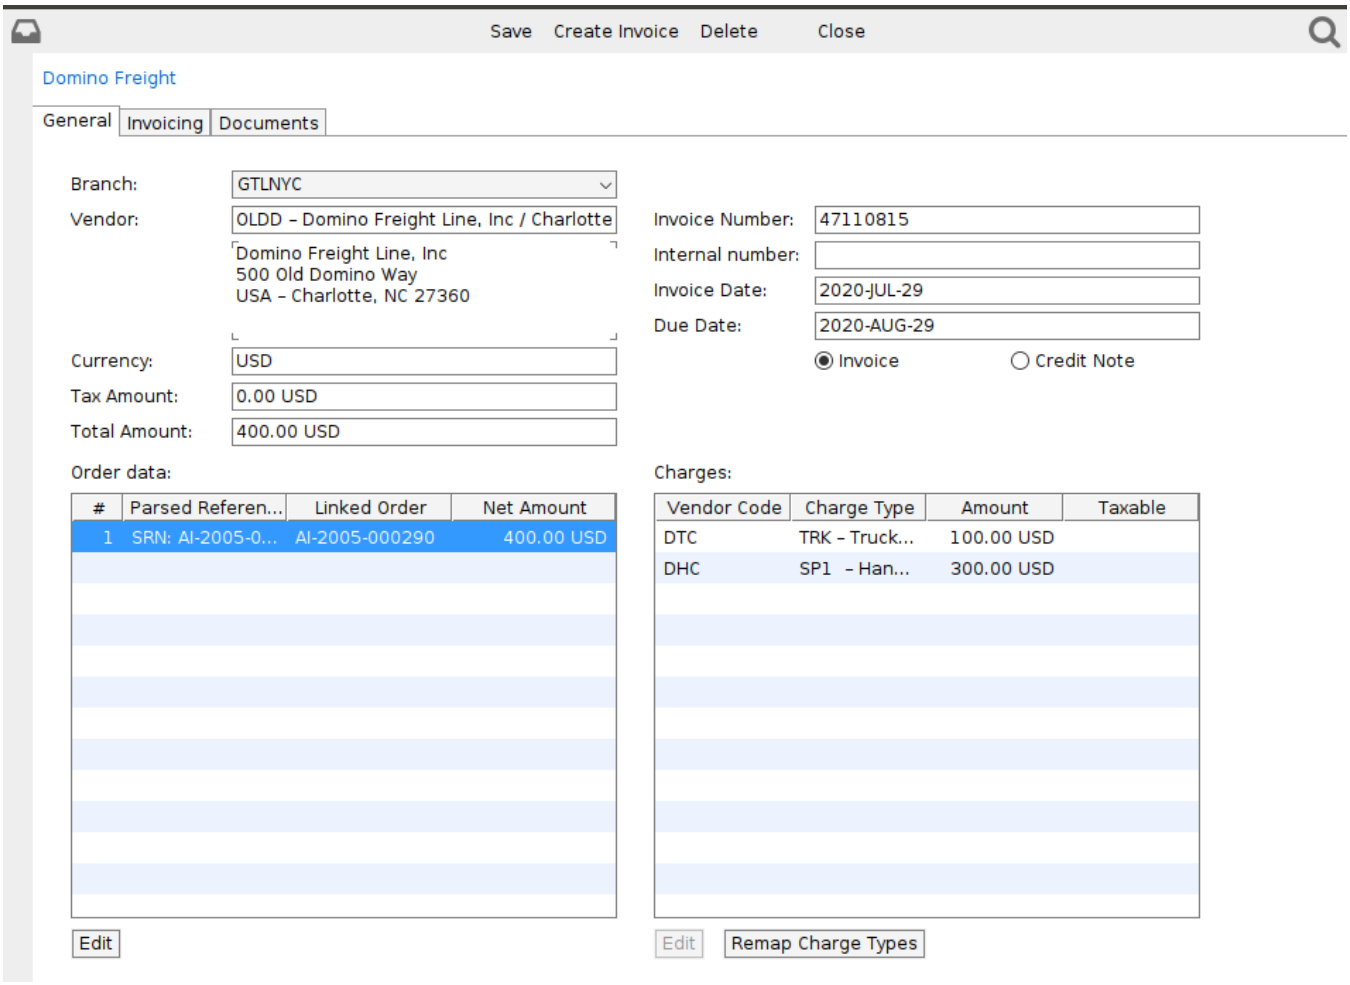


- **File** - use the file field to select the directory and CSV file on the local computer that is to be imported
- **Layout** - In the layout field find the layout that has been created which correctly maps the CSV file that is going to be imported

Click "OK" when ready

If the CSV file can be parsed by Scope, a pre-invoice view will appear. This can be used to check all the details that will be imported into Scope and any adjustments can be made

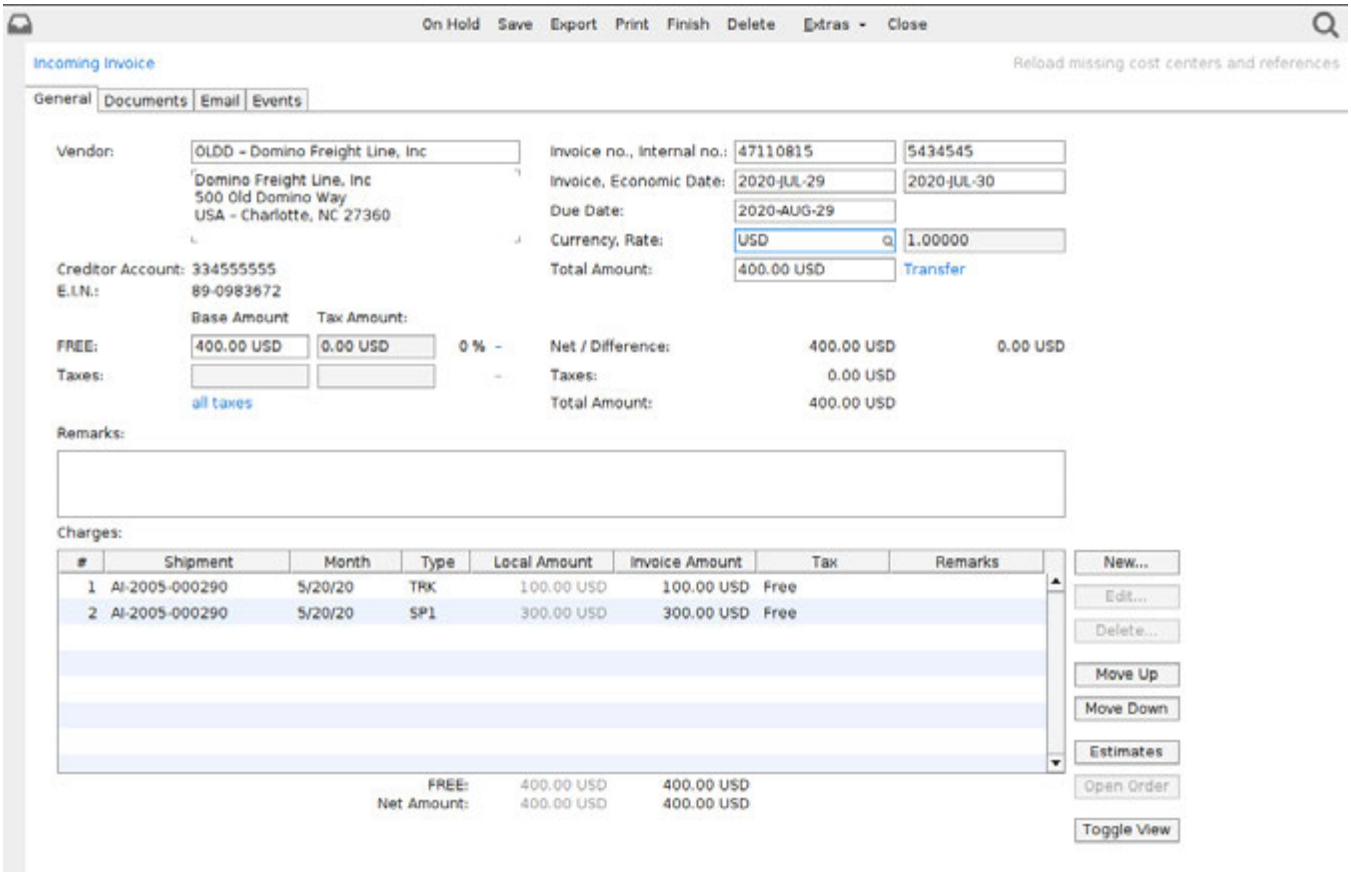
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When all the details are correct, use the "Create Invoice" option on the tool bar at the top.

The standard "Incoming Invoice" will appear, use this to complete and "Finish" the incoming invoice from the vendor. You can use the button Toggle View to show the amount of the related estimate, if a related estimated was found. This allows you to compare the amount estimated with the amount of the invoice.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-to use the Credit Limit

- Applying a Credit Limit to a Debtor
- An example of the Credit Limit check blocking a customer
- Unlocking a credit checked partner

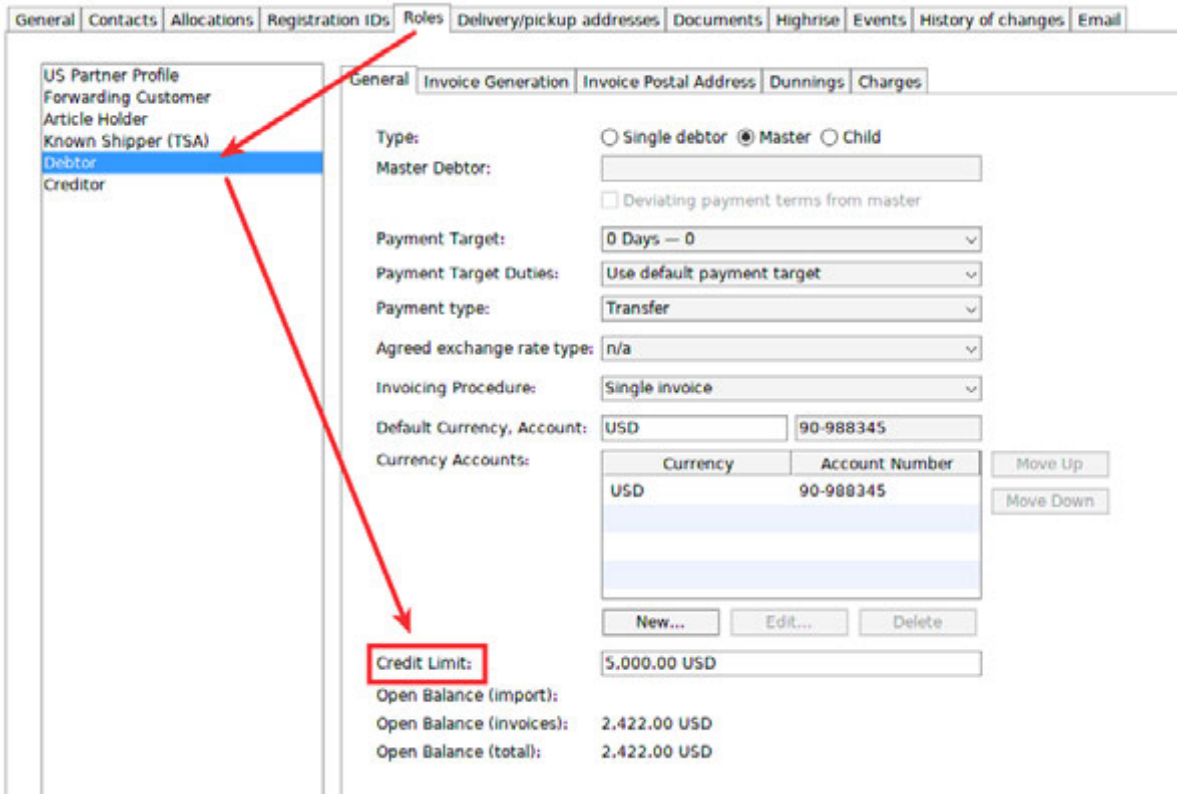
In Scope, a credit limit can be applied to each customer. When the customer exceeds their credit limit the user can be prevented from creating new shipments or new invoices for the customer.

If you would like this feature to be available on your Scope system, ask your system administrator to activate it.

Applying a Credit Limit to a Debtor

Once the Credit Limit feature is active, the credit limit for a customer is stored in the customer's "Debtor" role.

- Open the customer in partner maintenance
- Go to the role "Debtor"
- In the "Debtor" role, on the main tab "General" you will see the field "Credit Limit".



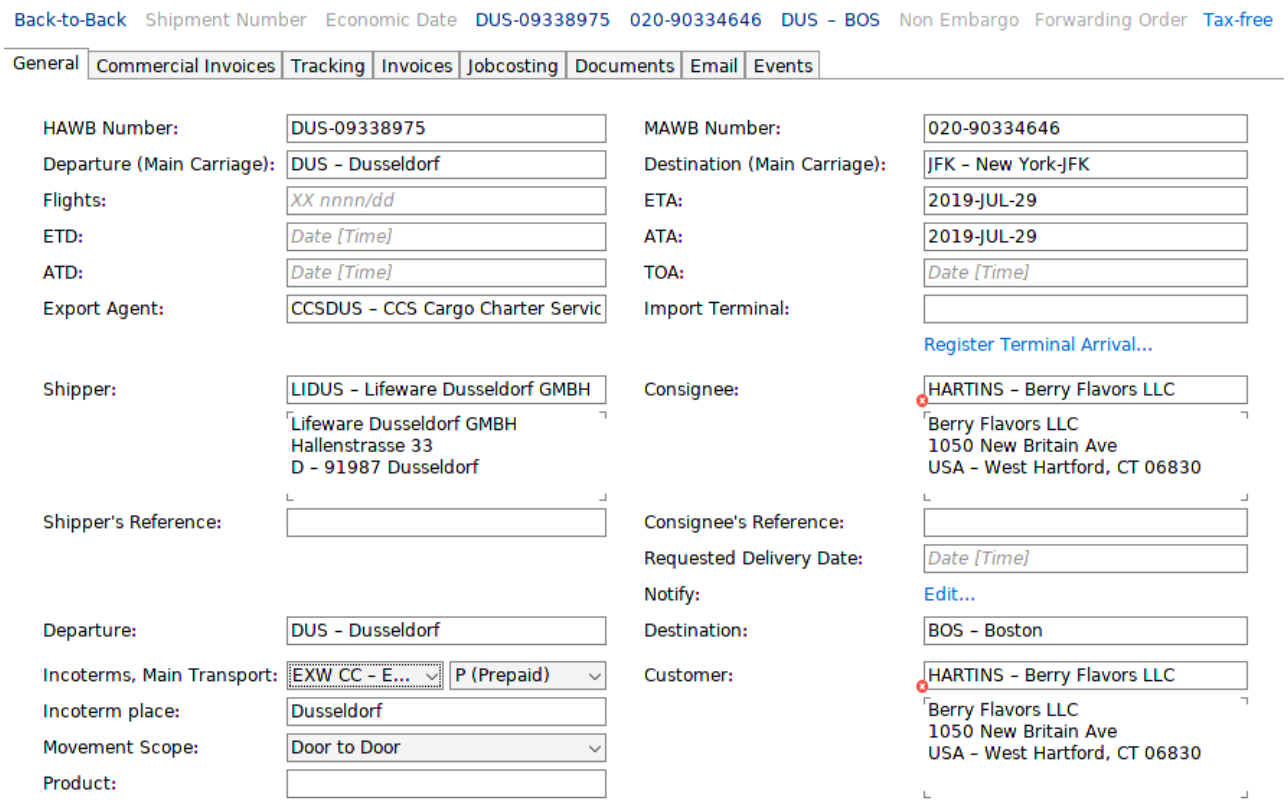
In the field "Credit Limit" enter the amount of credit you will extend to the customer.

Note the "Open Balance" details below the "Credit Limit" field, these show the unpaid balances still owed by the customer. These figures will be considered when determining the current total amount of credit available to the customer.

An example of the Credit Limit check blocking a customer

In the example below, the customer "Berry Flavors LLC" are blocked from use in a new shipment and we see the error:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Unlocking a credit checked partner

When a partner is blocked from use in new shipments there are 2 options

1. A user with authority may adjust the partners credit limit and increase the amount of credit allowed
2. A user with authority may over-ride the credit check, create a shipment and issue and invoice despite the customer exceeding their credit check.

Give your system administrator a list of users who may change the permitted credit amount and a list of users who may over-ride the credit check

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-to use ZIP Zones

- Navigate to Zip Zones
- Creating a Zip Zone Schema
  - Creating ZIP Zones within a schema
  - Editing ZIP codes
- Applying ZIP Zones to tariffs
- Using a ZIP Zone based tariff within an Invoice

Often a charge such as a delivery charge is billed based on the ZIP code of the delivery address. The delivery tariff for ZIP codes that are in close proximity to one another may be the same and therefore these ZIP codes can all be grouped together in a single ZIP zone. When billing is done, Scope can use these ZIP zones to automatically calculate the correct charges for a service that is based on the ZIP code of the pickup or delivery address.

This How-To explains how to create and use these ZIP zones.

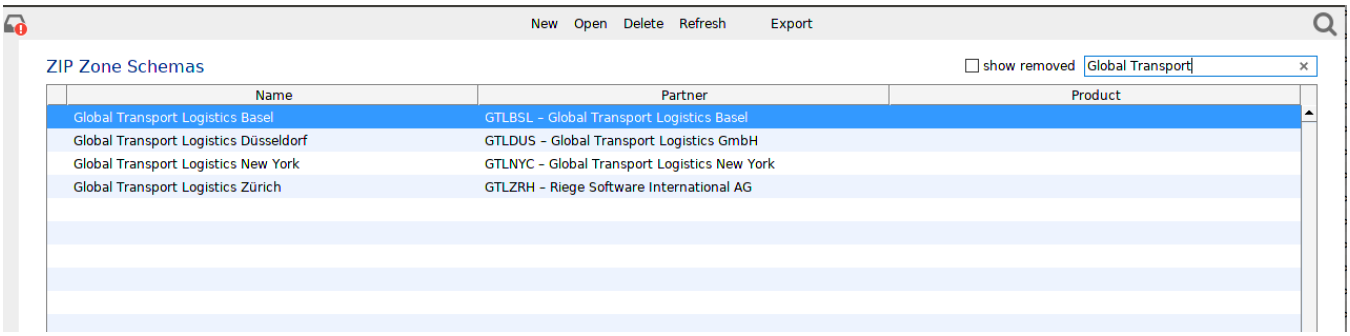
Navigate to Zip Zones

To open the Zip Zones module:

1. From the Scope menu, choose "Master Data"
2. In the "Master Data" menu, choose "Finance"
3. In the "Finance" menu, choose "Zip Zone Schemas"

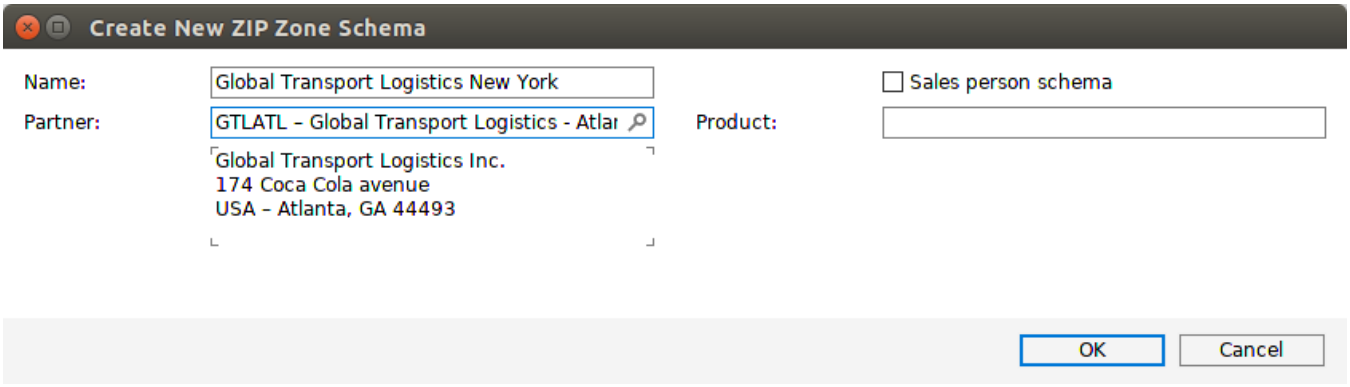
Creating a Zip Zone Schema

The Zip Zones module will show an overview of all existing Zip Zones



Click "New" on the tool bar at the top to make a new Zip Zone Schema

1. Give the new Zip Zone Schema a name
2. Apply the partner address of the branch where the Zip Zone Schema should apply
3. Click "OK"



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

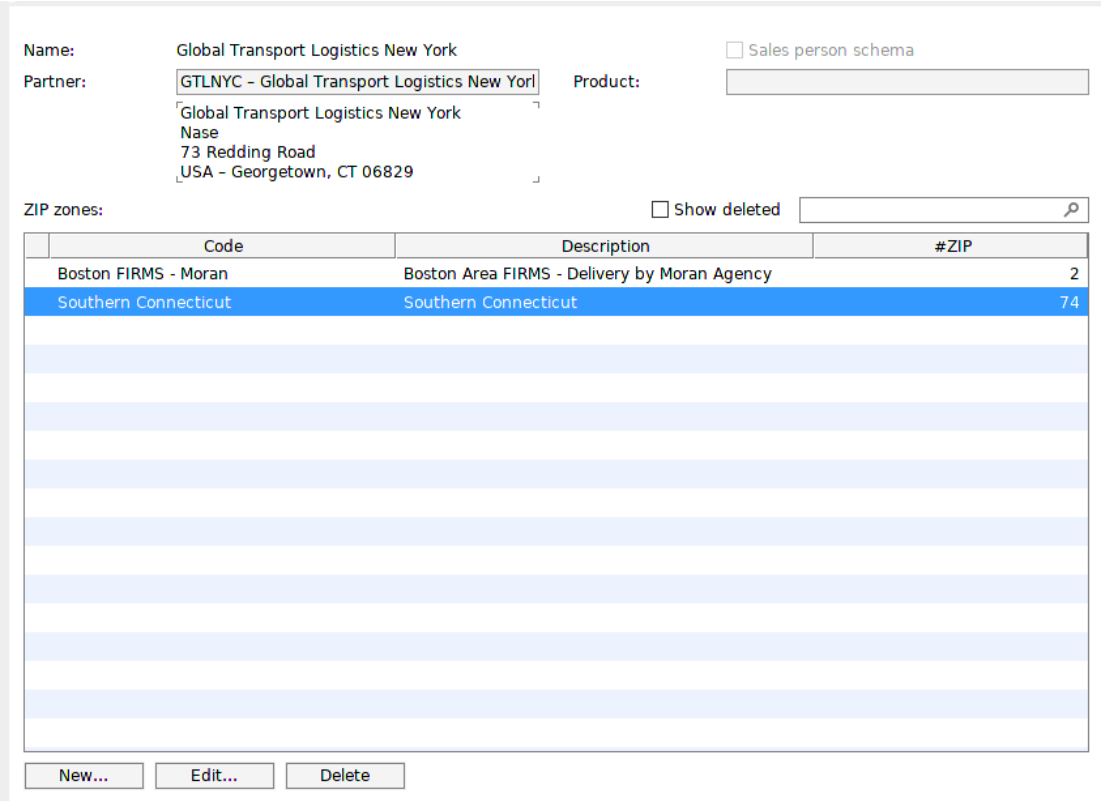
Creating ZIP Zones within a schema

Now that the ZIP Zone Schema is created for the branch, the actual ZIP zones can be created.

1. Open a ZIP Zone Schema
2. Any existing ZIP Zones will be shown
3. Add a new ZIP Zone by clicking "New" at the bottom of the list of ZIP Zones

In the example below the ZIP Zone schema for the branch GTLNYC is shown and so far there are 2 ZIP Zones for this branch:

- **Boston FIRMS - Moran**: These are ZIP Zones used when a vendor called "Moran Agency" delivers to some Boston FIRMS facilities.
- **Southern Connecticut**: These are ZIP Zones for the Southern Connecticut area



When making a new ZIP Zone:

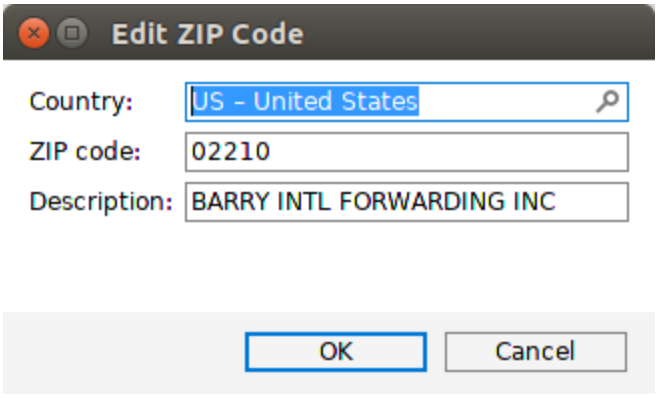
- Give the ZIP Zone a meaningful code name
- Use the description to add a fuller description of the ZIP Zone
- Click "New" to a single ZIP code to the Zone
- Click "Enter Range" to enter a start ZIP code and an end ZIP code to automatically generate a range of ZIP codes to be included in the Zone.
- A range of ZIP codes can also be imported from a spreadsheet by clicking "Import"

Editing ZIP codes

When new ZIP codes are added, each must have

1. The country where the ZIP is located
2. The ZIP Code
3. A description of the ZIP Code

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Applying ZIP Zones to tariffs

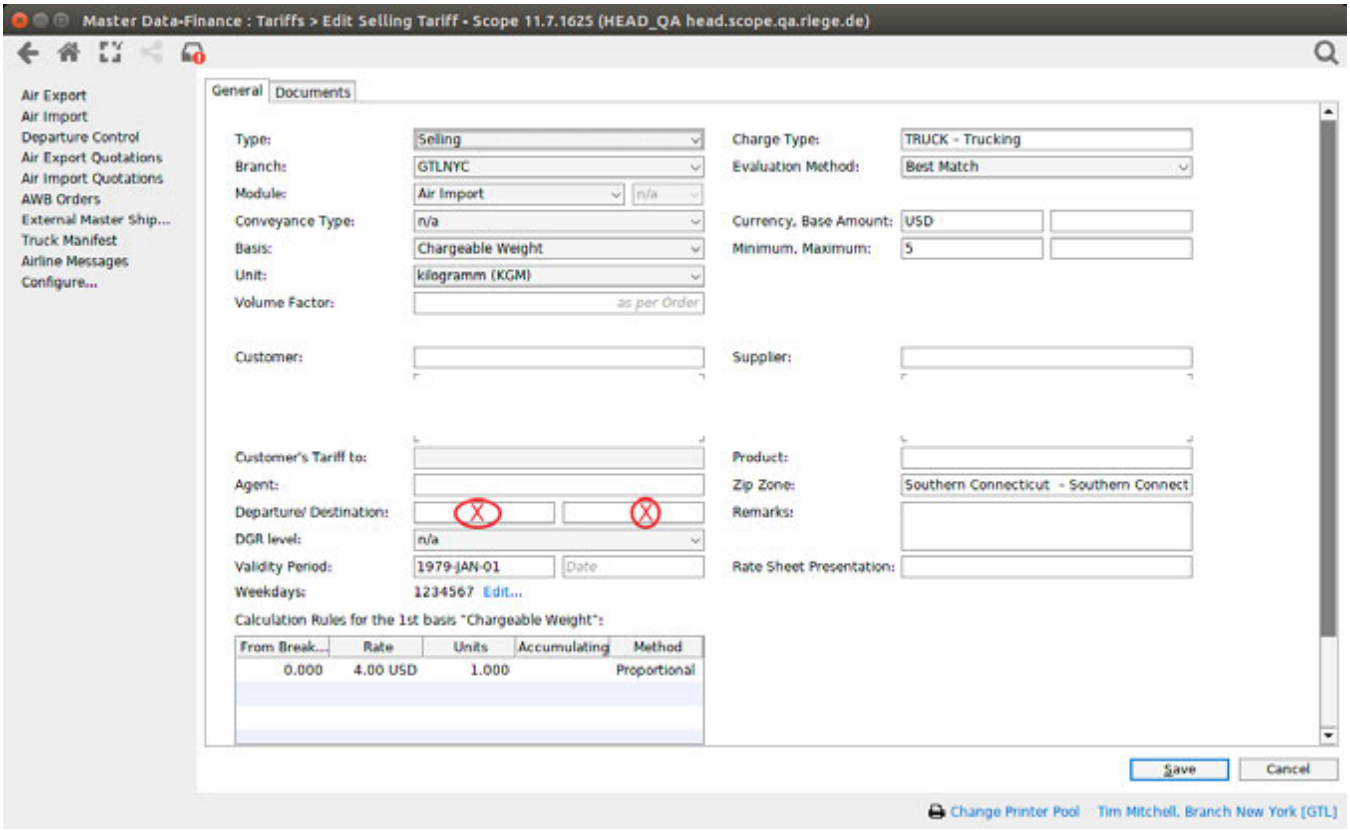
Once ZIP Zones have been created, they can be used in tariffs to assist in the automatic calculation of charges on invoices.

Below is an example of a simple tariff using ZIP zones

The important points to note about this tariff

- **Type = Selling tariff** - it is also possible for ZIP Zones to be used in a buying tariff
- **Branch = GTLNYC** - a ZIP Zone is branch specific, therefore a single branch must be chosen for the tariff, it cannot apply to multiple branches.
- **Departure and Destination** - these must be left blank when using ZIP Zones, since the tariff will use the ZIP code to determine if the tariff is applicable
- **ZIP Zone = Southern Connecticut** - this tariff will be considered when invoicing for any shipment delivered to a ZIP code included in the range of Southern Connecticut ZIP codes.
- **Customer** - it would be possible to include a customer if the tariff is specific to a customer
- **Supplier** - it would be possible to include a supplier if the tariff is specific to a supplier. For example the supplier could be a trucker with whom rates for deliveries to Southern Connecticut ZIP codes are stored.

When the "Zip Zone" field shown in the screen below is active, it is possible to search existing ZIP Zones in order to select the correct one.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

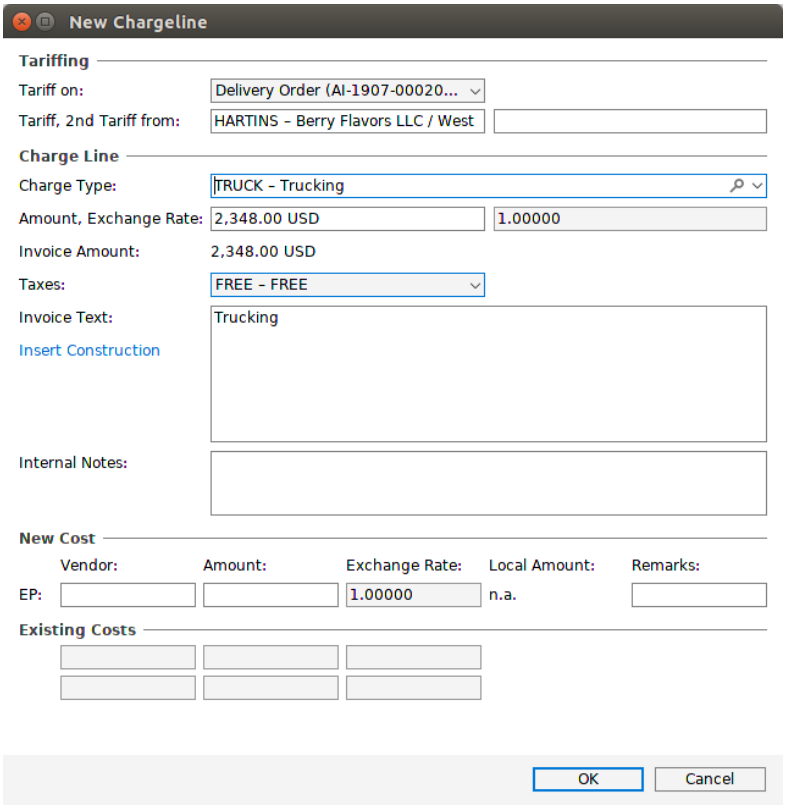
Using a ZIP Zone based tariff within an Invoice

Once the ZIP Zone tariff has been created, it can be used in an invoice.

Important points to ensure the tariff is found:

- Since ZIP Zones are generally applied to delivery or pickup notes, the shipment for which the invoice is being created must have a delivery or pickup note created and the delivery or pickup address must have a ZIP code corresponding to a ZIP code in the tariff.
- When adding a charge line, you must specify the tariff is applied to either the Delivery or Pickup Order

The example below is for an air import shipment with a delivery note, therefore "Delivery Order (AI-1907-00020.." is selected as the "Tariff on". As soon as the charge type "TRUCK" is used, The "Amount" field auto-completes with $2,348.00



If the tariff is not found, click the "Show tariffs" option in the "Amount" field. The search criteria show at the top of this window will show the criteria from the shipment that Scope is using to try to find the right tariff. This can be used to trouble-shoot tariffs.

How-To for CargoSteps

- FAQ CargoSteps - Does CargoSteps have route optimization for the driver?
- FAQ CargoSteps - How is the process for the driver, if the number of pieces do not match with the order in his app?
- FAQ CargoSteps - Using Google Maps, does it mean that it can be used by forwarders/truckers in other countries like Singapore or China?
- FAQ CargoSteps - What happens if there is no cellular coverage (eg army camps) for the driver's phone?

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ CargoSteps - Does CargoSteps have route optimization for the driver?

CargoSteps only allocates the taken route and can showcase the current position of the truck via Google Maps at this stage. The planning of the route and route optimization is in hand of the trucker choosing the corresponding tool, eg. the given routes by Google Maps are already live traffic optimized, which can be easily accessed by CargoSteps.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ CargoSteps - How is the process for the driver, if the number of pieces do not match with the order in his app?

If there is any problem, dispatchers usually want drivers to call them and ask what to do instead of deciding for themselves. This has many reasons and this is why CargoSteps doesn’t enable drivers to change anything. Dispatchers need to be in control and make the decisions and changes: for example they have the option to change the number of pieces in the CargoSteps Web-interface or cancel the order completely.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ CargoSteps - Using Google Maps, does it mean that it can be used by forwarders/truckers in other countries like Singapore or China?

The connection from CargoSteps to Google Maps can be used in every country except China. However, CargoSteps already found another map provider for the Chinese market. So, if requested, CargoSteps can connect to that alternative map provider.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ CargoSteps - What happens if there is no cellular coverage (eg army camps) for the driver's phone?

It is no problem, if there temporarily is no cellular coverage: the driver can still perform pup/pod functions on his mobile phone, which will be transmitted to Scope as soon as the driver's phone has access to internet again.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To for CRM

- FAQ How-To apply sales commission to shipments
- FAQ How-To create a quotation
- FAQ How-to set up Reason Codes
- How-To Create and Manage Sales Persons in Scope Forwarding

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To apply sales commission to shipments

- Introduction
- Identifying the commission charge type
- Setting up who can view or edit sales commissions
  - Permission to view sales commissions
  - Editing sales commissions
- Applying a sales commission percentage to a sales person
- Viewing and reporting sales commissions
  - Reporting sales commission
- Calculating sales commission for shipments
- Creating refund vouchers for sales commission
- General rules for sales commission calculation

Introduction

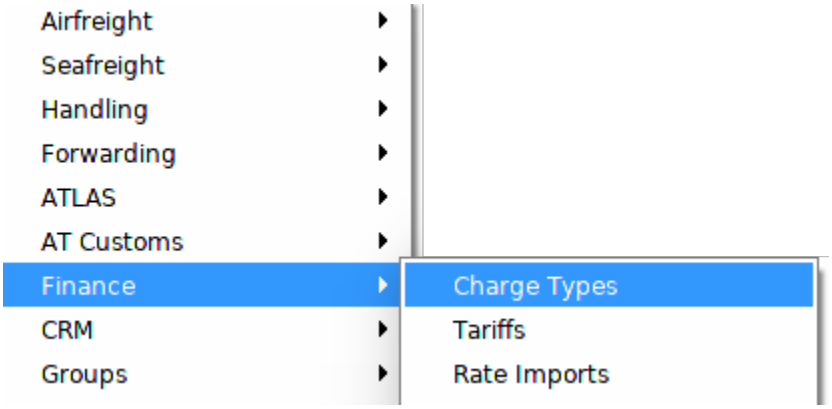
This How-To will describe how to setup percentage based commission in your Scope system for your sales people. This percentage based commission can then be applied when desired on a per shipment basis.

Identifying the commission charge type

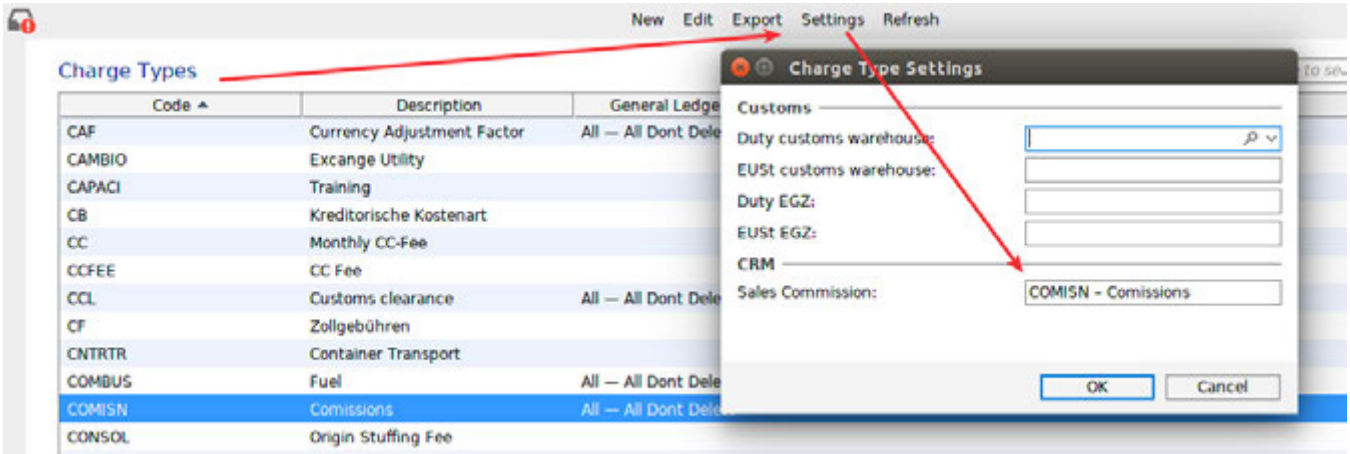
In order to apply sales commission to shipments, Scope will need to know which charge type to use for sales commission.

To setup the charge type for commissions:

1. From the Scope menu choose "Master data"
2. In the "Master data" sub-menu choose "Finance"
3. In the "Finance" sub-menu choose "Charge Types"



In the overview of charge types, click on settings.



In the Charge Type Settings, go to the field "Sales Commission" and find the charge type you would like to use for commission calculations

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Setting up who can view or edit sales commissions

Permission to view sales commissions

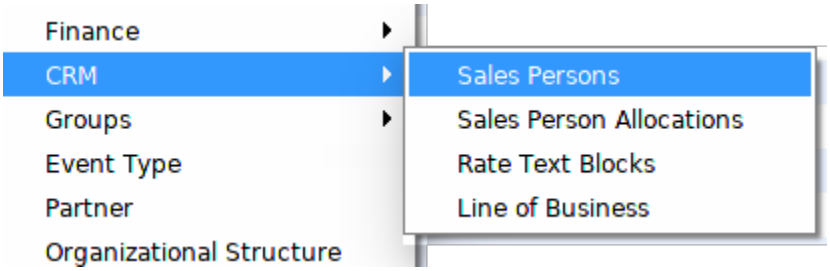
In order for a user to be able to view the sales commissions that have been applied to a shipment, the user needs to have the permission "View sales commission" added to their user profile.

Editing sales commissions

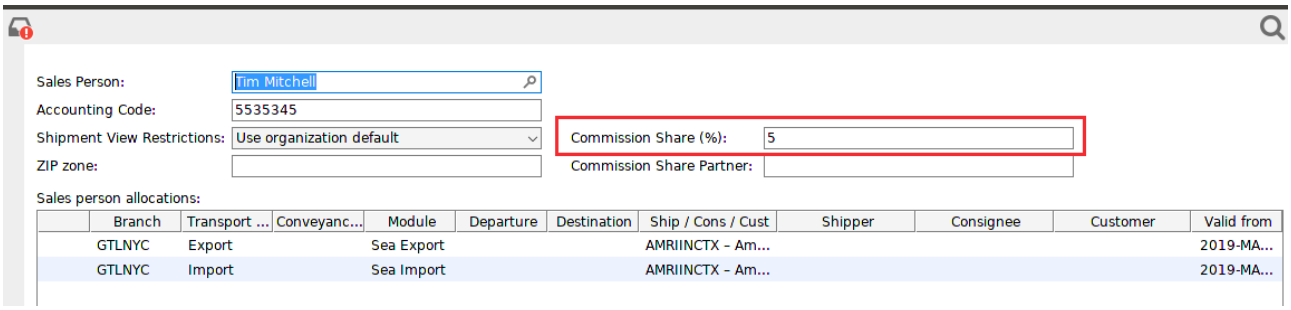
In order to apply a sales commission % to a sales person, the user needs to have the permission "Edit sales commission" added to their user profile

Applying a sales commission percentage to a sales person

1. From the Scope menu select "Master data"
2. In the "Master data" sub-menu select "CRM"
3. From the "CRM" sub-menu select "Sales Persons"



Find the Sales person who needs to have a sales commission percentage applied, edit the sales person and in the field "Commission Share (%)" enter the percentage amount the sales person will earn per shipment:



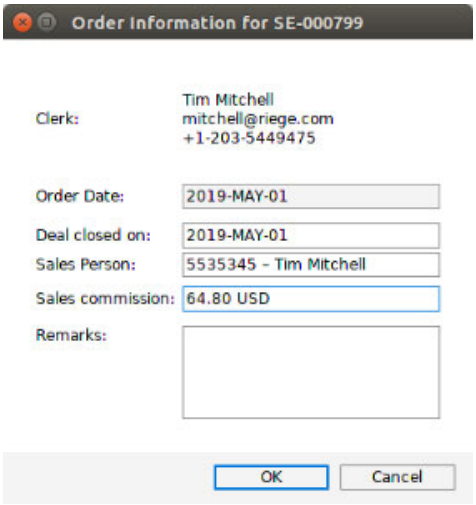
If a job costing line is to appear on the shipments for the commission, a Commission Share Partner needs to be linked to the Sales Person (having the debtor role for the credit note that can created based on these lines).

If the Commission Share Partner is missing, the commission can and will be calculated, but no job costing line will appear for it on the shipment (and no credit note can be created). It will appear in reporting.

Viewing and reporting sales commissions

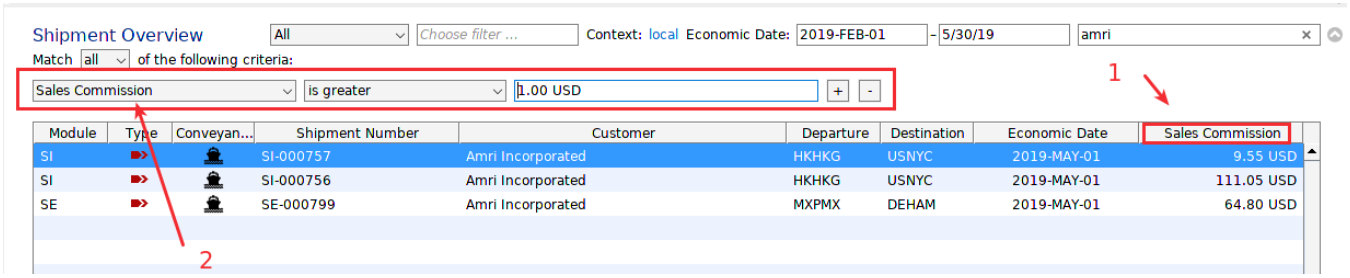
If a user has the permission to view sales commissions on shipments, this can be done directly within a shipment by pressing "Ctrl" + "i" in the shipment. The commission will be visible in the extra information about the shipment:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



For an overview of sales commissions, go to the shipment overview.

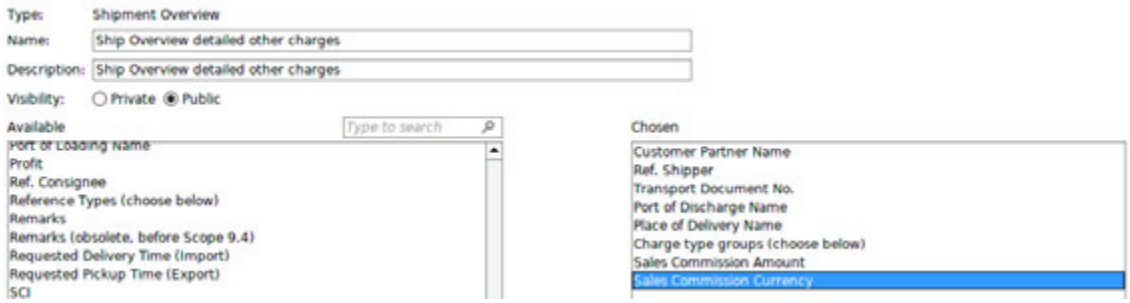
1. Add the "Sales Commission" column to the overview by right-clicking on the columns and then select "Sales Commission" from the list of available columns.
2. Use the filter "Sales Commission" to filter shipments with sales commission.



Reporting sales commission

To include sales commission on a report :

1. Got to the "Layouts" option in the Scope "Master data" sub-menu
2. In the "Layouts" choose an existing layout that is the type "Shipment Overview" or create a new report of this type
3. Open this layout and add the fields
    a. Sales Commission Amount
    b. Sales Commission Currency

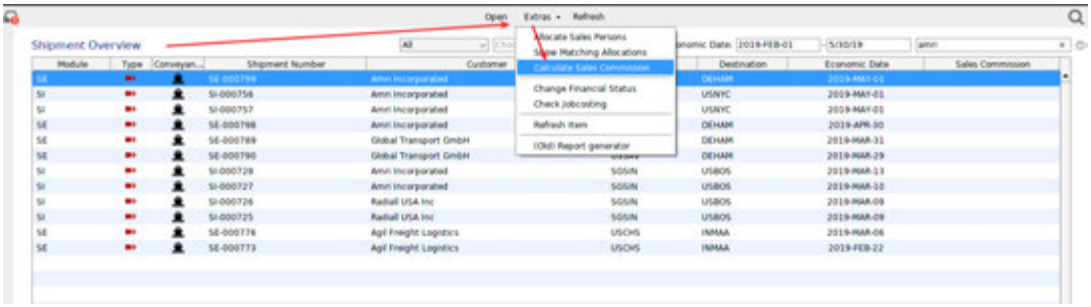


Calculating sales commission for shipments

Sales commission is not automatically calculated for shipments, this action must be done from the shipment overview

1. Open the shipment overview
2. from the "Extras" menu on the action bar, choose "Calculate Sales Commission"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



If a sales commission figure already exists on a shipment and the sales commission is calculated again, the commission will be recalculated and if necessary updated.

Creating refund vouchers for sales commission

The commission charge code is visible in the job-costing as an estimate cost . Aggregate invoices can then be created to converted to a credit refund (Note the Sales person mast have a partner applied to them in order for the sales commission to be applied to them as "Refunds" in the aggregated invoice.

General rules for sales commission calculation

- The sales commission cannot be negative
- The sales commission is only calculated, if the shipment has a sales person assigned.
- The sales commission is only calculated, if the current branch is the export agent (for export shipments), import agent (for import shipments) or supplier of the shipment. If the current branch is just the gateway for an export/import shipment the shipment will be skipped from the calculation.
- The commission is calculated based on the profit in local currency of the export/import agent or supplier of the shipment (depending on the shipment type). It is independent of any financial figures of a possibly different gateway branch as that branch may have a different local currency.
- The calculation is done regardless whether a sales commission has already been calculated or set manually on a shipment.
- If a job costing line is to appear on the shipments for the commission, a Commission Share Partner needs to be linked to the Sales Person (having the debtor role for the credit note that can created based on these lines).

How-To Create and Manage Sales Persons in Scope Forwarding

Overview

This document will show you how to:

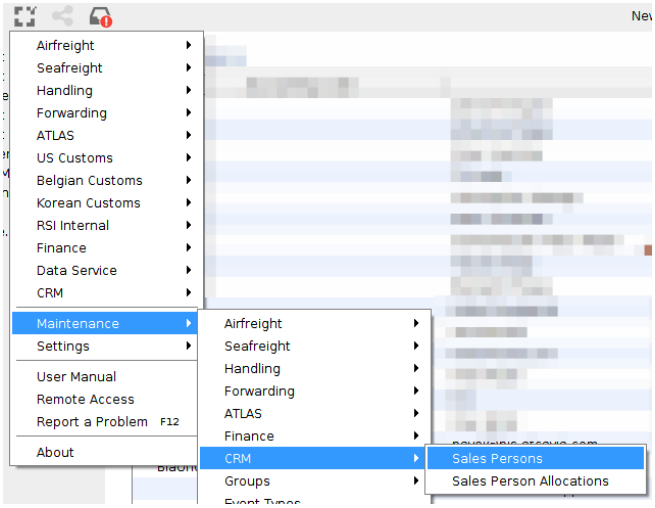
1. Create Sales Persons
2. Apply customers to Sales Persons
3. Run Sales Person reports

Creating Sales Persons

Navigating to Sales Person Maintenance

Navigate to the maintenance of sales persons from the Scope button

1. First select "Maintenance" from the main menu
2. Next select "CRM" from the sub-menu
3. Finally select "Sales Persons" from the CRM sub-menu

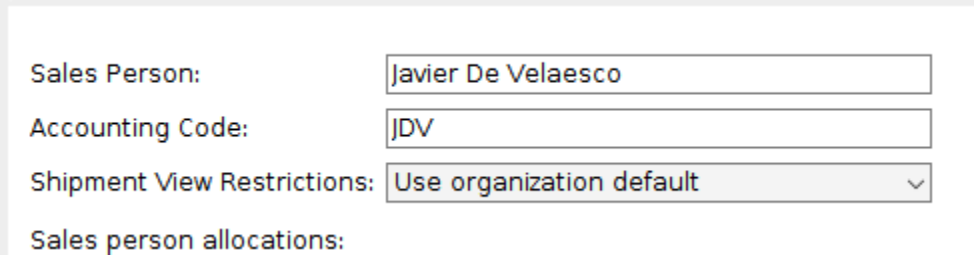


Making a New Sales Person

In the Manage Sales Persons application, select "New" at the top of the screen

In the new Sales Person application, fill in the fields

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Enter the sales person's full name in the field "Sales Person"
- Give the sales person an accounting code. In this example it is the initials of the sales person "JV"
- Set the viewing restrictions for this sales person
  - "Use organizations default" allows the sales person to see shipments as per their user profile (if they have one)
  - "No view restrictions" removes all viewing restrictions
  - "Show only own shipments" allows only the shipments applied to the sales person to be seen by the sales person

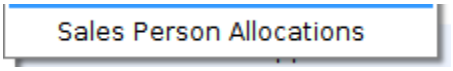
Now "Save" the new sales person.

Applying Customers to Sales Persons

Navigating to Sales Person Allocation Maintenance

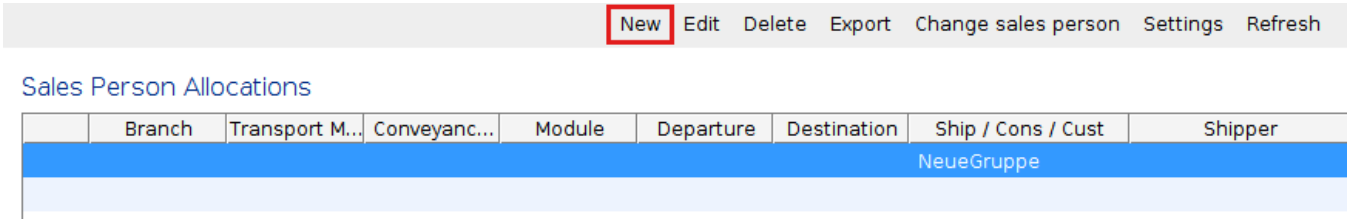
Navigate to the allocation of customers to sales persons from the Scope button

1. First select "Maintenance" from the main menu
2. Next select "CRM" from the sub-menu
3. Finally select "Sales Persons Allocations" from the CRM sub-menu



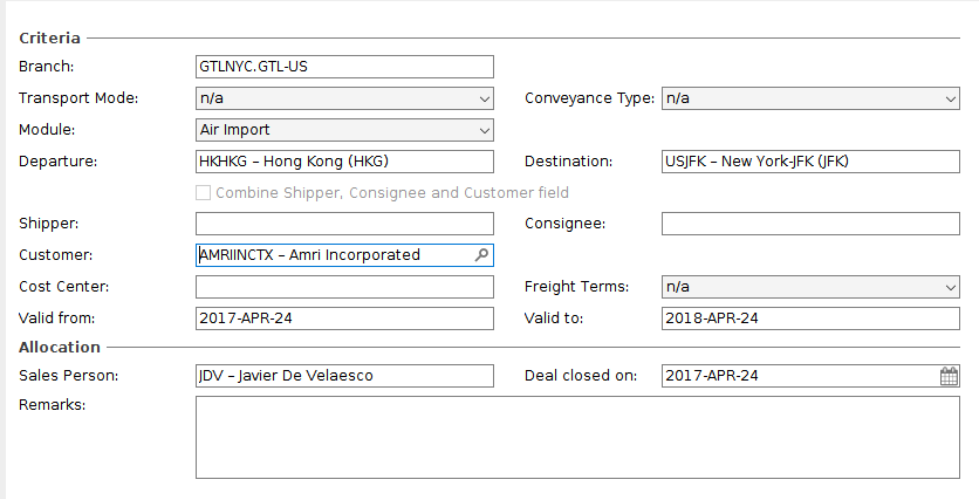
Making a New Sales Person Allocation

In the Manage Sales Persons application, select "New" at the top of the screen



Now fill in the fields for the new sales person:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- Branch - If the sales associated with the sales person and to be restricted to shipments from a single branch, then enter the branch name. If the sales person gets allocated shipments from any branch, then leave this field blank.
- Transport mode - Use this field to limit the sales allocated to the sales person to either imports or exports. Leave it blank if it does not apply
- Conveyance type - This field can be used to restrict sales for the sales person to air, sea or road shipments. Leave it bank to apply any of these modes to the sales person
- Module - This field can be used to restrict the sales for a sales person to a specific mode, air imports, air exports, sea imports, sea exports etc. In this example this sales person only gets allocated air import shipments
- Departure and Destination - These fields can be used to restrict the sales persons sales to lanes. In this example this sales person only gets sales of shipments from Hing Kong to JFK. Leave blank if lane restrictions do not apply
- Shipper/Consignee/Customer - Use these fields to specify which partners belong to this sales person. In this example, any shipment where the customer is "Amri Incorporated", is allocated to this sales person.
- Cost Center - only use this field if the sales person is to be allocated only shipments belonging to a particular cost center
- Freight terms - Use this field to apply the kind of freight terms on shipments that belong to this sales person
- Valid from and Valid to - These dates will control the period for which these shipments are allocated to this sales person
- Sales Person - apply the sales person to this allocation.
- Deal closed on - the agreed start date of the contract
- Remarks - additional information about this allocation.

Now save this new allocation.

Reporting on Sales Persons

Shipment overview

In the shipment overview, one of the additional filters available is "Sales Person" as shown in the example below. Use this with other filters to get the desired figures for the sales person.

How-To for Master Data

- FAQ How-To add a package type to Scope
- FAQ How-To create a product

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To add a package type to Scope

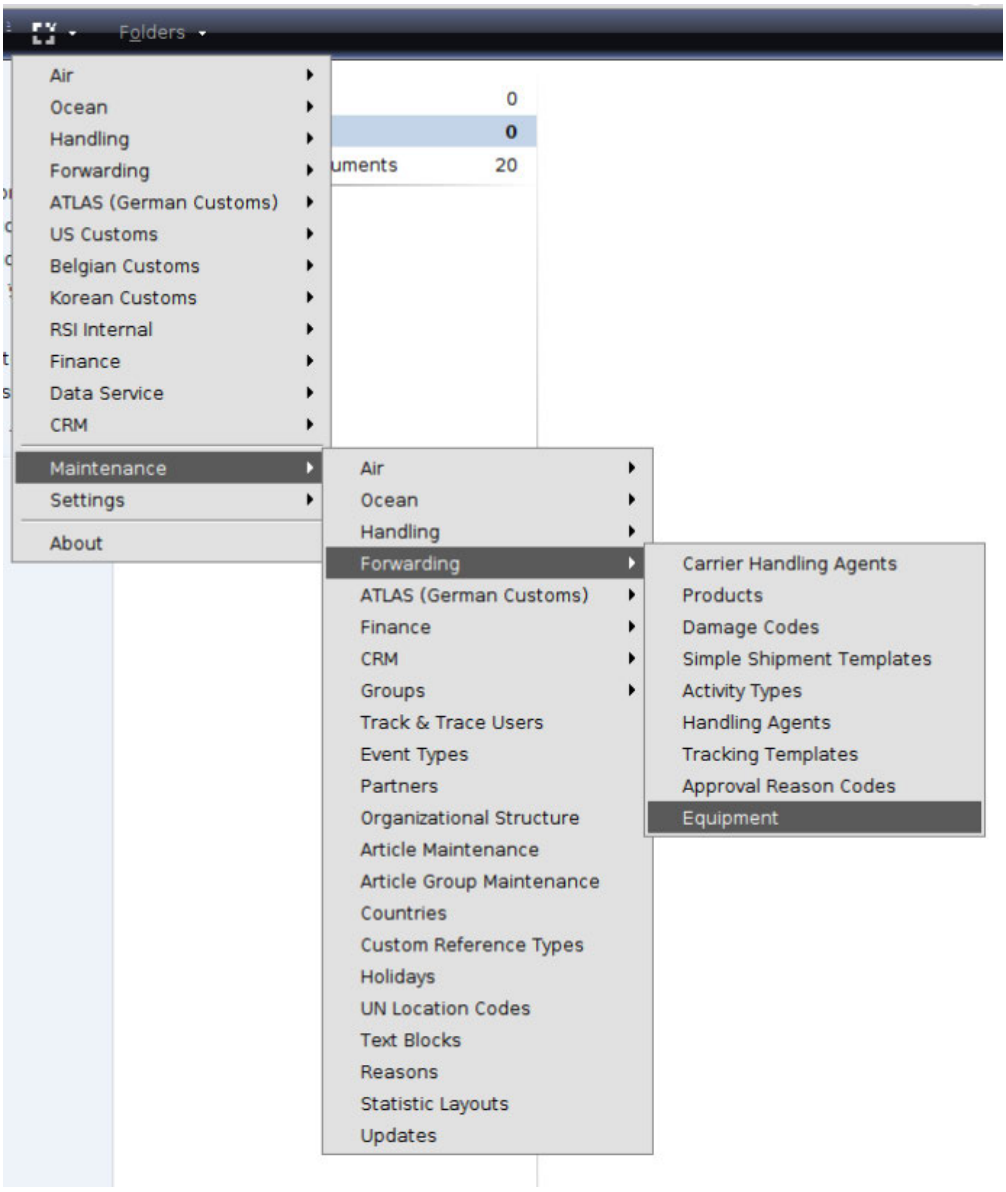
This guide explains how a new packing type can be added to Scope for instant availability in shipments.

Step-by-step guide

1.) From the main menu select "Maintenance"

2.) In the "Maintenance" menu select "Forwarding"

3.) Now select "Equipment"

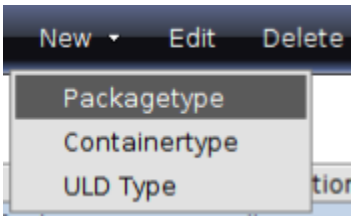


4.) The maintenance Equipment displays all existing packing and container types and provides search options.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

5.) Select "New" from the toolbar to add a new packing or container type

6.) From the sub-menu choose "Packing type" to create a new packing type.



7.) Fill in the packing type editor with the details of the new packing type. Start with the 2nd field "UN Rec. 21 code" to determine if a suitable UN code already exists for the new packing type. This UN code can also be used as the Scope code for the packing type.

8.) Complete the description of the packing type.

9.) If the packing type has specific dimensions and weights, then these can also be included.

FAQ How-To create a product

- Introduction
- Navigating to product maintenance
- Product overview
- Creating a new product

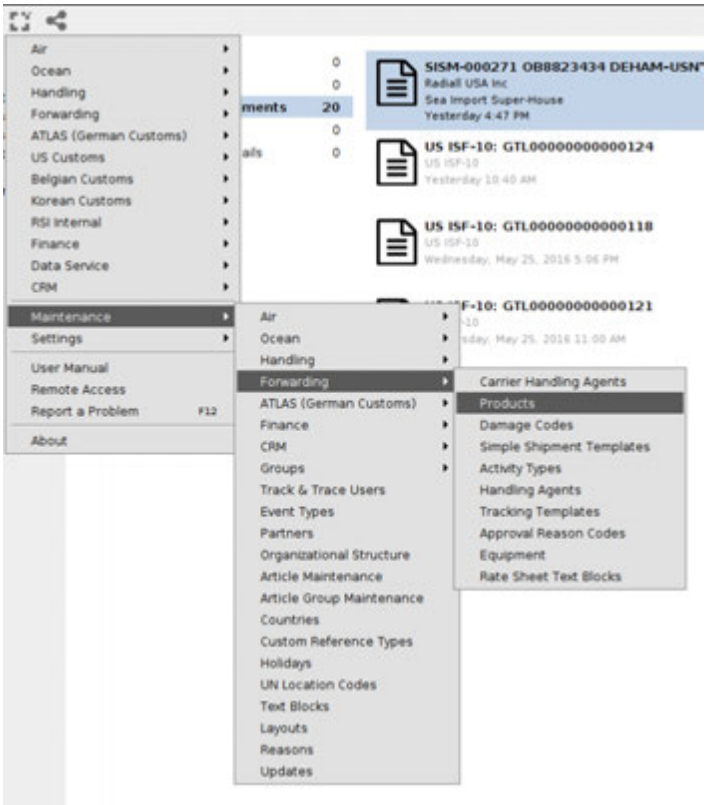
Introduction

Products can be applied to shipments and then used in tariffs and statistics.

Navigating to product maintenance

From the Scope application menu select:

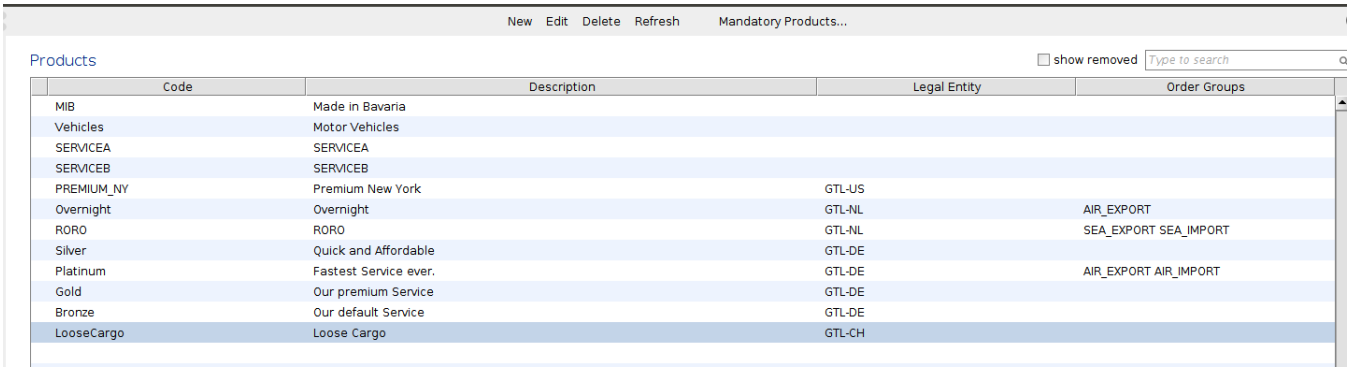
1. Maintenance
2. Forwarding
3. Products



Product overview

The product application will display an overview of existing products, select "New" from the tool bar:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Code	Description	Legal Entity	Order Groups
MIB	Made in Bavaria		
Vehicles	Motor Vehicles		
SERVICEA	SERVICEA		
SERVICEB	SERVICEB		
PREMIUM_NY	Premium New York	GTL-US	
Overnight	Overnight	GTL-NL	AIR_EXPORT
RORO	RORO	GTL-NL	SEA_EXPORT SEA_IMPORT
Silver	Quick and Affordable	GTL-DE	
Platinum	Fastest Service ever.	GTL-DE	AIR_EXPORT AIR_IMPORT
Gold	Our premium Service	GTL-DE	
Bronze	Our default Service	GTL-DE	
LooseCargo	Loose Cargo	GTL-CH	

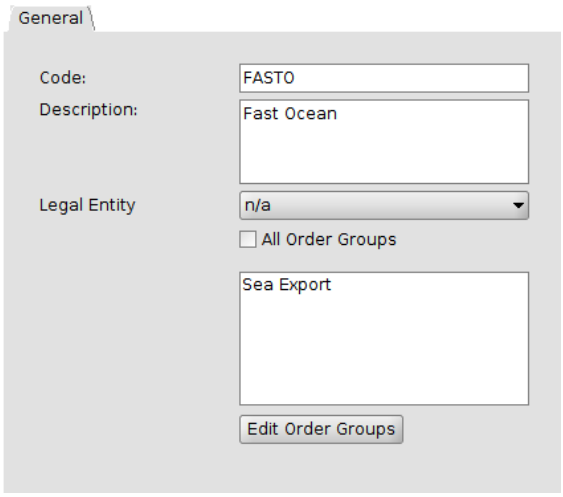
Creating a new product

Code - Create a code for the product. This can be anything but try to keep it short and succint

Description - Apply a description to the code which explains which product the code is for.

Legal Entity - If the product is for use by all branches, leave this as N/A. If this is specific to a branch then select the branch from the drop-down list.

Order Group - Check this box if the product is available for all products, otherwise uncheck it and use the editor to select the order group that may use the product, such as "Sea Exports"



Save the new product and it will be available in the shipments defined.

How-To for Partners

All How-Tos relating to partners

- FAQ How-To add and use partner roles in Scope (USA)
- FAQ How-To create partners in Scope
- FAQ How-To for address compliance checking
- FAQ How-To save contacts in Scope
- How-To manage Customs Broker details in Scope

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To add and use partner roles in Scope (USA)

- What is a role?
- How is a role applied to a partner?
- A brief guide to roles
  - Agent
  - Forwarding Customer
  - Debtor
  - Creditor
  - US Partner Profile
  - Liner Agent
  - Airline
  - Road Carrier
  - Known Shipper

All addresses in Scope are saved by creating them as partners, but some partners have special functions and this is why we need to give these partners a "Role"

What is a role?

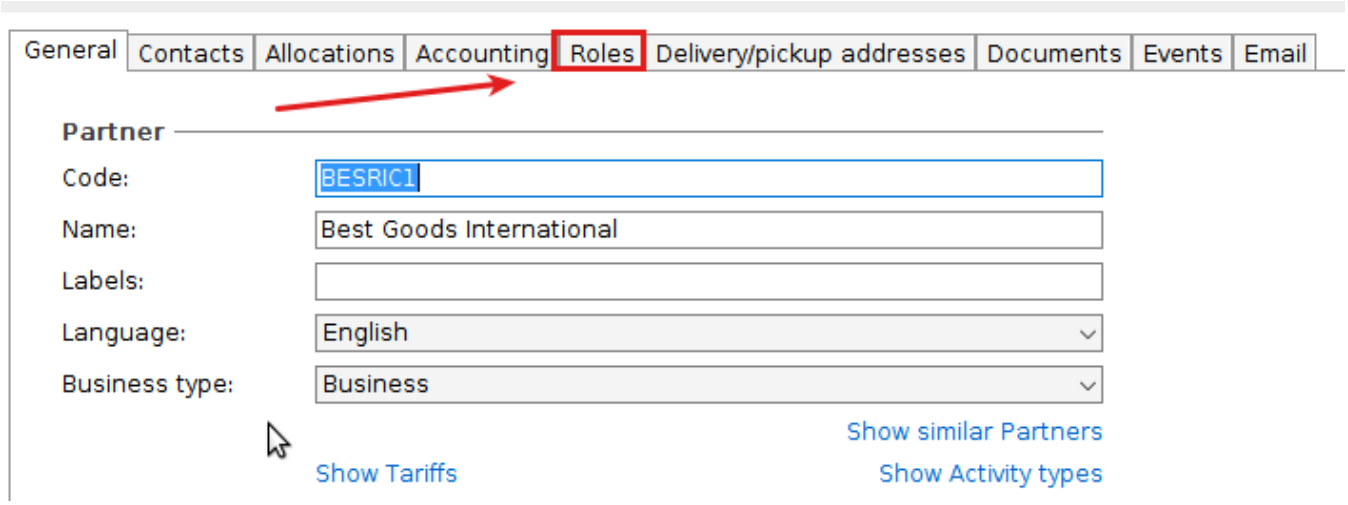
any address can be saved as a partner, but some addresses have more important functions or "Roles". The most important roles you should get to know are:

- Agent
- Forwarding Customer
- Debtor
- Creditor
- US Partner Profile
- Liner Agent
- Airline
- Road Carrier
- Known Shipper

How is a role applied to a partner?

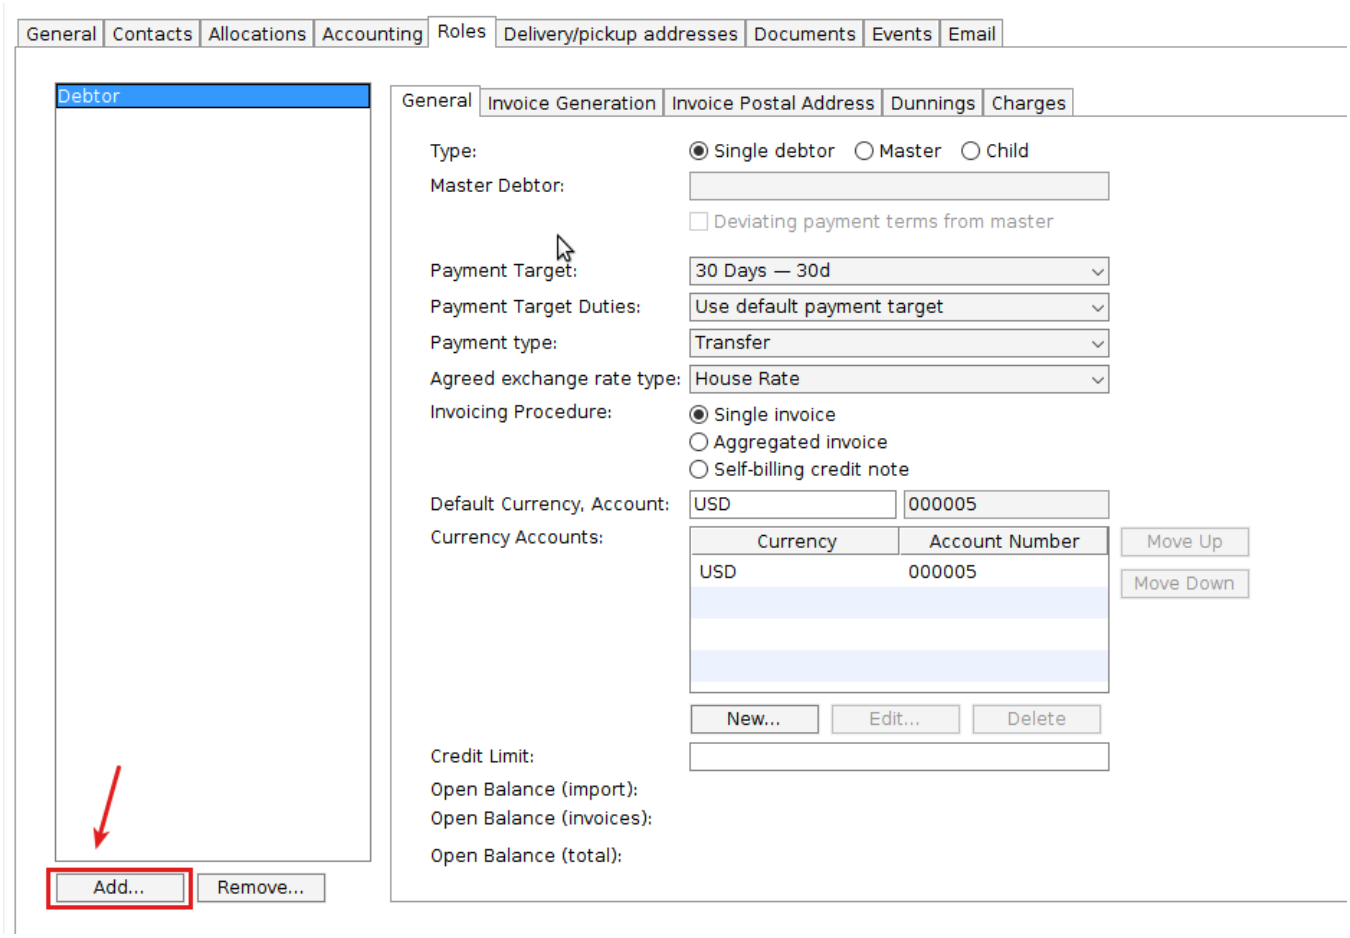
First create a partner (the Partner How-To explains this)

Once the basic address details for the partner have been entered, go to the "Roles" tab of the partner:



In the "Roles" tab of the partner, use the "Add" button at the bottom to add more roies. In the example below, the partner already has the "Debtor" role

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



A brief guide to roles

A partner can have one or more roles. For example they can be a creditor and an agent.

Agent

If the partner is the overseas agent who is sending or receiving the shipment, it is critical to give them this role. Within the role you should also enter the port or airports for which they handle freight. You will not be able to complete a shipment unless this is done.

Forwarding Customer

This role can save a lot of time when creating shipemtents by storing useful information about the partner.

- Airfreight Export - Store a notify party, save a custom AWB address and store the chargeable weight calculation. Store the docs to be attached to prealerts
- Airfreight Import - store a notify and the charge weight calculation
- Sea Exports - store a notify and the charge weight calculation. Define a custom B/L address.
- Sea Imports - store a notify and the charge weight calculation. Set the default customs broker
- Land Freight - Store a default document address
- Routing - Store the agents used for the ports/airports used by this customer

Debtor

If you will create invoices for this partner, then they must have the debtor role. This is where the account number and other details for this debtor are stored.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Creditor

If this partner is a vendor and will send you invoice, then they must have the creditor role

US Partner Profile

This role is critical if you do functions that involve CBP for this partner:

- Exports - AES details
- Imports - ISF details
- Bond details
- AMS details
- FIRMS code number

Liner Agent

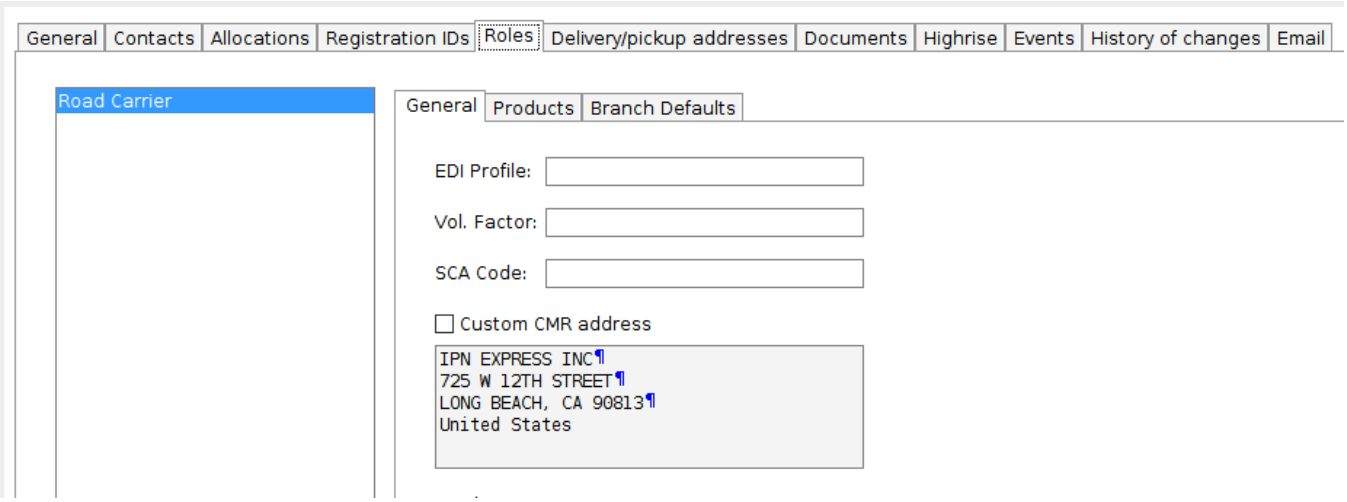
When the partner is the agent for a steamship line, this role is used to identify the steamship lines this agent handles using a SCAC code

Airline

When the partner is an airline, this is where all the airline specific details are stored. The pool of AWBs issued to you by the airline are stored here.

Road Carrier

When you create pickup and delivery notes, the carrier (trucker) address must have the role "Road Carrier". Other road carrier specific details are stored here.



Known Shipper

This is where all the Know shipper details like the Know Shipper ID are stored if the address is a known shipper.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To create partners in Scope

- What is a partner?
- Who can be a partner?
- How are partners entered?
  - Entering a partner within a shipment
  - Entering a partner directly
- Who can see the partners I enter in Scope ?

The basic details you need to know about entering addresses in Scope.

What is a partner?

Think of partners as your address book in Scope

Who can be a partner?

any address you enter in Scope is a partner:

- Shippers
- Consignees
- Agents
- Customers
- Truckers
- Vendors
- Airlines
- Steamship lines
- and more ....

How are partners entered?

There are 2 different ways to enter a partner in Scope

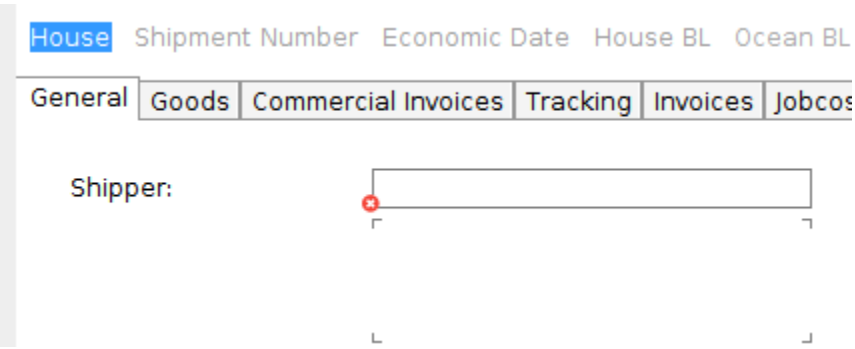
- When creating a shipment
- Directly in the partner maintenance

Entering a partner within a shipment

Often, when you are creating a shipment, you will realize you have to enter and save an address because it does not already exist in Scope.

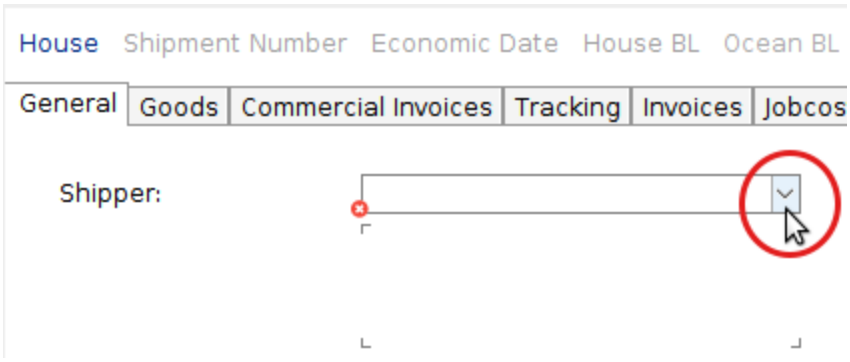
In the example below an address is saved as a partner during a sea import shipment:

Below, we have started a sea import shipment and we realize we have a new shipper address that we need to enter and save in Scope

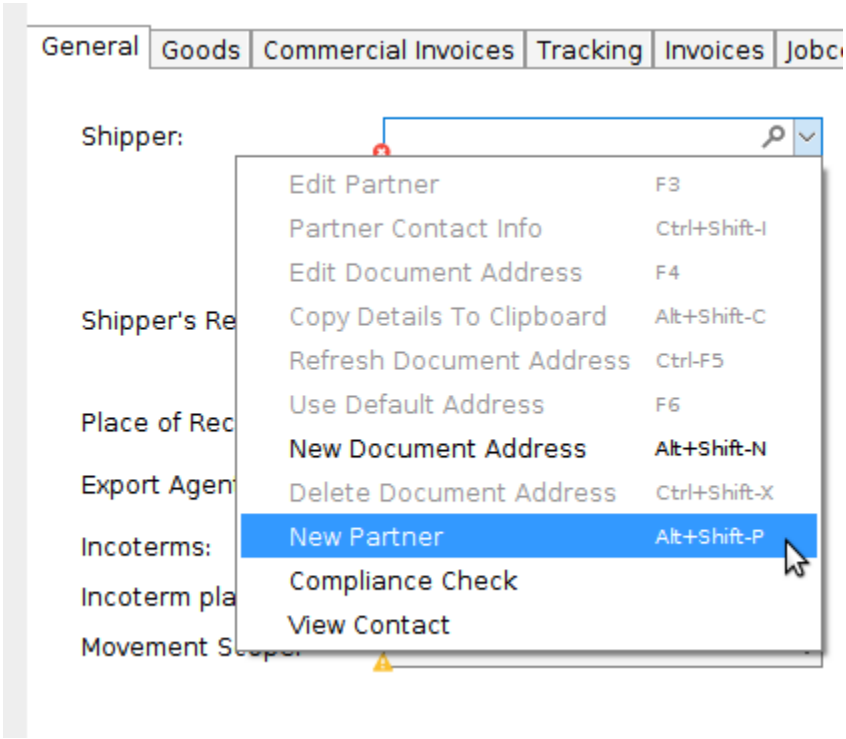


When the cursor is on any address field in Scope, note that there is an action menu available to the right:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click on this action menu:



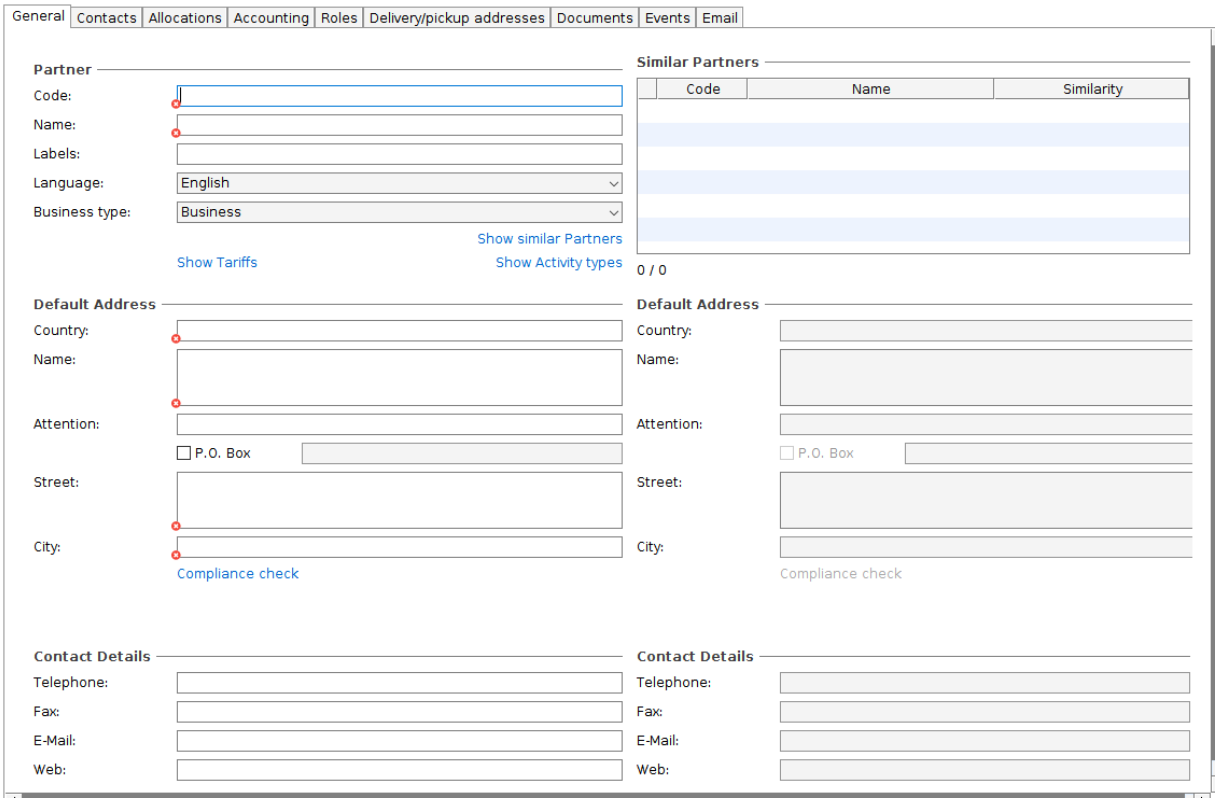
Select the option "New Partner"

New document address

Note: If you want to enter 1 time address details, then choose "New Document Address". This address will only be saved in the shipment.

As soon as you click "New Partner", the partner maintenance opens. Note that the red error icons mark the basic field that are required , all the other fields are optional:

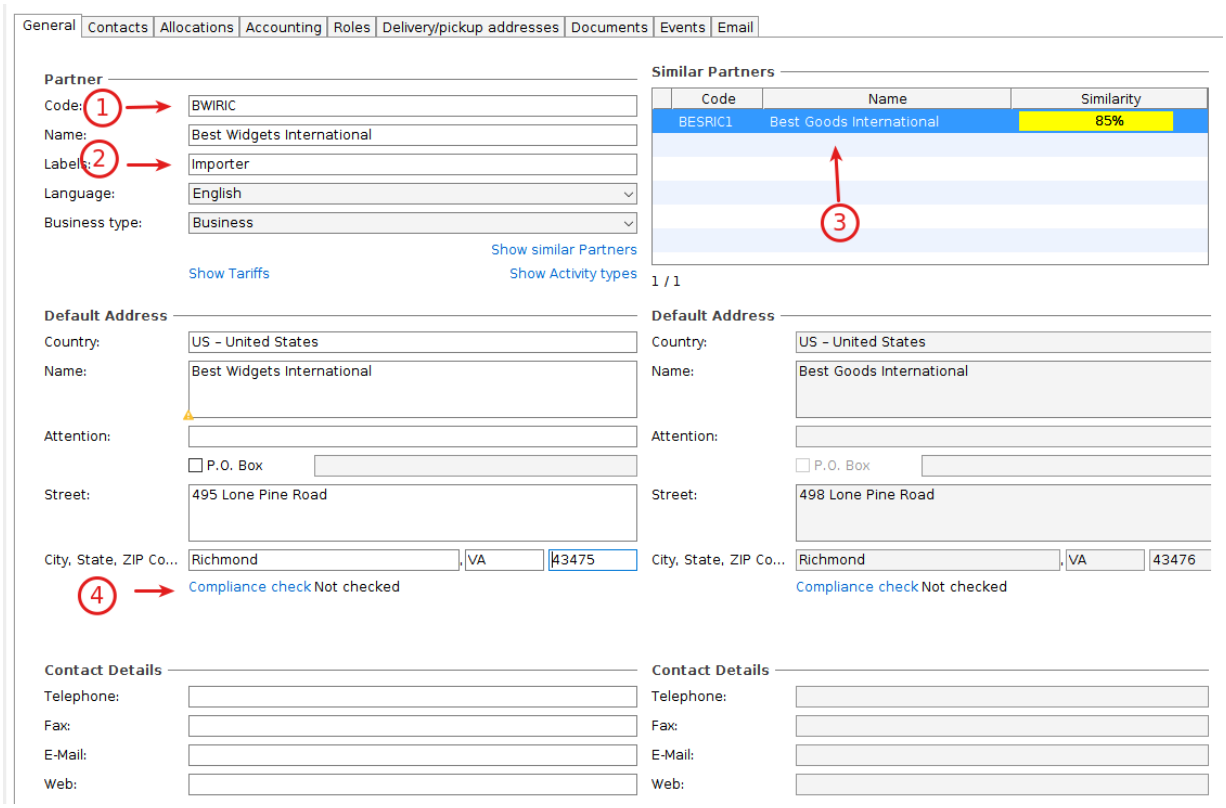
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Here are the basic address details for this partner completed. Some points about these details:

1. Code: This is a shortcode identifying the partner. Your organization should have a method of creating these. The example uses a good, simple method, it is the first 3 letters of the company name followed by the 3 letter city code. This makes the code for this new partner "BWIRIC" which is one quick way to call up this address when you need it in future
2. Labels: This partner is an importer and so the label "Importer" is used to assist describing and finding them in future. You can have multple labels, just leave a space between them.
3. Smilar Partners: Once the basic details are entered, Scope checks if this address is a duplicate of an existing address. To the right you can see in the "Similar Partners", Scope has detected that this new address is 85% similar to an existing address and this existing address is shown on the right side of the screen. Use this you can tell if you are making a duplicate address.
4. Compliance check: Click the blue link Compliance check to check if this address is on any kind of Denied Party list.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

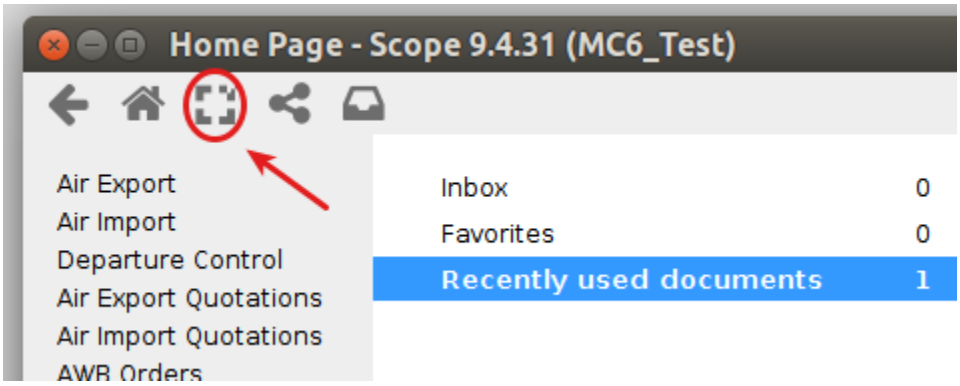


Once you have entered all the details of the address that you want to save, click the Save button at the bottom left to save the details and you will return to the shipment

Entering a partner directly

If you want to enter and save an address directly and not from within a shipment, do this from the Scope menu

1) Select the Scope application Icon at the top of the screen



2) From the dropdown menu select "Master Data" and then "Partner"

3) The Partner maintenance will open and you can enter and save all your address details.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Who can see the partners I enter in Scope ?

All users and branches in your organization will be able to see all the details you enter on the general tab of the partner maintenance.

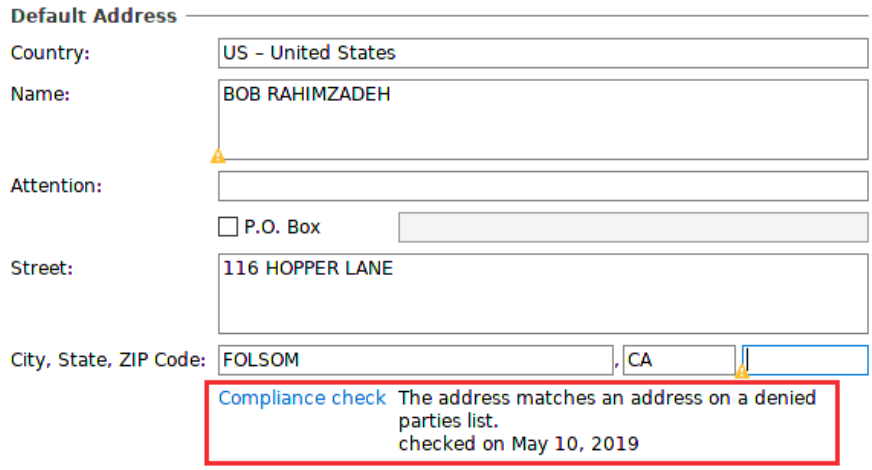
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To for address compliance checking

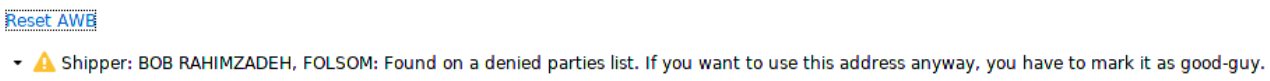
- Automatic check if an address is flagged as being on a terror or denied parties list
- Manually check an Address
- Checking the address
- Setting the address as a good-guy
- Available settings
- Overview of the denied party screening lists

Automatic check if an address is flagged as being on a terror or denied parties list

When you create a shipment and create a party for the shipment, as soon as you complete the name and address details for the party, Scope will automatically compliance check the address and provide a result for this check. Below is an example of an automatic check where the party has been found on a denied parties list. This check also occurs if you make a document address:



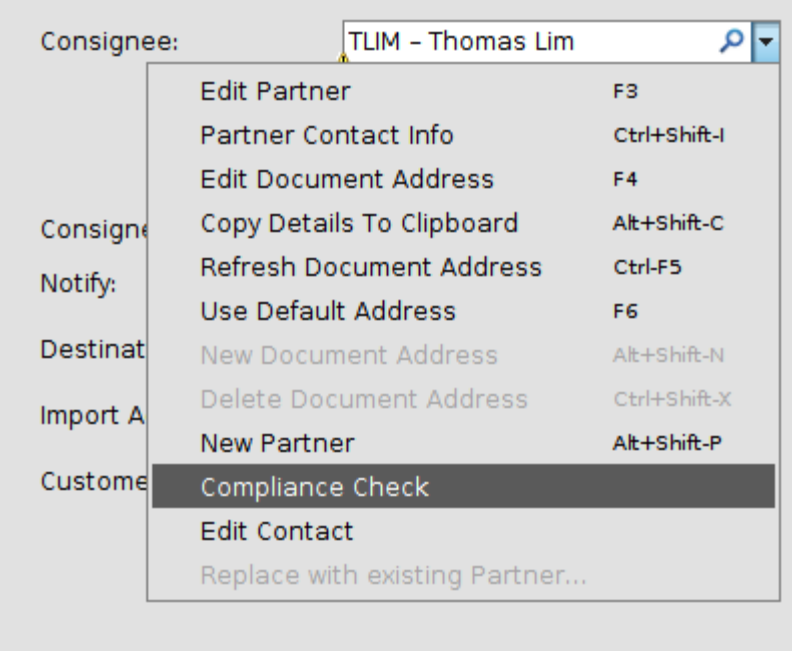
If you try to put this address on a shipping document, you will get a further warning:



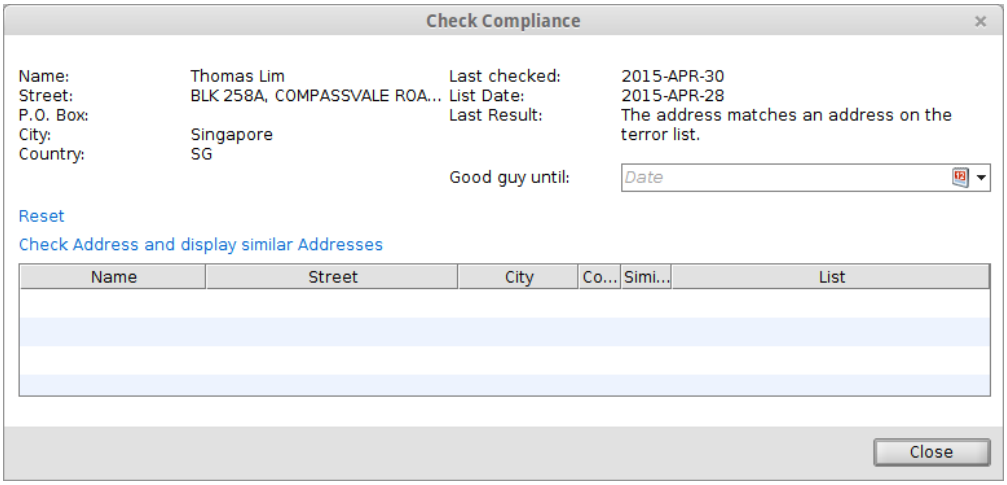
Manually check an Address

Using the drop-down menu to the right of the address, from the sub-menu select "Compliance Check"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



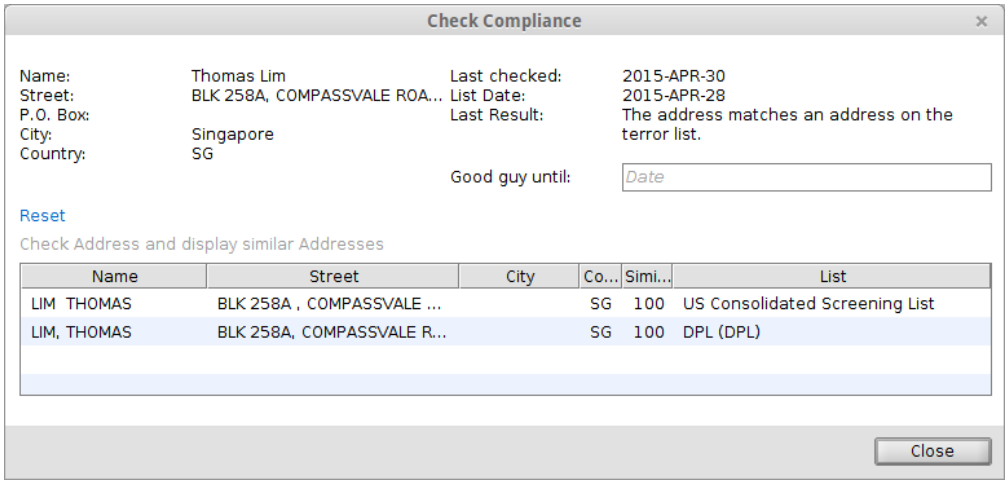
The details of the flagged address appear and show the result of the last check. In this case "The address matches and address on the terror list"



Checking the address

By clicking on the blue link "Check Address and display similar Addresses" (see screen shot above), the checker will show the parts of the address that match those on terror lists and it will show on which terror lists the matches occur. In the example below, both the name and address match on 2 lists, the "US Consolidated Screening List" and the DPL (Denied parties). The checker also shows there is a 100% match with the address on these lists.

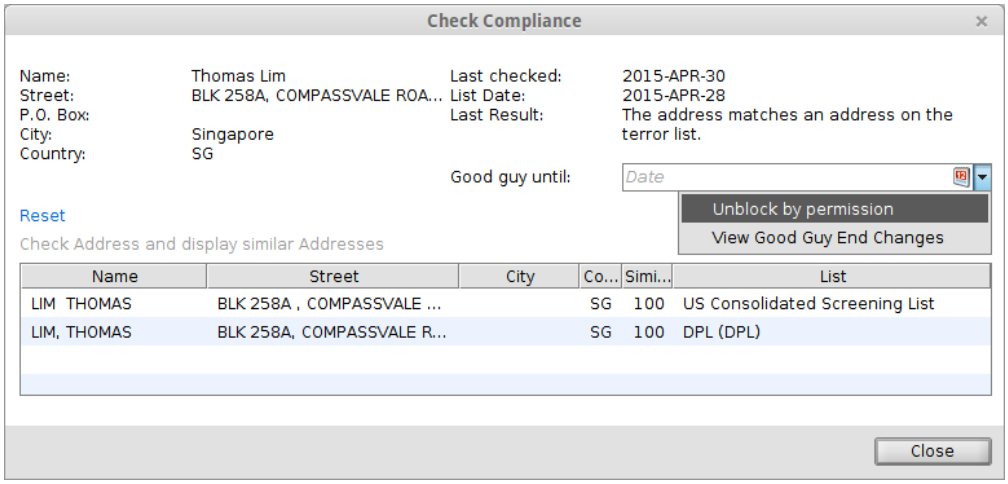
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



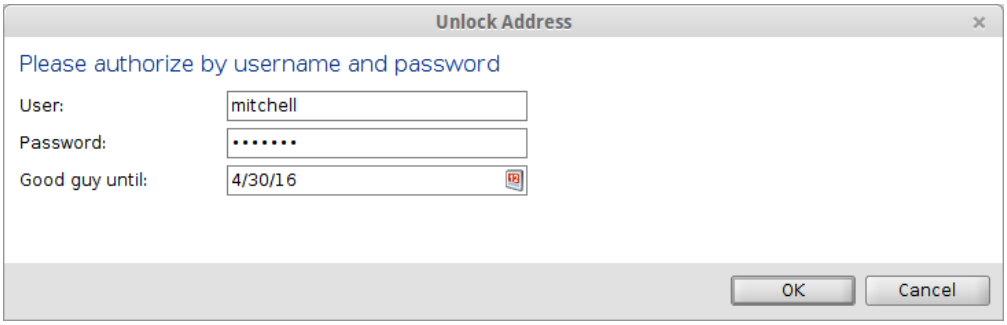
Setting the address as a good-guy

If the user has system permissions, then the address can be set to a "Good-guy" until a specified date. Simply enter the date in the field "Good guy until".

If the address is being used by a user who does not have permission to change an address to a "Good-guy", a user with permission can click on the drop-down menu to the right of the address on the users Scope session and choose "Unlock by permission"



A pop-up appears where the user with permission may enter their name and password in order to unlock the address for the user without permission.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Available settings

the following settings are available when setting up compliance checking

COMPLIANCE_ACTIVE - Means compliance checking is on

COMPLIANCE-AUTO - Means compliance checks are done automatically

COMPLIANCE_AS_WARNING - Means if a partner has a good match to an address on a list, this is treated only as a warning and the user may proceed with using the partner.

COMPLIANCE_GOOD_GUY_RESTRICTION - Allows the number of days into the future that any partner can be made a "Good Guy"

COMPLIANCE_THRESHOLD - Specifies as a percentage how closely a partner must match an address on a list for the partner to be considered the same as the list address.

Overview of the denied party screening lists

Country	Institution	Code by AEB	Official Name
UK	HM Treasury	BOE	Consolidated List of Financial Sanctions Targets (ehem. Bank of England)
EU	EU Credit Sector Federations	CFSP	Consolidated list of persons, groups and entities subjects to EU financial sanctions

FAQ How-To save contacts in Scope

- Navigate to Maintenance Partners
- Entering the contact details
- Using the "Roles" in the new contact
- Using Contacts when emailing
- Auto emails to customers

You can send emails from Scope and so it is useful to store email addresses in Scope together with other useful contact information such as:

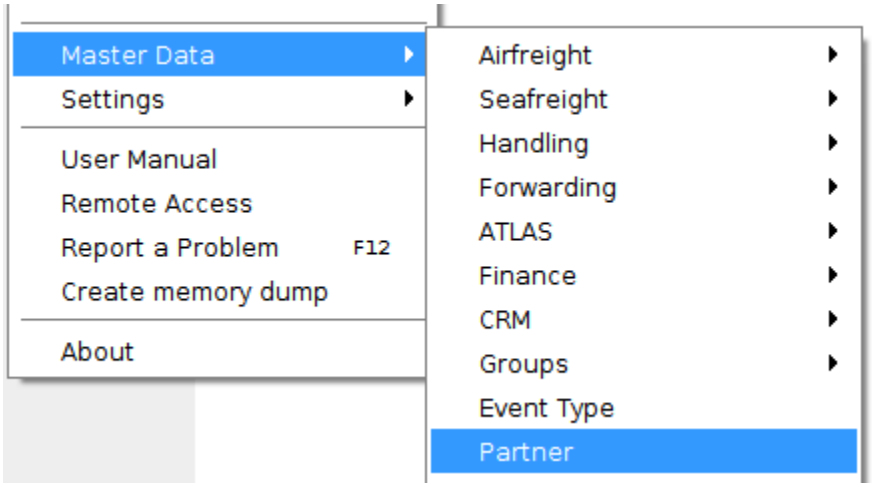
- Name
- Phone
- Mobile Phone
- Fax No.
- Description
- Role

Navigate to Maintenance Partners

contact details are stored with the address details of the party.

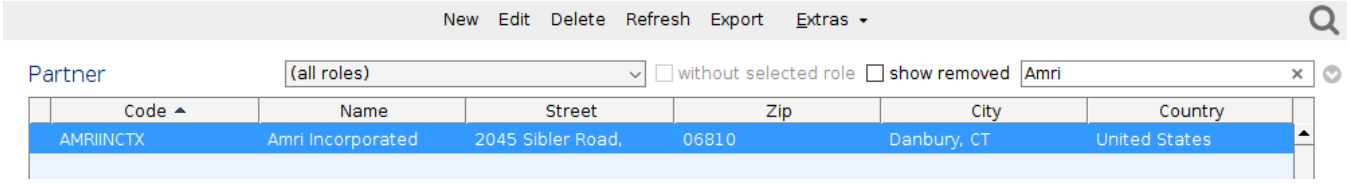
Navigate to "Maintenance Partner"

1. Click on the Scope menu icon
2. Select "Master Data"
3. From the Master Data sub-menu select "Partner"



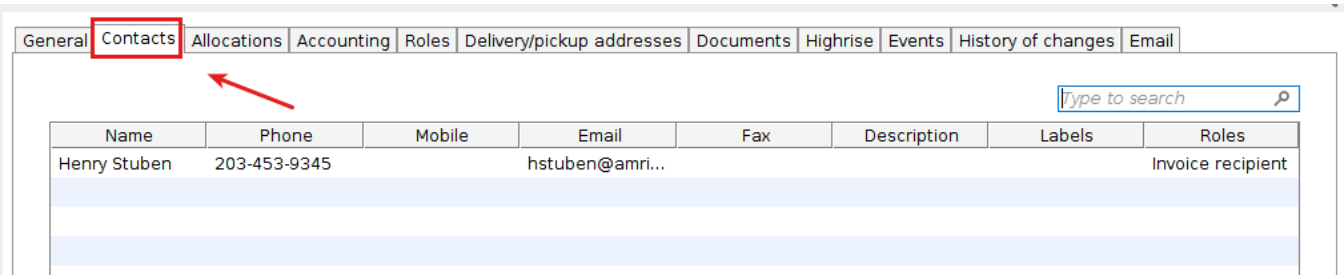
Entering the contact details

Search for the partner associated with the new contact. In the example below we add the new contact Peter Passmore who works for our client Amri Incorporated



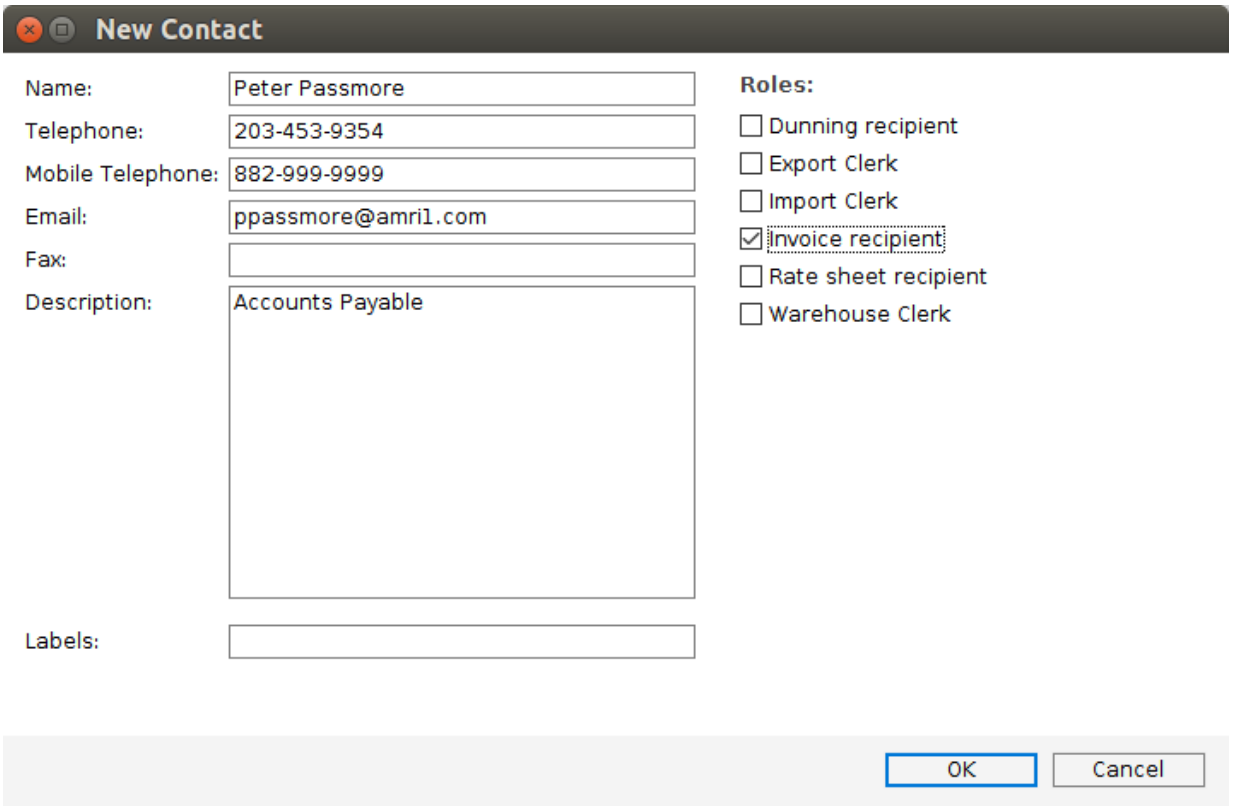
Edit the partner and go to the "Contacts" tab.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click "New" at the bottom if the contact tab

Now enter the details for the new contact and click OK when done:



Using the "Roles" in the new contact

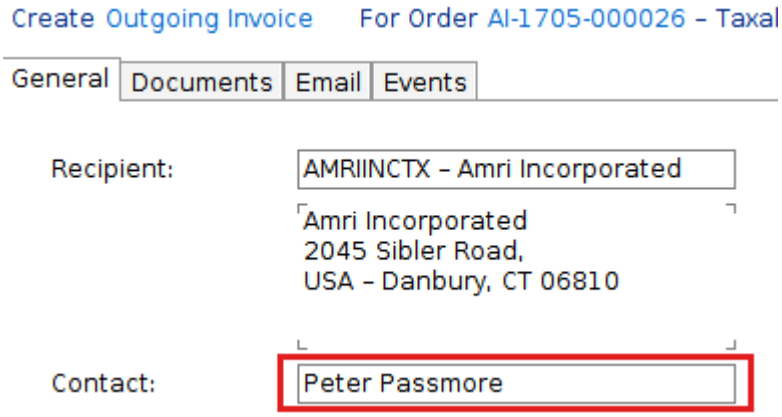
- Dunning recipient
- Export Clerk
- Import Clerk
- Invoice recipient
- Rate sheet recipient
- Warehouse Clerk

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If the contact has any of the defined roles show above, then be sure to check it. In this example Peter Passmore is an invoice recipient. By giving Peter this role, the next time we make an invoice to Peter's company, Amri Incorporated, if the invoice is emailed from within the invoice application, Scope will automatically use Peter's email as the default email address.

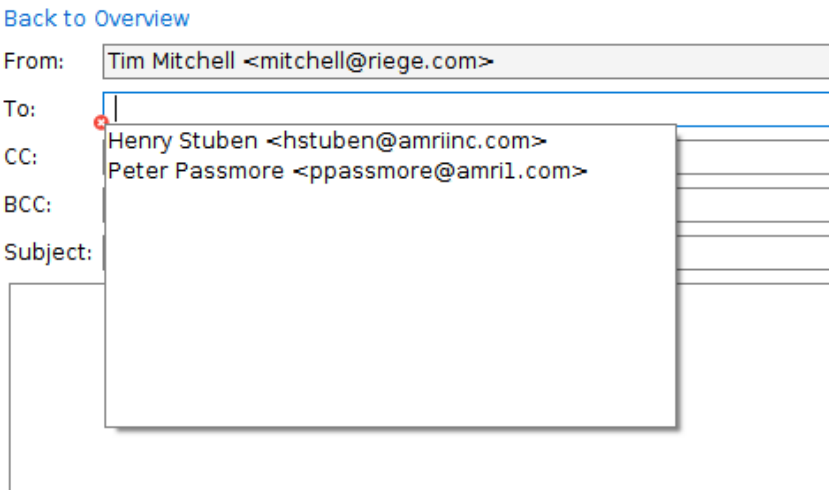
Using Contacts when emailing

In this example we make an invoice to Amri Incorporated. As soon as we create the invoice, the "Contact" field is automatically filled with "Peter Passmore". This can be changed if needed.



Now when we email the invoice the email will automatically use Peter Passmore's email address.

If a different email address is to be used, then start typing in the name or hit the space key in the "To:" field and Scope will display all saved contacts for this partner

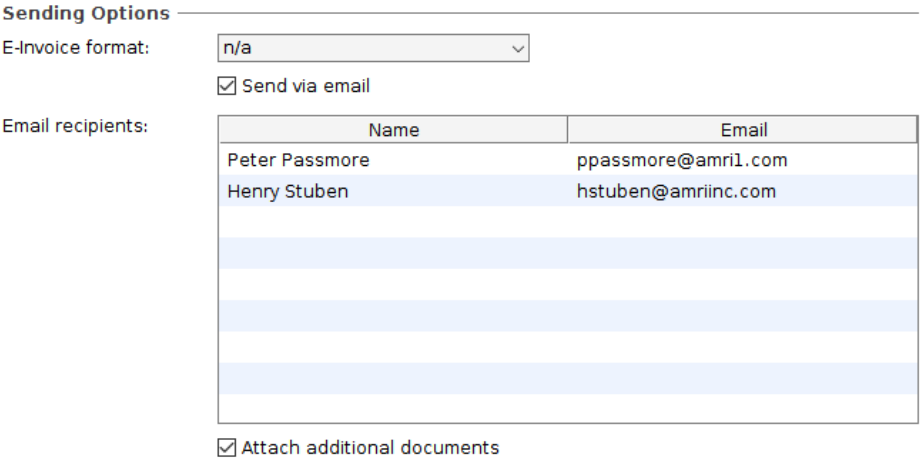


Auto emails to customers

If you want Scope to automatically email the invoice to the customer as soone as you hit "Print" in the invoice, the create the contact details as described above, but in addition, in the partner go to:

1. Roles tab
2. Next highlight "Debtor" role
3. Then go to the "Invoice generation" tab of the "Debtor" role
4. As per below, check "Send via email" and add recipients.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To manage Customs Broker details in Scope

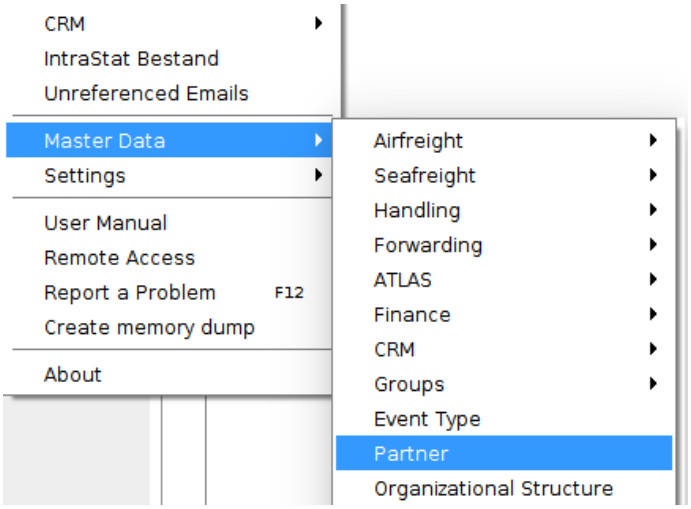
- Setting a default broker for a partner
  - Customs Broker Behavior
- Setting the default customs broker for a branch
- Checking or applying the Customs Broker on an import shipment
- Customs Broker for Customs Orders

This how-to will describe how default customs brokers can be stored in Scope, and where to view or enter the customs broker details within an import shipment.

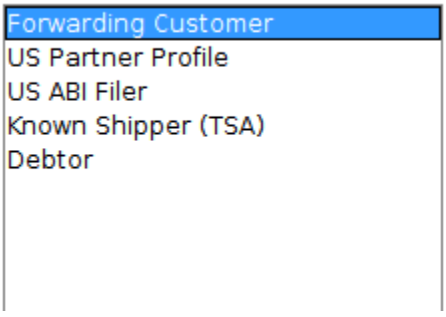
Setting a default broker for a partner

Each partner in Scope can have their own default broker.

To setup a partner's default customs broker, navigate to partner maintenance and open the partner:

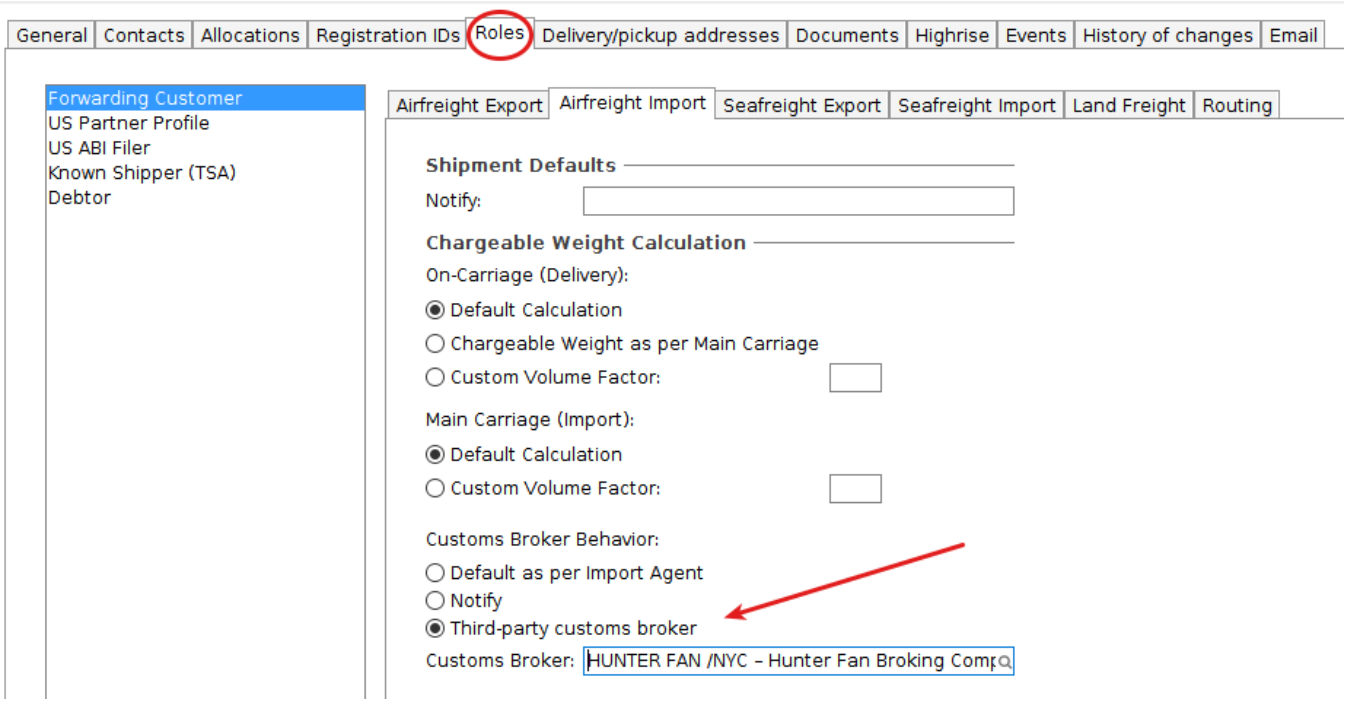


When the partner is open, in the "Roles" tab, add the role "Forwarding Customer" if the partner does not already have this role:



Now open the "Forwarding Customer" role and click on the "Airfreight Import" tab:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Customs Broker Behavior

The final option at the bottom of the "Airfreight Import" tab is "Customs Broker Behavior"

There are 3 possible options:

- Default as per import agent - this is the default option and means this partner will use the default broker for the branch (see below on setting this up)
- Notify - this option means that the notify on shipments for this partner will also automatically be the broker
- Third-party customs broker - this option means this party has a dedicated broker that is not the same as the broker used by the branch. Enter this broker in the "Custom Broker" field below this check-box.

In the example above, a third party broker called "Hunter Fan" has been selected for this partner.

Now click on the "Seafreight Import" tab and repeat this process to define the default customs broker for sea import shipments for this partner

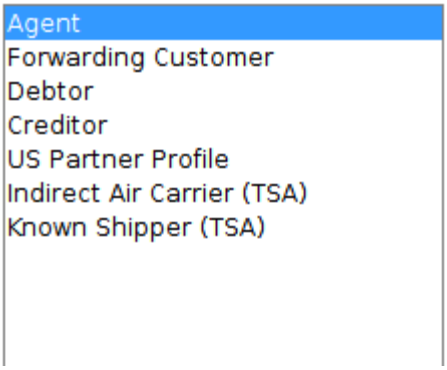
Setting the default customs broker for a branch

Since most importers will use the customs broker preferred by the import branch, this section describes how to set the default customs broker for a branch. When an import shipment is registered in Scope, if there is no default broker stored for the customer or consignee, then Scope will apply the branch Customs Broker to the shipment.

To set the default broker for the branch, as described above, navigate to the partner maintenance and open the partner record for the branch.

Next, go to the "Roles" tab, the partner should already have the role "Agent"

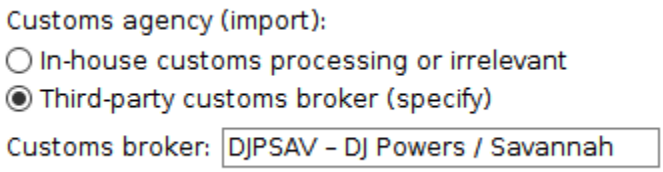
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Open the "Agent" role and be sure you are on the "General" tab of this role. At the bottom of the "General" tab are the branch customs broker details called "Customs agency (import)"

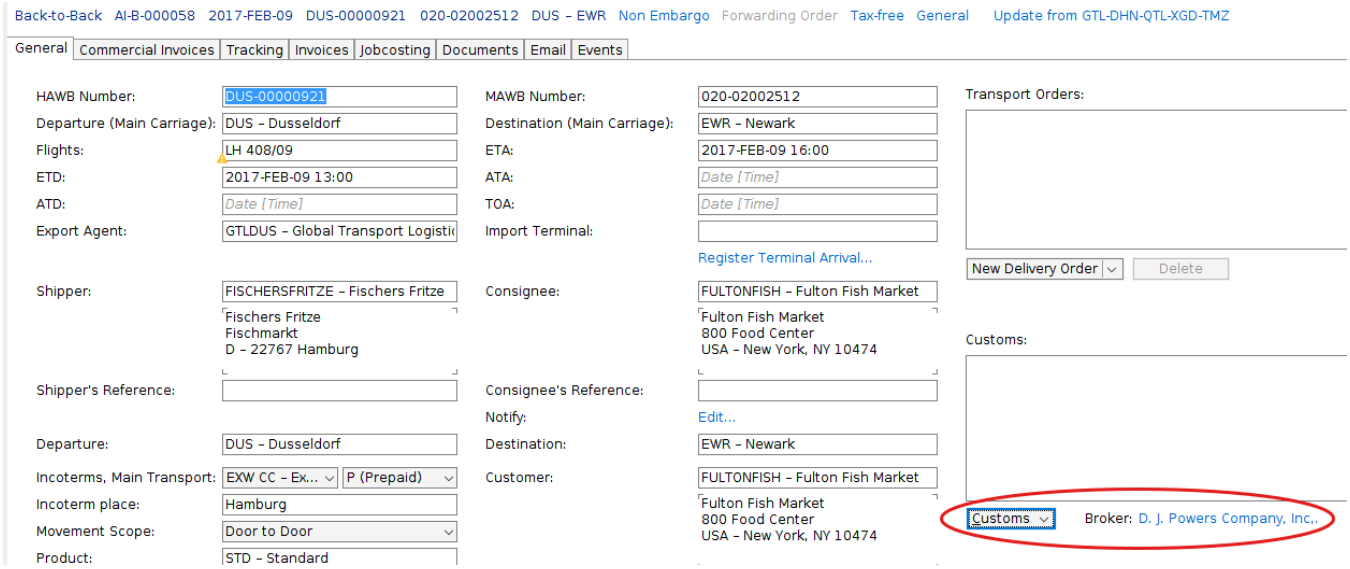
The options are:

- In-house customs processing or irrelevant - if this option is chosen then the import branch themselves are the default customs broker
- Third-party customs broker (specify) - choose this option if the branch has a standard customs broker and use the "Customs broker" field to store this brokers partner details.



Checking or applying the Customs Broker on an import shipment

Both sea and air import shipments in Scope provide the "Customs" button on the "General" tab of a shipment:

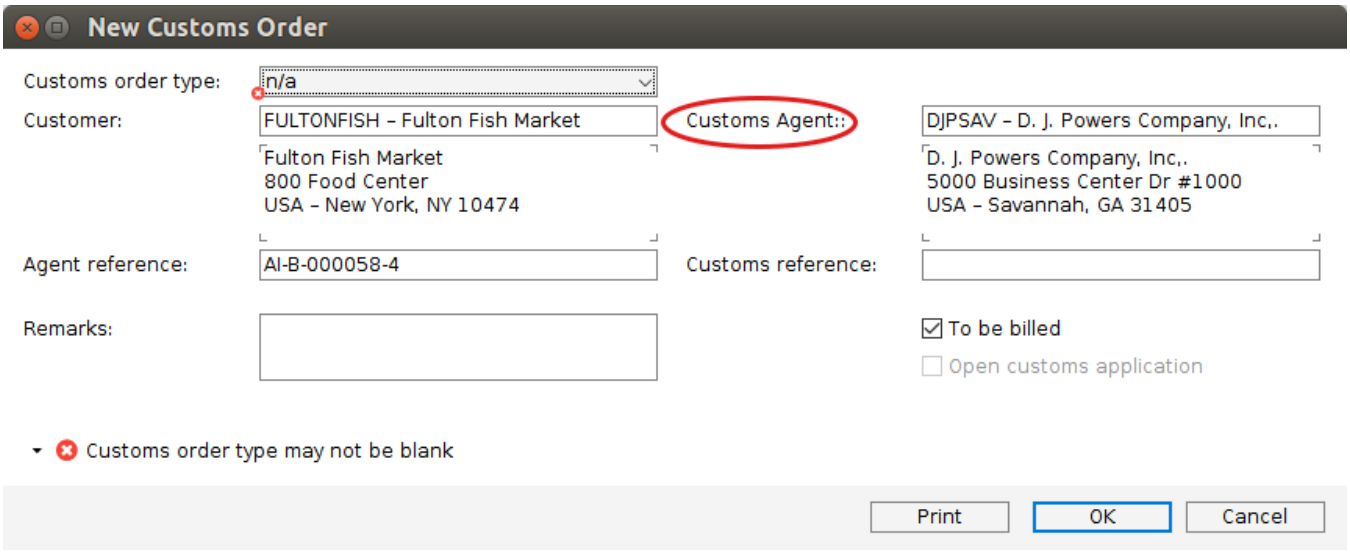


In the example above, the broker "D.J. Powers" has defaulted as the broker on the shipment because this is the broker stored and the customs broker for the import branch. You can click this broker name and change it if desired.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Customs Broker for Customs Orders

If you add a new customs order to a shipment, any type of customs order will also show the default broker and this can also be changed as desired:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To for Reporting

- FAQ How-To compare financial interface and accounting package
- FAQ How-To create a custom shipment report in Scope
- FAQ How-To create a seafreight container report
- FAQ How-To create a simple turnover and profit report by month for a module
- FAQ How-To create report layouts
- FAQ How-To manage CASS in Scope

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To compare financial interface and accounting package

As financial transactions are transferred from Scope to the external accounting package there is a procedure to check the completeness of the interfaced transactions in Scope and in the accounting package.

Warning
We strongly advise you to make NO changes on any bookings, created through the interface, in the accounting package directly. Do not change period, ledgers or amounts at all.
We strongly advise not to create any additional bookings in the accounting package directly on ledgers used by Scope.
If you choose to do so, please be aware that this has a big impact on the procedures followed to ascertain the completeness of the interfaced transactions.
It will work against you later when identifying and looking for differences between the two systems.
All corrections should be done by crediting and debiting from Scope by booking additional sales or purchase invoices.

NOTE: Before checking the completeness of the Scope and the accounting package interface, make sure all batches that have been created in Scope are successfully imported in the accounting package.

Please note that if you are making use of Exact Online the Period-date check (a setting which can be found in the Exact Online settings) should be set to no, else Exact Online will overrule the booking date (period) coming from Scope and you cannot do any booking date (period) comparisons.

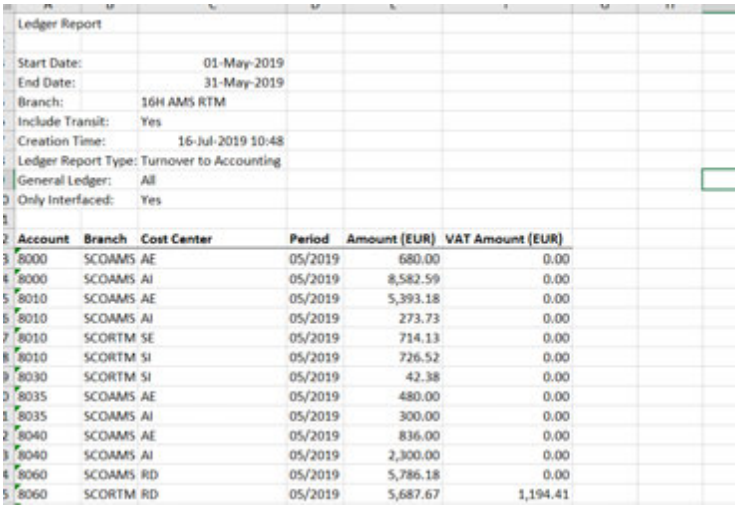
Scope Ledger Reports

[FinanceReporting] - Ledger reports

The ledger reports should match with the ledgers in the accounting package.
The ledger report can be run for a time span on Booking date (that equals the financial period in the accounting package). Check boxes for ‘Include Transit’ and ‘Interfaced only’ should be checked both.

The ledger report types you can choose are:

Turnover – Gives the total per ledger per cost center per financial period. The figures per ledger should match the figures on the same ledger in the accounting package (turnover ledgers of the P&L). At the bottom of the report a total per ledger (for all cost centers) is given;



Ledger Report

Start Date:	01-May-2019
End Date:	31-May-2019
Branch:	16H AMS RTM

You can compare this with the turnover ledgers on the P&L in the accounting package for the same period. The values should match exactly.
In case there is a difference on a ledger, you can go one deeper step in detail by running this report in Scope;

Turnover details – Gives all transactions per turnover ledger. Optionally you can specify an account number to just run it for one specific ledger;

[FinanceReporting] - Estimates report

The estimates report shows the individual bookings made on all/the given accrual ledgers for the selected booking(=financial) period.
If you want to check the balance on the accrual ledger on a certain date (f.e. 31-DEC-2018), you should run this report from 01-JAN-1900 till 31-DEC-2018. This will give all the bookings in that period, made on that accrual ledger.The total of these bookings should match with the balance on the accrual ledger in the accounting package on 31-DEC-2018.

Start Date:	01-May-2019
End Date:	31-May-2019
Branch:	AMS
Include Transit:	Yes
Creation Time:	16-Jul-2019 11:38

[FinanceReporting] - Financial Period Report

In [Finance->Reporting] you can run the Financial Period Report

A shipment in Scope has ONE **Economic Date**. By default this is the arrival date for import shipments and the departure date for export shipments. Financial bookings (turnover and estimated costs) on the shipments are booked in the **Booking Date**. The booking date is taken from the economic date of the related shipment. When that period is already closed, the booking date is adjusted to the first available date Scope can book in.

So this can lead to a shipment with financial bookings in different booking periods.

The reports from the Shipment Overview use the economic date of the shipment. So that might include amounts of financial bookings in different periods.

Just one example - create and print an additional invoice for 100€ in JUN for a shipment of MAY. If the MAY period has been closed in Scope, Scope is not allowed to book the additional invoice in MAY and it will be booked in JUN.
In operational reports the profit of the MAY shipment goes up with the 100€ even though this has been booked in the accounting package in JUN. The 100 € will not show in ledger reports ran over MAY but will show in the ledger reports ran over JUN. This, as explained above, to determine the correctness of the interface between Scope and the accounting package.
This is the reason that, apart from the [Finance->Reports] you cannot compare operational reports with figures in the external accounting package.

The Financial Period Report, however, does give you info on turnover or costs booked in periods where the booking period differs from the economic date of the shipment that invoice belongs to.
With the above example in mind, run the Financial Period Report like this:

Booking date: 2019-JUN-01 to 2019-JUN-30, [v] Include Transit, Economic date: ‘ Earlier’, Based on: ‘Order’.

This will show you the invoices booked in JUN for shipments with an economic date of MAY (or even earlier);

A	B	C	D	E
Financial Period Booking Report				
Start Booking Date	01-Jun-2019			
End Booking Date	30-Jun-2019			
Branch	AMS			
Include Transit	Yes			
Creation Time	16-Jul-2019 11:27			
Economic Date	earlier			
Based on	Orders			
Branch	**Shipment Number**	**Cost Center**	**Economic Date**	**Booking Period**
SCOAMS	AI-004635	AI	26-May-2019	6/2019
SCOAMS	Fwd-000581	RD	23-May-2019	6/2019

The option Invoice / Order determines whether Scope will only check Outgoing and Incoming Invoices(option: Invoice) or whether it will check estimate bookings as well (option: Orders).

FAQ How-To create a custom shipment report in Scope

- Introduction
- Design the custom report layout
- Using the new custom layout in a report
  - Filter down to the desired shipments in the Shipment Overview
  - Apply the custom layout

Introduction

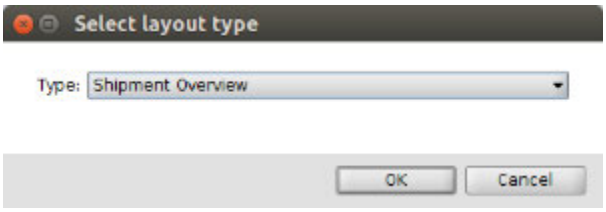
This how-to will explain how a customs report is designed saved and printed in Scope.

Design the custom report layout

From the Scope menu select:

1. Maintenance
2. Layouts

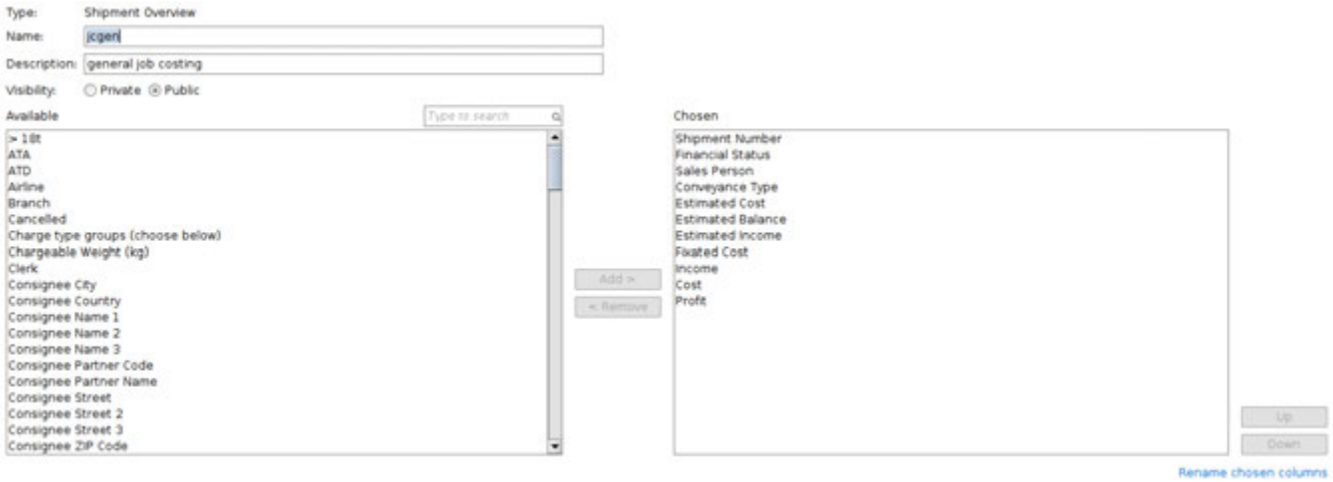
In the overview of layouts click "new" to create a new layout. Next, choose the type of layout. Since this custom report will appear in the shipment overview, choose "Shipment Overview"



Now the report designer opens.

1. Give the report a short name. In the example below "jcgen" is used
2. Give the report a full description. The example below is "general job costing"
3. Use the "Visibility" buttons to indicate who can see this custom layout. "Private" means only the creator of the report can see it, and "Public" means any user with access to the shipment overview can see and use it.
4. Choose the elements in the left-hand "Available" column that are to appear in the report. Use the "Add" and "Remove" buttons to build the list of desired elements in the right hand "Chosen" column.
5. Use the blue "Rename chosen column" to apply a different name to any element. This custom name will then be used on the report
6. When complete, click "Save" and exit.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

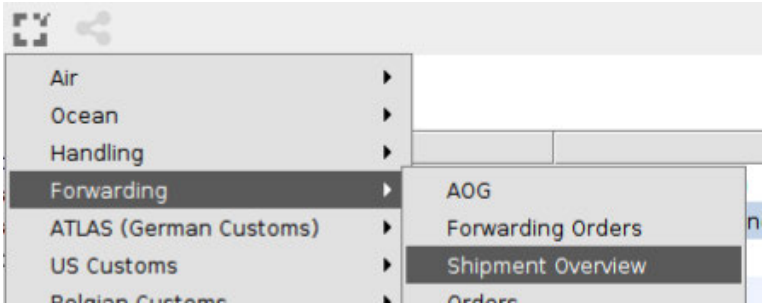


Using the new custom layout in a report

Now that the new custom layout is saved and ready, it can be used to create a report.

Navigate to the shipment overview:

1. Select the Scope Menu
2. Select "Forwarding"
3. Select "Shipment Overview"



Filter down to the desired shipments in the Shipment Overview

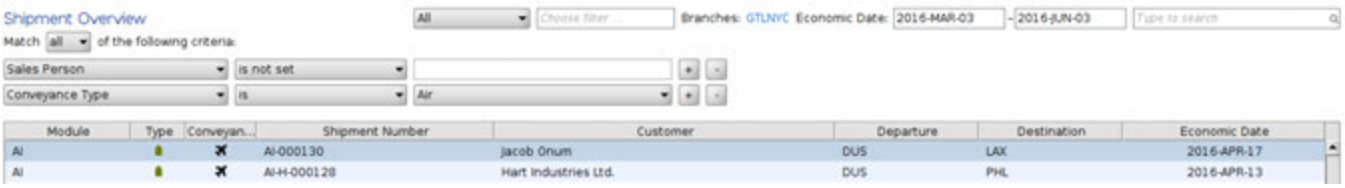
In the shipment overview, use the search and filter fields to drill down to the desired shipments.

In the example below:

- All" means all types (Mode) of shipments are included
- There is no saved filter applied.
- Only shipment in the branch "GTLNYC" are included
- Only shipments with economic month "2016-MAR-03" to "2016-JUN-03" are included.
- The is nothing in the general search field
- It is required that the "all" elements of the individual filters be found for the shipment to be considered a match
- "Salesperson" + "is not set" is a filter that only finds shipments with no salesperson applied to them
- "Conveyance Type" + "is" + "Air" is a filter that only finds shipments where the mode is air.

> **Organize filters**
>
> Note that if the filtering shown above is going to be used repeatedly, then it can be saved as a saved filter. Use the "Organize filters" drop-down option in the "Choose filter" field to do this. The filter can then be recalled at any later time.

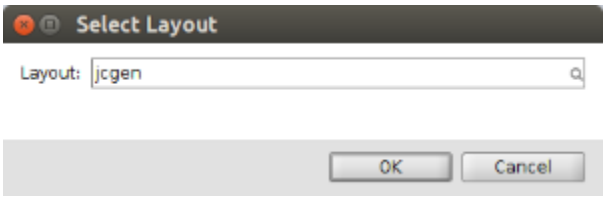
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Apply the custom layout

Now that the desired set of shipments has been selected, click on the blue "Detailed" report option at the bottom of the screen:

A popup will appear where you can search custom layouts to apply to the report. In the example below our custom layout created above called "jcgen" will be used:



On Clicking "OK" the custom report will open in a spreadsheet.

FAQ How-To create a seafreight container report

- Introduction
- Navigate to the Shipment Overview
- Show only FCLs or LCLs and set filters
- Run the reports
- Detailed Container Statistics
- Grouped Container Statistics

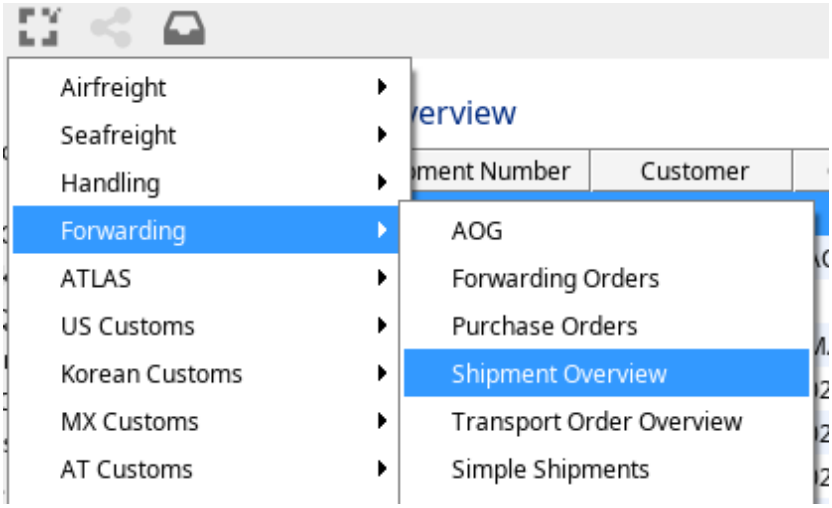
Introduction

Seafreight container reports are available in Scope and this How-To explains how these are created

Navigate to the Shipment Overview

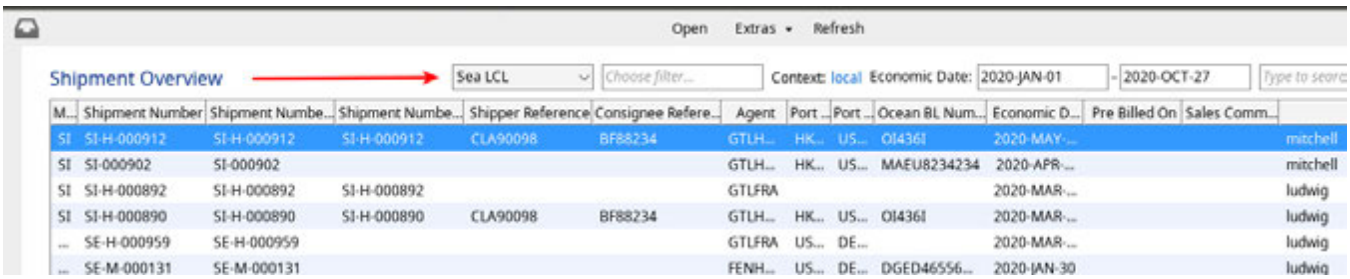
From the main menu

1. Choose "Forwarding"
2. Then choose "Shipment Overview"

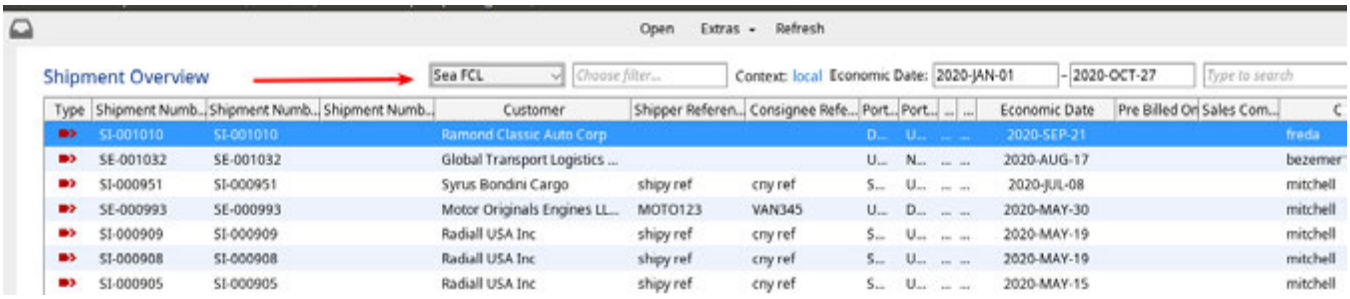


Show only FCLs or LCLs and set filters

The overview will initially show all shipments. To run container reports only FCL or LCL shipments must be present. To do this set the first filter at the top of the overview to "Sea LCL" or "Sea FCL"



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

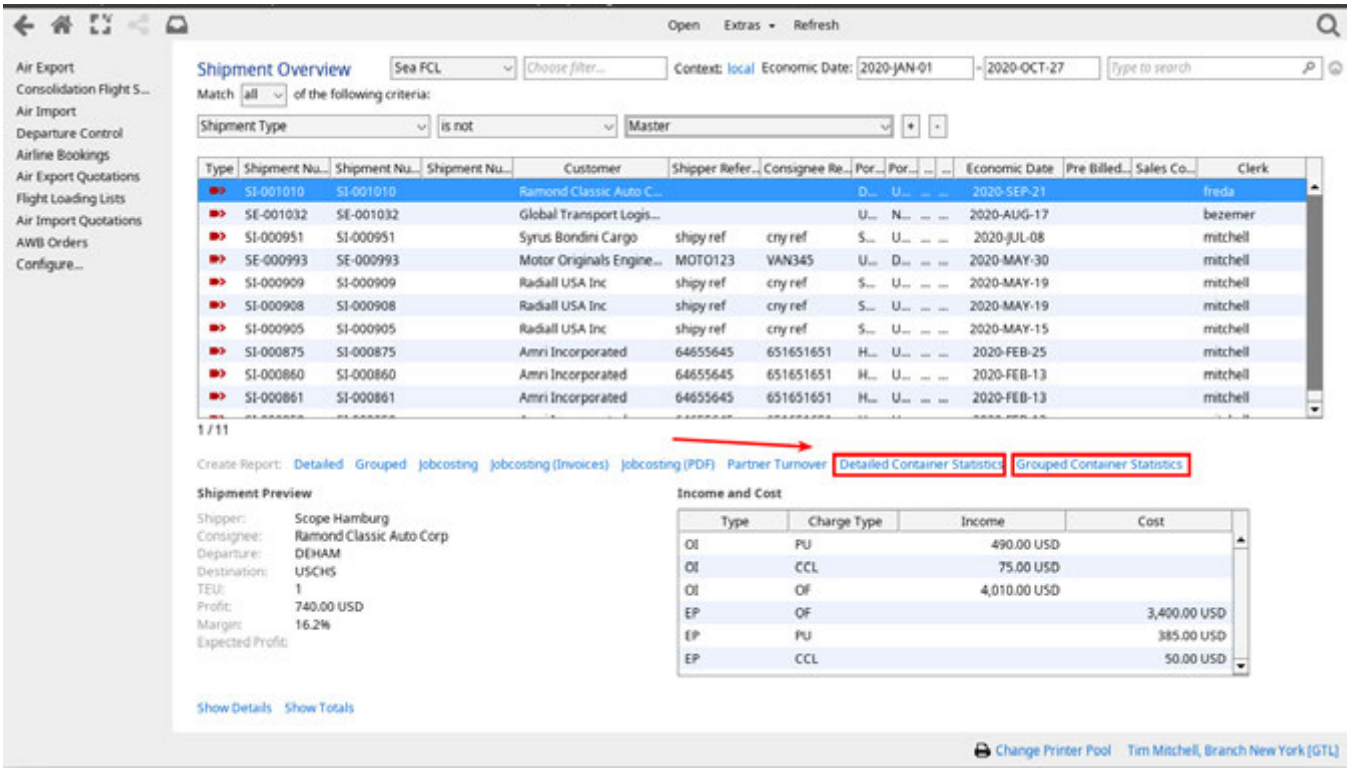


Once the FCL or LCL filter has been selected, apply any further filters like date range etc.

Run the reports

When only Sea FCLs or Sea LCLs are selected, note that extra container reports are now visible at the bottom of the overview of shipments, these are:

- Detailed Container Statistics
- Grouped Container Statistics



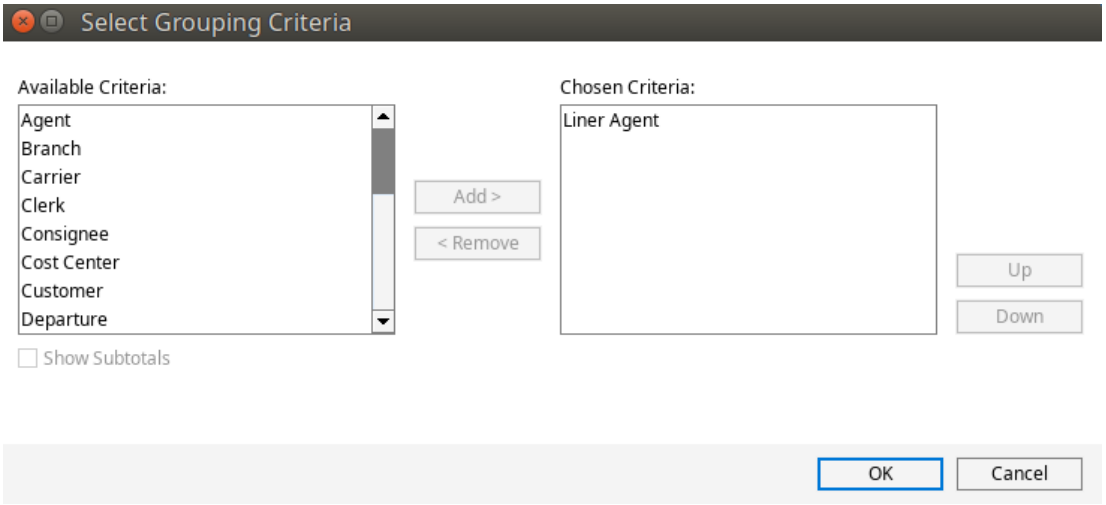
Detailed Container Statistics

When this report is run, if a container report layout has been created, it is possible to type in the name of the layout or search for it. If no layout has been created, the Scope will print the default detailed container report

Grouped Container Statistics

The grouped statistic has a pop-up box that allows you to choose how the containers should be group on the report, for example they can be grouped based on the liner agent used for each container

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The report will open as a spreadsheet on the desktop

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To create a simple turnover and profit report by month for a module

- Introduction
- Date range
- The filters
- Select the Grouped report
- Select Grouping Criteria
- The report contents

Introduction

This report allows you to select the date range and uses filters to present basic financial figures per month

Date range

in the economic date range enter the period you are interesed in. The example below uses the date range 2016-MAY-01 to 2016-NOV-29

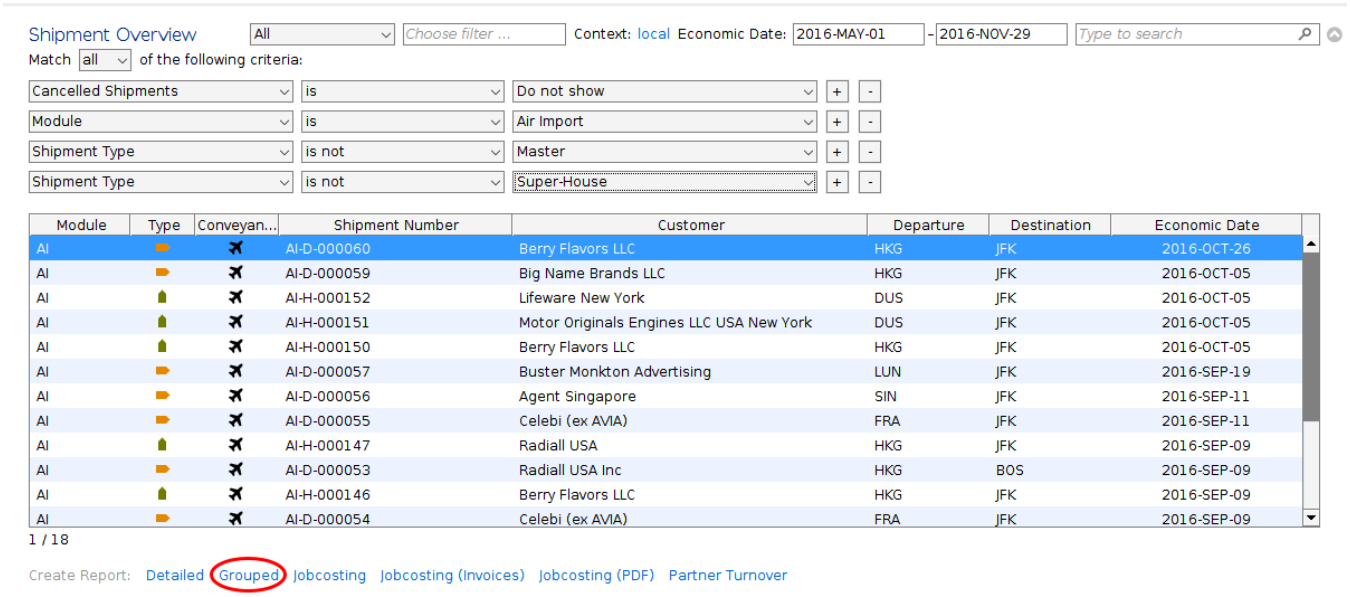
The filters

This example reports on air import profit and turnover per shipment with sub-totals per month. Therefore filters are added that do the following:

- remove any cancelled shipments
- report only air import shipments
- exclude any master or super-house shipments

Select the Grouped report

Once the date range and filters have been applied, from the list of report types select the "Grouped" report. This is circled in red in the screenshot



Select Grouping Criteria

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the grouped report is selected, a window appears where the type of grouping can be chosen. As per the screenshot, first select "Economic month" and then add "Customer"

Finally, be sure to check the box "Show Subtotals". This will subtotal the figures by month.

Click "OK" to generate the spreadsheet.

The report contents

The report will list:

- Economic month of shipment (subtotaled)
- Customer (Shipments subtotaled)
- Number of shipments (by customer)
- Pieces
- Gross Weight
- Charge Weight
- Volume
- Income
- Cost
- Profit

FAQ How-To create report layouts

- Navigating to the layout maintenance
- Creating a new report
  - Order of the data in the report
  - Rename the columns of the report
- Using the new custom report
- Related articles

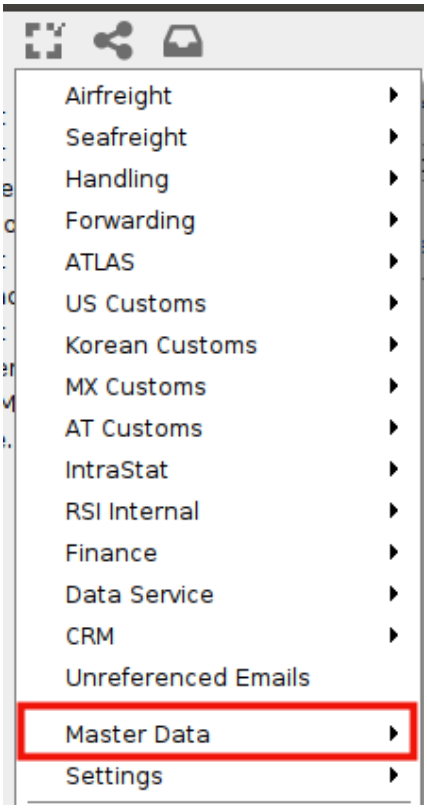
There are various reports in Scope where you can create a custom layout for the report. This means you can choose the data columns you would like to appear in this custom report and you can rename these data columns to your liking. This is especially useful for creating specific reports demanded by customers. You can create these custom layouts for the following types of reports:

- Customer Invoice Report
- Partner Turnover Report
- Shipment Monitor
- Shipment Overview
- Web-tracking

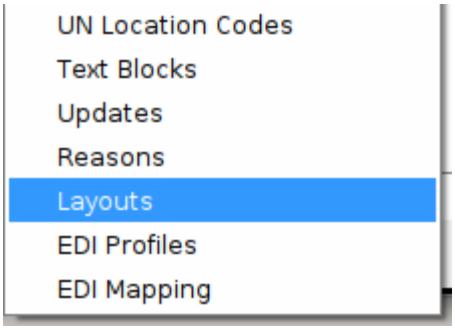
This guide explains how to make these custom reports.

Navigating to the layout maintenance

1. Click the Scope menu Icon 
2. Navigate to *Master Data* and then *Layouts*:



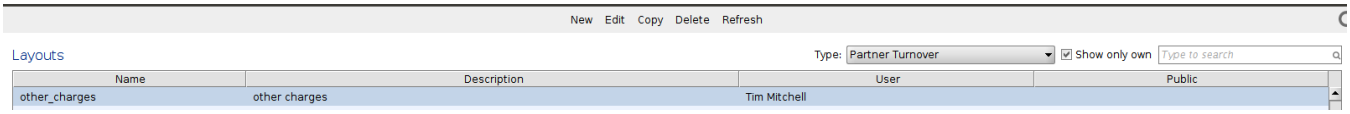
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



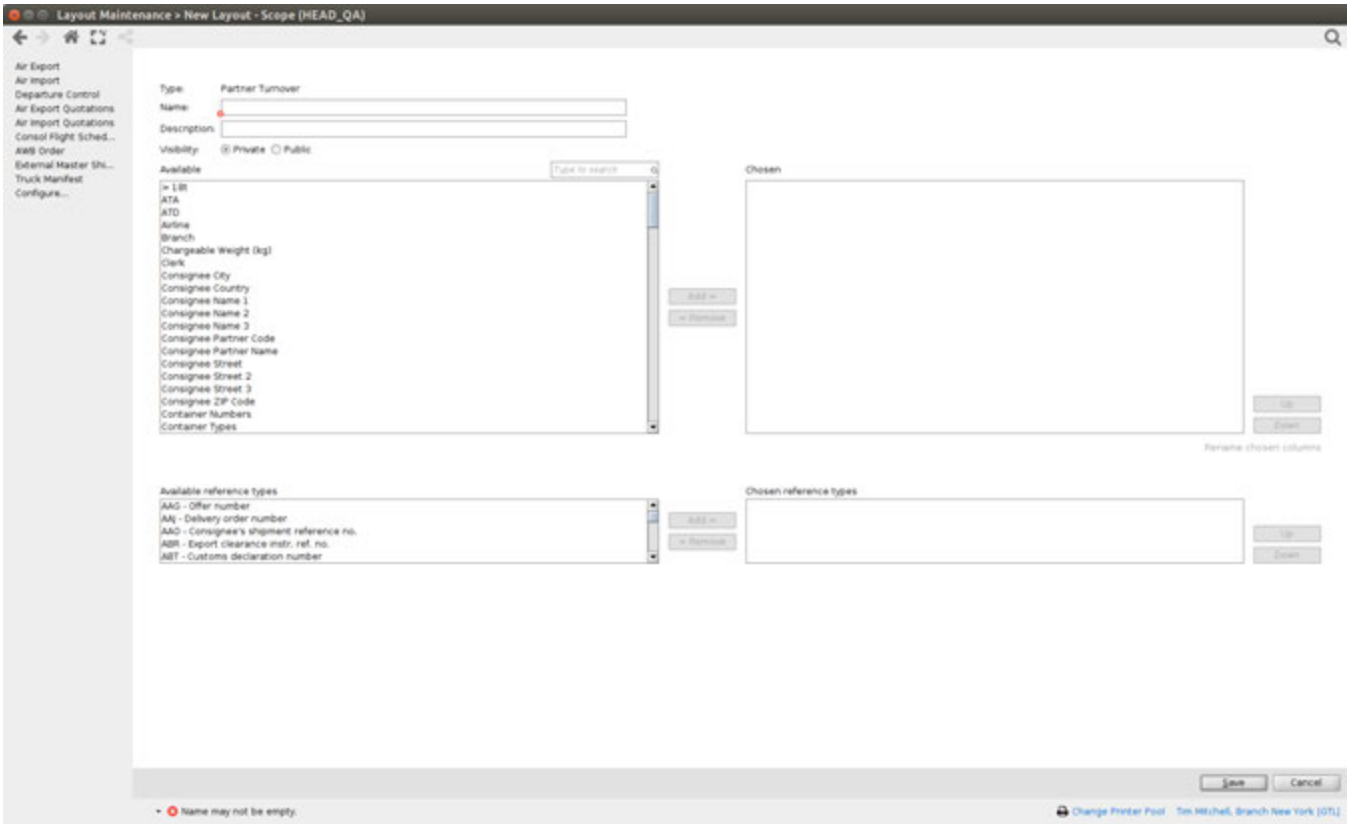
Creating a new report

The Layouts application will open. This can be used to see existing layouts and to create new layouts.

First, at the top of the overview, select the *Type* of layout you are interested in. The example below shows the Partner Turnover report as the type of report and it shows one existing report called *other_charges* exists already for this report type.



Select the New button on the menu bar to create a new custom layout for the Partner Turnover report. The layout editor will open:



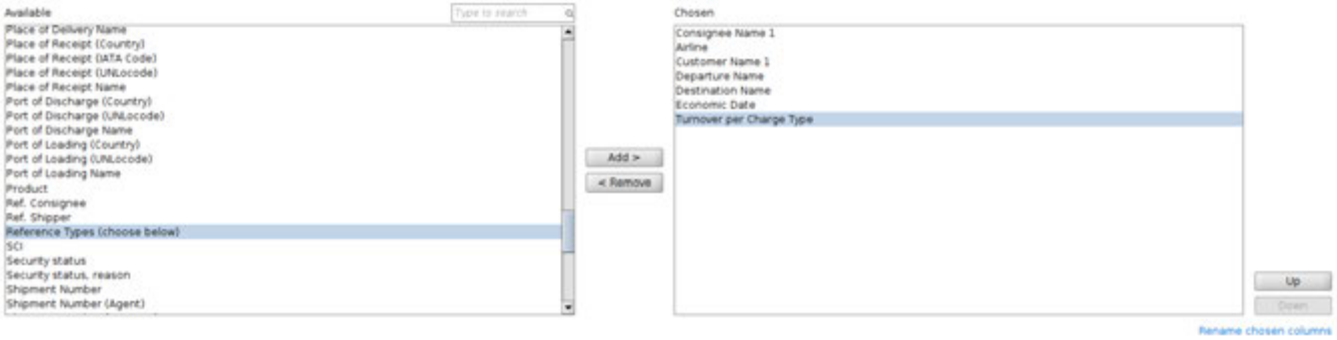
Give the new report a short meaningful name in the field *Name.* The example below uses the name *ABC CORP CHARGES*

Next, provide a full description of this new layout so that it is easy to identify in future.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

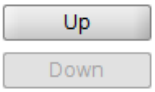
If the report is only to be visible to you, then for *Visibility* check *Private*. If it is to be visible to all users, then check *Public*.

Now choose which fields should appear in the report. The available fields are shown in the left hand column. Use the *Add* button to add them to the right hand *Chosen* column and the *remove* button will remove them again from the right hand column.



In the example above the set of fields that will appear in the report are present in the *Chosen* column.

Order of the data in the report

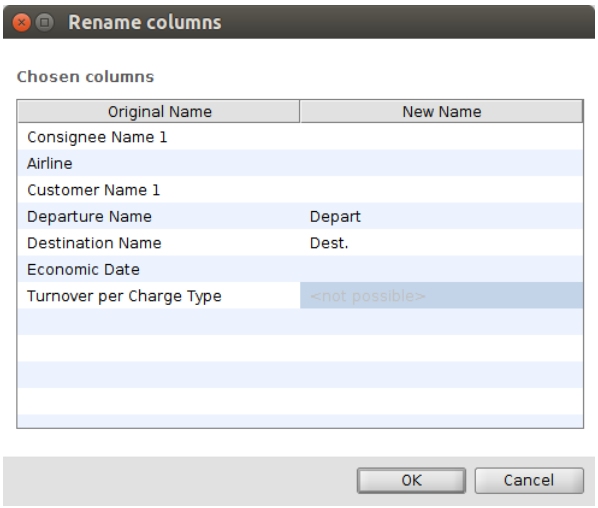


To change the order of the columns of the report, highlight an item in the list on the right and use the *Up* and *Down* buttons to move it to the correct order.

Rename the columns of the report

In some cases, the description of a column will need to be changed. To do this click the blue *Rename chosen columns*.

The renaming editor opens and shows all the chosen columns. Click to the right of the original name used in the *New Name* field. Now you can type in the new name of the column. In the example below the column *Departure Name* is renamed *Depart* and *Destination Name* is renamed *Dest*.



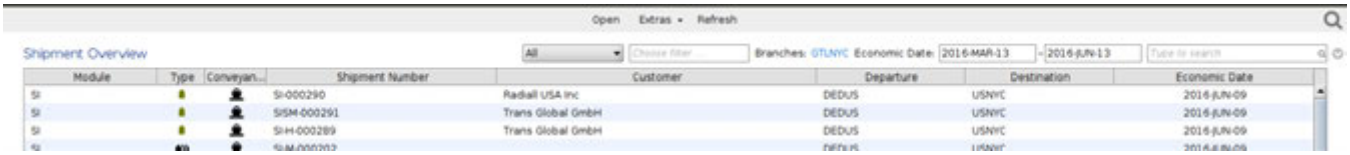
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click *OK* when ready and click *Save to* store the new report which will now appear in the list of saved reports.

Using the new custom report

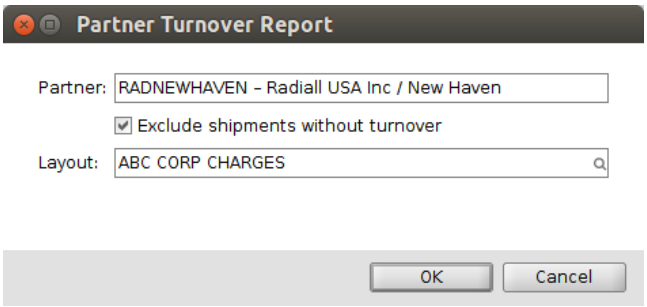
Since the new layout is for the *Partner Turnover* report, we need to navigate to the *Shipment Overview* to apply it.

In the shipment overview apply any filters to focus on the required shipments. In the example below the filters restrict the shipments to the GTLNYC branch and the date range 2016-MAR-13 to 2016-JUN-13.



Now print the partner turnover report by clicking the blue *Partner Turnover* link:

An overlay appears where the name of the desired partner can be entered and the layout created above can be chosen. In the example below, the report is being done for the partner *Radiall USA* and the report the the *ABC CORP CHARGES* report.



On clicking *OK*, the spreadsheet will open using the *ABC CORP CHARGES* layout.

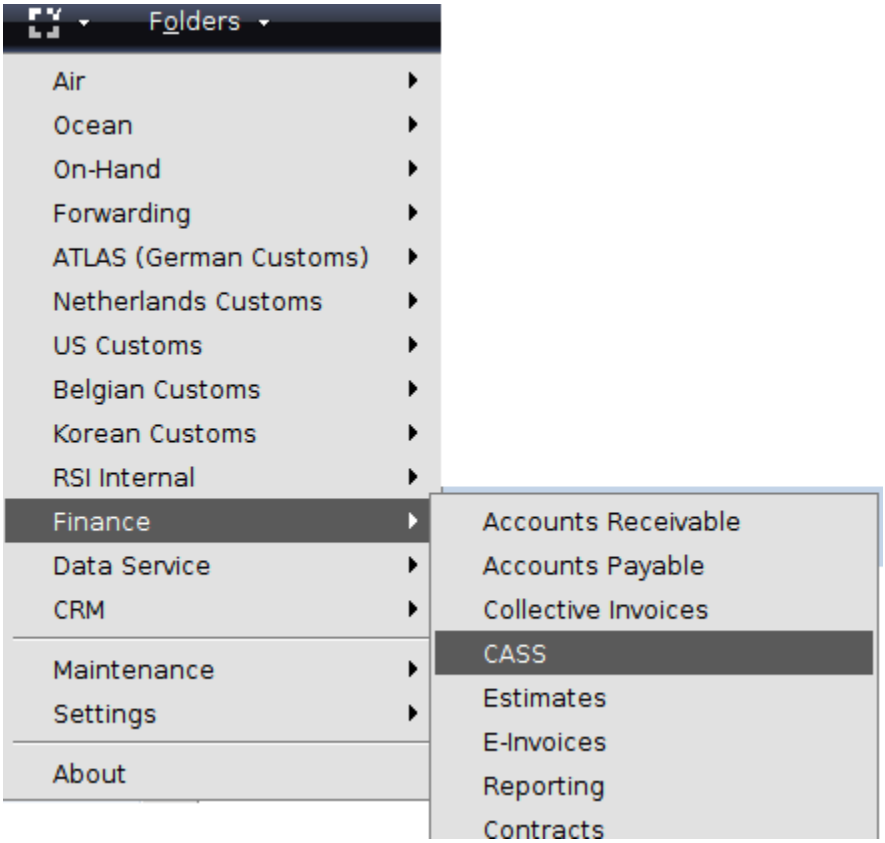
FAQ How-To manage CASS in Scope

This article describes how-to import a CASS file into Scope in order for air export payables to be automatically applied to MAWBs, generating payable vouchers and breaking these charges to the house level in job-costing.

Step-by-step guide

Navigate to and open the CASS application

1. CASS will provide a file containing the airfreight and other charges costs to be paid by the agent. Copy these files to the PC where they will be imported into the Scope CASS application.
2. The files provided, differ slightly according to region:
    a. In the EU the CASS file is known as the HOT file (Hands on Tape) is provided and accordingly has the suffix "hot".
    b. In the USA, 2 files may be provided, a spreadsheet file and a file with the suffix "fil". The "fil" file is the file that will be imported into Scope.
3. Import the file into Scope:
    a. Click the Scope application icon 
    b. Navigate down to the "Finance" option and then in the sub-menu choose "CASS"



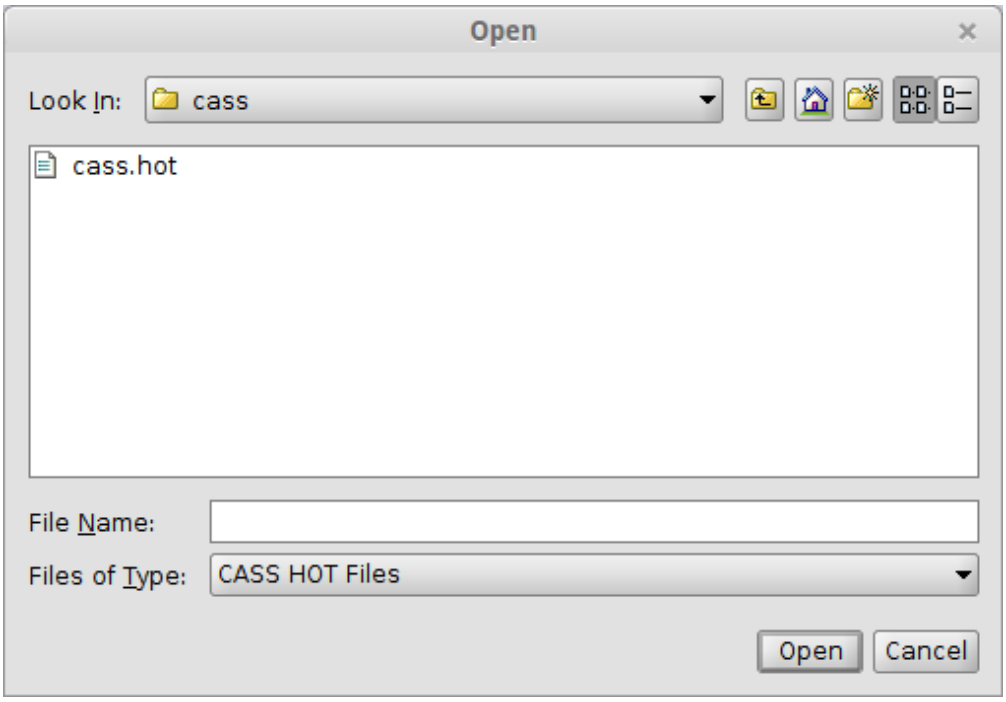
Import the CASS file

The CASS application will now open. It will list previously imported and processed CASS files.

To import a new file:

1. From the menu bar choose 
2. A pop-up explorer window will appear that can be used to navigate to where the CASS file is stored on the local PC:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The explorer will default to look for a "hot" file. If in the USA, then simply change the "File of Type: from "CASS HOT Files" to :

This will allow you to find a "fil" file if you are not in the EU. Now navigate to where the file supplied by CASS is stored and use the 
button to import it.

The application may take a few moments to import the file. Check the progress via the progress bar to the bottom right of the screen.

Check and process the imported CASS file

Once the file has been imported it will appear as an item in the list of imported CASS files. To check and process it:

1. Highlight the new CASS data you have just imported
2. Select 

from the menu bar

The CASS transaction is presented on 2 tabs:

1. The first is the "General" tab which will show the total details of the file about to be processed.
2. The 2nd tab is the "Documents" tab.

Documents in the documents tab

1. The "Difference" report is a spread sheet that will show for each MAWB that has been found, both the airfreight and other charges billed by CASS. The estimates for these charges created by the Scope user and the differences between the CASS figures and the Scope figures.
2. The "Warnings" report will highlight any potential problems such as where the actual agent for a MAWB is not the same as the stated agent.
3. MAWBs from the CASS file that cannot be matched in Scope will be placed against the CASS administrative order for each branch.

Once differences have been checked and accepted, the voucher can be finished

1. On the General tab, in the "Created Invoices" window, double click the voucher that is to be processed
2. The details of the voucher will open, showing dates to be used, total amounts and individual shipments that make up the total
3. To finalize the voucher, from the tool bar select 

4. If there are differences between CASS amounts and Scope Estimates, for each shipment the application will offer to create a new estimate that takes into account this difference. Use the check boxes to indicate if this should be done.

Once the voucher is finished, it will appear in the documents tab (use the print option if it does not appear automatically). This voucher will also appear in the documents tab of each shipment that is included in this CASS voucher.

- Consolidating house shipments on a master
    - Master - Shipper and Consignee
    - Master - Main Transport
    - Master - Consolidation
- Converting the export pre-alert to a Scope import

Introduction

Scope Connect allows a user to create a sea or air pre-alert.

A pre-alert is details of a sea or air shipment that are normally entered by the export agent immediately before export of the shipment.

By creating pre-alerts in Scope Connect, the export agent or shipper is able to advise the import agent of the shipment well in advance of the shipments arrival. These pre-alerts can also be converted by the import agent into shipments in Scope which saves time and improves accuracy.

This document will tell you:

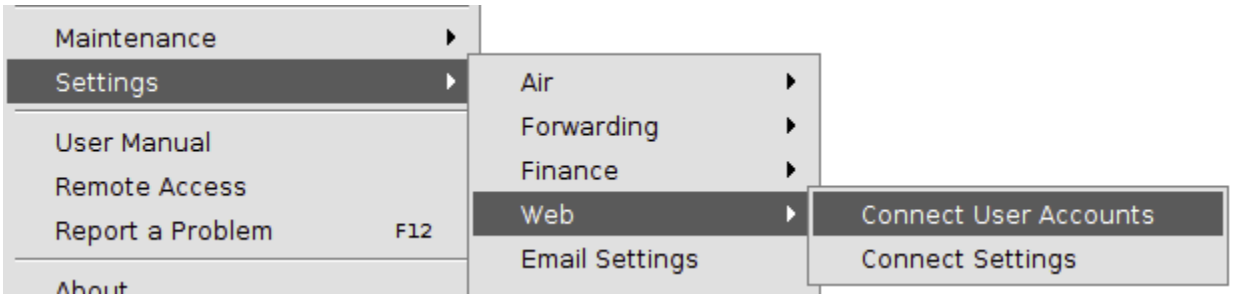
- How to setup a Scope Connect user account so that a user can create pre-alerts
- How to create an air export pre-alert
- How to create a sea export pre-alert
- How to consolidate house pre-alerts onto a master pre-alert
- How to transmit a pre-alert
- How to convert an incoming pre-alert into a Scope import shipment.

Creating a Scope Connect user account

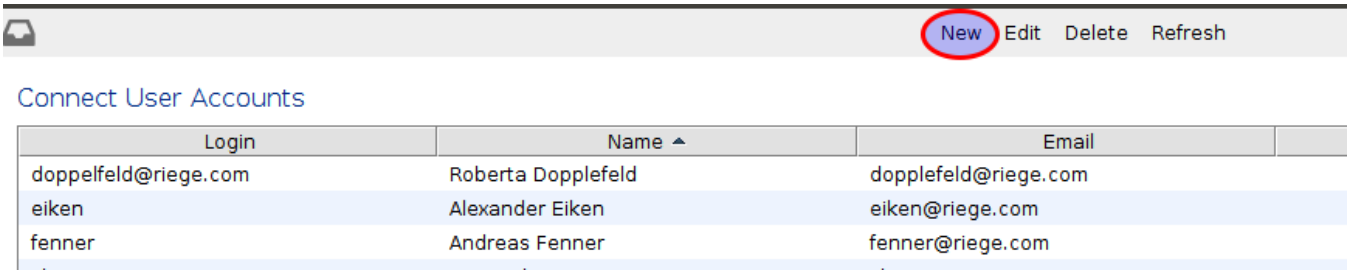
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In order to be able to create pre-alerts, the export agent or shipper must be granted access to Scope Connect. The Scope administrator can do this by creating a Connect User Account

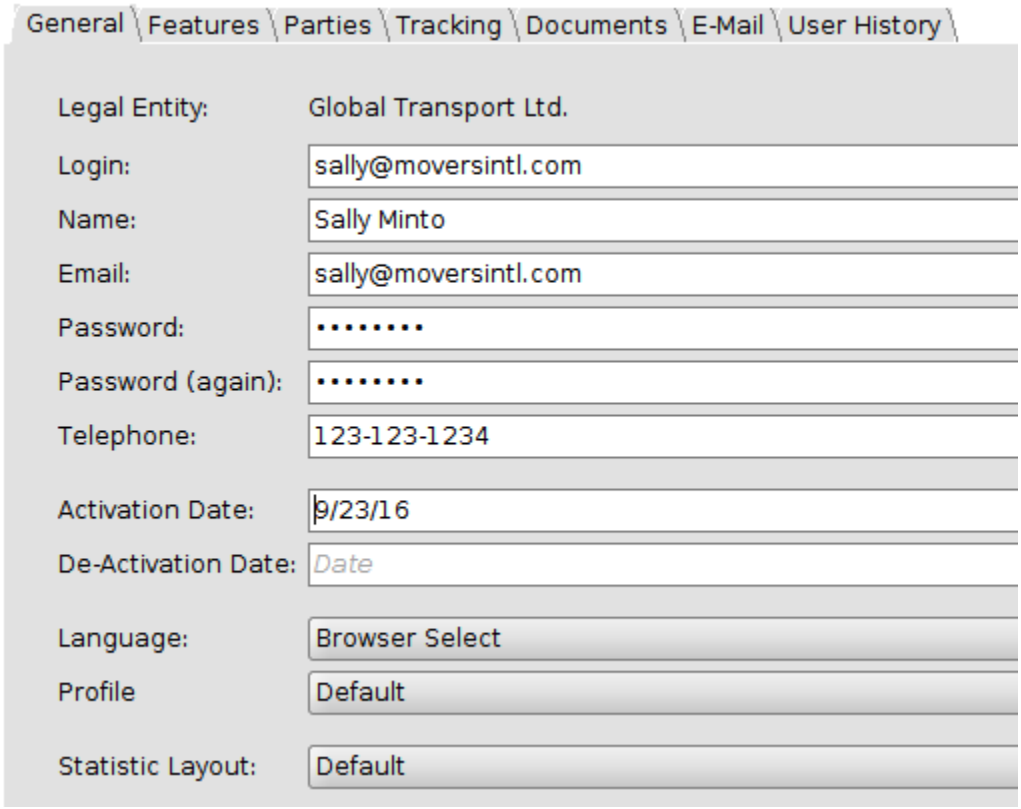
- Navigate to the Connect User Accounts



- Open Connect User Accounts and select "New" from the menu bar to create a new Scope Connect account

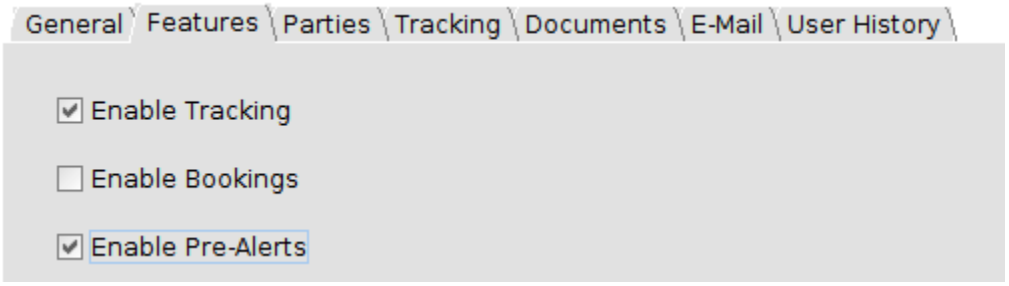


- Complete all the details about the new user in the "General" tab.



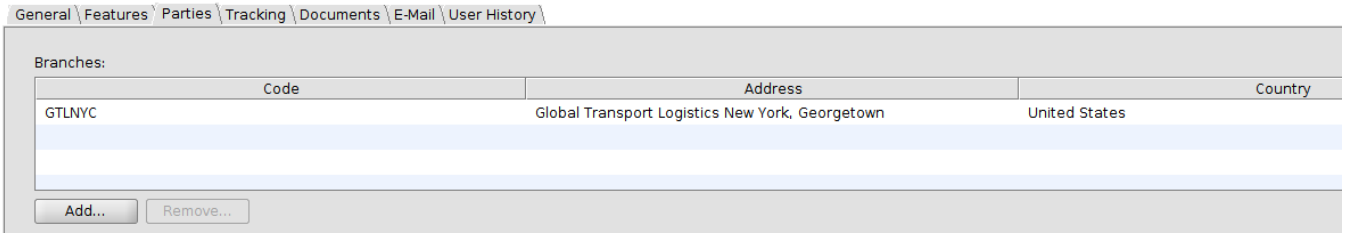
- In the "Features" tab, be sure to check "Enable Pre-Alerts".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

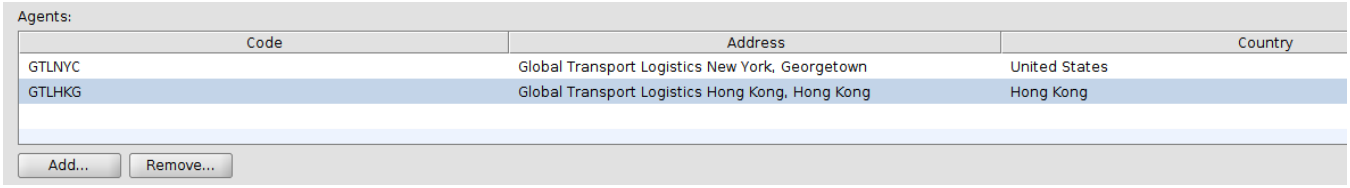


Use the "Parties" tab to define who this new user may communicate with and which parties will be automatically available to them:

- In the "Branches" section, add the import branches they may send pre-alerts to. In this example the user may send pre-alerts to GTLNYC

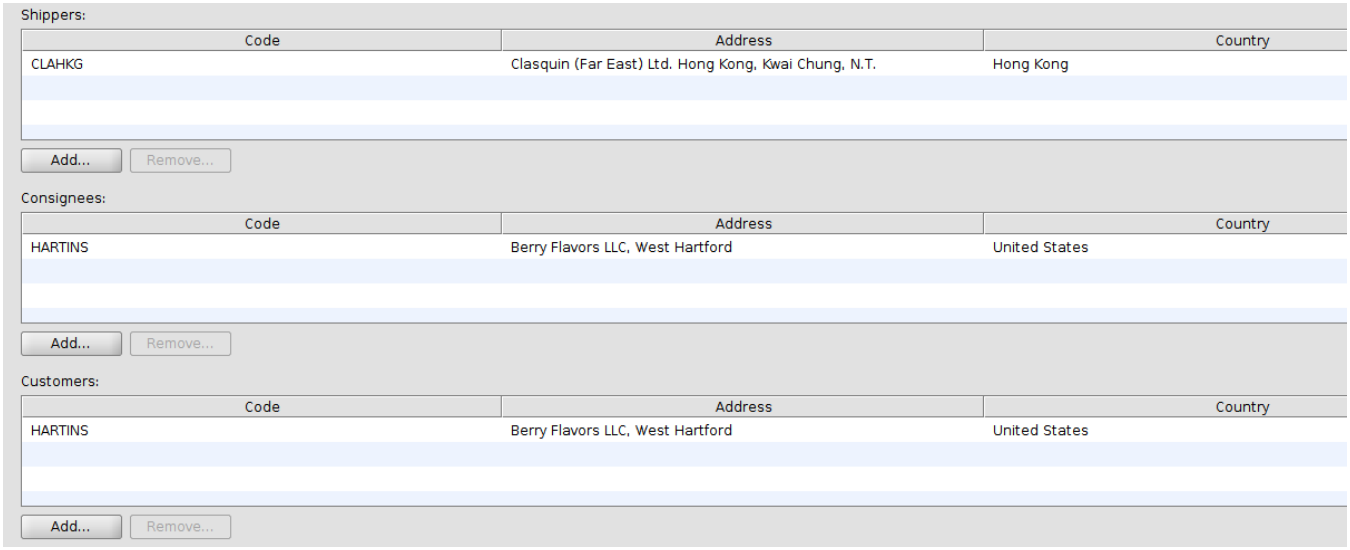


- In the "Agents" section, add the agents who will be the shown as the senders and recipients of any pre-alerts. In this example GTLNYC and GTLHKG will be the allowed agents:

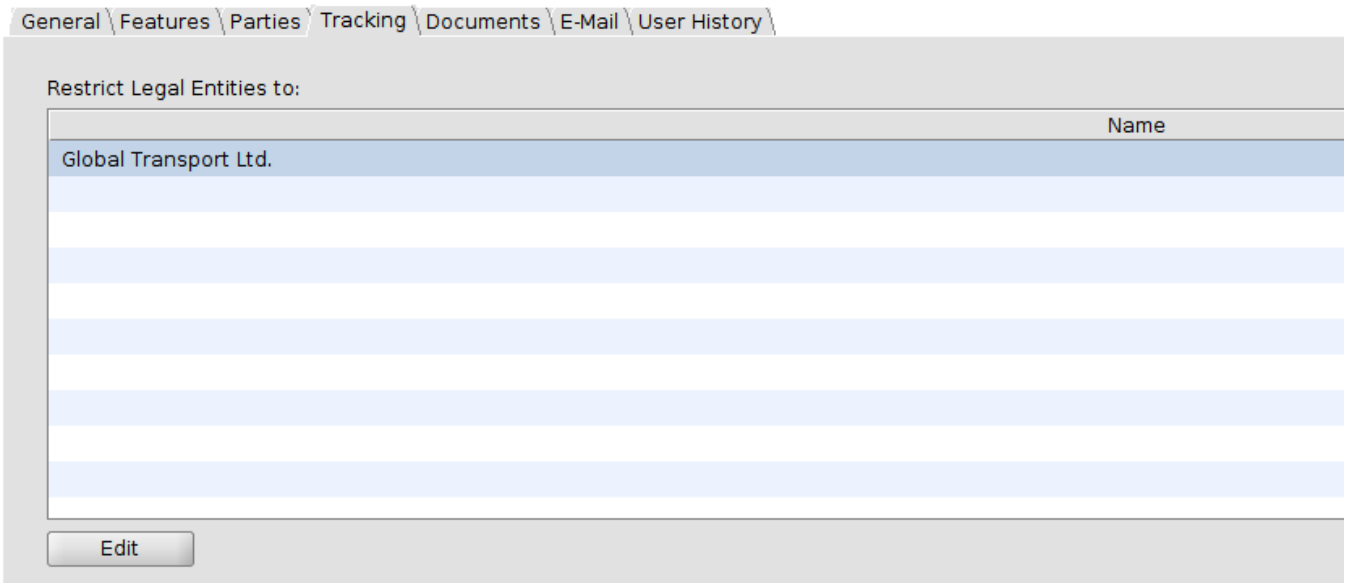


- Use the "Shippers", "Consignees" and "Customer" sections to specify parties whose tracking the Web Connect user may view. These addresses will also automatically be available to the user during creation of a pre-alert, this saves the Scope Web Connect user having to create partners from Scratch. The user can still create new partners from scratch when building the pre-alert if these partners are not allocated to them in their web account.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the "Tracking" tab, define the legal entity whose tracking information the Web Connect user may view. In the example below, only tracking for Global Transport US is visible to this user.



Once the above details are complete, click "Save" and advise the new Scope Web Connect user of their login details.

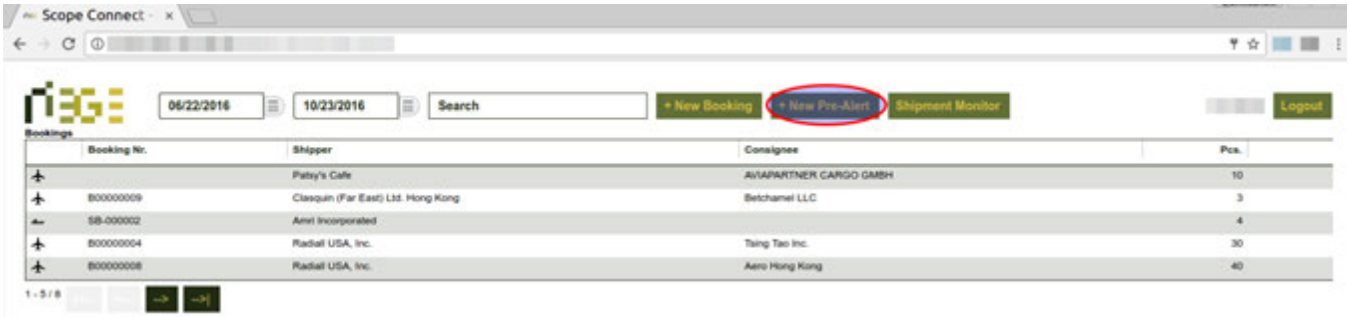
Creating a Scope Connect Pre-Alert

The new Scope Connect user needs to login to Scope Connect with their browser in order to create pre-alerts. Ask your administrator for the web-address for your Scope Connect.

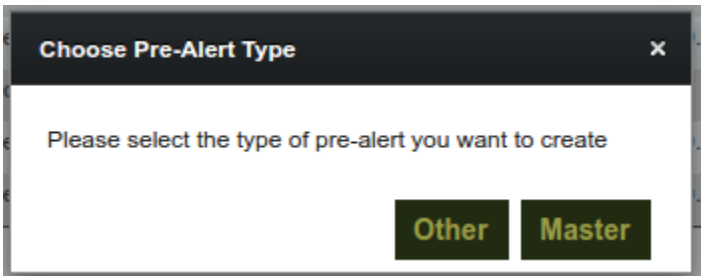
Using the link address, the Scope Connect user can login to Scope Connect using a browser.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

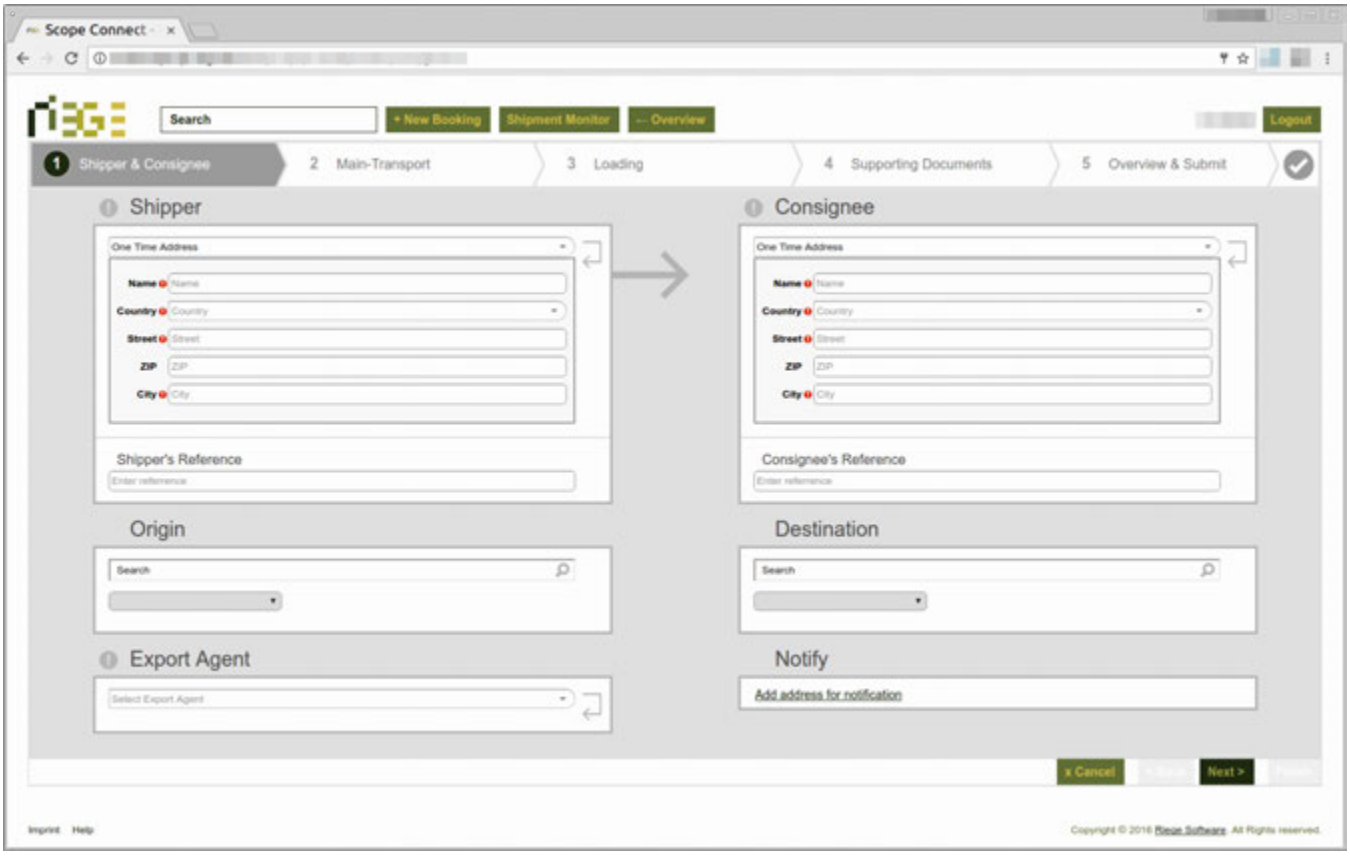
At the top of the landing page the user will have the option: + New Pre-Alert



Now choose the type of pre-alert to create. This example will be an "other" meaning any type of shipment except a master shipment:



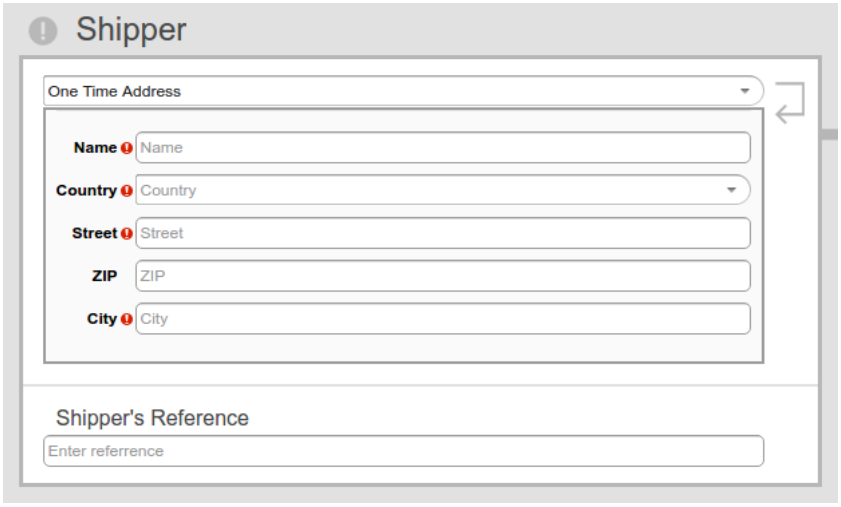
The new pre-alert will open at the first step which is adding the shipper and consignee details:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Step 1: Shipper & Consignee

Shipper

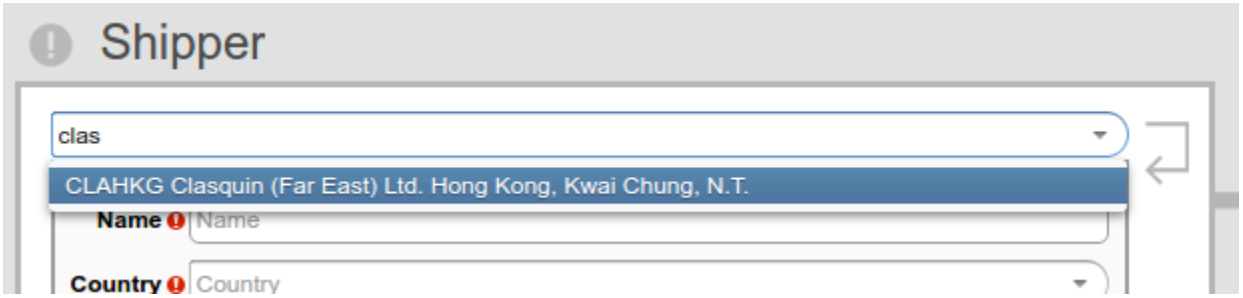


There are 2 methods for entering the shipper details:

1. From stored addresses
2. One time addresses

Stored addresses

If the Scope Connect user has been given an existing Scope partner in their Scope Connect user account, then they can clear the text "One Time Address" and start typing the name or address of any partner allocated to them, Scope connect will then search for this party:

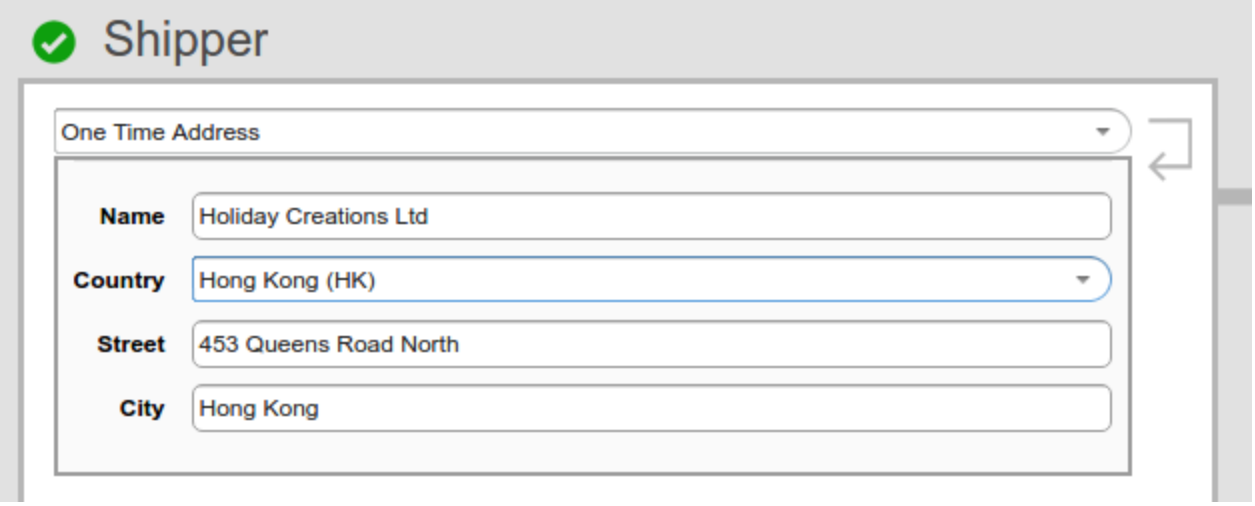


If the party displayed in the search results is correct, the click it to apply it as the shipper.

One time address

If this is a new address, then put the cursor in the "Name" field of the shipper, fill it out and all subsequent address details for the shipper:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Shipper's Reference

Enter the shipper's reference if there is one. If more than 1, the separate them with a comma. These references will be transferred to the import shipment.

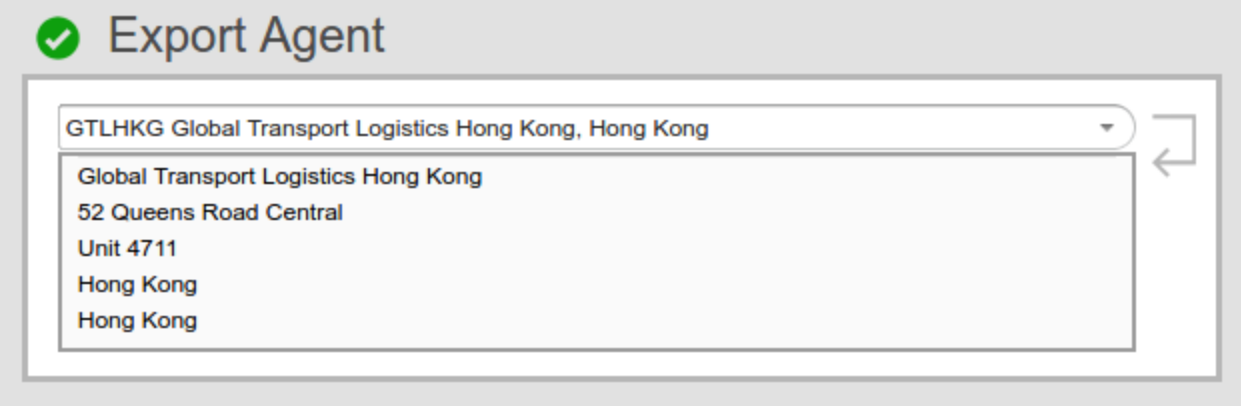
Origin

This is the place or airport where the goods originated from. Type the place name, airport or port code to insert the correct origin:

Export Agent

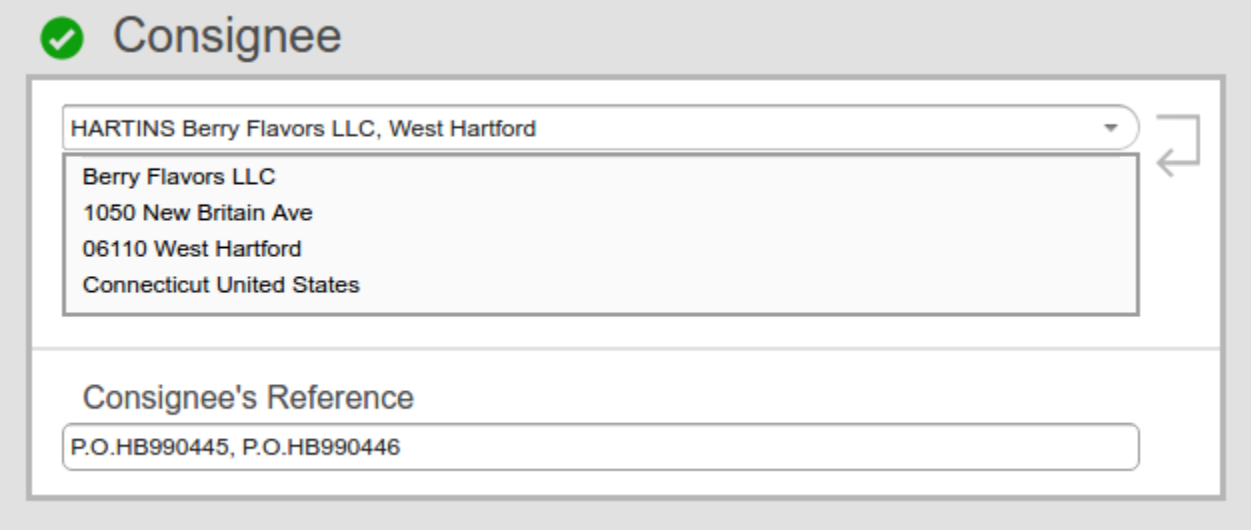
Enter the name of the export agent responsible for creating the prealert. Only export agents allocated to the Scope Connect user in their user account will be available. Typically the Scope Connect user is an employee of the agent that is selected:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Consignee and Consignee's reference

Use the same methods described above for the shipper to find or enter the correct consignee details and the consignee references:

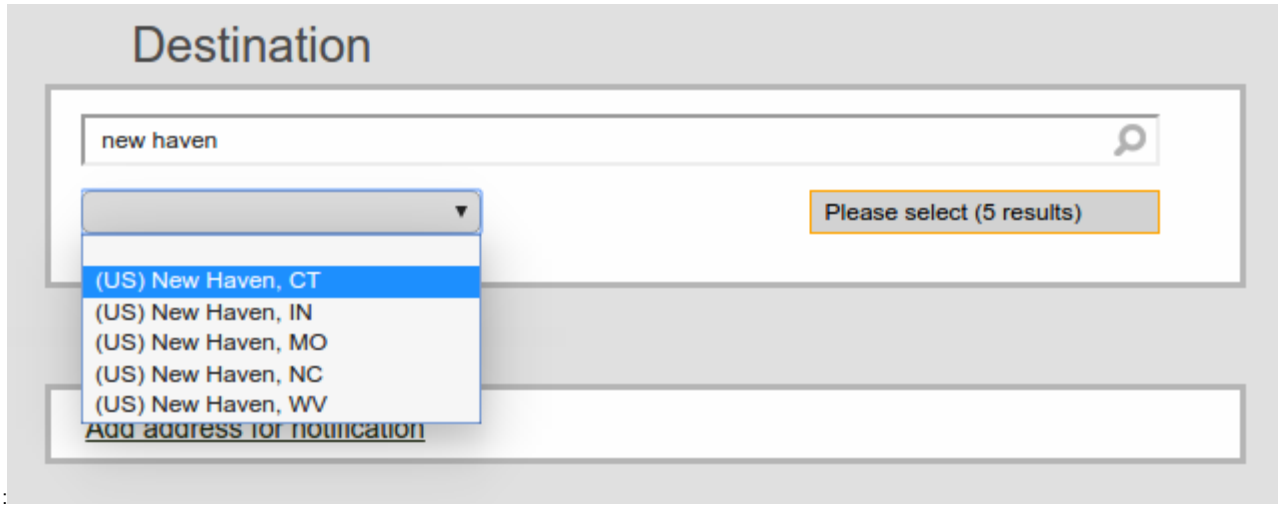


Destination

This is the destination port or airport of the shipment. Start typing the name or code of the port or airport to locate the correct destination.

The number of search results is displayed to the right and clicking on the drop-down list allows the desired port or airport to be selected.

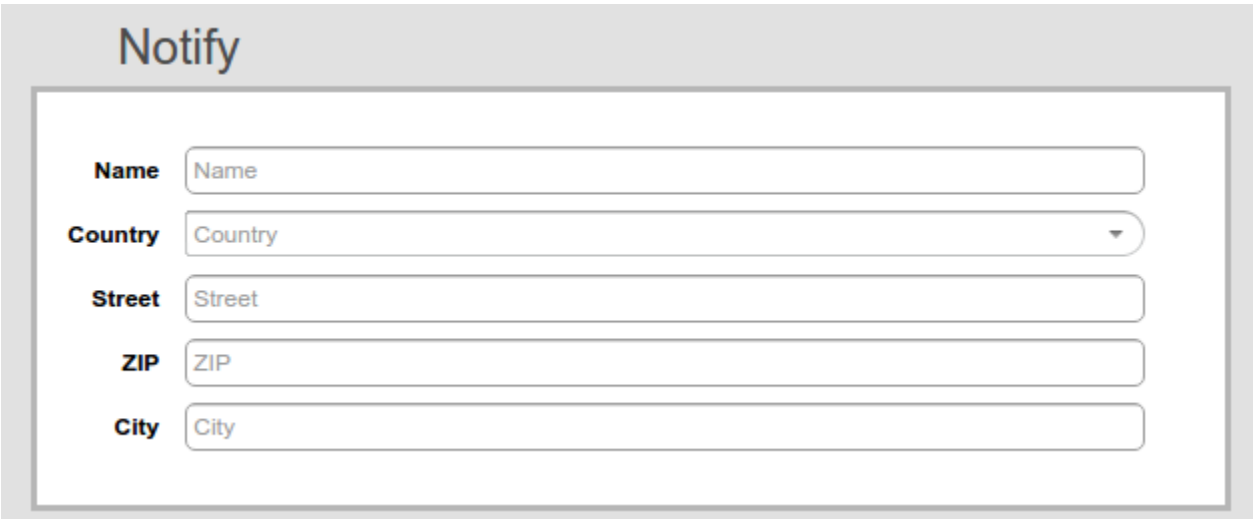
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



:

Notify

A notify party may be included with the pre-alert. The notify must be entered as a one time address:

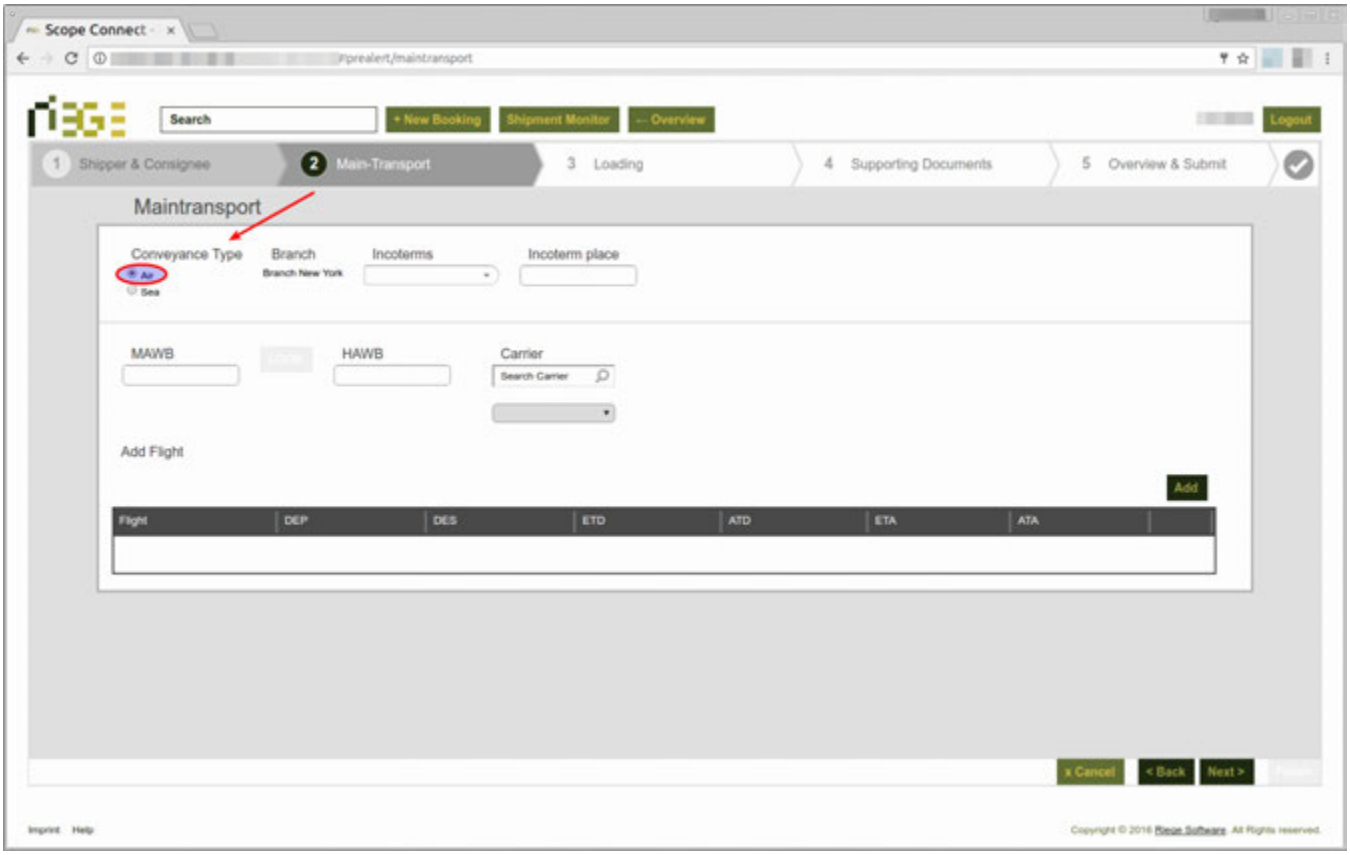


When step 1, Shipper and Consignee have been completed, click 
Air Export pre-alerts

Step 2, Main Transport - creating an air pre-alert

The main transport screen opens and the first step is to indicate the type of pre-alert that is being created. This can be an air or sea pre-alert. In this example an "air" pre-alert will be created.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

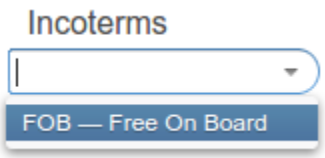


Branch

The branch to whom the pre-alert is being sent will be shown

Incoterms

Start typing the correct INCO term for the pre-alert if this is to be included. Then select the correct one:



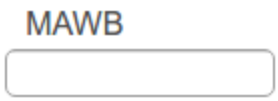
Incoterm Place

Type the place where the Incoterm applies to.

MAWB

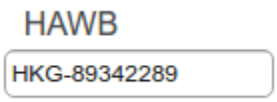
If the MAWB is known, then it can be entered. If this is a house shipment that does not yet have a MAWB, it can be left blank. The MAWB will be automatically filled in if the shipment is later consolidated on a master pre-alert.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



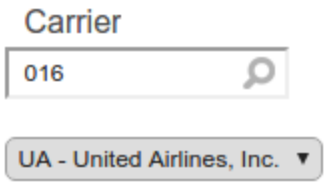
HAWB

Enter the HAWB of the air export pre-alert



Carrier

Enter the airline that will transport the shipment. You can enter the airline name or the 2 letter airline code or the 3 digit AWB prefix.



Add flights to an air export pre-alert

If the flights are known for the air export shipment, they can be included in the pre-alert. If a pre-alert for a house shipment is being created, once the house is consolidated on the master pre-alert, the flights from the master pre-alert will over-write any flights originally entered on the house pre-alerts.

To add a flight, click 

Now fill in all the details about the flight:

Click 

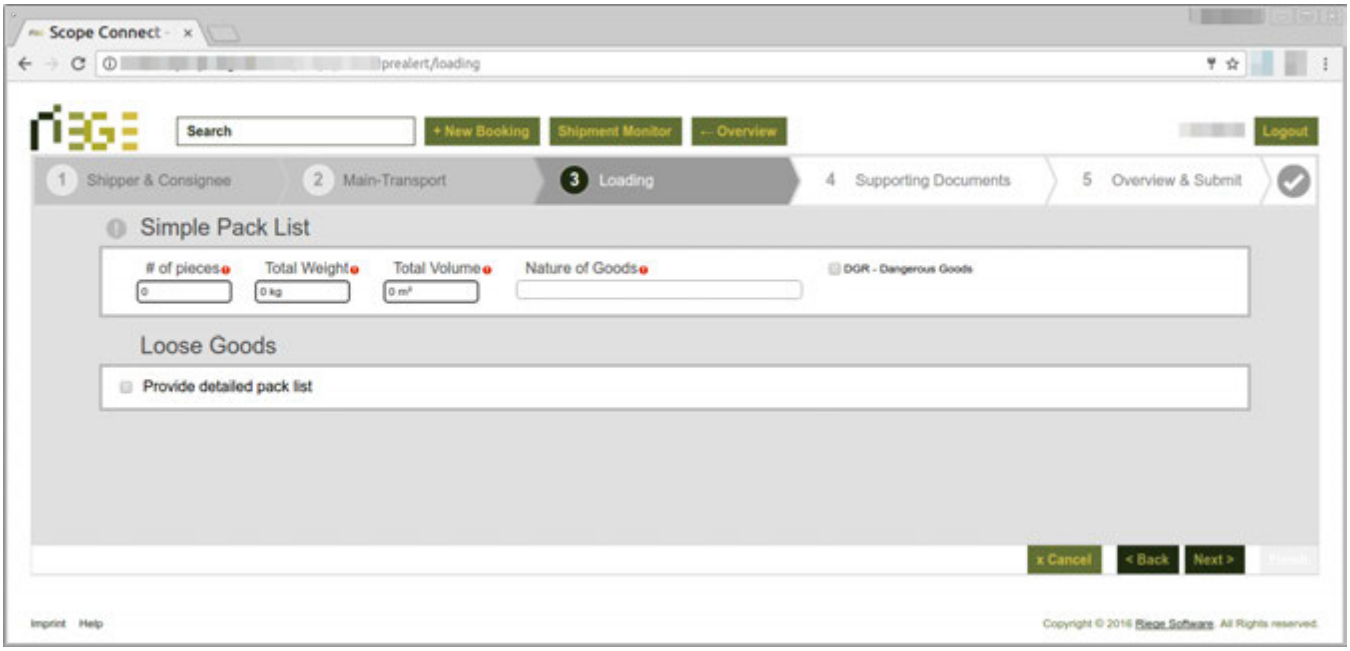
when done. The completed main transport should be similar to the example below. Use the 

button to add further flights.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click  to get to the next step - Loading

Step 3, Loading - air export pre-alert



The loading screen is used to enter details about the goods on the pre-alert:

- Pieces
- Weight
- Volume
- Nature of goods
- DGR

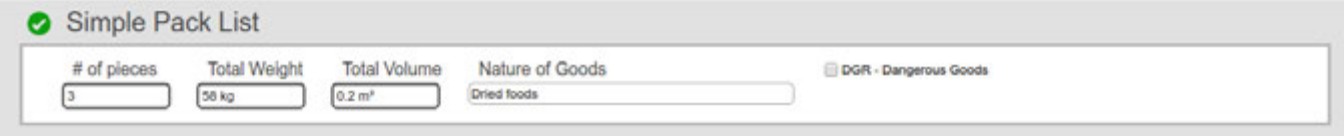
There are 2 ways to enter goods details:

1. Totals only using the Simple Pack List
2. Full details of loose goods with the detailed pack list

Entering goods totals only

Direct fill in the fields provide with the total details of the goods and the overall description. If the goods are dangerous, check the DGR box.

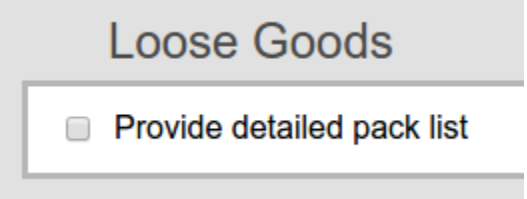
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



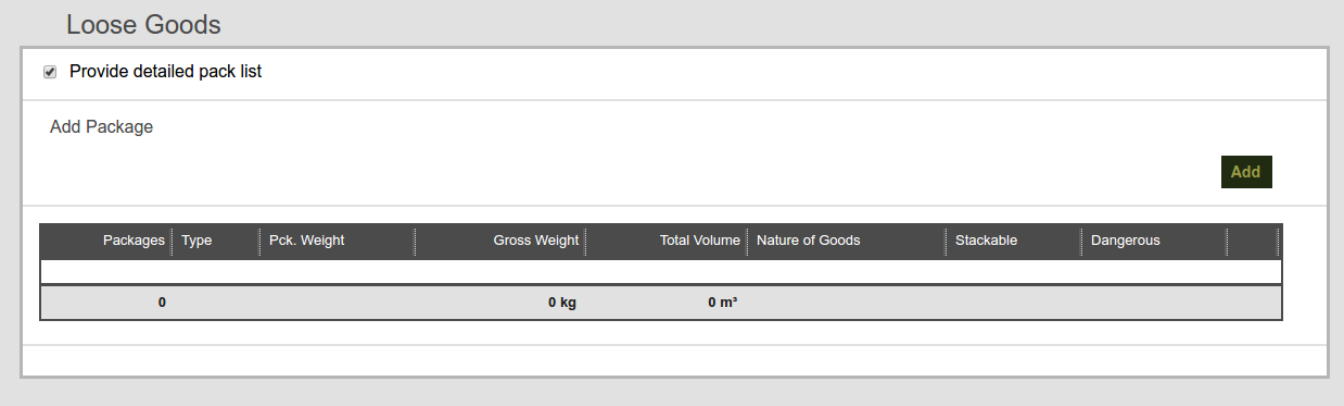
With the totals entered, it is possible to move on to the next stage of the pre-alert by clicking the Next > button, this will move you to step 4, "Supporting Documents"

Entering a detailed packing list

A detailed listing of the goods can be entered using the detailed pack list. Instead of entering the totals of the goods in the simple pack list shown above, check the detailed pack list box:

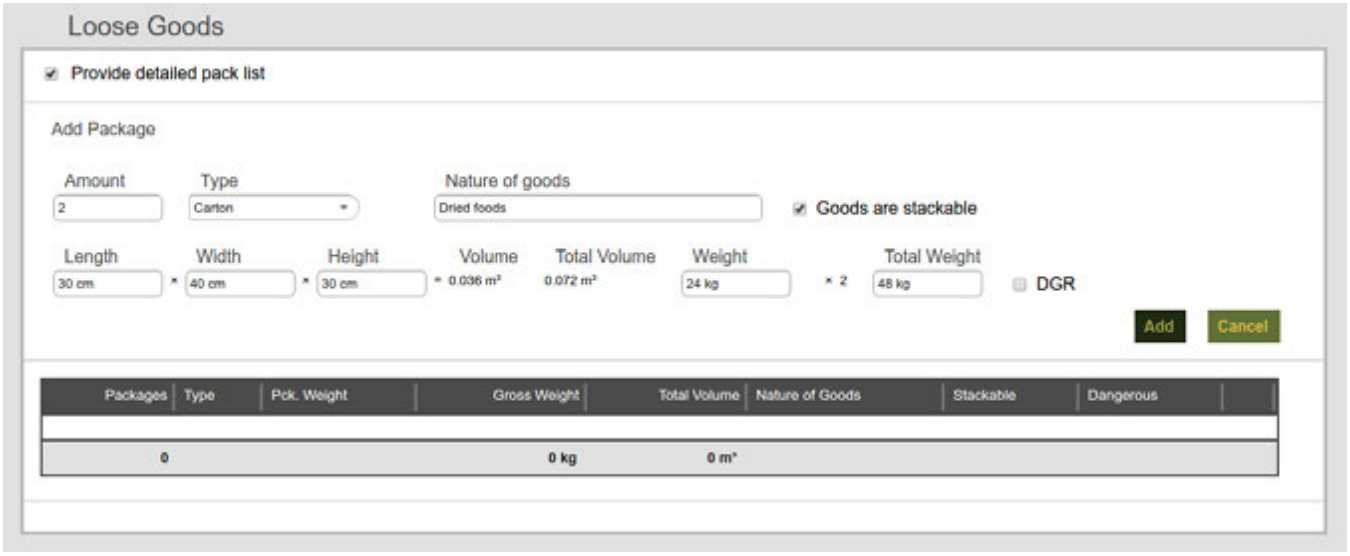


The "Add Package" function will open:



Click on the Add button to begin entering detailed goods information:

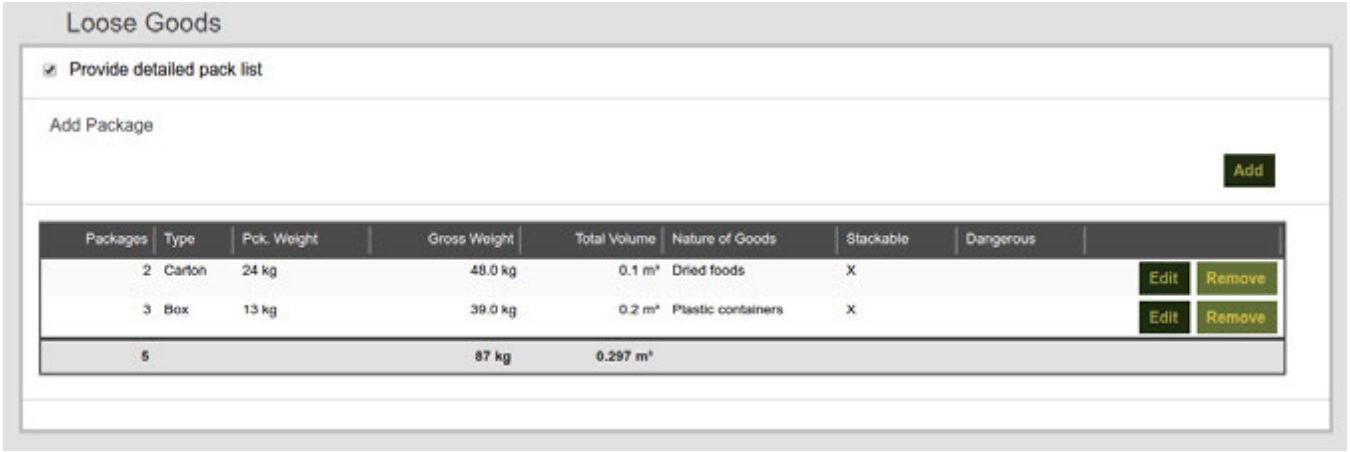
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the goods entry is complete, click 

To add further goods, click the  button again and repeat the process.

The example below shows 2 different cargo items on the shipment. Use the  button to change any details and the  button to remove an item from the pre-alert.

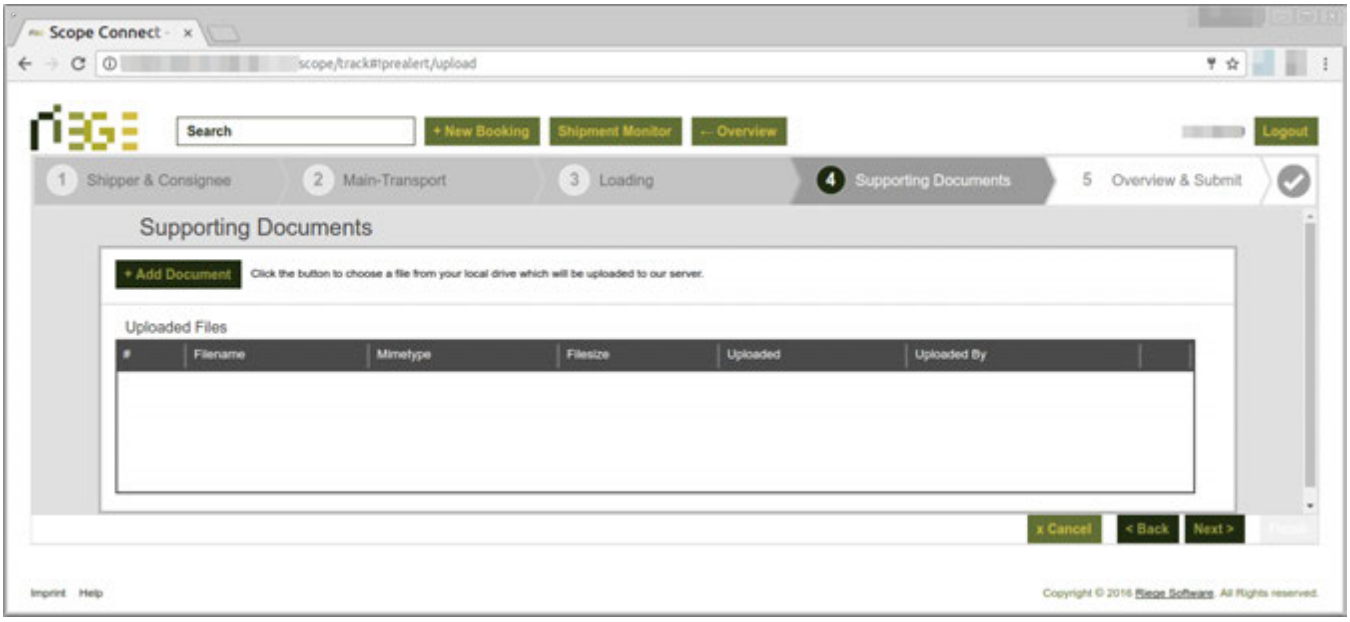


When all the goods are on the pre-alert use the  button to go to the next step "Supporting Documents".

Step 4, Supporting Documents - air export pre-alert

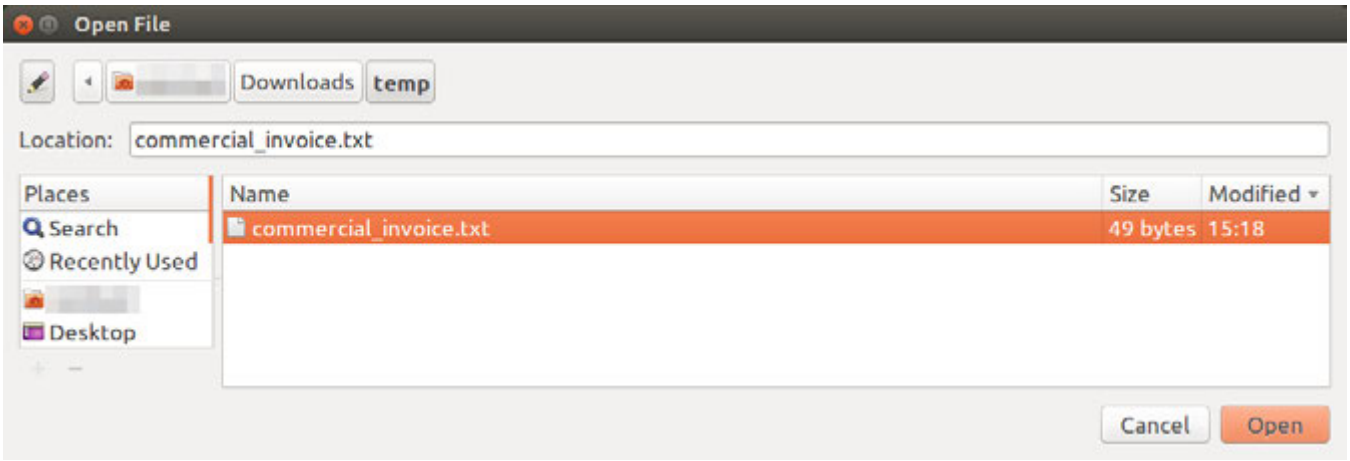
When additional documents like the commercial invoice for example need to be included with the pre-alert, these can be uploaded in the "Supporting Documents" section.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

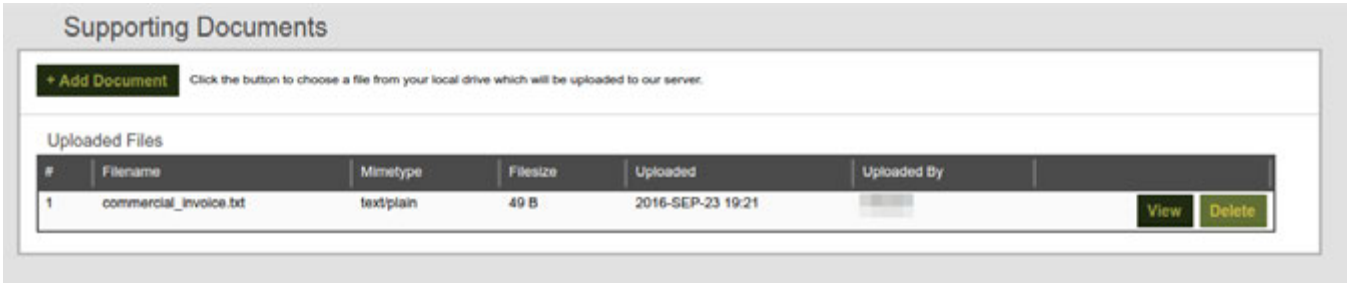


Click  to upload a document.

A file browser will open. Use it to find and select the document to be uploaded to the air export pre-alert.



The uploaded document will appear in the supporting documents section:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

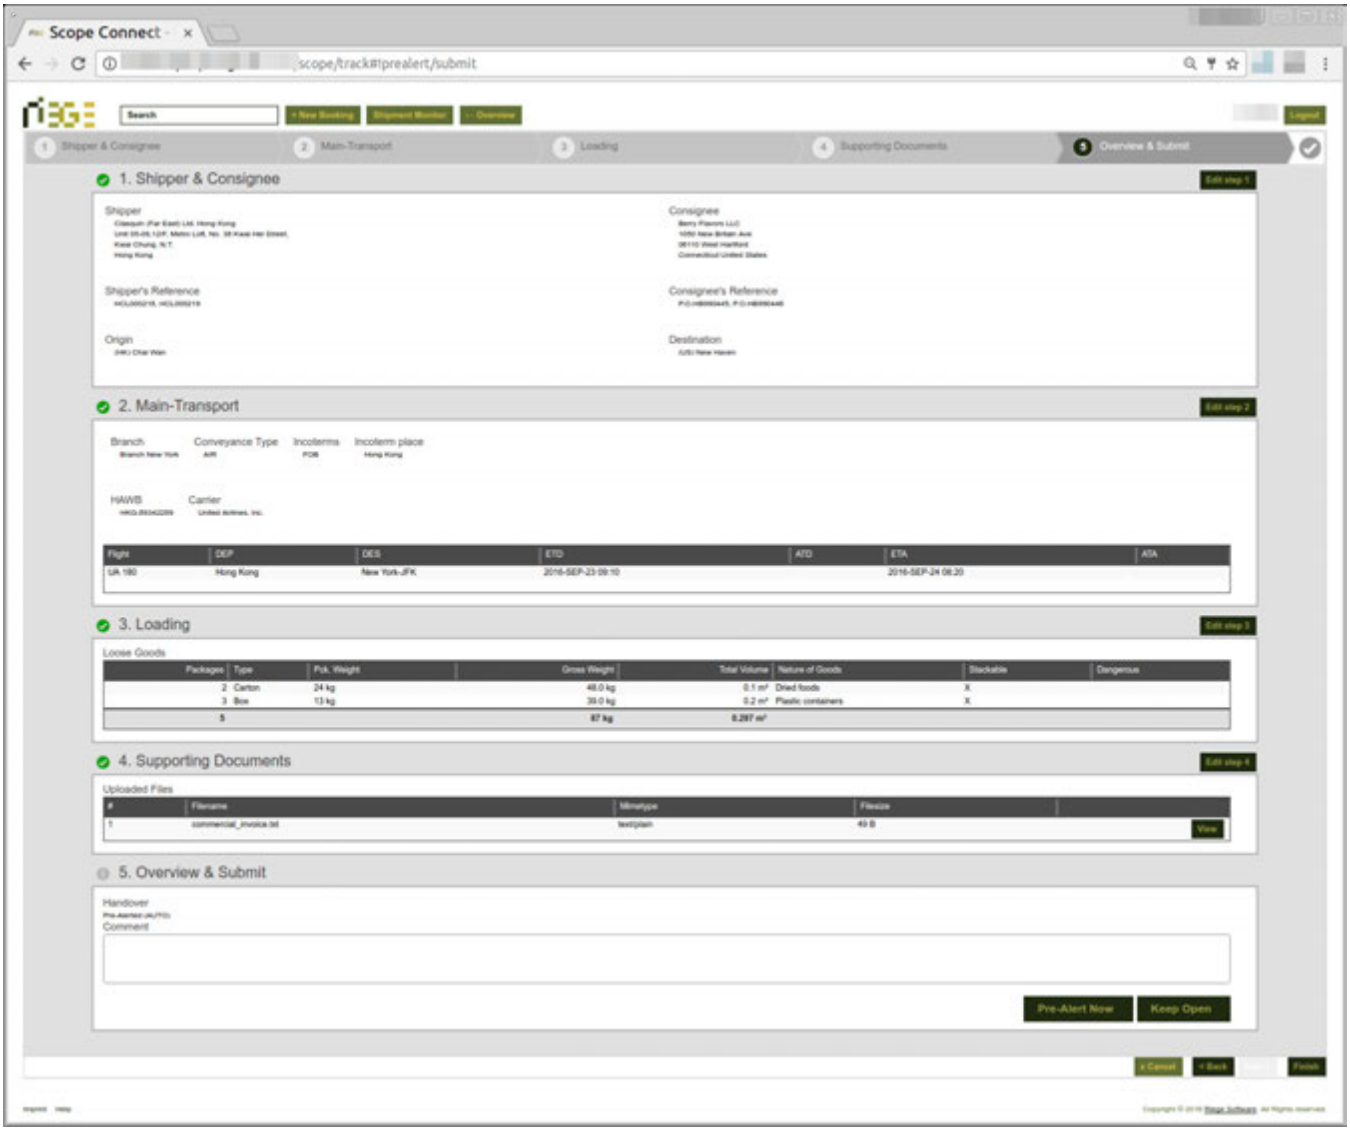
Use the View button to view the uploaded document, and use the Delete button to delete it from the pre-alert.

Use the + Add Document button to add further documents to the pre-alert.

When all documents are uploaded to the pre-alert, use the Next > button to go to the next step "Overview & Submit".

Step 5, Overview & Submit - air export pre-alert

The final step will show an overview of all information entered on the pre-alert. Any of the data can be changed by editing that step.



Sending the pre-alert

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Once all required information is in the pre-alert, it can be transmitted to the receiving Import Agent by clicking **Pre-Alert Now** or **Finish**

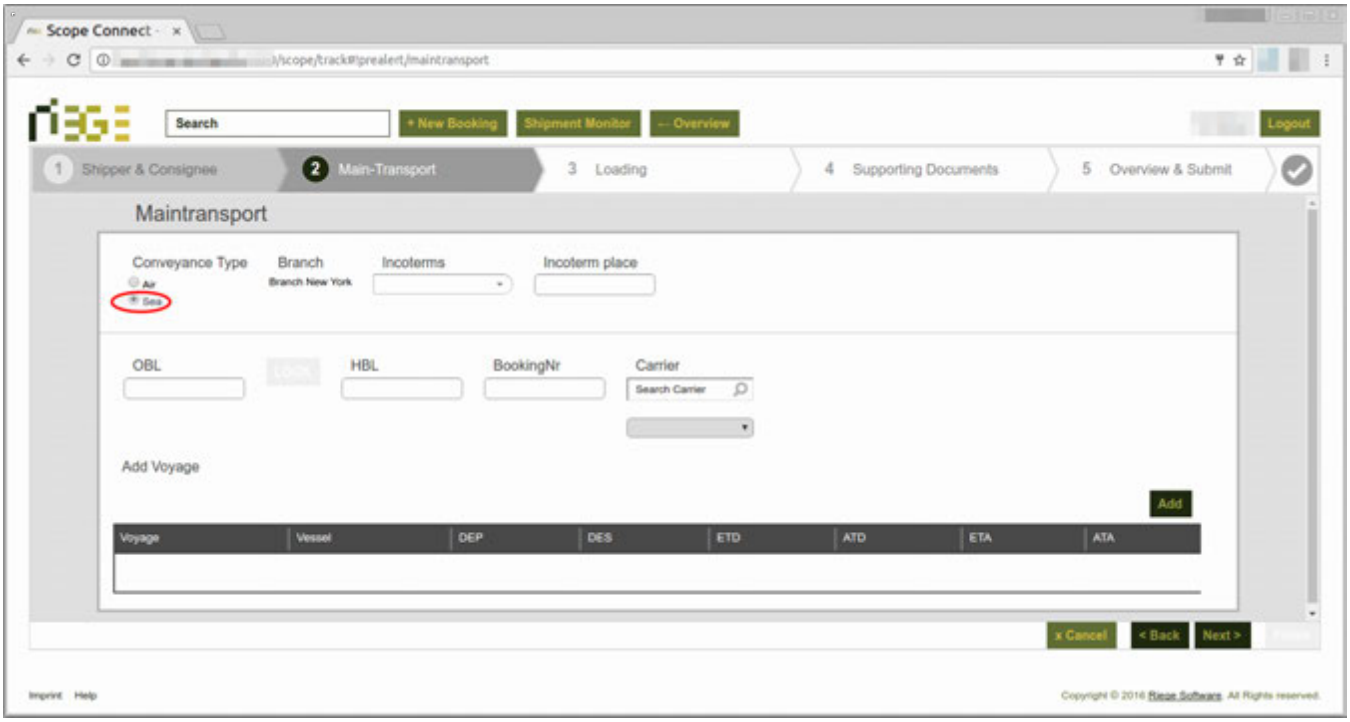
If you do not want the import agent to see the pre-alert yet then click **Keep Open**

Sea Export pre-alerts

Step 1 of pre-alerts is the same for both air and sea pre-alerts. In Step 2, Main Transport, if the conveyance type is "Sea", then a sea freight pre-alert is created.

Step 2, Main Transport - creating an sea pre-alert

The main transport screen opens and the first step is to indicate the type of pre-alert that is being created. This can be an air or sea pre-alert. In this example a "sea" pre-alert will be created.



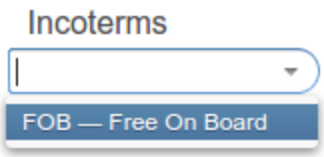
Branch

The branch to whom the pre-alert is being sent will be shown

Incoterms

Start typing the correct Incoterm for the pre-alert if this is to be included. Then select the correct one:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Incoterm Place

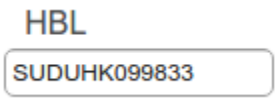
Type the place where the Incoterm applies to.

OBL

If the Ocean Bill of Lading is known, then it can be entered. If this is a house shipment that does not yet have an ocean bill, it can be left blank. The OBL will be automatically filled in if the shipment is later consolidated on a master pre-alert.

HBL

Enter the HAWB of the air export pre-alert

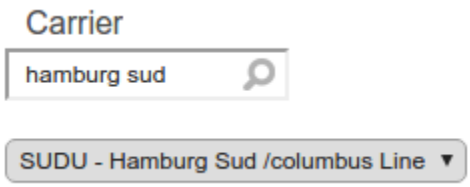


BookingNr

If the Liner Agent has provided a booking number for the shipment, it can be entered in the "BookingNr" field.

Carrier

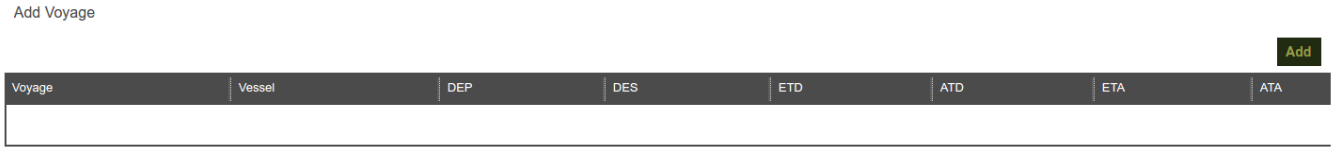
Enter the carrier that will transport the shipment. You can enter the carrier name or the 4 letter SCAC code and Scope Connect will search for the correct carrier.



Voyage

One or more voyages can be added to the pre-alert

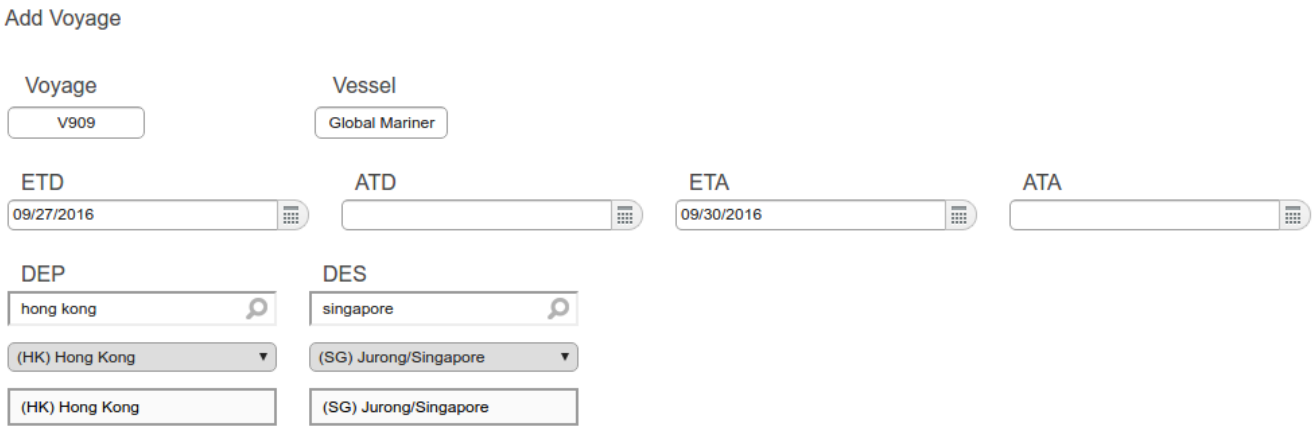
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



To add a voyage click 

Fill in the:

- Voyage Number
- Vessel for the Voyage
- ETD of the voyage
- ATD of the voyage (if any)
- ETA of the voyage
- ATA of the voyage (if any)
- Depart port of the voyage
- Destination port of the voyage



When the voyage information is complete click 

again

If there are further voyages, click 

to add these further voyages.

Use the 
and 
to adjust existing voyages

When all main transport details are complete, click 

to move to the next section "Loading"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

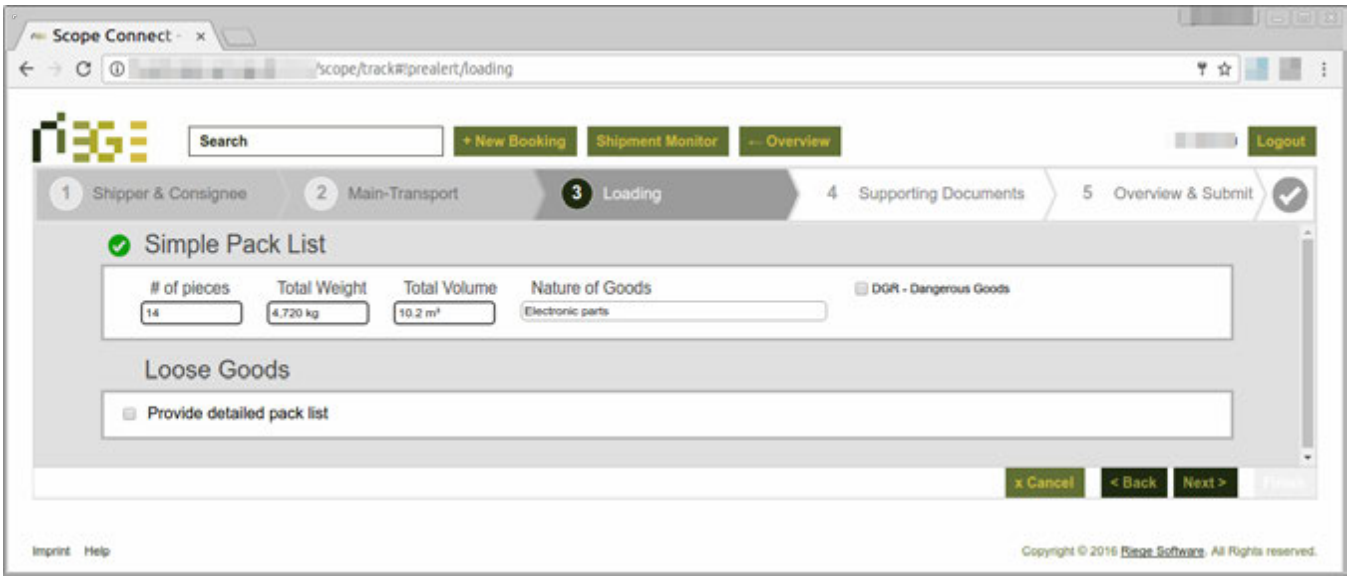
Step 3, Loading

In the loading section of the sea export pre-alert the goods can be entered in 2 ways:

- Simple Pack List - this is a simple total of all the goods and an overall description
- Loose goods and container details - this is a detailed description of all the goods and the containers the goods are in

Simple Pack list

- enter total details of the goods
- Total number of pieces
- Total weight
- Total volume
- Nature of goods
- DGR - use the checkbox to indicate DGR



Detailed goods and containers

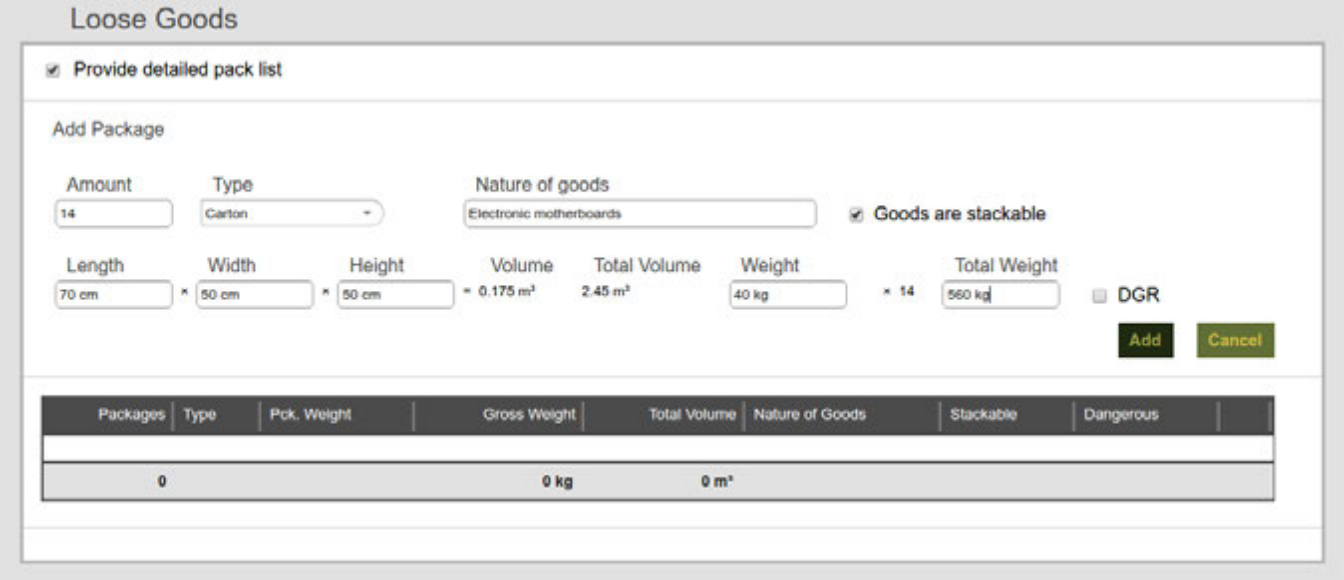
If detailed goods and containers are to be entered then click the check box

Now click 

to begin adding goods to the sea export pre-alert.

- Amount - number of packing units of this goods item
- Type - type of packing, start typing the packing type name to see and select from the list of packing types.
- Goods are stackable - check this box if the cargo can be stacked.
- Nature of goods - the description of this goods item
- Dimensions - length, width, height and weight
- DGR - check this box if the goods are dangerous

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the first goods item is complete click 

If there are more goods to add, then click 

again.

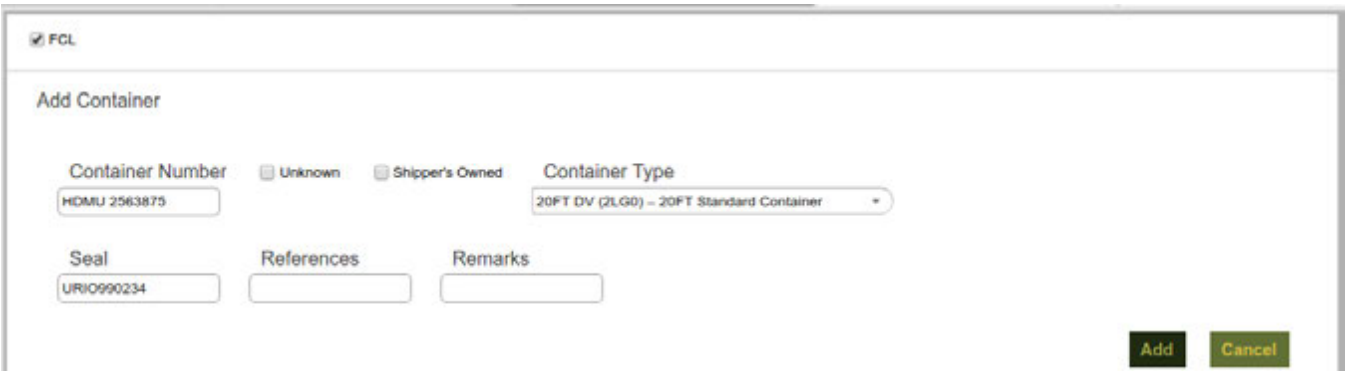
Containers

to add the containers where the goods are located, go to the container section and check the FCL box

Now click 

to enter container details

- Container Number - Scope connect will check the container check digit
- Unknown or Shipper's Owned
- Container type - start typing to see a list of container types and select the correct one.
- Seal
- References
- Remarks



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the container details are complete click Add

Adding goods to a container

Highlight the container in the container list that will have goods added to it

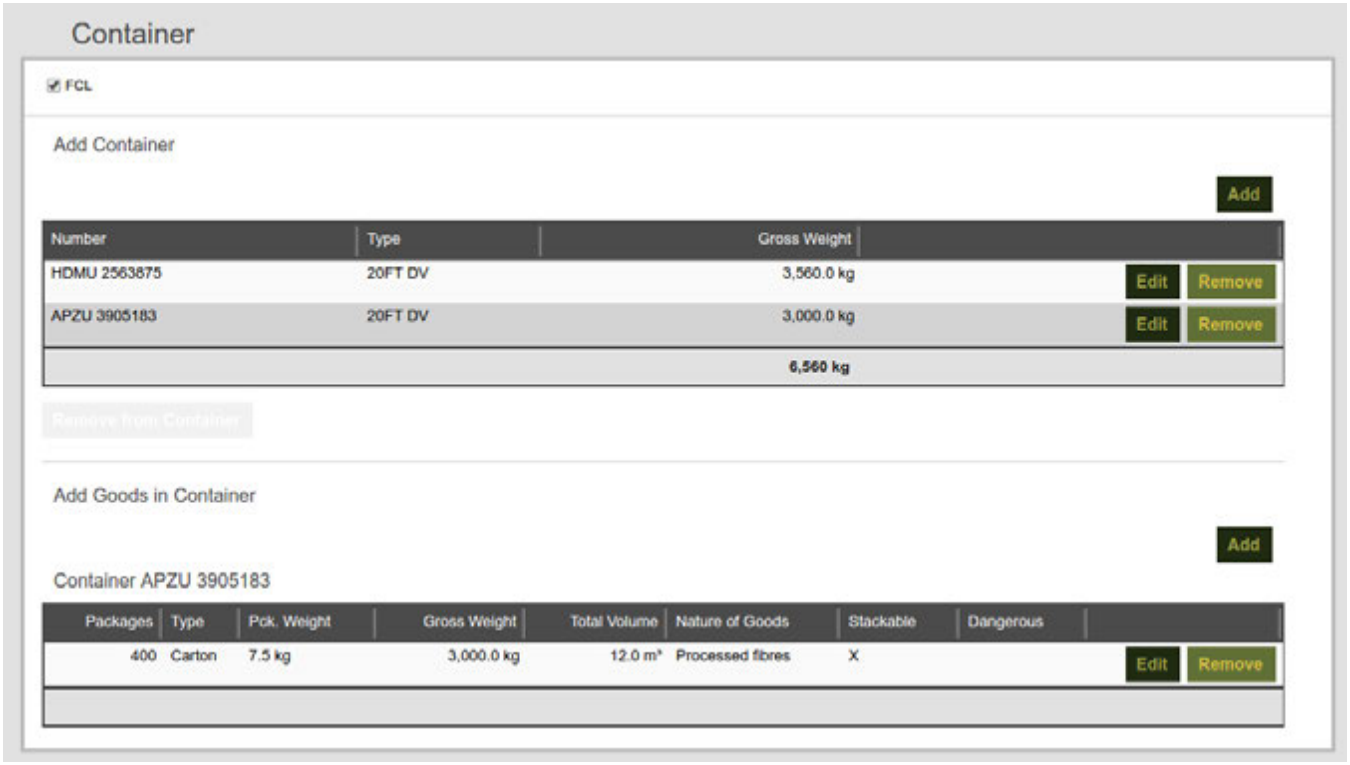
Number	Type	Gross Weight	
HDMU 2563875	20FT DV	0.0 kg	Edit Remove
APZU 3905183	20FT DV	0.0 kg	Edit Remove
		0 kg	

Now highlight the goods in the goods list that are to move into the container

Packages	Type	Pck. Weight	Gross Weight	Total Volume	Nature of Goods	Stackable	Dangerous	
14	Carton	40 kg	560.0 kg	2.5 m³	Electronic motherboards	X		Edit Remove
25	Barrel	120 kg	3,000.0 kg	3.2 m³	Cleaning Fluid	X		Edit Remove
400	Carton	7.5 kg	3,000.0 kg	12.0 m³	Processed fibres	X		Edit Remove
439			**6,560 kg**	**17.6 m³**				

Now click Move To Selected Container

The container will now have the total weight of the goods shown in it and when it is highlighted, the screen below will show the details of the goods in the container



Once all goods and container details have been entered, click Next > to move to the next section "Supporting Documents".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

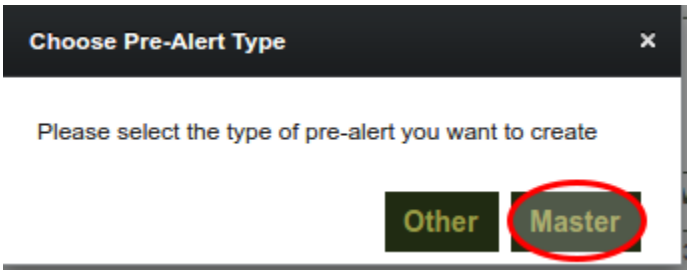
See the section on Supporting documents for instructions on this activity

See the section on Overview and Submit for instructions on this activity

Consolidating house shipments on a master

Create the house shipment pre-alerts in the normal manner described above but be sure to enter the MAWB or OBL in the shipment:

When the house pre-alerts are ready, create a master shipment by clicking + New Pre-Alert and then Master



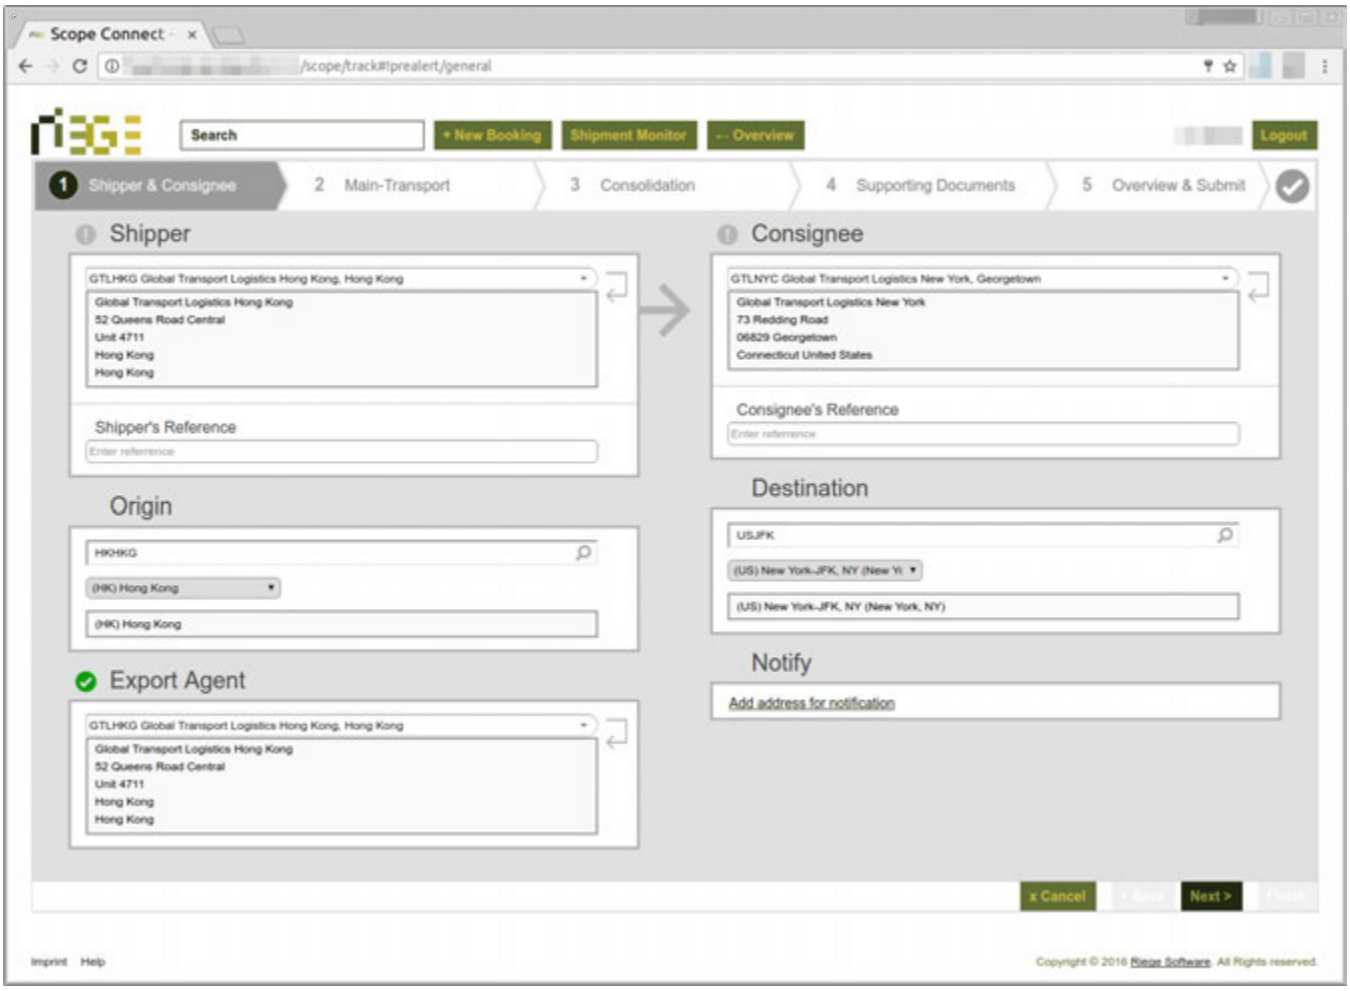
Master - Shipper and Consignee

Complete the shipper, consignee and export agent of the master:

- Shipper - this is the export agent sending the pre-alert.
- Consignee - this is the import agent who will receive the pre-alert
- Export Agent - this is the export agent sending the pre-alert

Complete the Origin and Destination of the master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

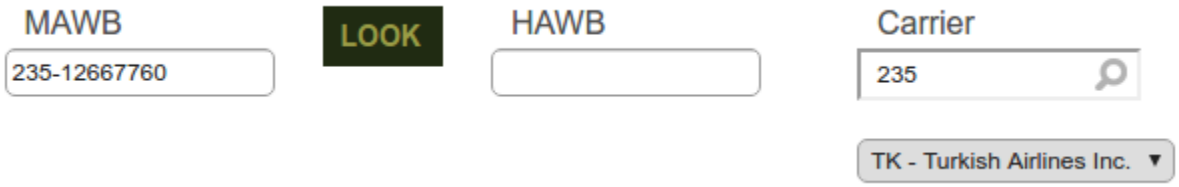


When complete click  to get to the Main Transport screen of the master pre-alert

Master - Main Transport

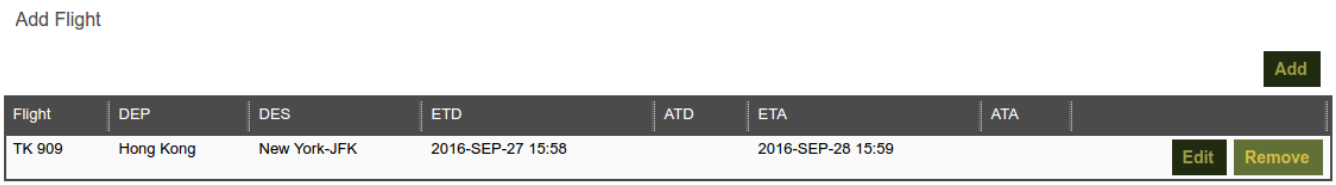
Use the air/sea button to indicate if the master is for an air or sea pre-alert and enter the master Incoterms and place

Enter the MAWB or OBL and the carrier for the master



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Add all the flights for the master pre-alert



When complete click Next > to get to the Consolidation screen of the master pre-alert

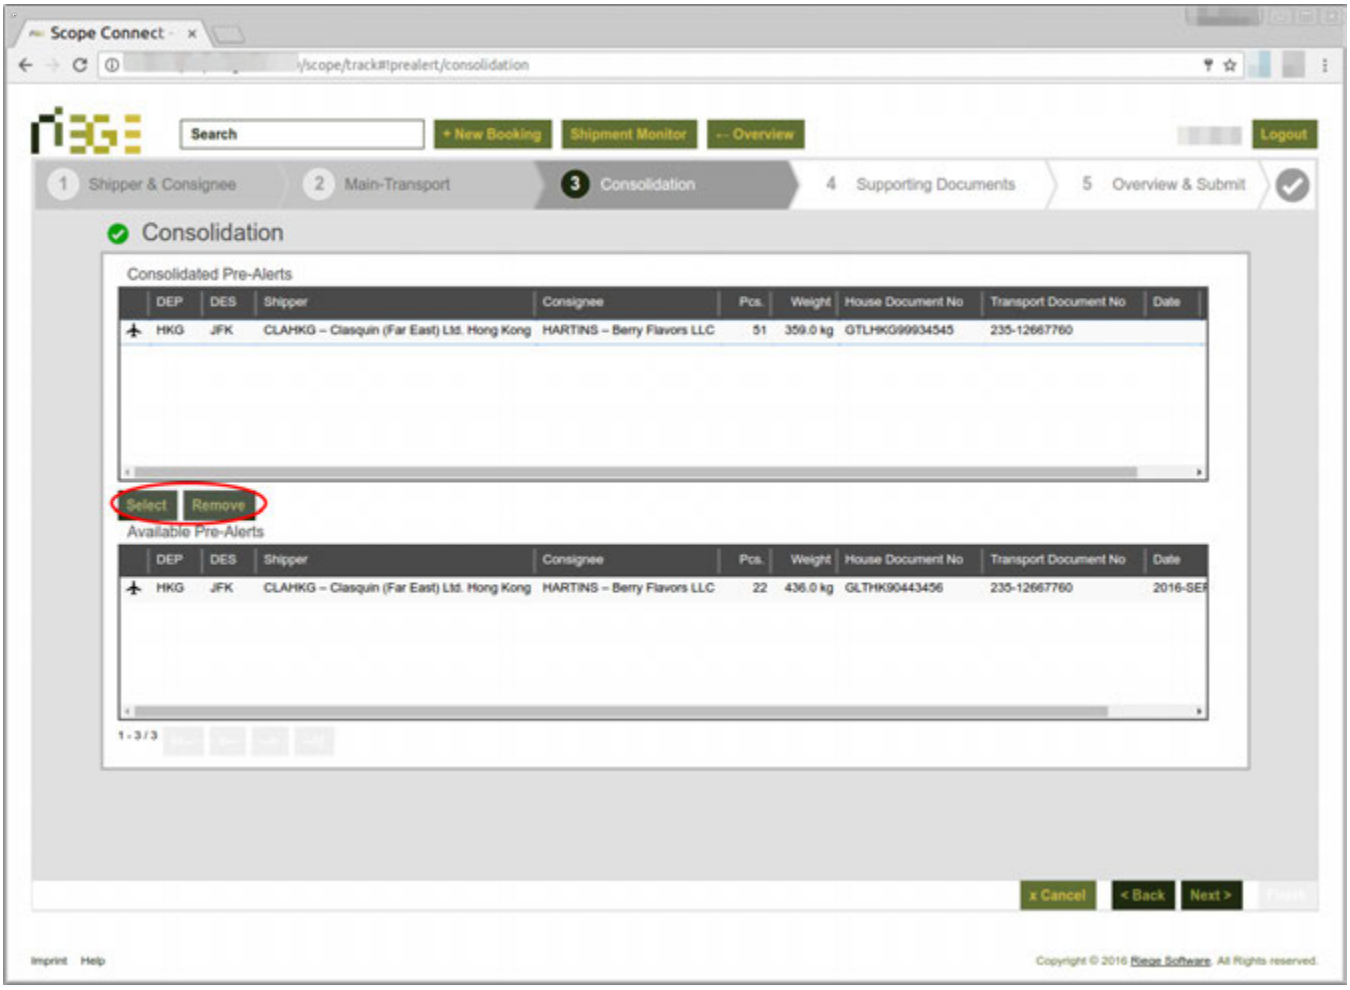
Master - Consolidation

The consolidation screen will show in the lower window all house shipments found that can be added to the master pre-alert. These are described as "Available Pre-Alerts".

Highlight the house shipments to be added to the master and use the Select button to add then to the master. They will appear in the top window as "Consolidated Pre-Alerts".

To remove a house from a consol, highlight the house in the "Consolidated Pre-Alerts" window and click the Remove button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When complete click Next > to get to the Supporting Documents screen of the master pre-alert

See the section on Supporting documents for instructions on this activity

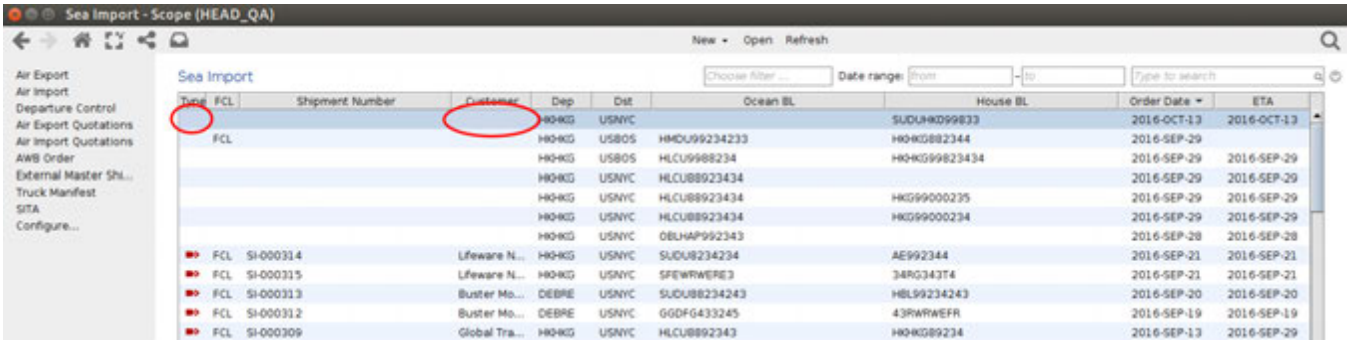
See the section on Overview and Submit for instructions on this activity

Converting the export pre-alert to a Scope import

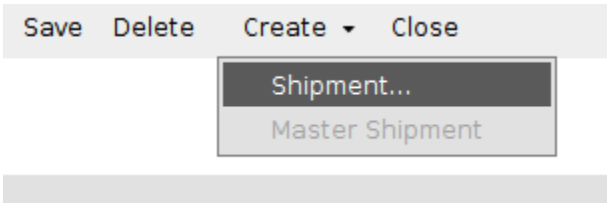
When the export agent clicks Pre-Alert Now or Finish to complete an export pre-alert, this pre-alert immediately becomes visible in the air or sea import overview of the import agent:

The example below shows 7 pre-alerts ready to be converted to sea imports by the import agent. It is clear these are pre-alerts because there is no icon type set for these entries and the customer field is blank.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

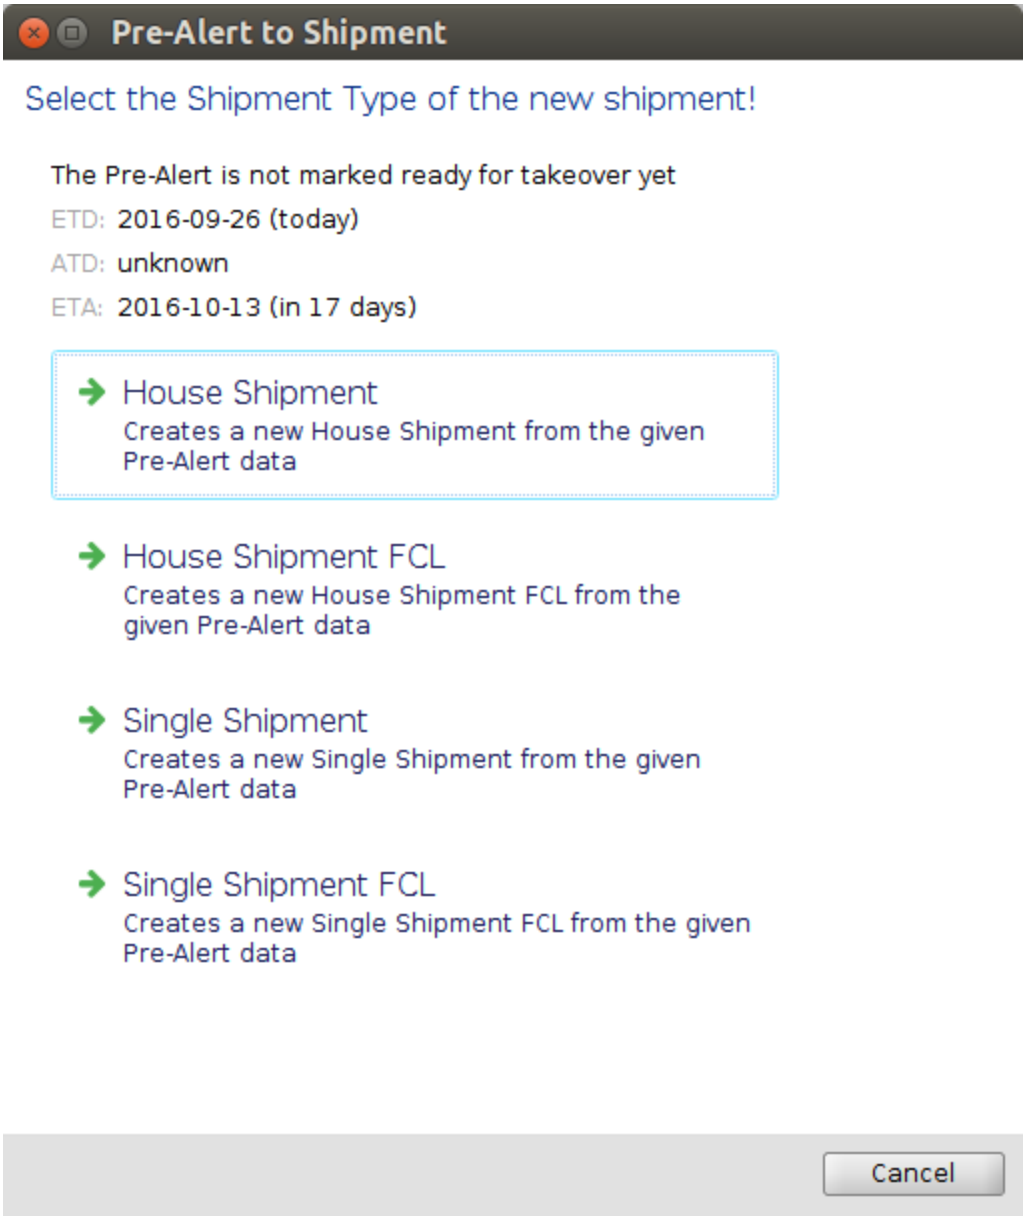


These pre-alerts can easily be converted into shipments by opening them, click on "create" from the menu bar and choose "Shipment"



Next, choose the type of shipment to create and proceed with shipment creation in the normal manner.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Once the import user converts a pre-alert to a shipment, it is no longer visible in Scope Connect as a pre-alert and will be displayed as a shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Introduction

Scope Connect allows a user to create a sea or air pre-alert.

A pre-alert is details of a sea or air shipment that are normally entered by the export agent immediately before export of the shipment.

By creating pre-alerts in Scope Connect, the export agent or shipper is able to advise the import agent of the shipment well in advance of the shipments arrival. These pre-alerts can also be converted by the import agent into shipments in Scope which saves time and improves accuracy.

This document will tell you:

- How to create an air export pre-alert
- How to create a sea export pre-alert
- How to consolidate house pre-alerts onto a master pre-alert
- How to transmit a pre-alert

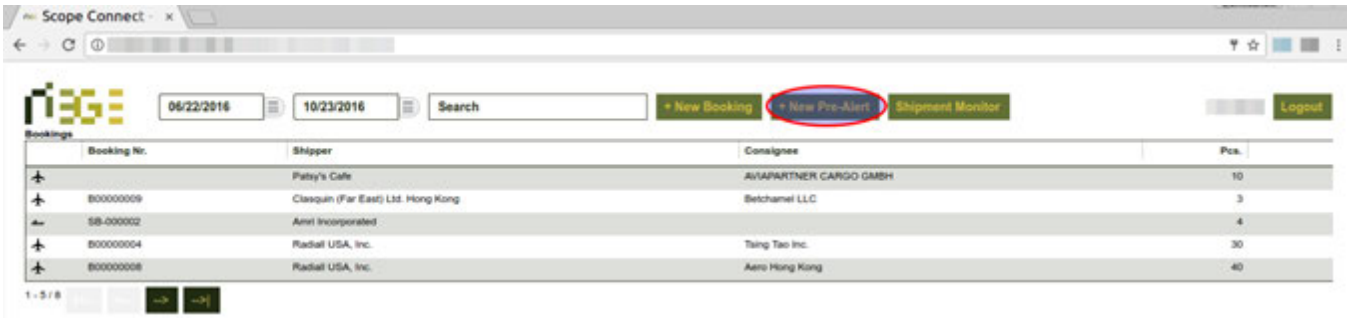
Creating a Scope Connect Pre-Alert

The new Scope Connect user needs to login to Scope Connect with their browser in order to create pre-alerts. Ask your administrator for the web-address for your Scope Connect.

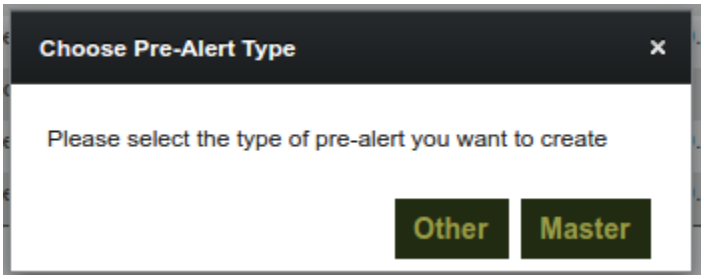
Using the link address, the Scope Connect user can login to Scope Connect using a browser.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

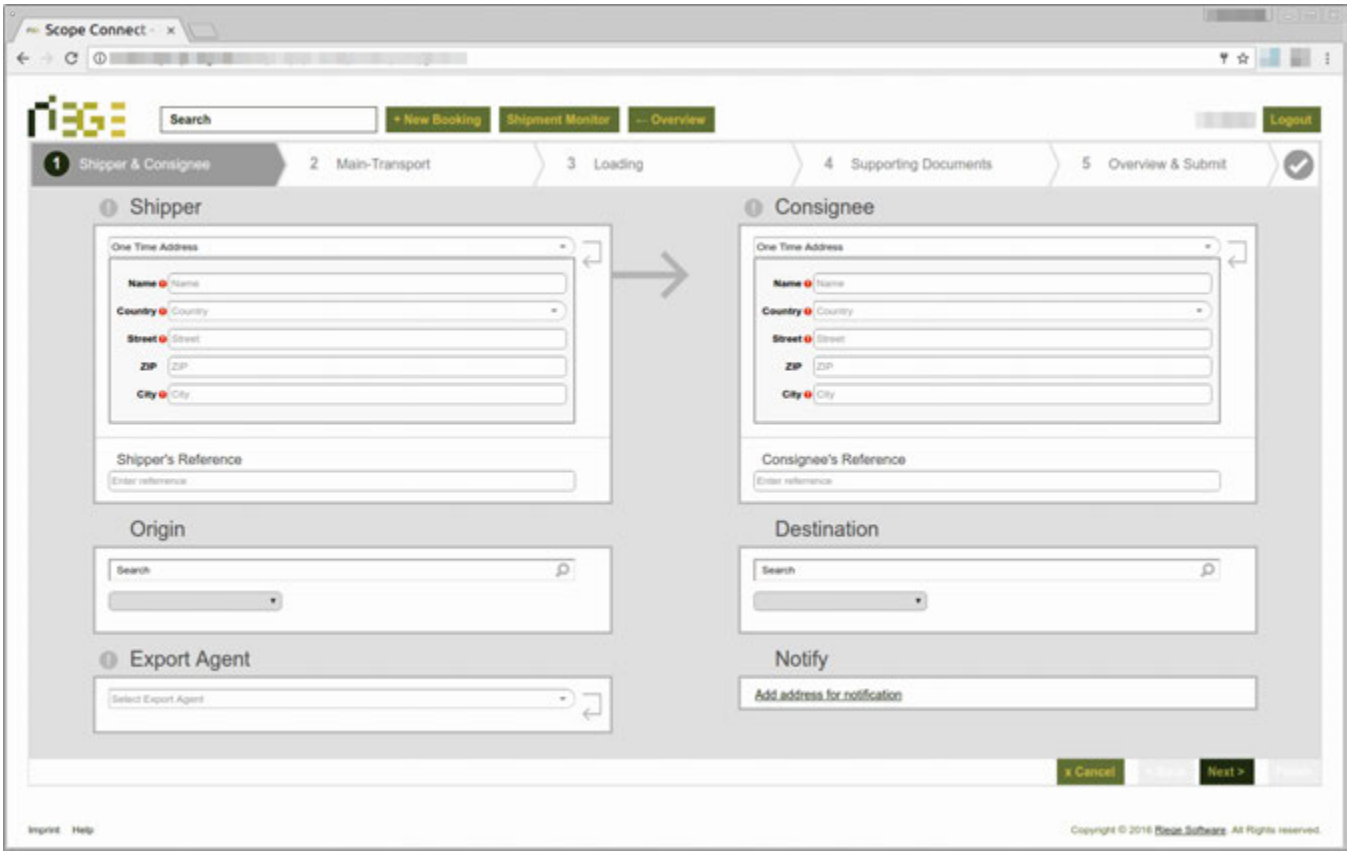
At the top of the landing page the user will have the option: 



Now choose the type of pre-alert to create. This example will be an "other" meaning any type of shipment except a master shipment:



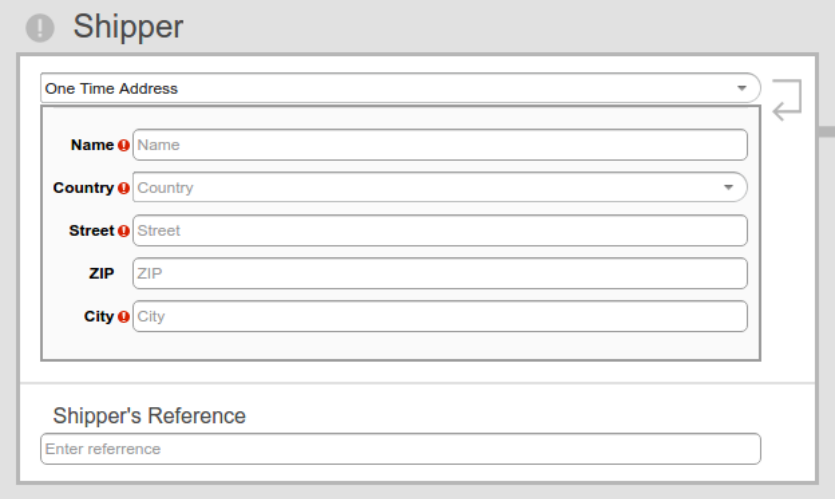
The new pre-alert will open at the first step which is adding the shipper and consignee details:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Step 1: Shipper & Consignee

Shipper

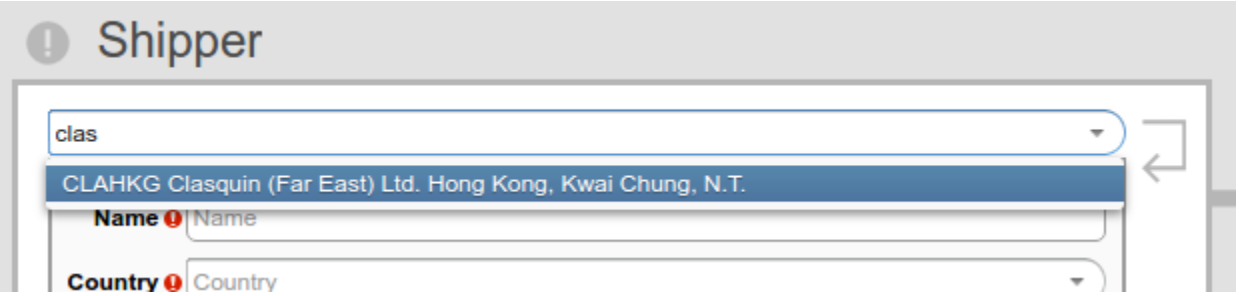


There are 2 methods for entering the shipper details:

1. From stored addresses
2. One time addresses

Stored addresses

If the Scope Connect user has been given an existing Scope partner in their Scope Connect user account, then they can clear the text "One Time Address" and start typing the name or address of any partner allocated to them, Scope connect will then search for this party:

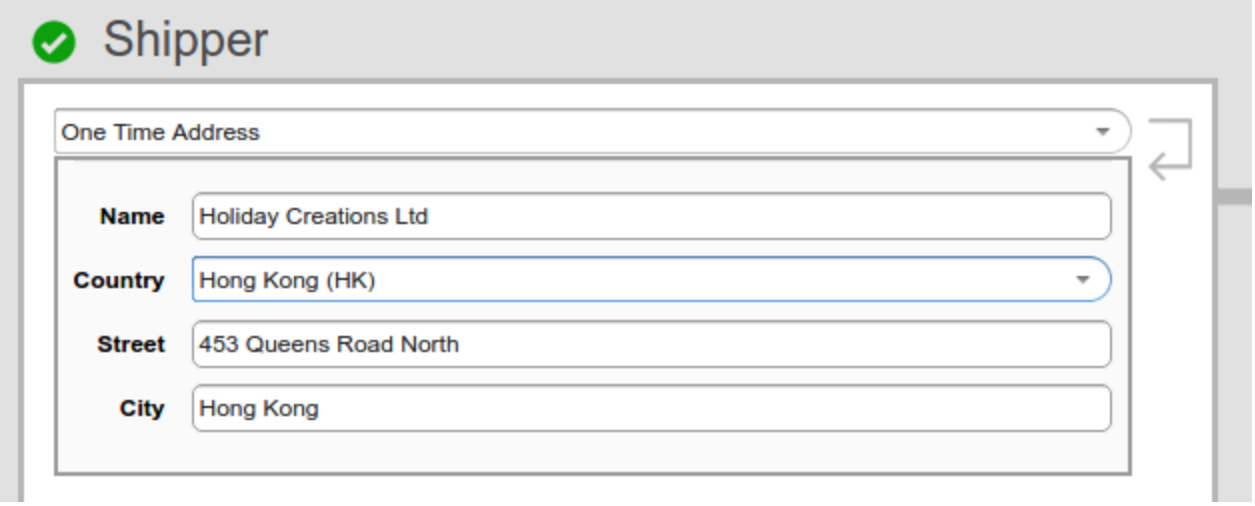


If the party displayed in the search results is correct, the click it to apply it as the shipper.

One time address

If this is a new address, then put the cursor in the "Name" field of the shipper, fill it out and all subsequent address details for the shipper:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Shipper's Reference

Enter the shipper's reference if there is one. If more than 1, the separate them with a comma. These references will be transferred to the import shipment.

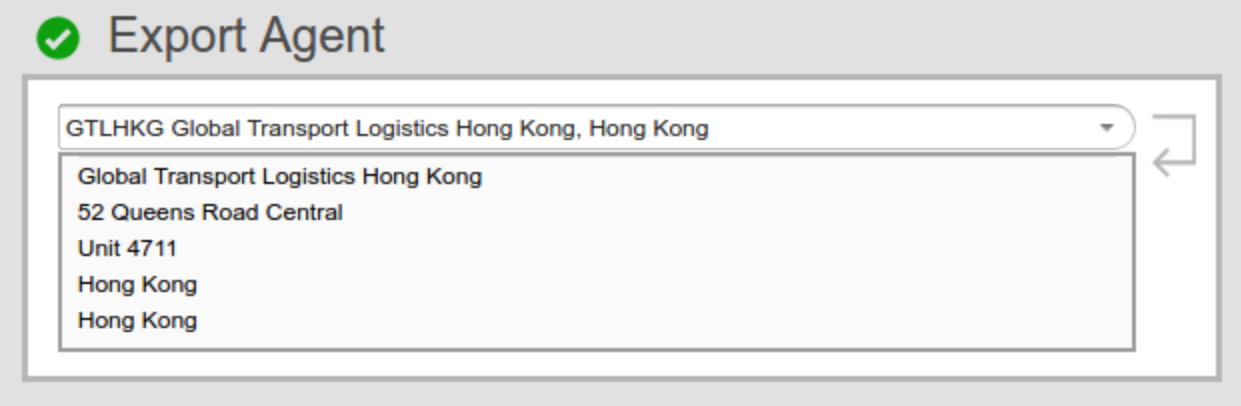
Origin

This is the place or airport where the goods originated from. Type the place name, airport or port code to insert the correct origin:

Export Agent

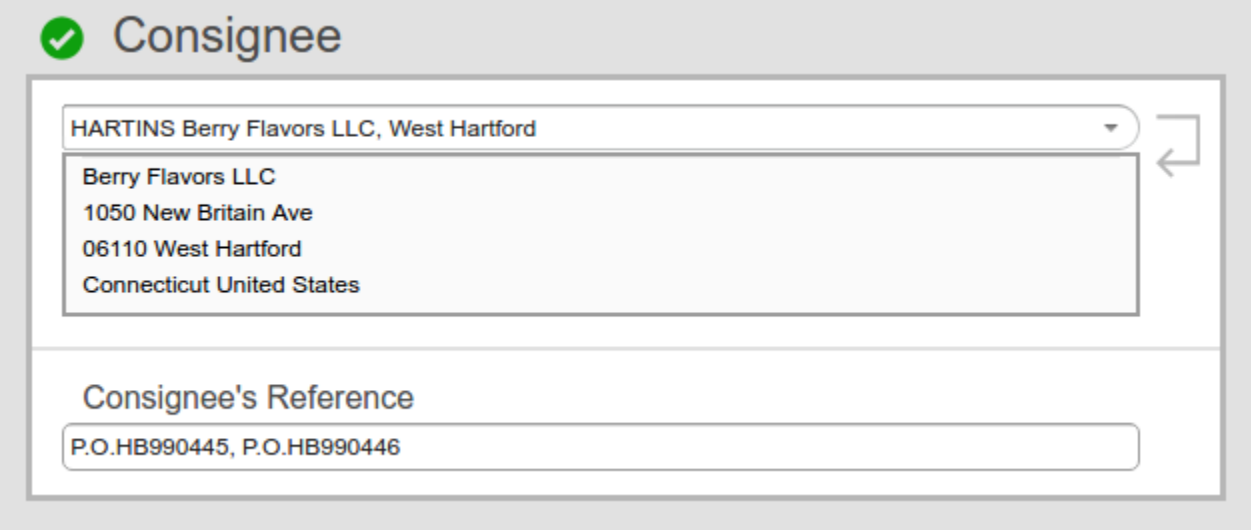
Enter the name of the export agent responsible for creating the prealert. Only export agents allocated to the Scope Connect user in their user account will be available. Typically the Scope Connect user is an employee of the agent that is selected:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Consignee and Consignee's reference

Use the same methods described above for the shipper to find or enter the correct consignee details and the consignee references:

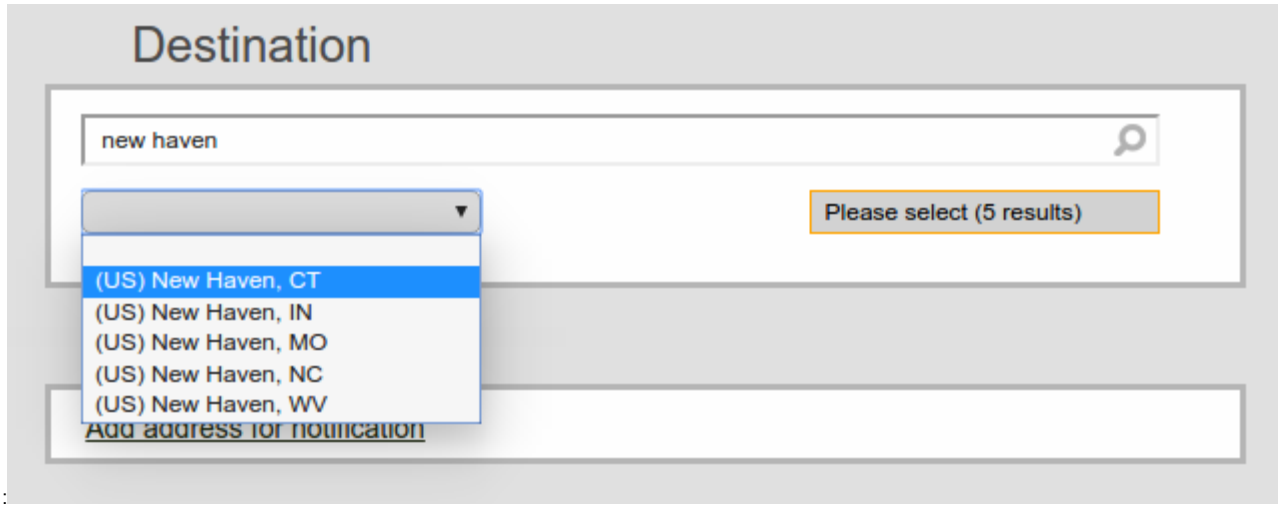


Destination

This is the destination port or airport of the shipment. Start typing the name or code of the port or airport to locate the correct destination.

The number of search results is displayed to the right and clicking on the drop-down list allows the desired port or airport to be selected.

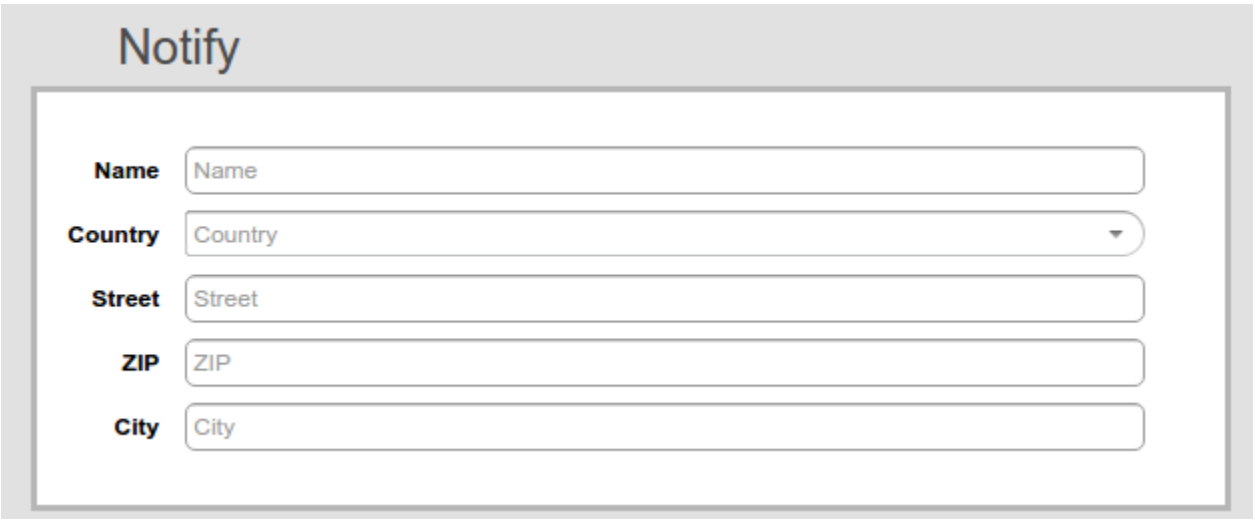
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



:

Notify

A notify party may be included with the pre-alert. The notify must be entered as a one time address:

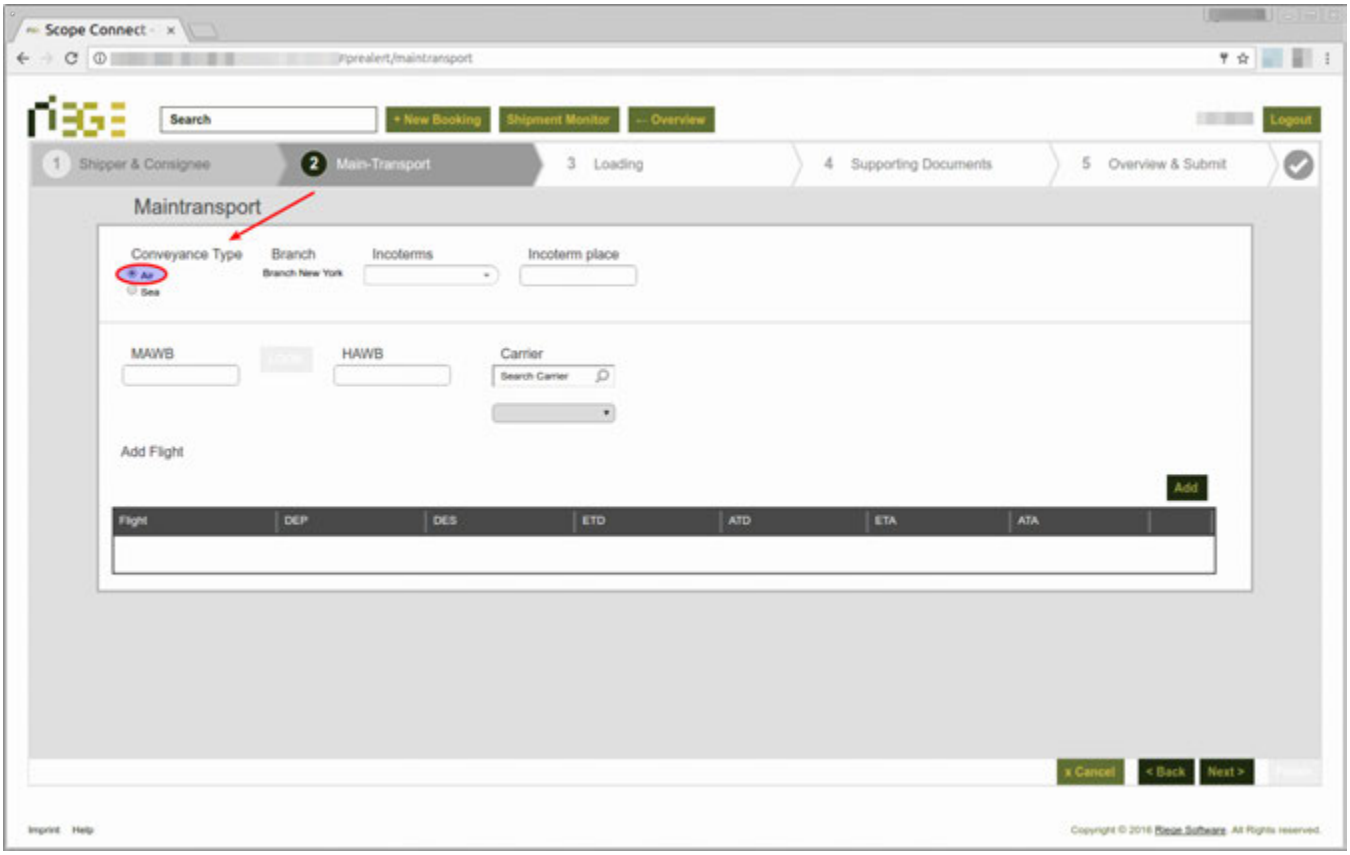


When step 1, Shipper and Consignee have been completed, click 
Air Export pre-alerts

Step 2, Main Transport - creating an air pre-alert

The main transport screen opens and the first step is to indicate the type of pre-alert that is being created. This can be an air or sea pre-alert. In this example an "air" pre-alert will be created.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

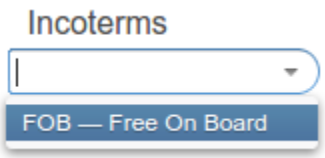


Branch

The branch to whom the pre-alert is being sent will be shown

Incoterms

Start typing the correct INCO term for the pre-alert if this is to be included. Then select the correct one:



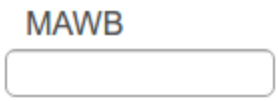
Incoterm Place

Type the place where the Incoterm applies to.

MAWB

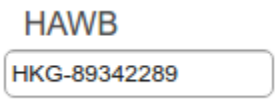
If the MAWB is known, then it can be entered. If this is a house shipment that does not yet have a MAWB, it can be left blank. The MAWB will be automatically filled in if the shipment is later consolidated on a master pre-alert.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



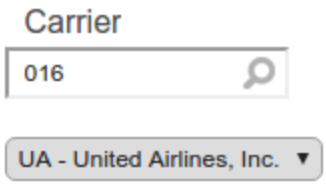
HAWB

Enter the HAWB of the air export pre-alert



Carrier

Enter the airline that will transport the shipment. You can enter the airline name or the 2 letter airline code or the 3 digit AWB prefix.



Add flights to an air export pre-alert

If the flights are known for the air export shipment, they can be included in the pre-alert. If a pre-alert for a house shipment is being created, once the house is consolidated on the master pre-alert, the flights from the master pre-alert will over-write any flights originally entered on the house pre-alerts.

To add a flight, click 

Now fill in all the details about the flight:

Click 

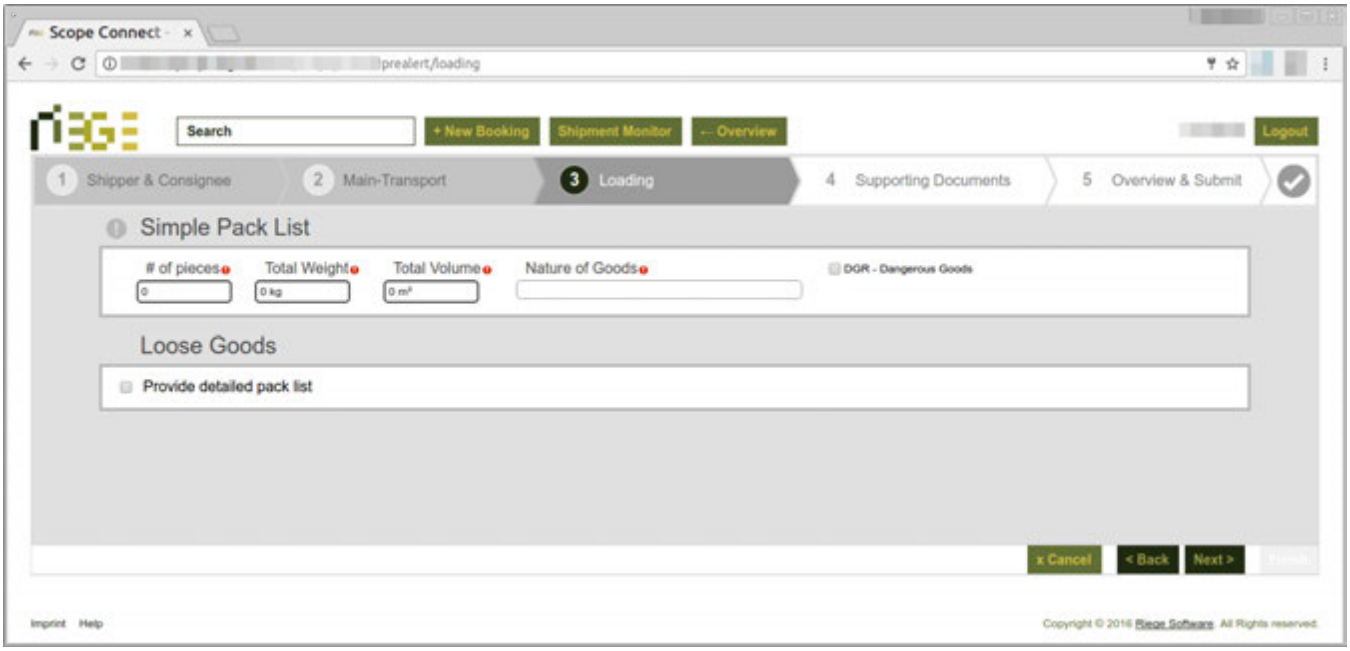
when done. The completed main transport should be similar to the example below. Use the 

button to add further flights.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click  to get to the next step - Loading

Step 3, Loading - air export pre-alert



The loading screen is used to enter details about the goods on the pre-alert:

- Pieces
- Weight
- Volume
- Nature of goods
- DGR

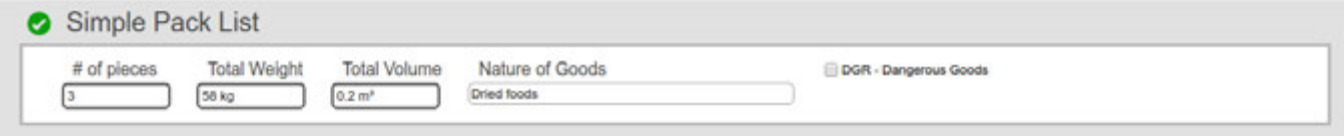
There are 2 ways to enter goods details:

1. Totals only using the Simple Pack List
2. Full details of loose goods with the detailed pack list

Entering goods totals only

Direct fill in the fields provide with the total details of the goods and the overall description. If the goods are dangerous, check the DGR box.

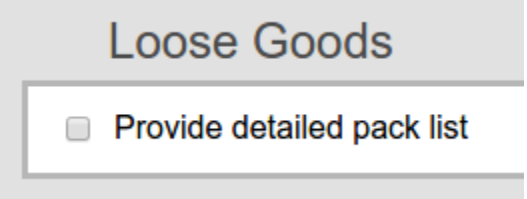
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



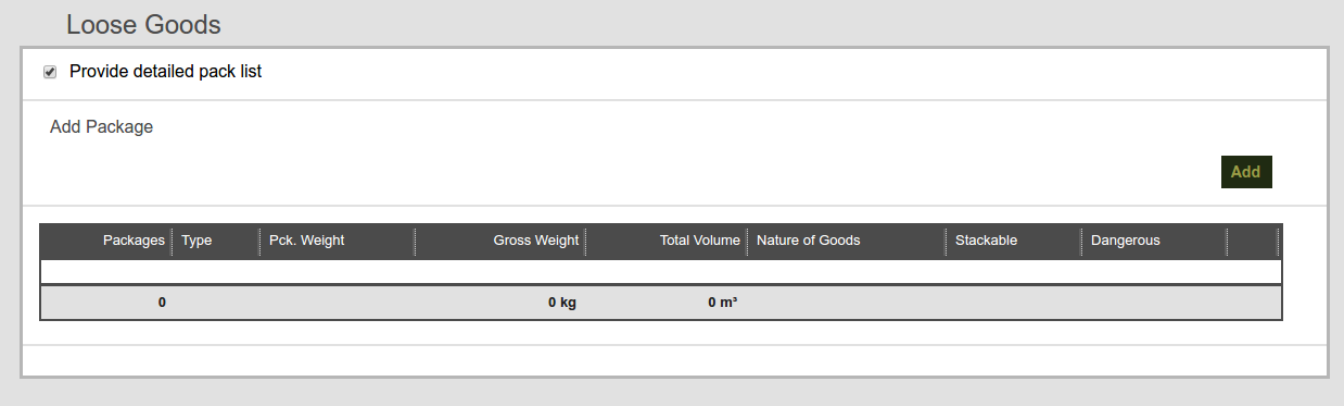
With the totals entered, it is possible to move on to the next stage of the pre-alert by clicking the Next > button, this will move you to step 4, "Supporting Documents"

Entering a detailed packing list

A detailed listing of the goods can be entered using the detailed pack list. Instead of entering the totals of the goods in the simple pack list shown above, check the detailed pack list box:

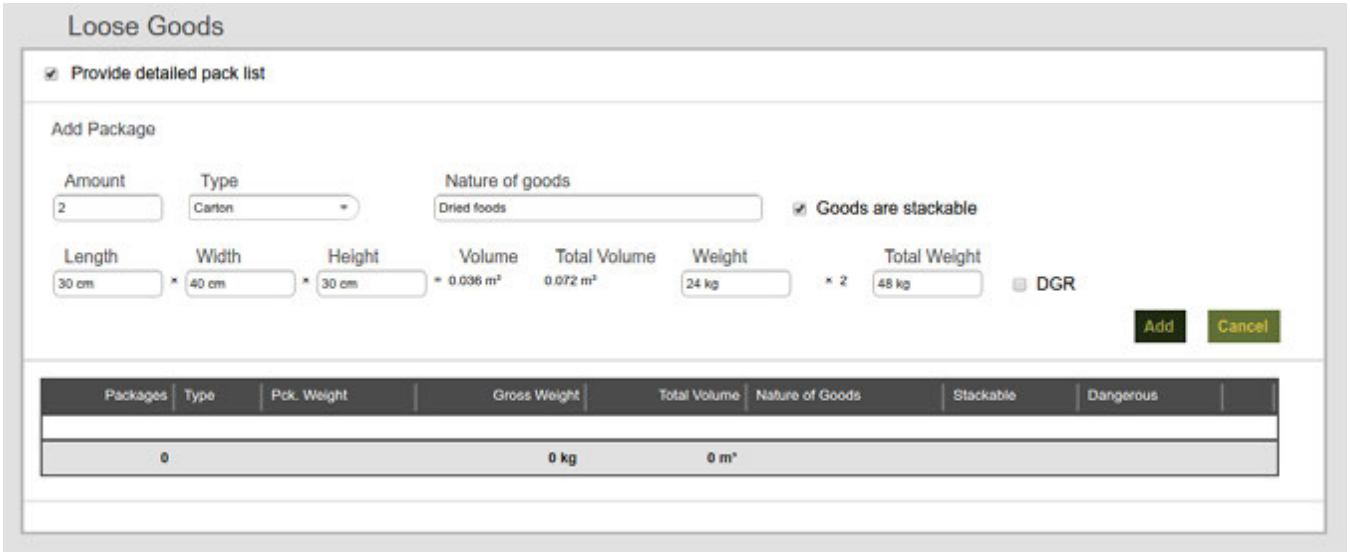


The "Add Package" function will open:



Click on the Add button to begin entering detailed goods information:

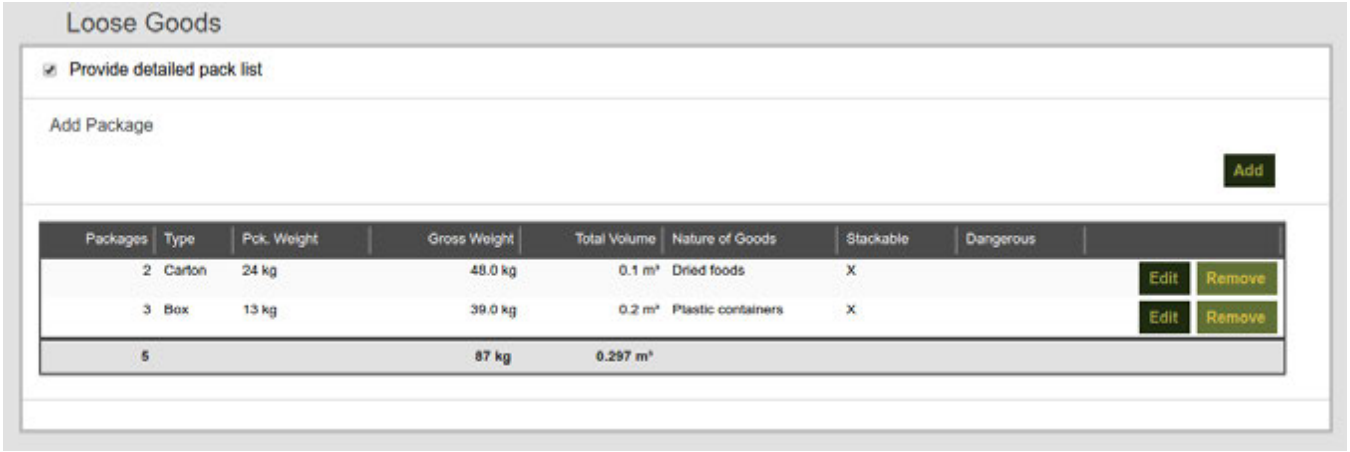
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the goods entry is complete, click 

To add further goods, click the  button again and repeat the process.

The example below shows 2 different cargo items on the shipment. Use the  button to change any details and the  button to remove an item from the pre-alert.

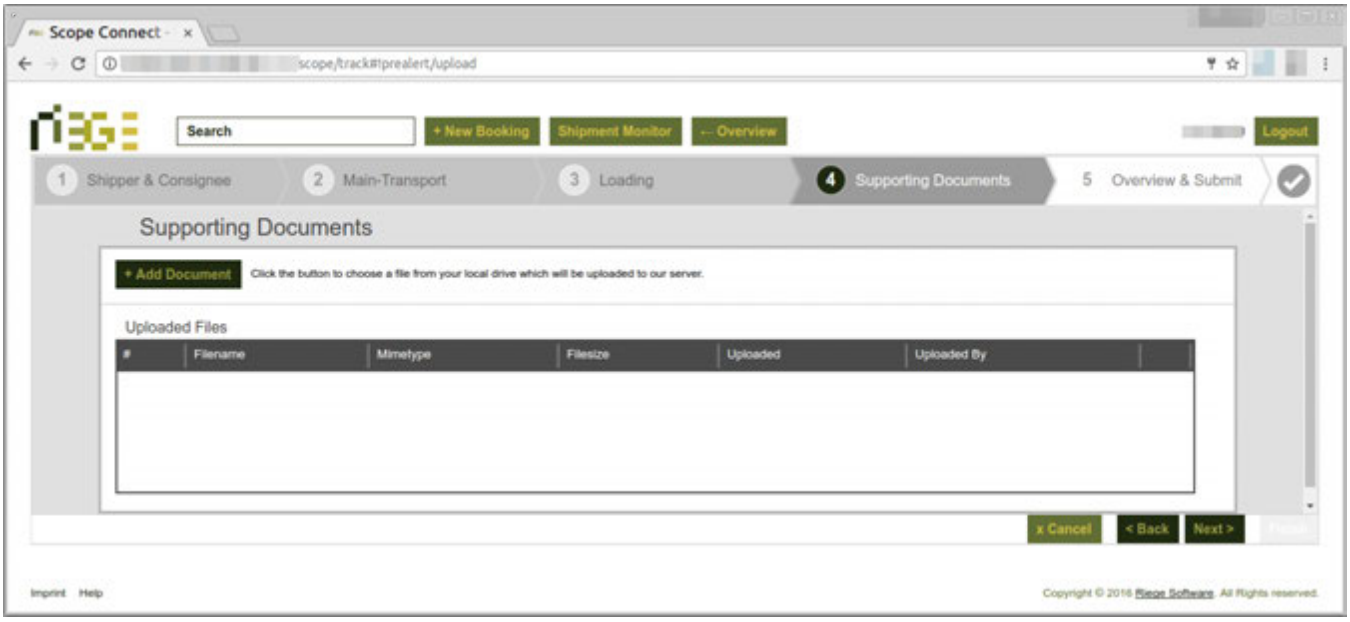


When all the goods are on the pre-alert use the  button to go to the next step "Supporting Documents".

Step 4, Supporting Documents - air export pre-alert

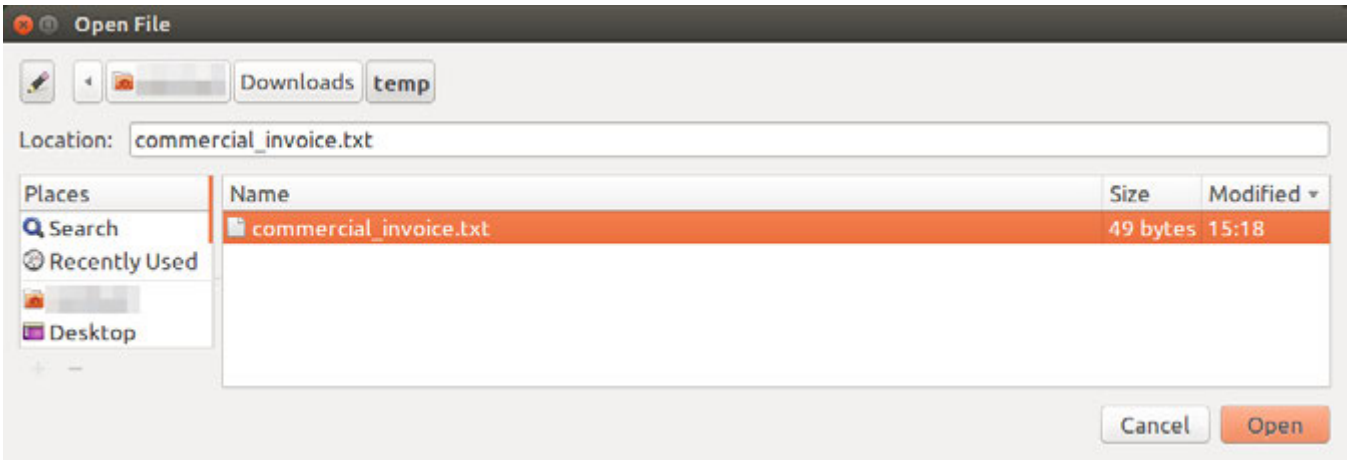
When additional documents like the commercial invoice for example need to be included with the pre-alert, these can be uploaded in the "Supporting Documents" section.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

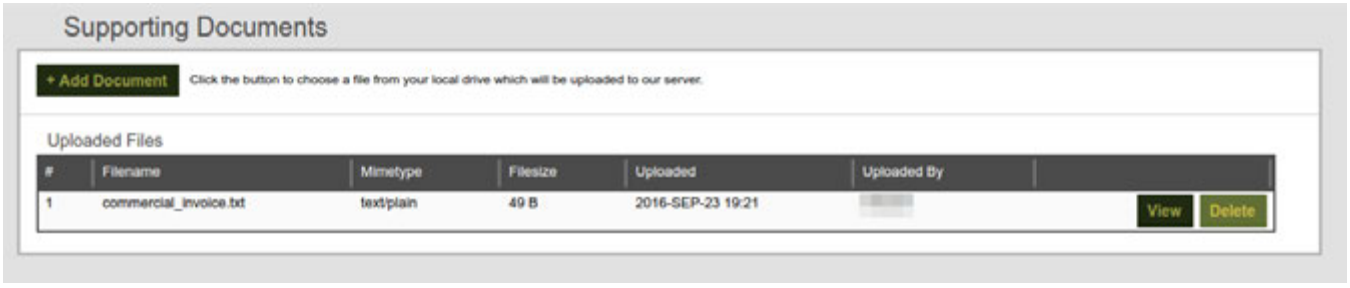


Click  to upload a document.

A file browser will open. Use it to find and select the document to be uploaded to the air export pre-alert.



The uploaded document will appear in the supporting documents section:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

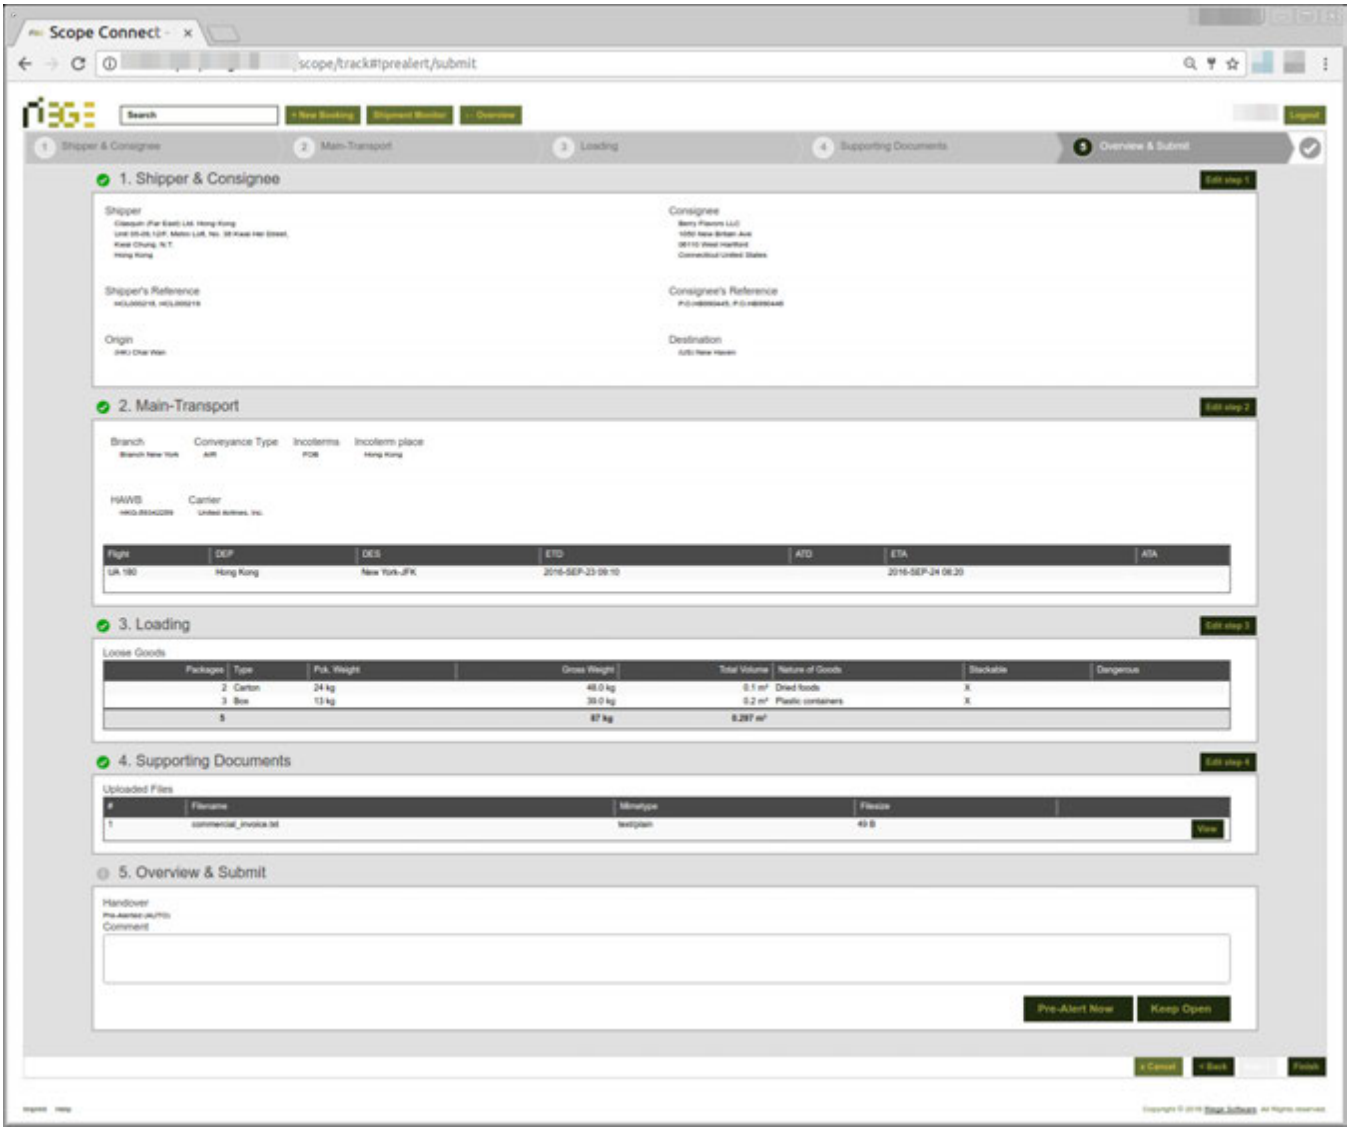
Use the View button to view the uploaded document, and use the Delete button to delete it from the pre-alert.

Use the + Add Document button to add further documents to the pre-alert.

When all documents are uploaded to the pre-alert, use the Next > button to go to the next step "Overview & Submit".

Step 5, Overview & Submit - air export pre-alert

The final step will show an overview of all information entered on the pre-alert. Any of the data can be changed by editing that step.



Sending the pre-alert

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Once all required information is in the pre-alert, it can be transmitted to the receiving Import Agent by clicking **Pre-Alert Now** or **Finish**

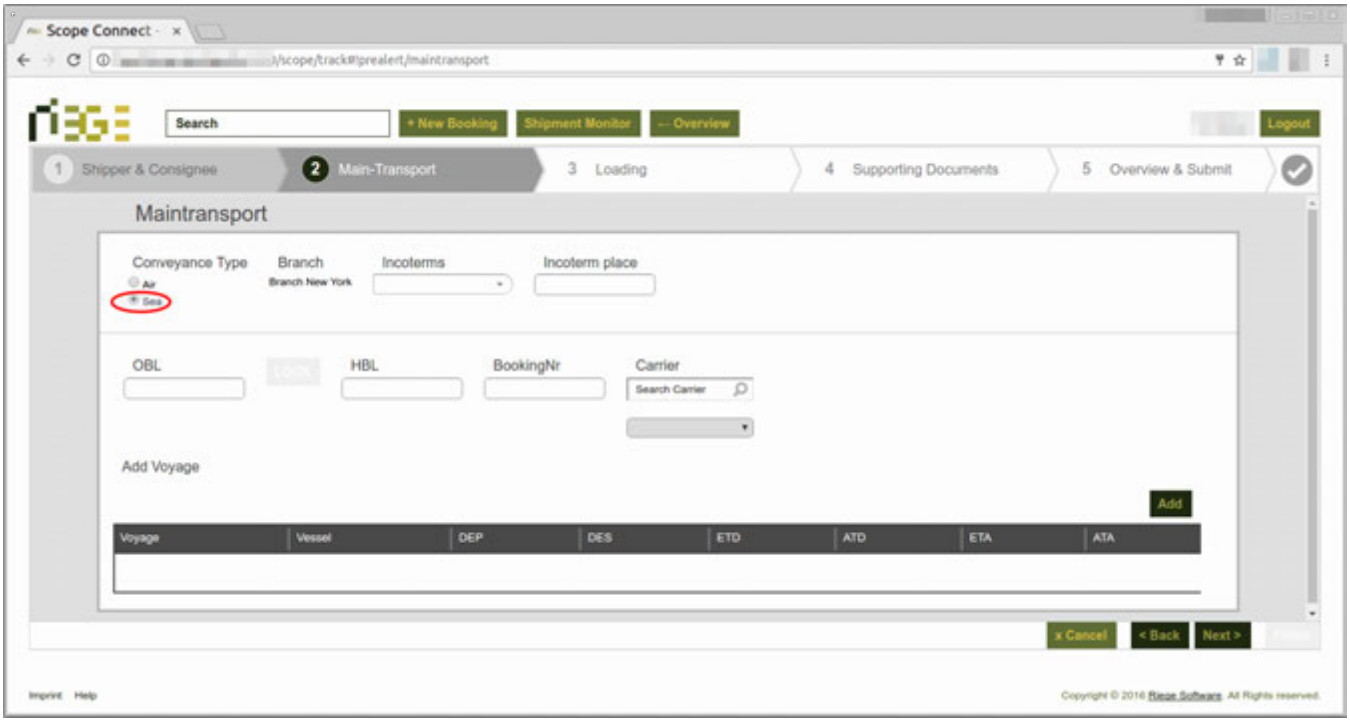
If you do not want the import agent to see the pre-alert yet then click **Keep Open**

Sea Export pre-alerts

Step 1 of pre-alerts is the same for both air and sea pre-alerts. In Step 2, Main Transport, if the conveyance type is "Sea", then a sea freight pre-alert is created.

Step 2, Main Transport - creating an sea pre-alert

The main transport screen opens and the first step is to indicate the type of pre-alert that is being created. This can be an air or sea pre-alert. In this example a "sea" pre-alert will be created.



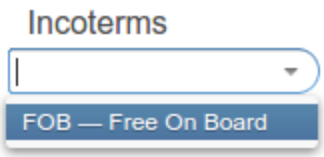
Branch

The branch to whom the pre-alert is being sent will be shown

Incoterms

Start typing the correct Incoterm for the pre-alert if this is to be included. Then select the correct one:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Incoterm Place

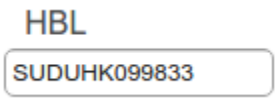
Type the place where the Incoterm applies to.

OBL

If the Ocean Bill of Lading is known, then it can be entered. If this is a house shipment that does not yet have an ocean bill, it can be left blank. The OBL will be automatically filled in if the shipment is later consolidated on a master pre-alert.

HBL

Enter the HAWB of the air export pre-alert

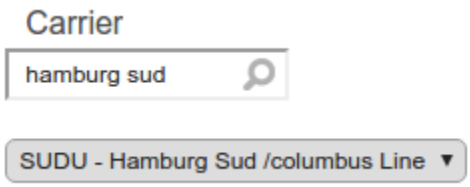


BookingNr

If the Liner Agent has provided a booking number for the shipment, it can be entered in the "BookingNr" field.

Carrier

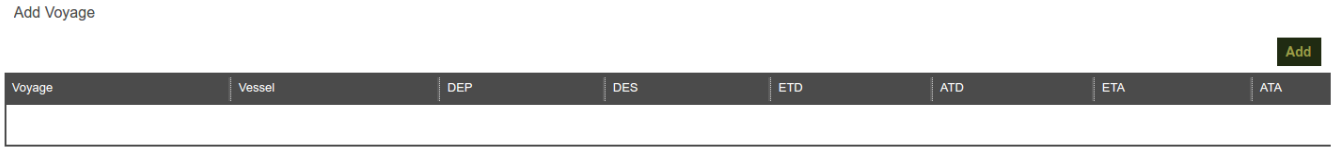
Enter the carrier that will transport the shipment. You can enter the carrier name or the 4 letter SCAC code and Scope Connect will search for the correct carrier.



Voyage

One or more voyages can be added to the pre-alert

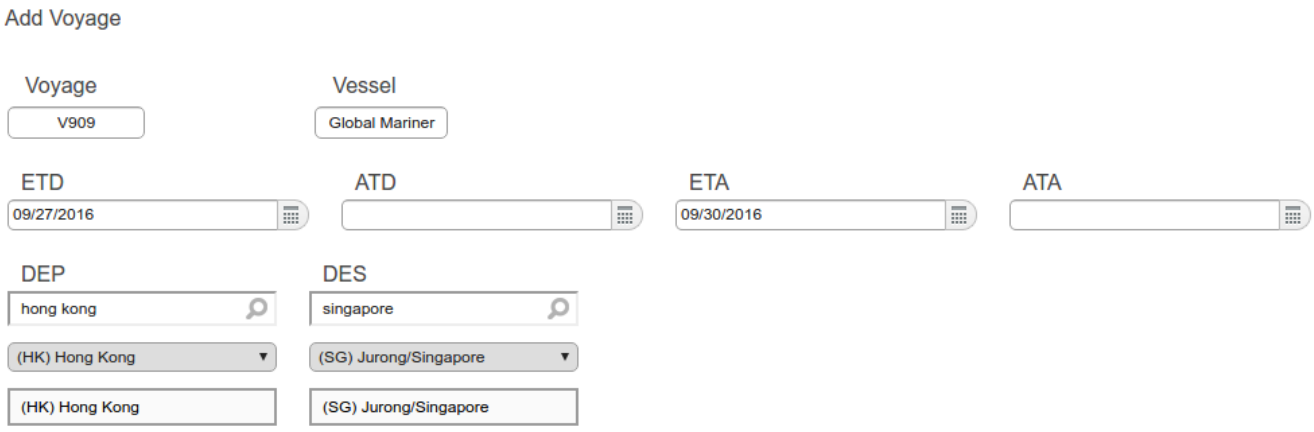
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



To add a voyage click 

Fill in the:

- Voyage Number
- Vessel for the Voyage
- ETD of the voyage
- ATD of the voyage (if any)
- ETA of the voyage
- ATA of the voyage (if any)
- Depart port of the voyage
- Destination port of the voyage



When the voyage information is complete click 

again

If there are further voyages, click 

to add these further voyages.

Use the 
and 
to adjust existing voyages

When all main transport details are complete, click 

to move to the next section "Loading"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

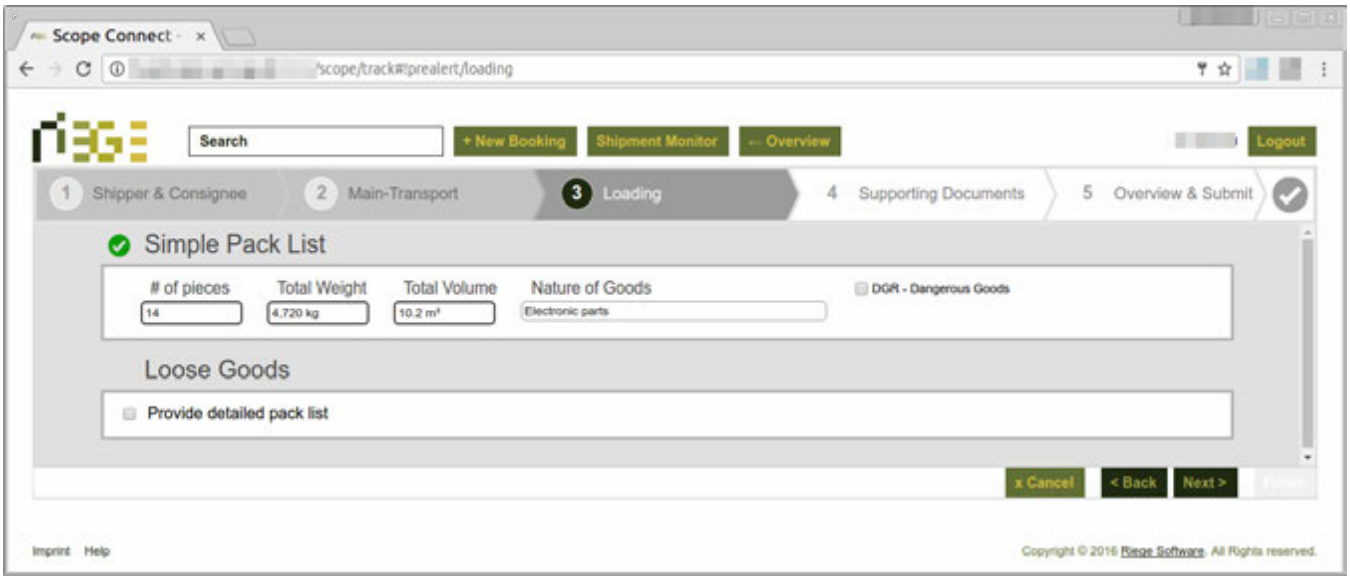
Step 3, Loading

In the loading section of the sea export pre-alert the goods can be entered in 2 ways:

- Simple Pack List - this is a simple total of all the goods and an overall description
- Loose goods and container details - this is a detailed description of all the goods and the containers the goods are in

Simple Pack list

- enter total details of the goods
- Total number of pieces
- Total weight
- Total volume
- Nature of goods
- DGR - use the checkbox to indicate DGR



Detailed goods and containers

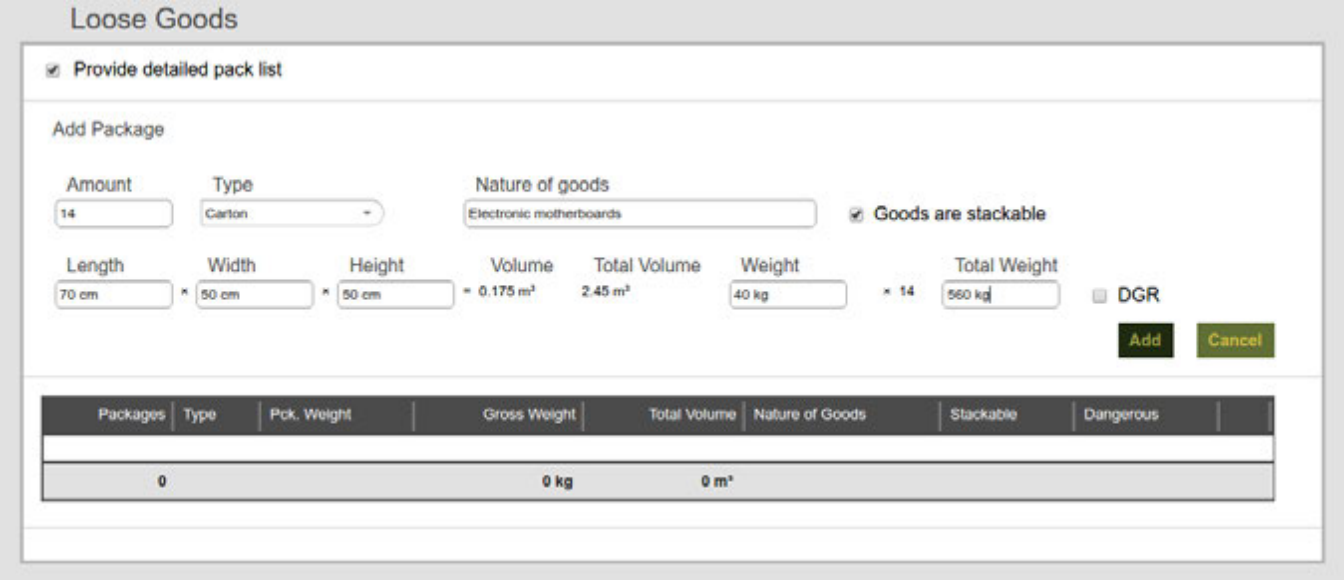
If detailed goods and containers are to be entered then click the check box

Now click 

to begin adding goods to the sea export pre-alert.

- Amount - number of packing units of this goods item
- Type - type of packing, start typing the packing type name to see and select from the list of packing types.
- Goods are stackable - check this box if the cargo can be stacked.
- Nature of goods - the description of this goods item
- Dimensions - length, width, height and weight
- DGR - check this box if the goods are dangerous

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the first goods item is complete click 

If there are more goods to add, then click 

again.

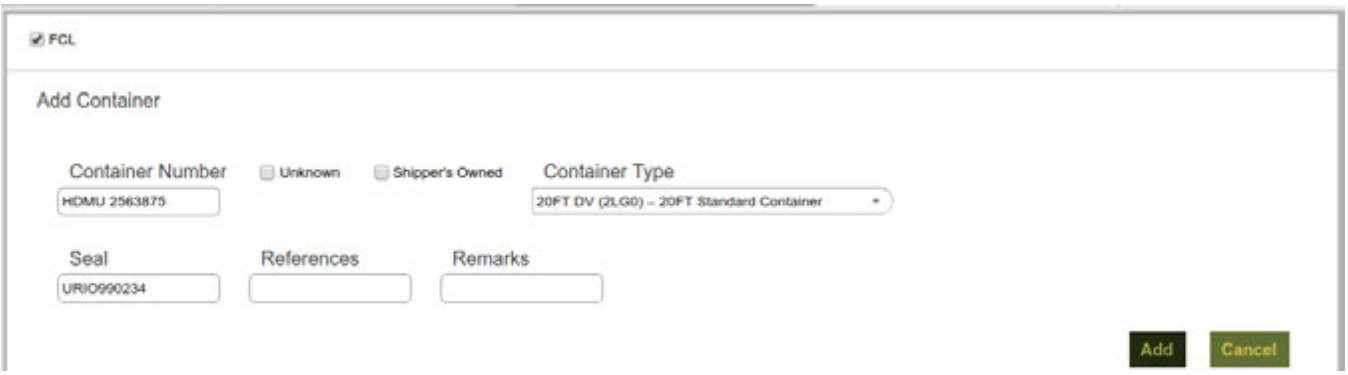
Containers

to add the containers where the goods are located, go to the container section and check the FCL box

Now click 

to enter container details

- Container Number - Scope connect will check the container check digit
- Unknown or Shipper's Owned
- Container type - start typing to see a list of container types and select the correct one.
- Seal
- References
- Remarks



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the container details are complete click Add

Adding goods to a container

Highlight the container in the container list that will have goods added to it

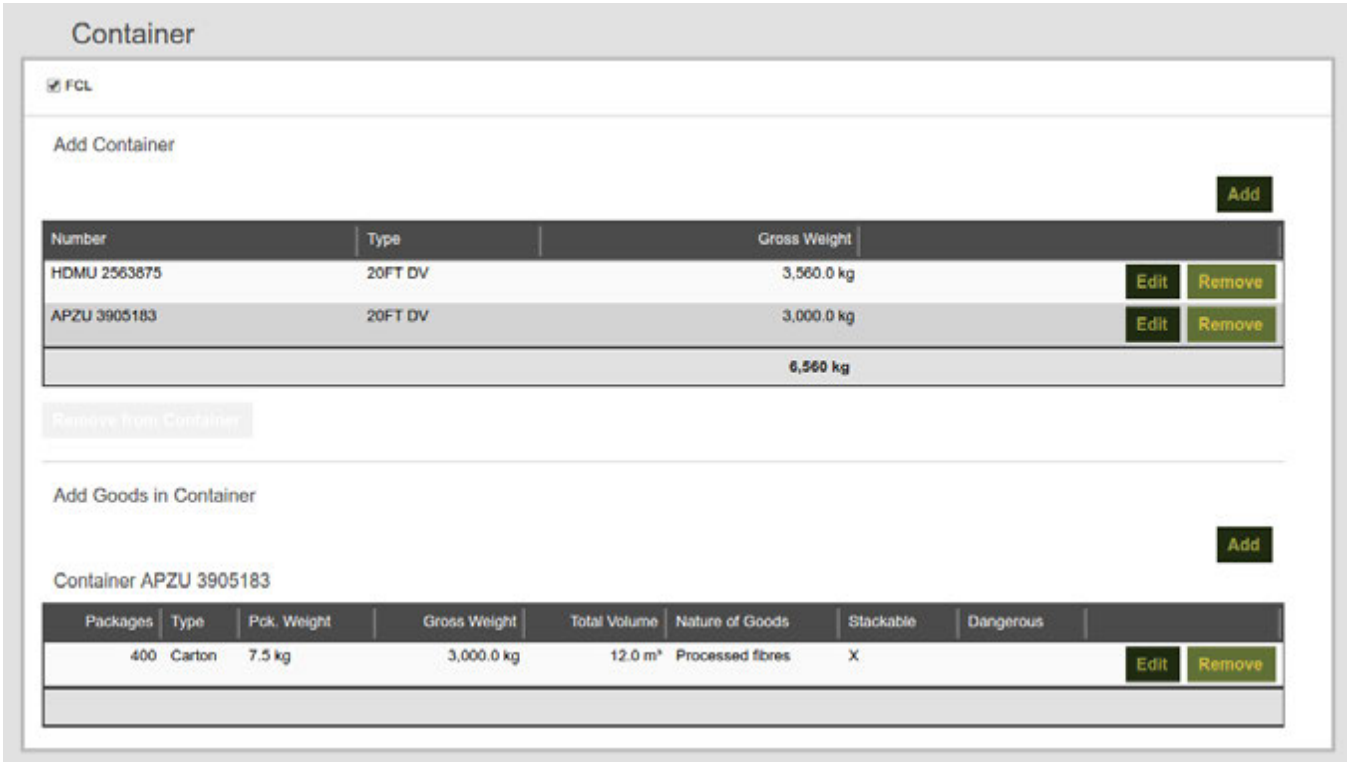
Number	Type	Gross Weight	
HDMU 2563875	20FT DV	0.0 kg	Edit Remove
APZU 3905183	20FT DV	0.0 kg	Edit Remove
		0 kg	

Now highlight the goods in the goods list that are to move into the container

Packages	Type	Pck. Weight	Gross Weight	Total Volume	Nature of Goods	Stackable	Dangerous	
14	Carton	40 kg	560.0 kg	2.5 m³	Electronic motherboards	X		Edit Remove
25	Barrel	120 kg	3,000.0 kg	3.2 m³	Cleaning Fluid	X		Edit Remove
400	Carton	7.5 kg	3,000.0 kg	12.0 m³	Processed fibres	X		Edit Remove
439			**6,560 kg**	**17.6 m³**				

Now click Move To Selected Container

The container will now have the total weight of the goods shown in it and when it is highlighted, the screen below will show the details of the goods in the container



Once all goods and container details have been entered, click Next > to move to the next section "Supporting Documents".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

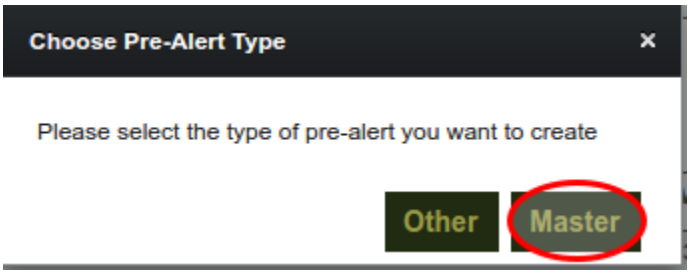
See the section on Supporting documents for instructions on this activity

See the section on Overview and Submit for instructions on this activity

Consolidating house shipments on a master

Create the house shipment pre-alerts in the normal manner described above but be sure to enter the MAWB or OBL in the shipment:

When the house pre-alerts are ready, create a master shipment by clicking + New Pre-Alert and then Master



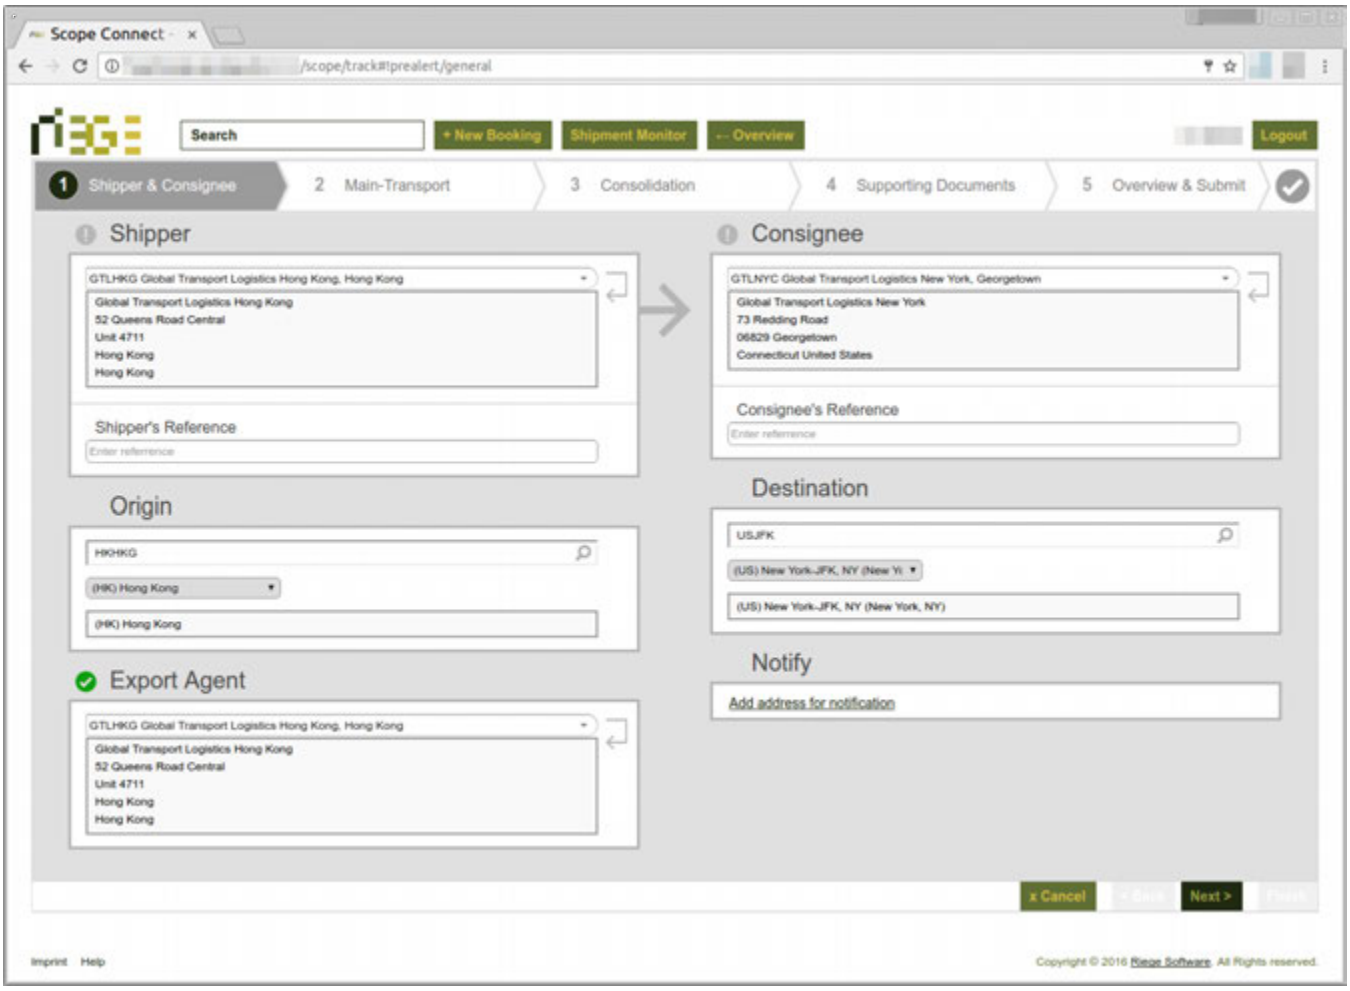
Master - Shipper and Consignee

Complete the shipper, consignee and export agent of the master:

- Shipper - this is the export agent sending the pre-alert.
- Consignee - this is the import agent who will receive the pre-alert
- Export Agent - this is the export agent sending the pre-alert

Complete the Origin and Destination of the master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

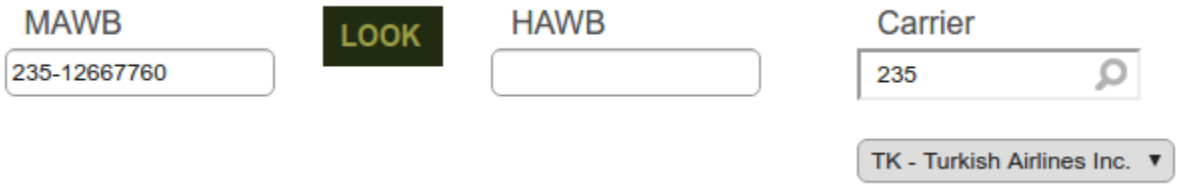


When complete click  to get to the Main Transport screen of the master pre-alert

Master - Main Transport

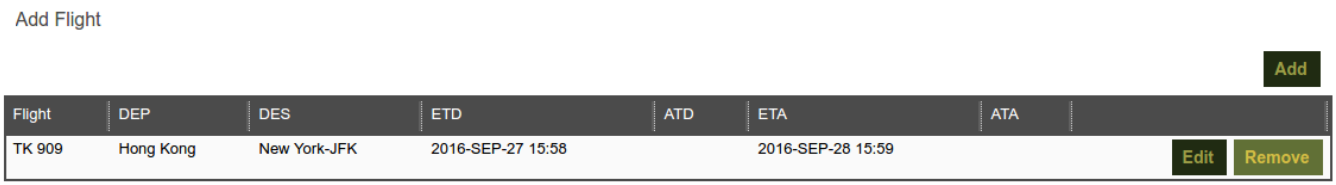
Use the air/sea button to indicate if the master is for an air or sea pre-alert and enter the master Incoterms and place

Enter the MAWB or OBL and the carrier for the master



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Add all the flights for the master pre-alert



When complete click Next > to get to the Consolidation screen of the master pre-alert

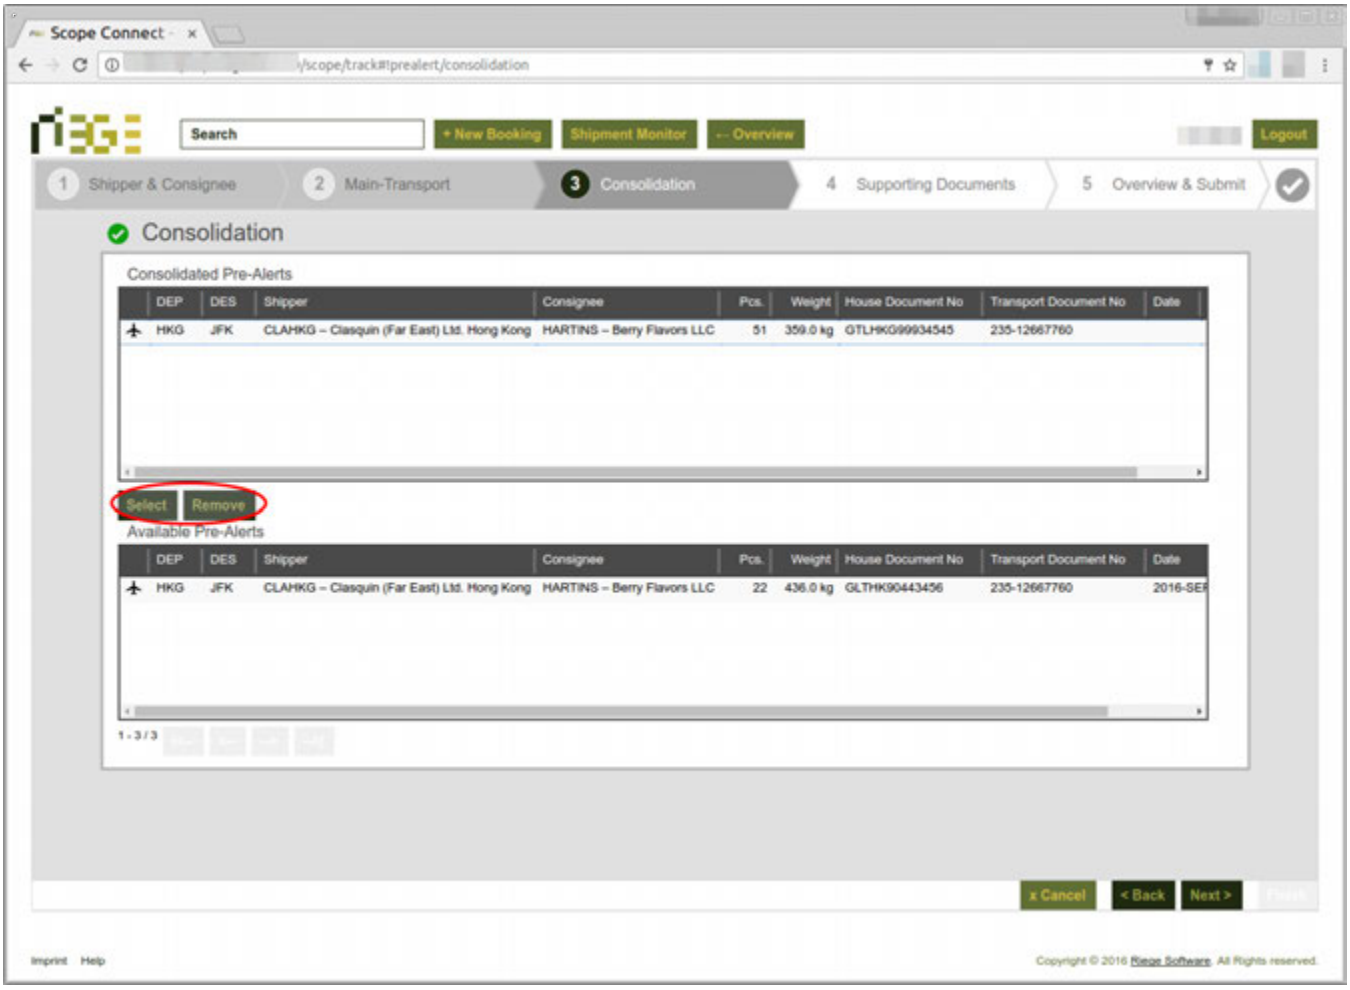
Master - Consolidation

The consolidation screen will show in the lower window all house shipments found that can be added to the master pre-alert. These are described as "Available Pre-Alerts".

Highlight the house shipments to be added to the master and use the Select button to add then to the master. They will appear in the top window as "Consolidated Pre-Alerts".

To remove a house from a consol, highlight the house in the "Consolidated Pre-Alerts" window and click the Remove button.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When complete click 

to get to the Supporting Documents screen of the master pre-alert

See the section on Supporting documents for instructions on this activity

See the section on Overview and Submit for instructions on this activity

How-To create a Scope Connect tracking account

- Introduction
- Navigating to Scope Connect user account
- Creating a new user
  - Entering the users' basic details
  - Allocating Scope Connect features to the new user
  - Determining what the Scope Connect User can see and do in tracking
  - Selecting the parties the Scope Connect user has access to when creating bookings or pre-alerts
  - Documents
  - Email
  - User History
- Save and Exit

Introduction

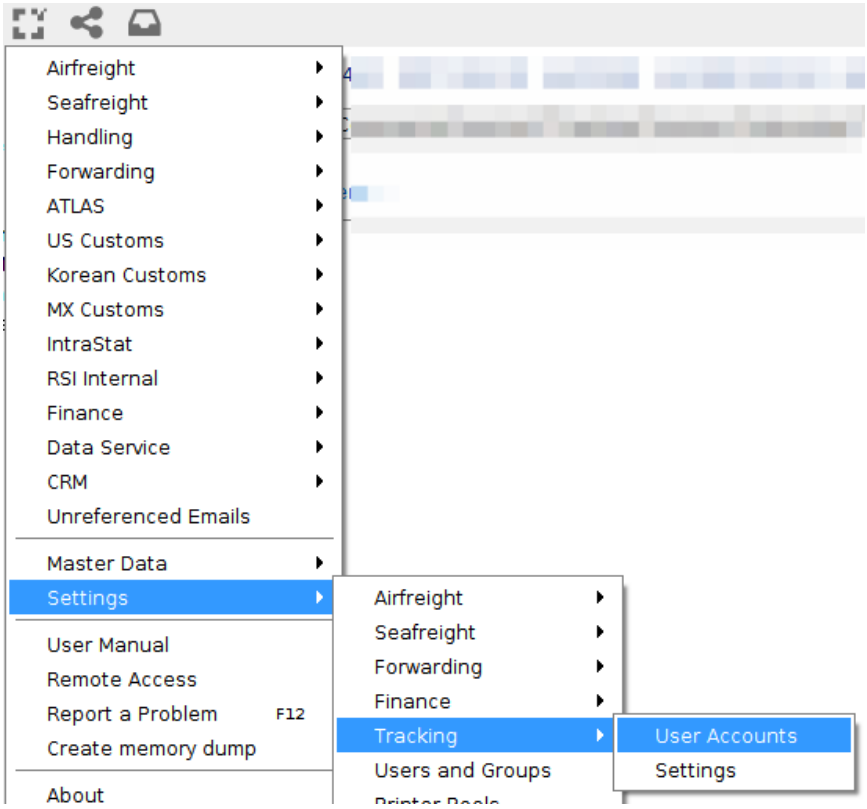
This document explains how a login account can be created within Scope for any user who needs to be able to login to Scope Connect.

Scope Connect users can be Scope users or any user with a valid email address

Navigating to Scope Connect user account

From the Scope menu icon, select:

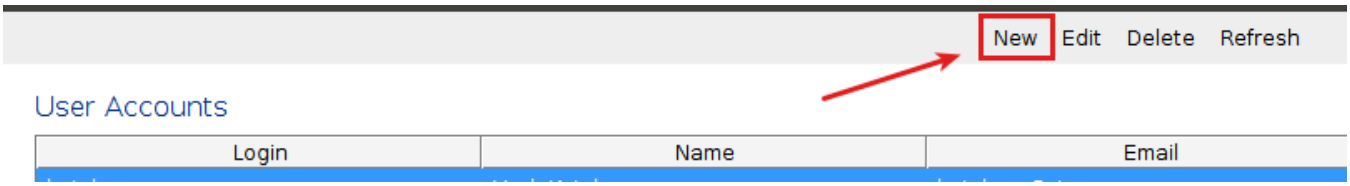
1. Settings
2. Tracking
3. User Accounts



Creating a new user

When the overview of tracking users opens, select "New"

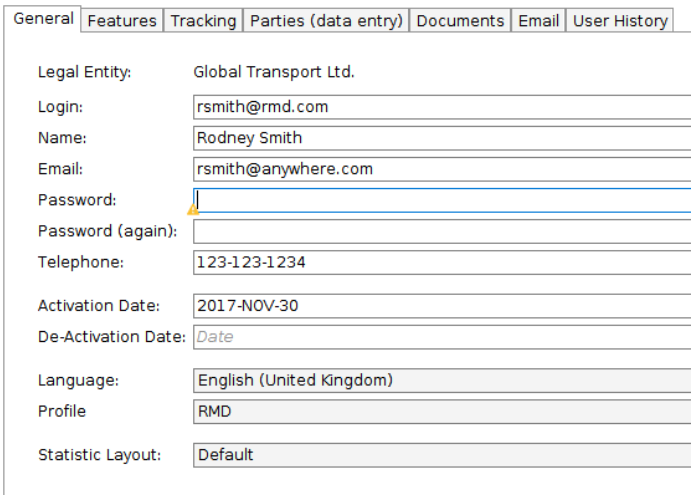
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Entering the users' basic details

On the general tab of the new user, enter the user login details

- Login - this should be a valid email address
- Name - the full name of the user
- Email - the email of the user, this is normally the same as the login
- Password - enter this twice
- Telephone - the phone number for this new user
- Activation Date - the date this new user should be allowed to first login
- De-Activation Date - A date when the account will no-longer be active. Leave this blank if there is no expiry date.
- Language - use the drop-down menu to select the language in which Scope Connect should appear for this user
- Profile - a profile is a "Branding" that can be applied to Scope connect. In the example below, a profile called "RMD" will be applied when this user logs in. If there are no profiles then this will be set to "Default"
- Statistic Layout - Customized statistics layouts can be created and applied to a Scope Connect user.

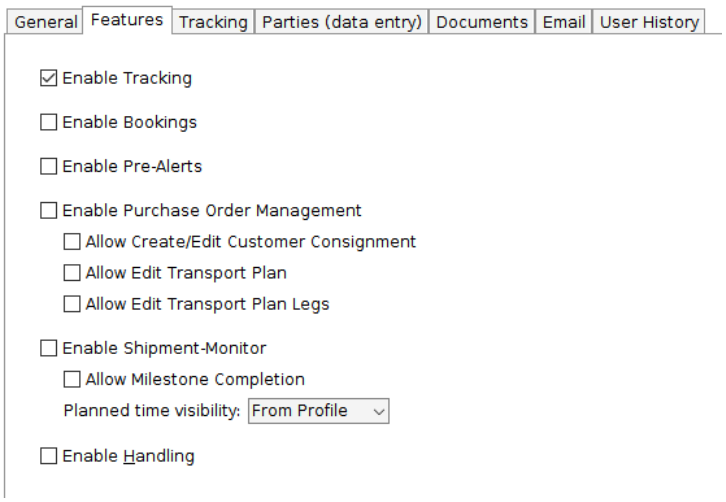


Allocating Scope Connect features to the new user

Use the "Features" tab to select which Scope Connect functions the new user will have when they login to Scope Connect:

- Enable Tracking - This is will allow the user to see their shipments, milestones and documents
- Enable Booking - This will enable the user to create export bookings for sea and air. The Scope users will see these in Scope and can convert them into Scope shipments.
- Enable Pre-Alerts - This will enable export agents to create shipments in Scope Connect. These will be seen by the Scope import users and they can convert them to Scope air and sea import shipments.
- Enable Purchase Order Mangement - This will allow the Scope Connect user to see purchase order information (POMS) in Scope Connect
    - Allow Create/Edit Customer Consignment - The user may create POMS consignments
    - Allow Edit Transport Plan - The user may edit any POMS transport plans
    - Allow Edit Transport Plan Legs - The user may edit any POMS transport plan Legs
- Enable Shipment Monitor - the Scope Connect user will be able to see shipment monitoring which indicates the if shipments are within planned timepoints
    - Allow Milestone Completion - The Scope Connect user will be able to enter completion times for some milestones.
    - Planned Time visibility - Settings here will determing if the user can see the planned times for Milestones
- Enable Handling - The cope Connect user has access to features of the Scope Handling module

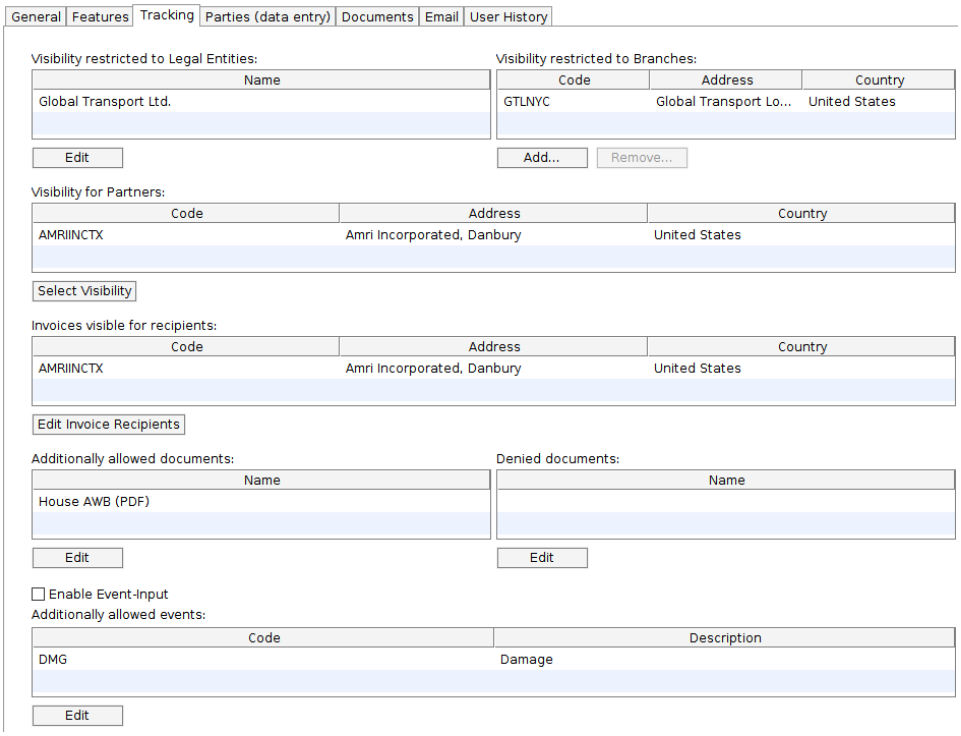
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Determining what the Scope Connect User can see and do in tracking

Use the "Tracking Tab" to:

- Define which shipments the Scope Connect user can see
- If they can see Scope invoices
- The shipment documents they can see
- Additional Events they can see and events they can input



In the example above, this user is setup as follows:

- Legal Entity - They can only see shipments within the legal entity of "Global Transport Ltd." You will probably find you only have one legal entity so this will be easy to select.
- Branch - The user can only see shipments within the Scope branch "GTLNYC" and this is a branch of the legal entity "Global Transport Ltd."
- Visibility for Partners - The user can only see shipments where one of the partners on the shipment is "Amri Incorporated"
- Invoices visible for recipients - This user can see invoices created in Scope whose recipient is "Amri Incorporated"
- Additionally Allowed Documents - in addition to regularly allows documents, this user can also see "House AWBs"
- Denied documents - none of the regularly visible documents are denied to this user
- Enable event input - this user may not update any events

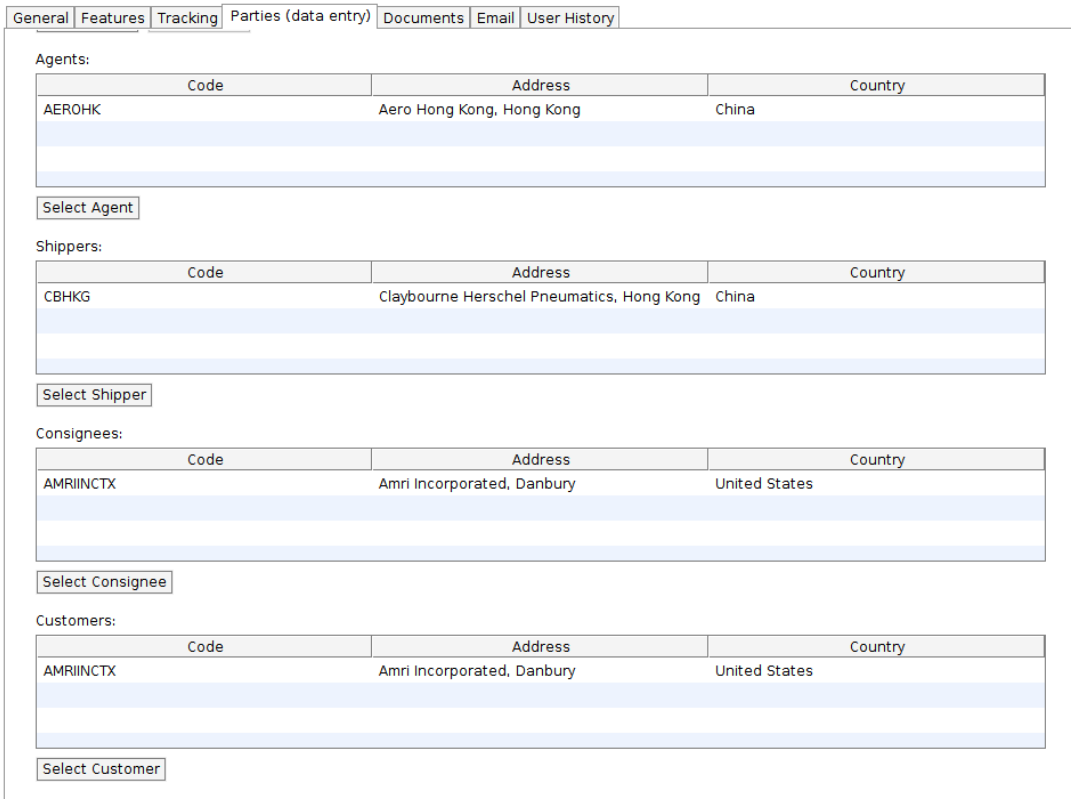
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Additonally allowed events - this user may enter the event "DMG"

Selecting the parties the Scope Connect user has access to when creating bookings or pre-alerts

If a customer or export agent is allowed to make bookings or prealerts, then it is useful if they can lookup Scope parties in Scope Connect. The "Parties" tab of the Scope Connect user, are used to allocate desired Scope parties to the user

- Agents - lookup and select the Scope agents that the user may apply to bookings and prealerts in Scope Connect
- Shippers - lookup and select the Scope parties that the user may apply as a shipper to bookings and prealerts in Scope Connect
- Consignees - lookup and select the Scope parties that the user may apply as a consignee to bookings and prealerts in Scope Connect
- Customers - Shippers - lookup and select the Scope parties that the user may apply as a customer to bookings and prealerts in Scope Connect



Documents

Use the documents tab to store any docs that are important for this Scope Connect user

Email

The Email tab can be user to communicate with the Scope Connect user. An email will automatically be generated here giving the user details of their login to Scope Connect and a link to change their password.

User History

the user history tab will show all the logins to Scope Connect by this user.

Save and Exit

Once all the details are correct, click "Save" to save and exit. Make sure the email has been sent giving the new user details of their login.

How-To for Scope on a Mac

- FAQ How-To allow the Scope client run on a Mac
- FAQ - How-To stop a Mac disconnecting Scope when it sleeps

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To allow the Scope client run on a Mac

After you have downloaded the Scope client, your Mac might not permit you to run the Scope app and you see a message like:

“Scope.jnip” can’t be opened because it is from an unidentified developer - Your Security preferences allow installing of only apps from the App Store and Identified developers."

To solve this problem:

1. Go into System Preferences,
2. then Security & Privacy,
3. under the “General” tab on the bottom there will be a button that says “Open Anyway”
4. click on it and it will proceed with the installation.

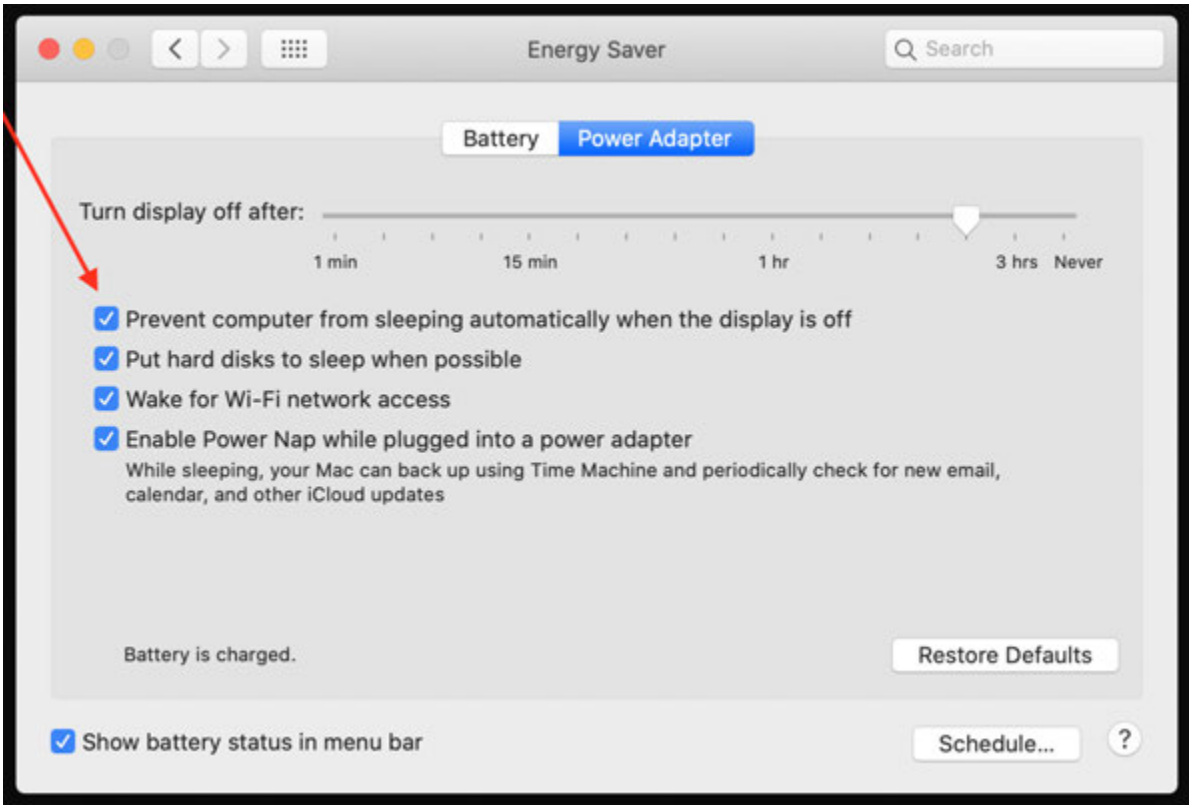
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ - How-To stop a Mac disconnecting Scope when it sleeps

These instructions are followed entirely at the discretion of the Mac user, Riege Software cannot be held responsible for any changes made to the settings of the users computer.

When a computer goes to sleep it disconnects from the internet which would cause an application like Scope that relies on the internet connection to run to disconnect.

You can go into the "Energy Saver" options on your Mac and make it so that only the display sleeps and not the computer itself:



This will keep Scope and other network dependent applications from disconnecting.

VPN

Note: If you are connecting to Scope via a VPN, when the Mac is reactivated from sleep, you will have to wait until your VPN reconnects before you can reconnect to Scope. If you try to connect to Scope before the VPN is up again, you will not be able to reach Scope.

How-To for Scope User Maintenance

- FAQ How-To configure Scope to prevent receiving of Scope E-Mail as SPAM
- FAQ How-To lock a user account in Scope
- FAQ How-to setup new Scope user
- FAQ How-To switch User in Scope

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To configure Scope to prevent receiving of Scope E-Mail as SPAM

In some cases it is possible that E-Mails powered by Scope can be located as SPAM. To prevent such cases you can adjust the settings:

- Configuration for interference-free receipt of emails from Scope
- Scope email and SPAM
- Measures
  - Routing emails over your own email systems
  - Authorize the email systems of Riege Software as a valid sender with an SPF record
  - Email to your domain over the Internet
- MTAs of Riege Software

Configuration for interference-free receipt of emails from Scope

Scope email and SPAM

Scope sends emails on behalf of the Scope user. The email address of the user is therefore set as sender address. This is done so that any replies go directly to the personal mailbox of the user. The disadvantage is that due to SPAM detection, the receiver may reject the emails. This is because the mail originates from the Riege Software data center and not the Internet domain of the customer.

This document describes what actions you can take to prevent incorrect SPAM designation of such emails. Forward this information to administrators responsible for your email systems and DNS (Domain Name Service).

A liability for the rejection of emails on recipient domains is not assumed by Riege Software.

Measures

Routing emails over your own email systems

If you operate a direct connection to Riege software, for example a leased line or VPN (Virtual Private Network), Riege Software can transmit emails from the Scope system to your MTA (Mail Transport Agents, ie. mail servers). All emails are henceforth processed by your internal email systems, and sent in this manner to the Internet and on to the recipients by your official MTAs.

This is the preferred method. On request you will receive an IP address from Riege Software for the network Scope operates in. Riege Software then forwards your emails to your internal MTAs. You have only to accept this IP address as legal sender. Please let us know the internal IP addresses of your MTAs which must be available using the direct network link.

But please remember to take the email transmission into account in your bandwidth calculation. Otherwise, bottlenecks in the use of Scope may arise for your users.

Authorize the email systems of Riege Software as a valid sender with an SPF record

If you do not have a direct link to Riege Software or you do no want to apply the preferred solution above, you can authorize the MTAs of Riege Software to send email on your behalf. This requires a so called SPF record (Sender Policy Framework) to be applied to your DNS zone (Domain Name Service) of your Internet domain.

An SPF record may be used by recipients to determine whether the emails were sent from a valid system. If the email is sent from an unauthorized delivery system, the receiving system may reject the email.

As for the SPF record, you can add the following entry in your DNS zone:

1. Create a **TXT record** in the zone.
2. As the value, please enter: **v=spf1 include:_spf.riege.com ~all**
3. The new zone has to be published.

If a TXT DNS line already exist then the Riege SPF details should be added at the end of the existing line

Email to your domain over the Internet

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

One easy way to receive emails from Scope for your domain is to set the email systems of Riege software on your whitelist, this means there is no SPAM detection performed. With this, you allow interference-free reception of emails from Scope for your employees when the first 2 methods above are currently not feasible for you. This method is not foolproof to further recipients on the Internet, your customers for instance, and you may still get rejections, which is why we do not recommend this method.

MTAs of Riege Software

Below are the instructions on how to identify the email system of Riege Software.

1. The SPF systems are responsible for sending messages for the domain riege.com and are sending all messages originating the data centers of Riege Software. You can retrieve the list of systems via the following link: http://mxtoolbox.com/SuperTool.aspx?action=spf%3ariege.com&run=toolpage
2. The MX systems are responsible for receiving the messages for the domain riege.com. Some systems for SPAM detection used to analyze the MX records, although this is not correct. You can retrieve the list of systems via the following link: http://mxtoolbox.com/SuperTool.aspx?action=mx%3ariege.com&run=toolpage

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

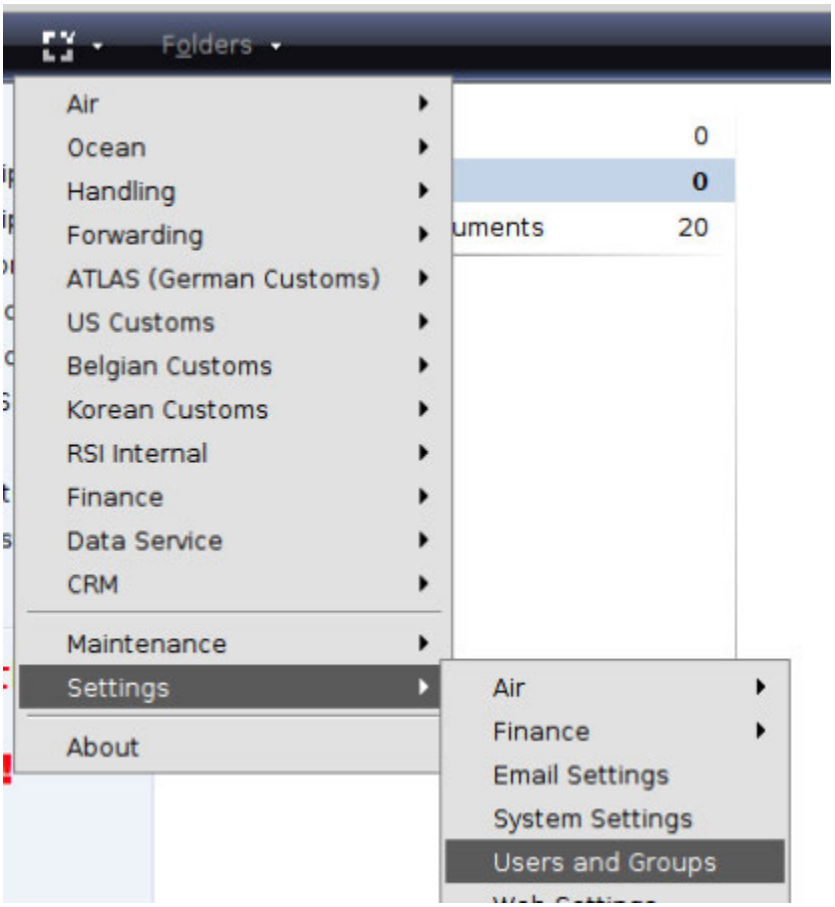
FAQ How-To lock a user account in Scope

Introduction

System Administrators have the ability to lock a users account. This can be done to immediately prevent the user from logging into Scope.

Workflow

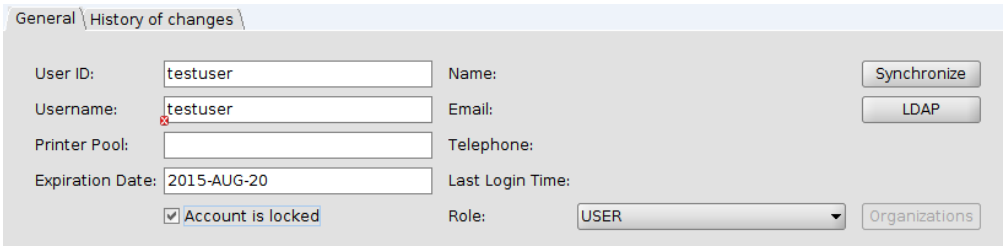
1) From the Scope menu scroll down to "Settings" and in the settings sub-menu choose "Users and Groups



2) From the complete list of user, select the user to be locked and double click it or click the edit user button 

3) The user's profile will open. Check the box labeled "Account is locked"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



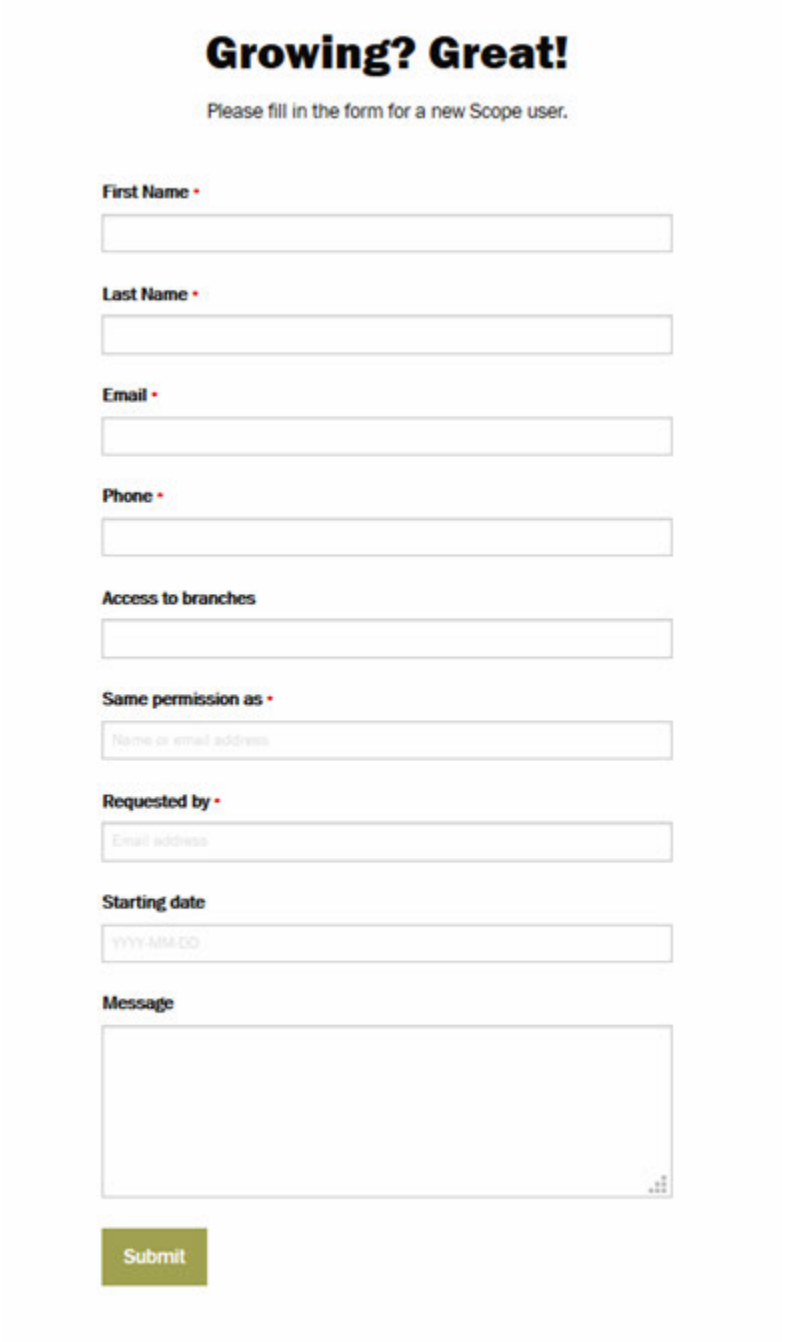
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-to setup new Scope user

If you need to setup new Scope user, you can use below mentioned links and fill in the required information. There will be issued a JIRA ticket and you'll receive a confirmation mail automatically.

For all countries (excepting DE / NL / CH) use the following link:

https://www.riege.com/new-scope-user/



User from DE / NL / CH have to use the following links:

DE = https://www.riege.com/de/neuer-scope-benutzer/
CH = https://www.riege.com/ch/neuer-scope-benutzer/
NL = https://www.riege.com/nl/new-scope-user/

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To switch User in Scope

If you have choosen the option "save password" on Scope-Login-Screen, Scope will start automatically with your user data.

To log-off and switch to another user in Scope you have to work as below mentioned:

- Switch to Scope Dashboard and choose on the left side
- Switch to second tab
- Unchoose the option "start automatically"

By starting Scope the next time, you have to sign in with your password. You can switch to another user by clicking on your user name and the option "change user".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To for Tracking

- How-To create a Tracking Template
- How-To Trigger a Milestone with a Scope Event

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To create a Tracking Template

- Introduction
- Navigating to tracking templates
- Overview of Tracking Templates
- Make a new Tracking Template
    - Making a new Tracking Template by copying an existing Template
    - Defining when to apply a Tracking Template
        - A generally applied Tracking Template
        - A customer specific Tracking Template
    - Creating the Milestones for the new Template
        - Adding a milestone to the Pickup leg
        - Completing the general elements of the milestone
        - Completing the schedule of the milestone
        - Creating Actions associated with completion of a milestone
        - Creating milestone alarms

Introduction

tracking templates are used to:

- define which milestone to apply to shipments
- specify the time window allowed for the milestone to be completed
- manage how the milestone might be completed
- apply the actions and alerts associated with each milestone
- Determine which milestones are visible in Connect to the customer, shipper, consignee, agent or other party.

When a tracking template is applied to a shipment, the results are seen in the "Tracking" tab of the shipment

Navigating to tracking templates

1. Main menu
2. Master data
3. Forwarding
4. Tracking Templates

Overview of Tracking Templates

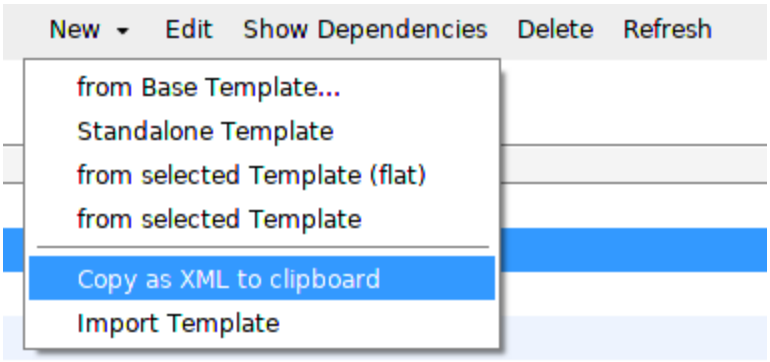
The overview displays all the tracking templates that have already been created. When a tracking plan in the overview is highlighted, the "Applicability" window at the bottom of the screen will show the order attributes used to apply the template to the correct shipment.

Make a new Tracking Template

There are a number of ways to make a new tracking template but the 2 easiest methods are:

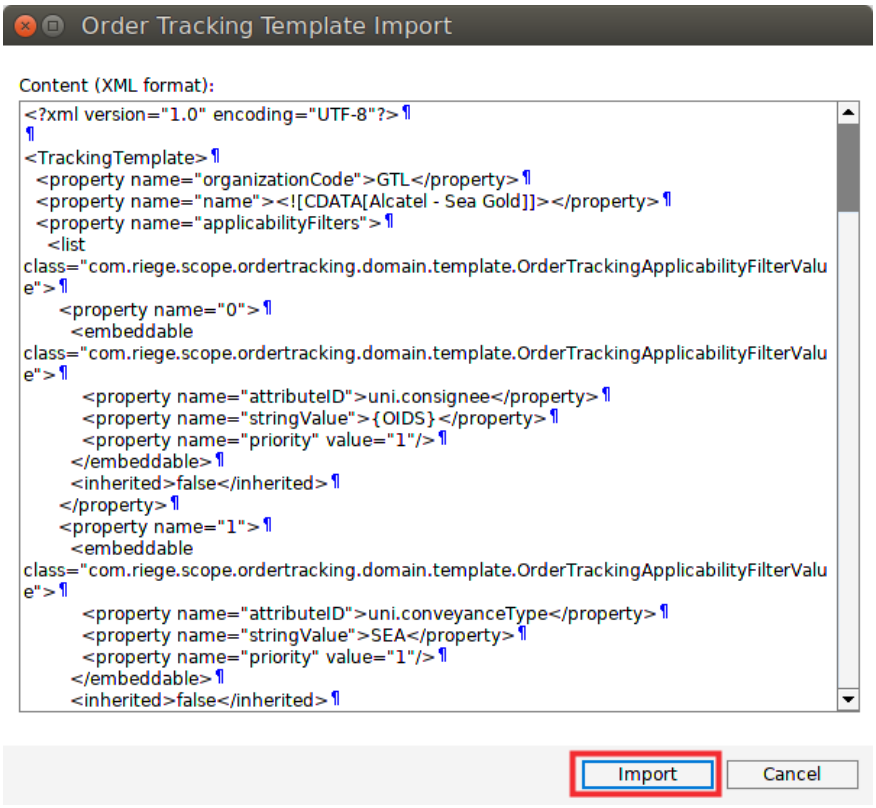
- **Standalone Temple** - this will let you create a template from scratch
- **Copy as XML to clipboard** - this lets you copy an existing template to your clip board and then import it as the basis for a new template.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Making a new Tracking Template by copying an existing Template

1. From the the "New" menu, choose "Copy as XML to clipboard"
2. Now, from the "New" menu choose "Import Template"
3. A blank "Order Tracking Template Import" window will appear
4. Put the cursor in the blank content area and right click. Choose "paste" and the copied template will appear as XML data.
5. Click "Import"
6. The copied template will appear. Give it a new name and make any further changes, then click "Save" to keep it.



Defining when to apply a Tracking Template

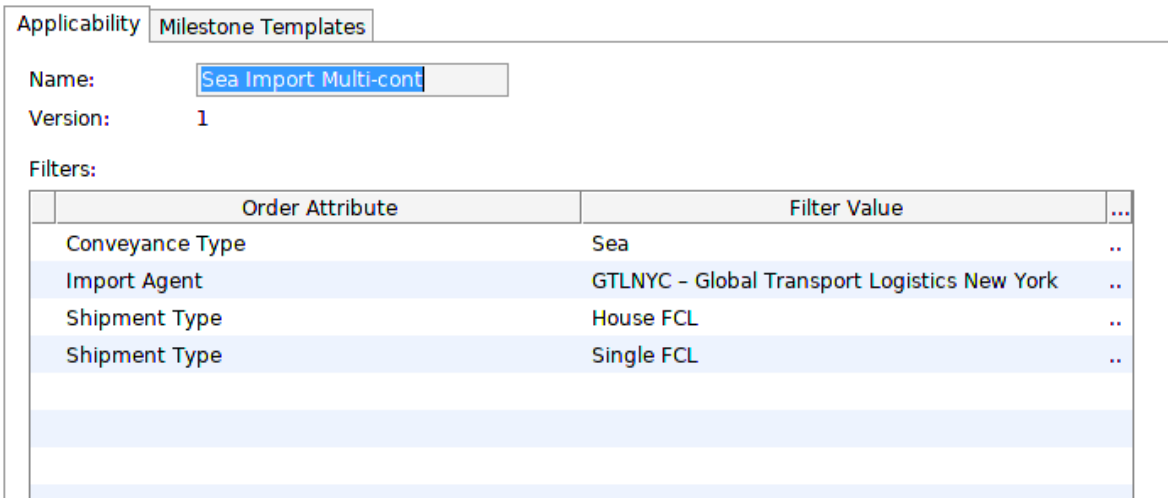
A tracking template can be very general or it can be very specific, or anything in between. The "Applicability" tab of a template is used to define when the template must be applied to a shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

A generally applied Tracking Template

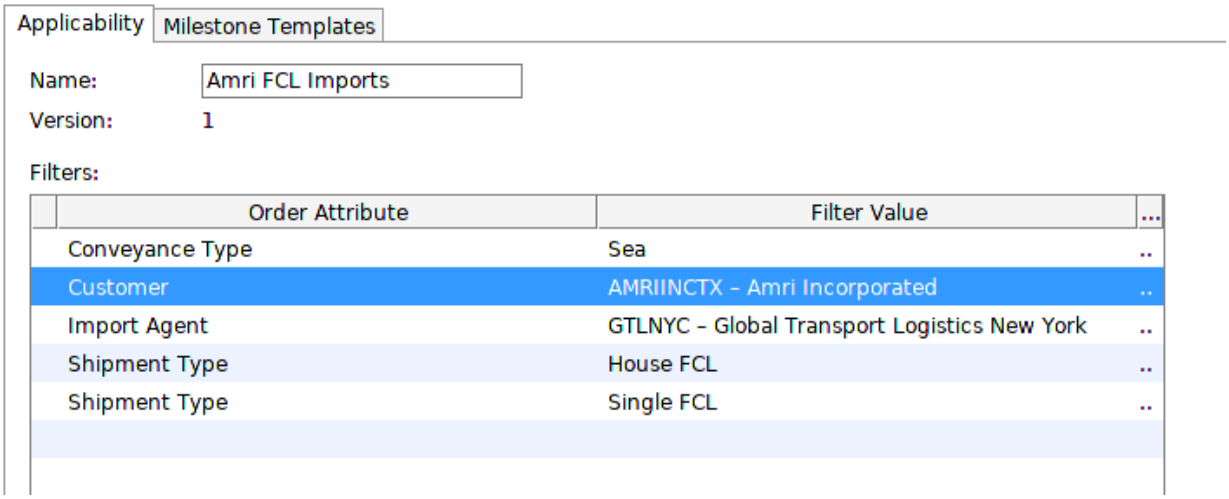
In the example below, this tracking template will be applied to any shipment where

1. The method of transport is "Sea"
2. The import agent is Global Transport Logistics in New York
3. The type of shipment is a house FCL or a Single FCL (note a single FCL shipment may have more than 1 container on it)



The above template will only be applied when a more specific template cannot be found

A customer specific Tracking Template



The applicability of the tracking template above looks very similar to the above general tracking template except that the customer is specified as "Amri Incorporated". This means that this template will be applied to sea import FCL shipments when :

1. The method of transport is "Sea"
2. The import agent is Global Transport Logistics in New York
3. The type of shipment is a house FCL or a Single FCL (note a single FCL shipment may have more than 1 container on it)

and

- The customer on the shipment is "Amri Incorporated"

There are many order attributes that can be used to make tracking templates very specific.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

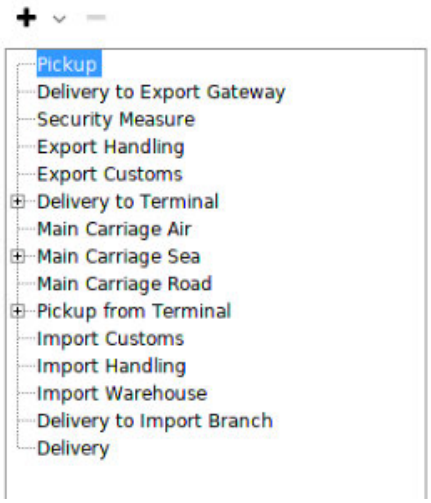
Creating the Milestones for the new Template

Every shipment has a life-cycle from Pickup to Delivery . This life-cycle is made up of a series of legs and you can define milestones within each leg. The first leg is the pickup, and for this leg we might define the following milestones

1. Issuing the pickup instructions to the trucker
2. Receiving confirmation of the pickup by the trucker
3. Confirmation of delivery by the trucker to the export terminal

Depending on the type of shipment that the tracking template is being applied to we could define all these milestone for the pickup leg, or just some or them, or none of them.

Below is shown the complete set of legs than are available for every shipment. Milestones can be created for each of these legs as desired.

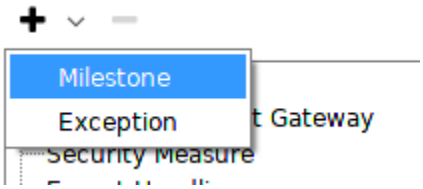


Adding a milestone to the Pickup leg

In this example we will create the milestone "Pickup confirmation" for the pickup leg.

- Highlight the leg "Pickup" and click the "+" symbol.

- From the sub-menu choose "Milestone"

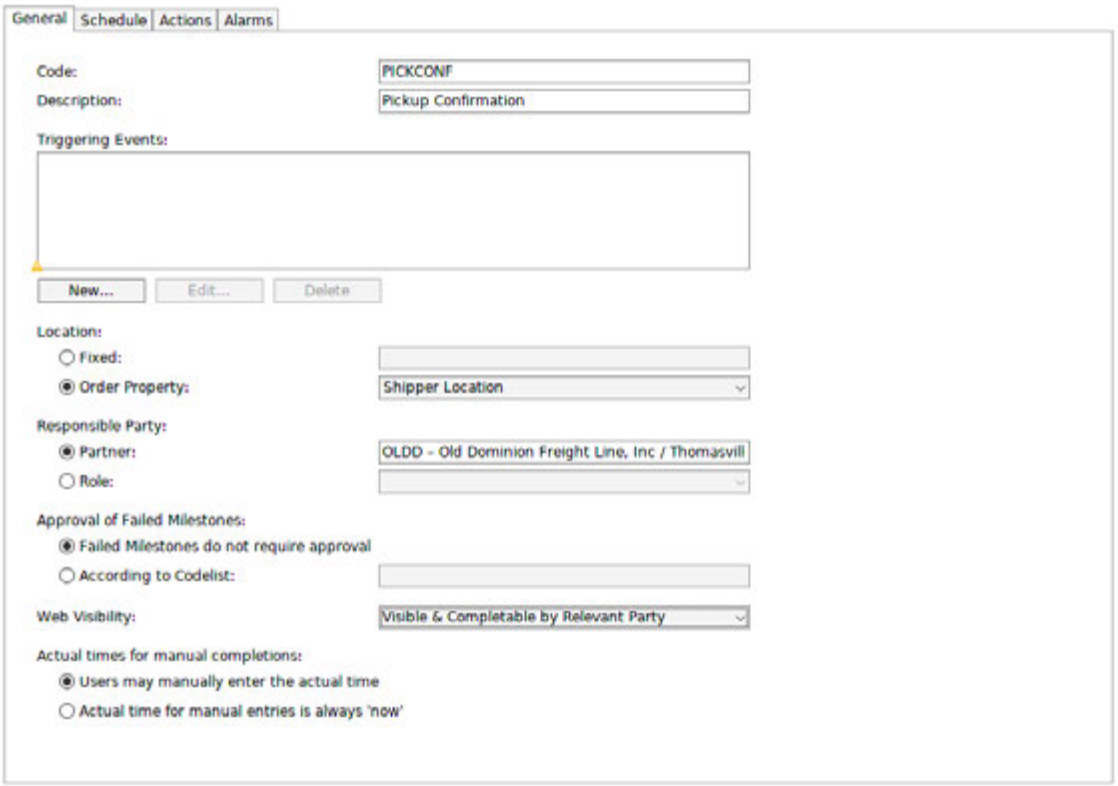


Completing the general elements of the milestone

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The first tab of a new milestone is the general tab and this is where we define the basics of the milestone

- **Code** - This is the short code for the milestone. Our example is "PICKCONF"
- **Description** - The full description of the milestone, ie. "Pickup Confirmation"
- **Triggering events** - A milestone can be completed automatically, for example if the trucker can electronically transmit his pickup event to us, we could use this to automatically complete the event. In this case the trucker cannot do this and it will therefore be manually completed, so this field is left blank.
- **Location** - We need to specify where the milestone will take place in order to apply the correct time-zone to it. In this case the pickup will occur at the shipper's location.
- **Responsible party** - here we define who should complete this milestone. In this case we expect the trucker to notify us by logging into Connect and completing the milestone for us there.
- **Approval of failed milestone** - most of the time when a milestone in not completed on time it is sufficient alert the user, but some milestone require very close control and for advanced users a codelist can be created to control failures.
- **Web Visibility** - Sometimes we need to make the milestone visible in Connect. This field allows the user to choose the kind of visibility of the milestone in Connect:
    - Invisible
    - Visible
    - Visible and completable
    - Visible and completable by responsible party
- **Actual times for manual completions** - Either the current time may only be used or the user may choose a completion time.



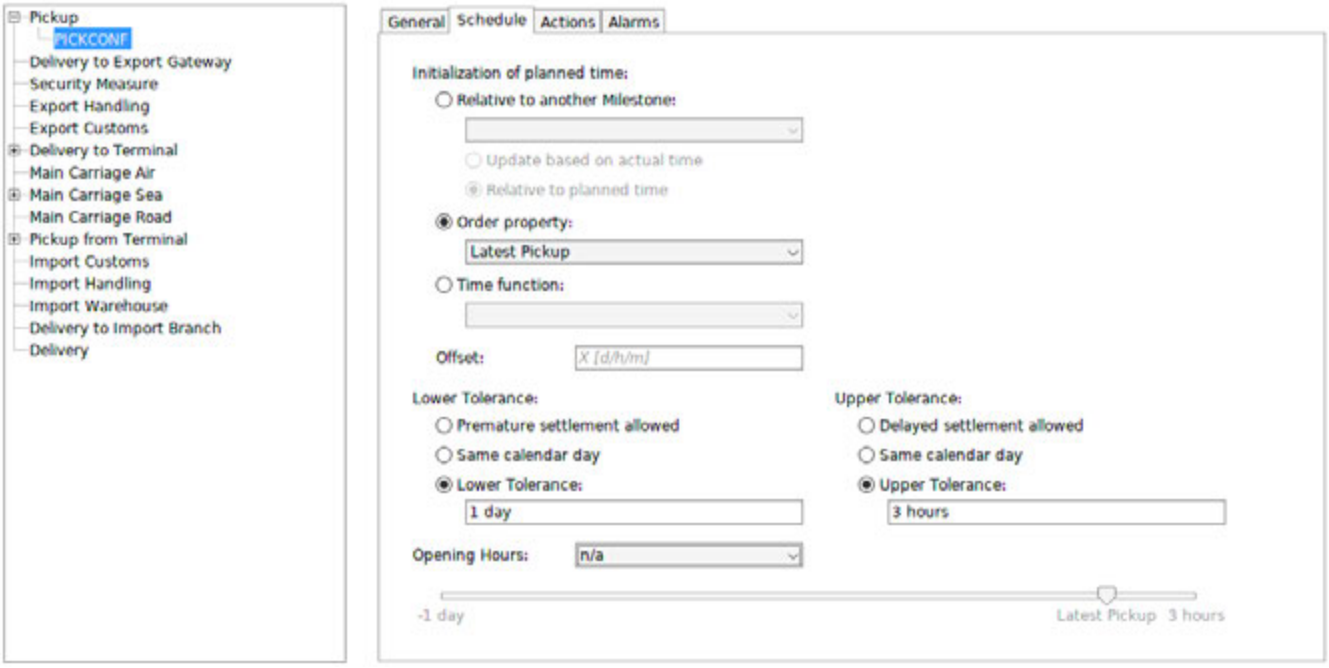
Completing the schedule of the milestone

The second tab of a milestone in the "Schedule" and here we define when we expect the milestone to be complete, the earliest to the latest times this may occur.

- **Initialization of planned time** - There are three ways to set when a milestone must be completed
    - Relative to another milestone - this method looks at an already existing milestone and calculates based on the completion date of that milestone
    - Order property - Here a date belonging to the shipment is used. In this example the "Latest pickup date" recorded by the user in the shipment will be used to fix the expected completion date and time
    - Time function - this is the shipment creation time.
- **Offset** - The offset can be used to push the completion date and time to before or after a known shipment date and time. For example the completion of the pickup may be relative to the ETD of the vessel and therefor the offset could be use to specify that the completion of the pickup must occur 72 hours before the ETD of the vessel

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **Lower Tolerance** - here we can define how early the completion can occur. In this example the completion of the pickup is relative to the latest pickup date recorded in the shipment. "1 day" in the example means that the earliest we expect the pickup to occur is 24 hours prior to the latest pickup date and time.
- **Upper Tolerance** - here we define how late the completion may occur. The example below allows 3 hours after the latest pickup date and time recorded in the shipment.

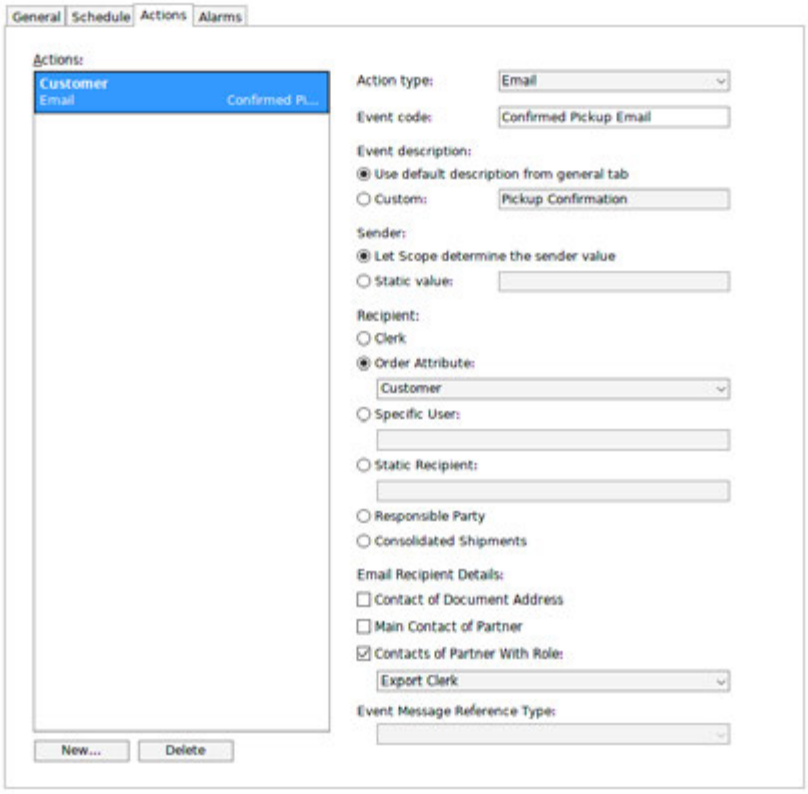


Creating Actions associated with completion of a milestone

When a milestone is completed, there are actions that can be automatically executed. The "Actions" tab of a milestone is used to create these and multiple actions can be created for a single milestone.

- **Action type** - The most common type of actions are:
  - Send an email notifying someone that the milestone is completed
  - Notify the user a milestone has been completed
- **Event Code** - this field can be used to give this action its own event code
- **Event Description** - here we can define if the description of the milestone is sufficient, or by using the custom description more specific information about the event can be used.
- **Sender** - here we can define who the alert should appear to be originating from
- **Recipient** - depending on the type of action, various methods can be used to specify who is the recipient of the action. In the example below, the action will send an email. To ensure the correct recipient gets the email we can choose from:
  - Clerk - this would send the email to the user who currently owns the shipment
  - Order attribute - here we can choose from list of parties who are associated with the shipment. In the example our email will go to the customer who the shipment belongs to
  - Specific user - Use this field if the email should go to a specific user in Scope or a Scope partner.
  - Static Recipient - This field is used if the recipient is a specific unchanging email address.
  - Responsible party - this would send an email to the party responsible for completing the milestone
- **Email recipient details** - this section allows us to be even more specific as to who should get the email notifying them of the action. In the example, the customer who the shipment belongs to is getting the email, but we are specifying that the customer contact with the role "Export Clerk" must get the email

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



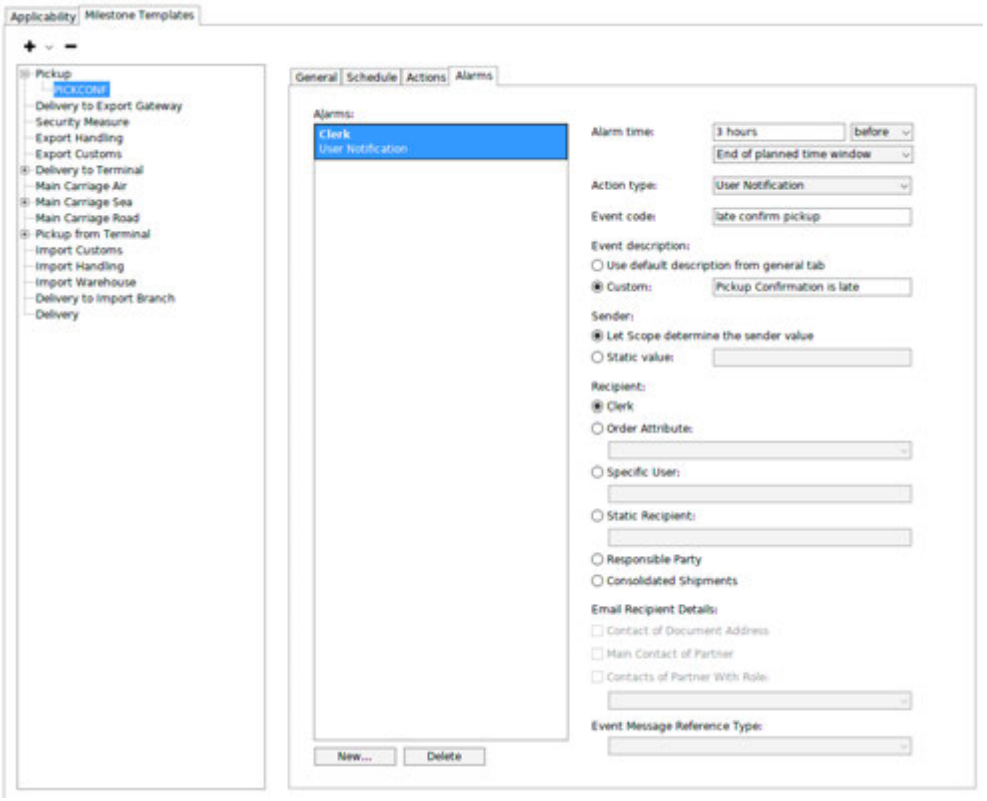
Creating milestone alarms

Just as actions may be created when a milestone is successfully complete, alarms may be created for milestones when failure of timely completion appears imminent. Multiple different alarms may be created for a single milestone.

Below, using the "Alarms" tab of the milestone, an alarm has been created for the "Pickup Confirmation" milestone:

- **Alarm time** - here we have specified that this alarm must be triggered 3 hours before the the end of the allowed time window. This should allow time to contact the trucker and ensure he is on his way to the pickup.
- **Action type** - here we specify what the alarm should do. We have chosen to send the user a Scope notification
- **Event Code** - a specific code for this alarm. This will default to the code of the milestone and this can be retained if preferred
- **Event description** - a full description of the event. This will help the recipient immediately understand the problem
- **Sender** - the party who should be appearing to send the alarm
- **Recipient** - as with actions, there are numerous options to ensure the correct party gets the alert. In this case the user responsible for the shipment will get the alert

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When all 4 tabs of the milestone are complete, work can begin on defining the next milestone.

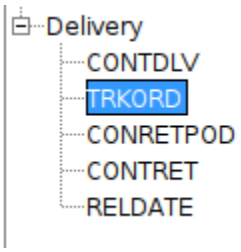
Click "Save" when all the milestones for a tracking plan are complete.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

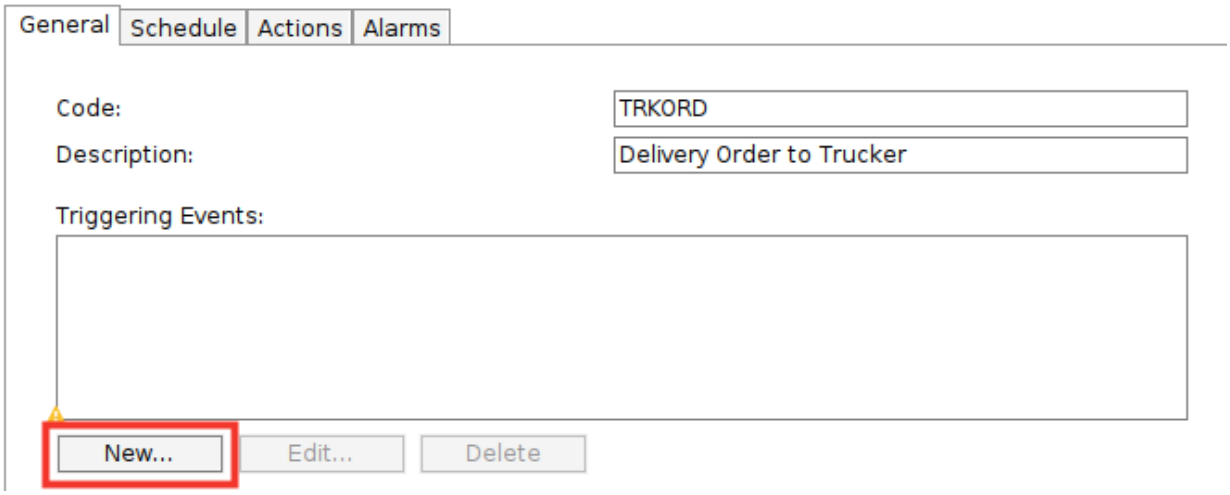
How-To Trigger a Milestone with a Scope Event

Create the milestone in the desired tracking template or select an existing milestone

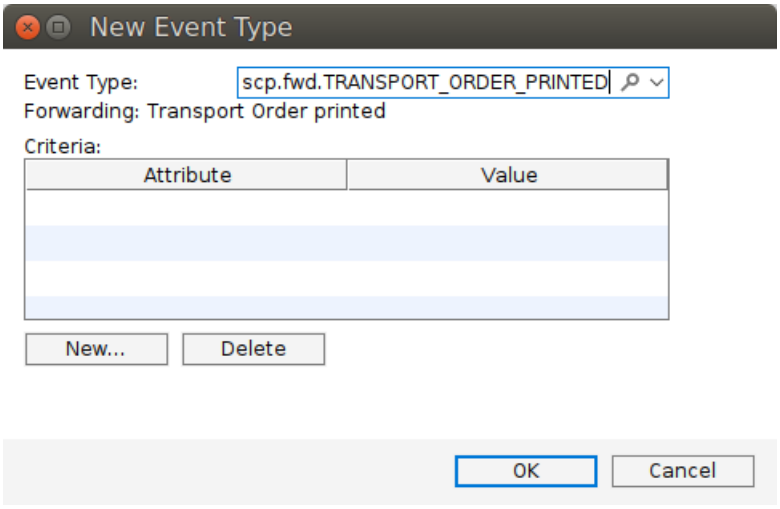
In the example below, the new milestone TRKORD (Delivery Order to Trucker) is used



On the "General" tab of the the milestone click on the "New" button beneath the "Triggering Events" window



Search for the event type, in this case the Scope event "scp.fwd.TRANSPORT_ORDER_PRINTED" is being used. This event occurs when a delivery or pickup note is printed



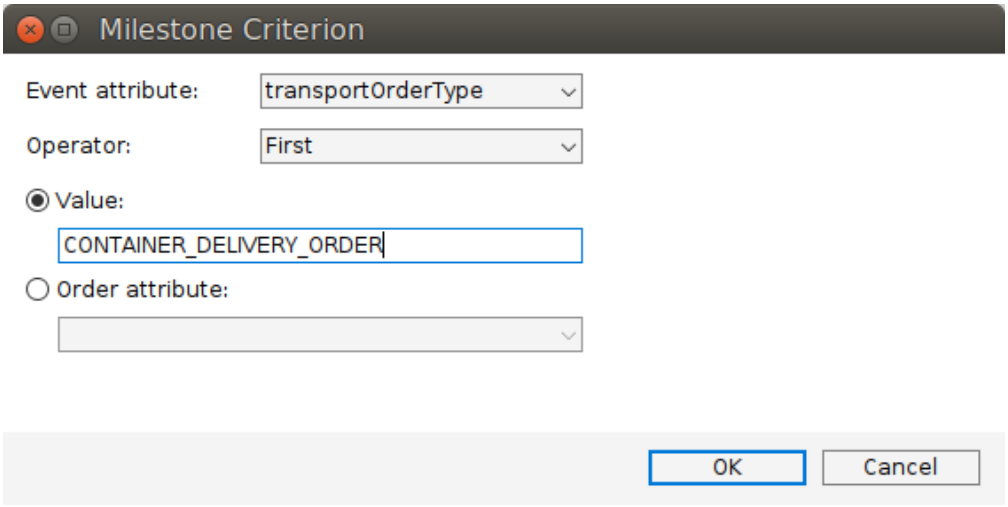
Because multiple delivery or pickup notes can be printed, we need to further define this event and so we click "New.." to add a new attribute to the event

- **Event attribute:** The event attribute will be a type of transport order because we want the printing of a container delivery note to be the trigger, and so "transportOrderType" is selected
- **Operator:** Next we select the Operator, since multiple container delivery orders can be printed, the operators we are offered are:
  - Sum

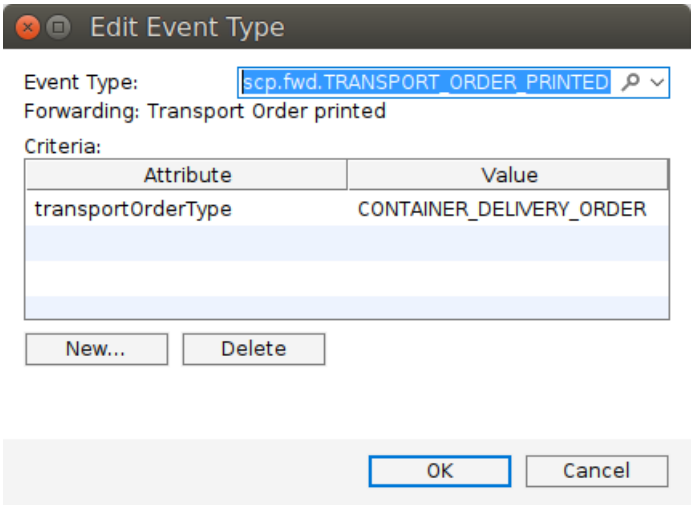
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- First (This has been chosen so the trigger will activate when the first container delivery order is printed)
- Last
- Any

- **Value:** Here we restrict the action to a specific type of transport order and in this case this must be CONTAINER_DELIVERY_ORDER. This ensures this trigger only activates when an FCL delivery order is printed and it will not activate when a pickup note or LCL delivery order is printed

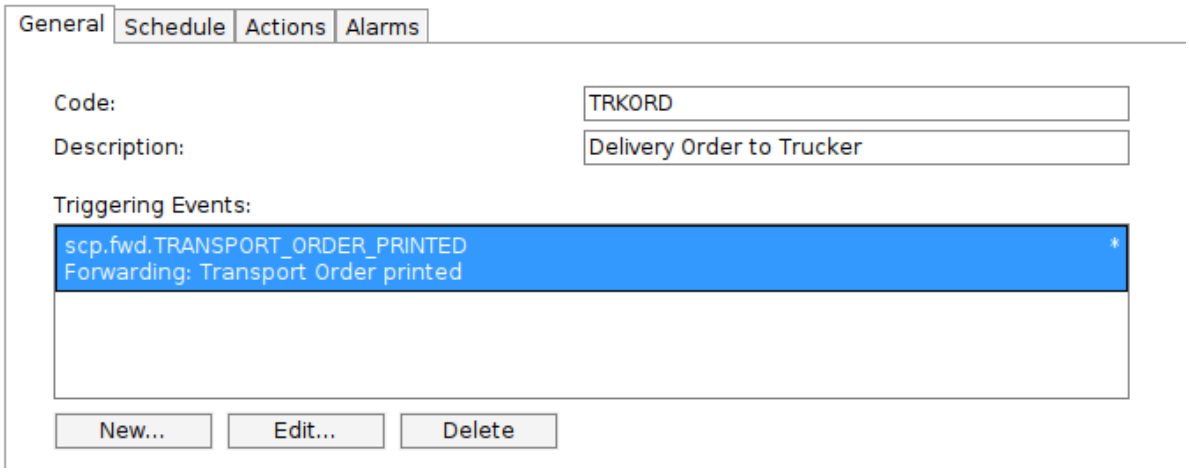


When we click "OK" the event type is updated to look like the example below:



Click "OK" again and the new trigger appears in the "Triggering Events" window and the rest of the milestone can be completed

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To for Transport Orders

How-To articles for:

- Pickup Notes
- Delivery Notes
- Delivery to terminal
- Container Deliveries
- Container Pickups

- How-To create and use multiple pickup and delivery addresses

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

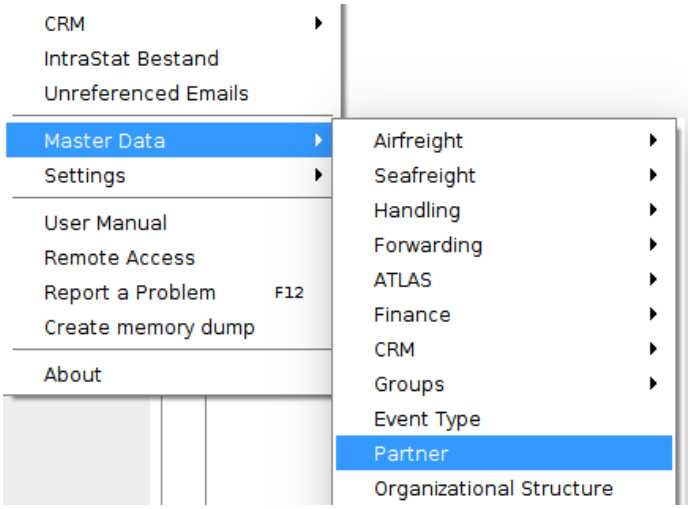
How-To create and use multiple pickup and delivery addresses

- Adding multiple pickup or delivery addresses to a partner
- Selecting the right location in a pickup or delivery note

A customer might have a large number of pickup or delivery addresses. Rather than create each of these as a partner, they can be saved in Scope as pickup or delivery addresses. They can then easily be selected from a list when the pickup or delivery note is created.

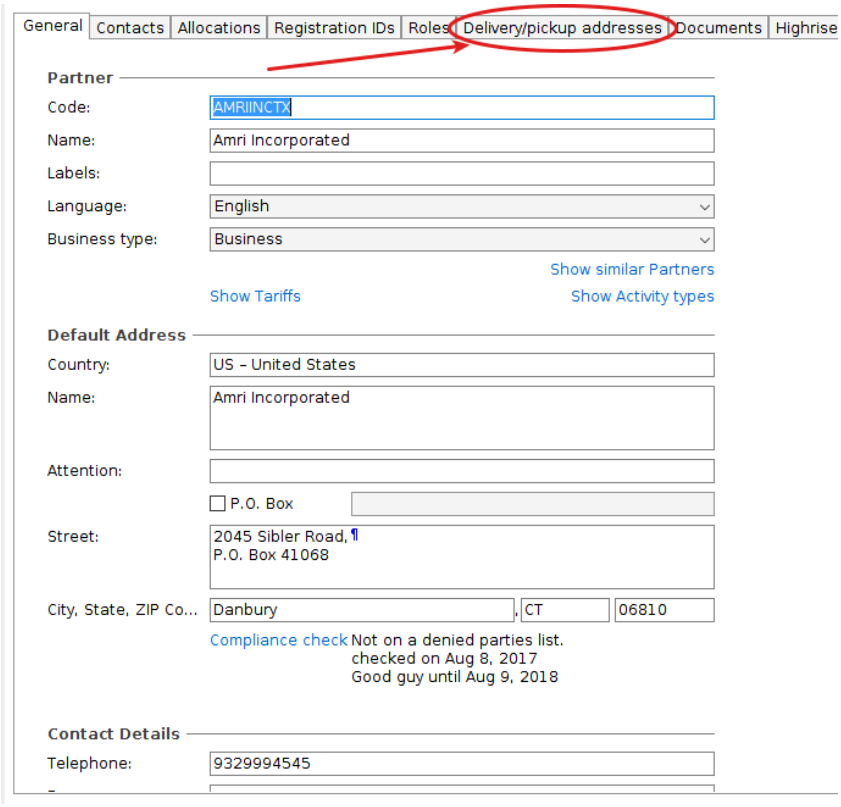
Adding multiple pickup or delivery addresses to a partner

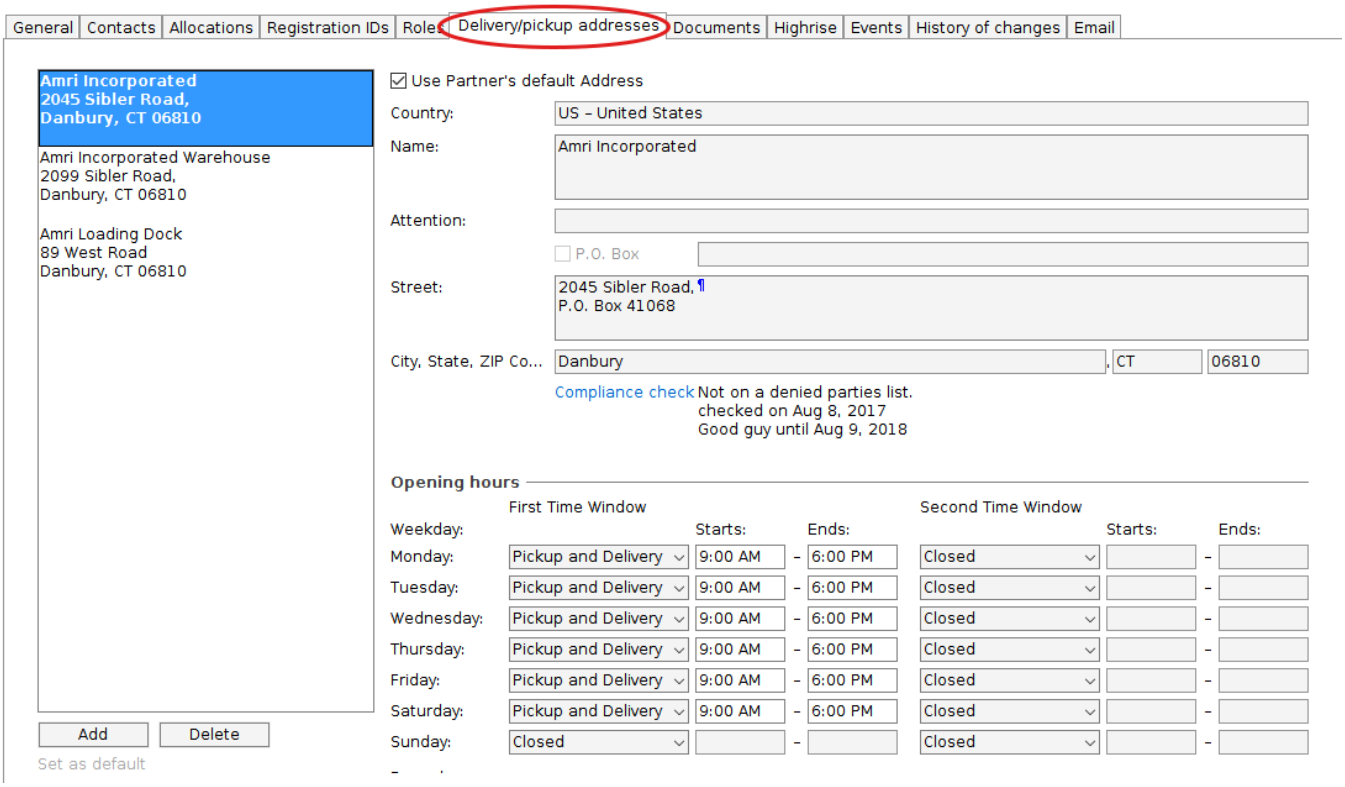
Navigate to partner maintenance.



Now find and open the partner. Click on the "Delivery/Pickup addresses" tab of the partner:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

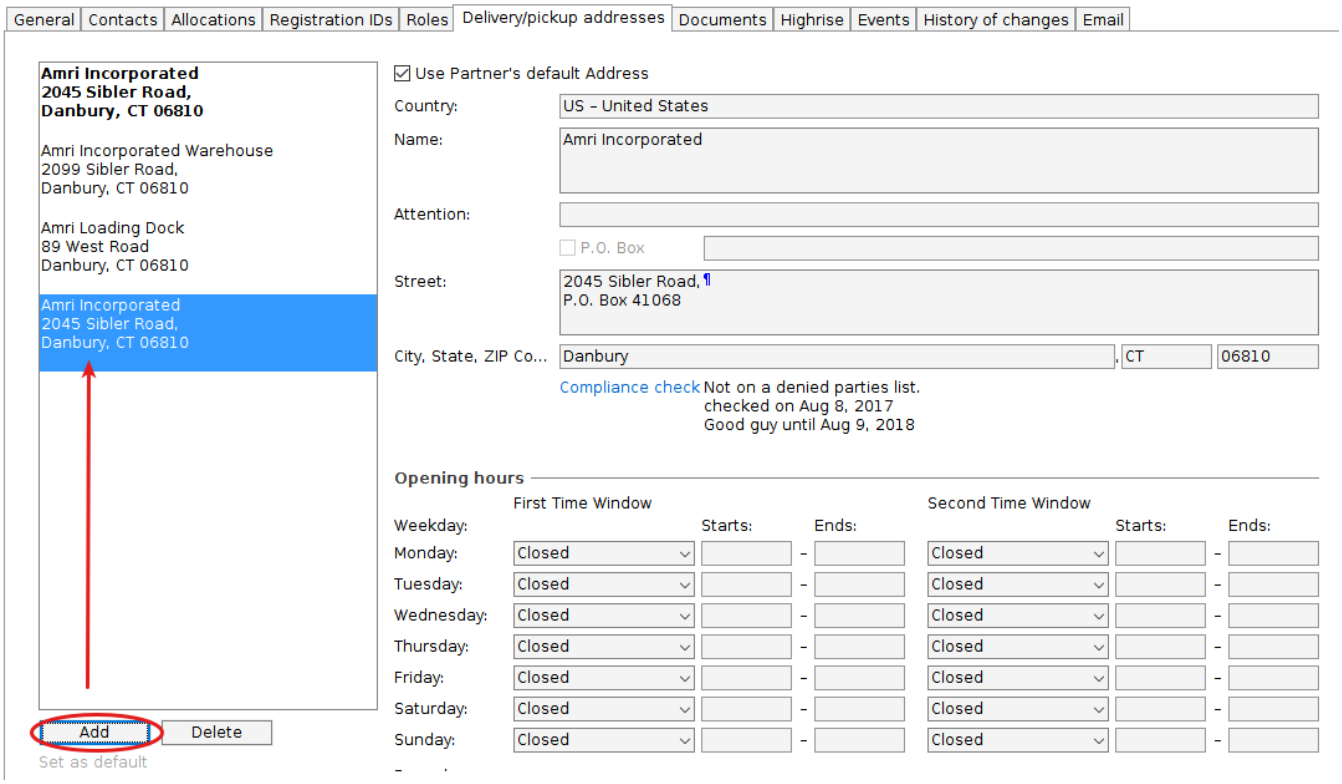




In the example above, this partner already has 3 pickup/delivery addresses. Add a new one:

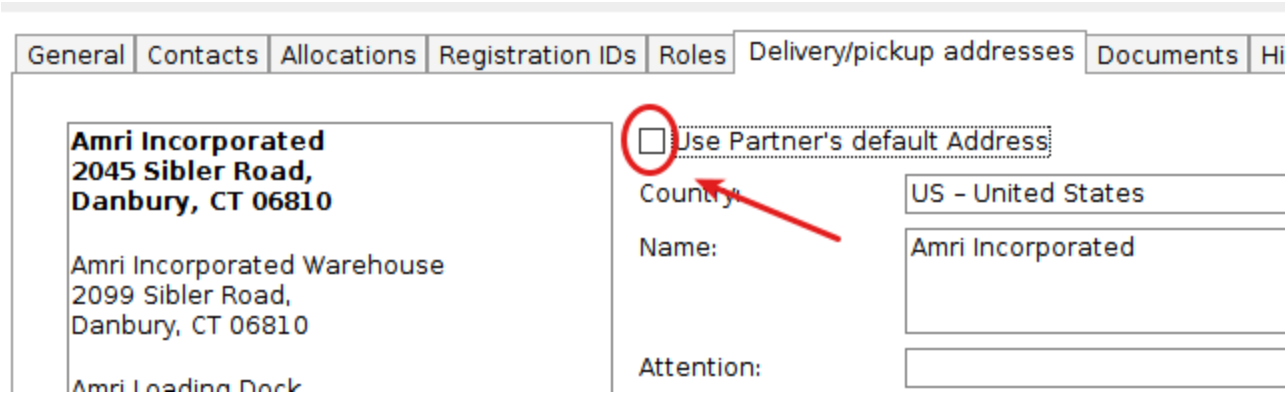
Click "Add"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



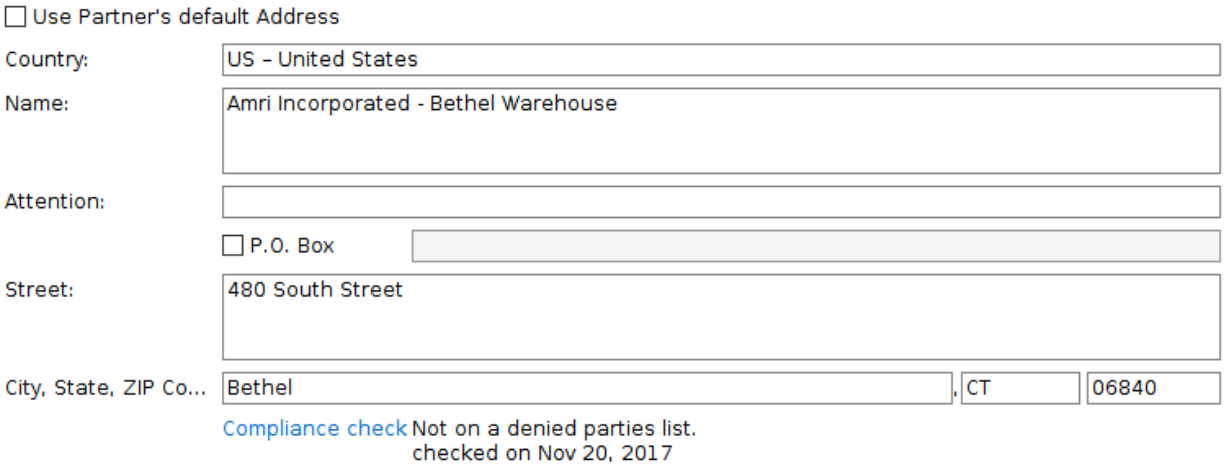
Scope will add a new address, by default this will show the details of the parners main address.

Un-check the option "Use Partners default address" to change this to a new address



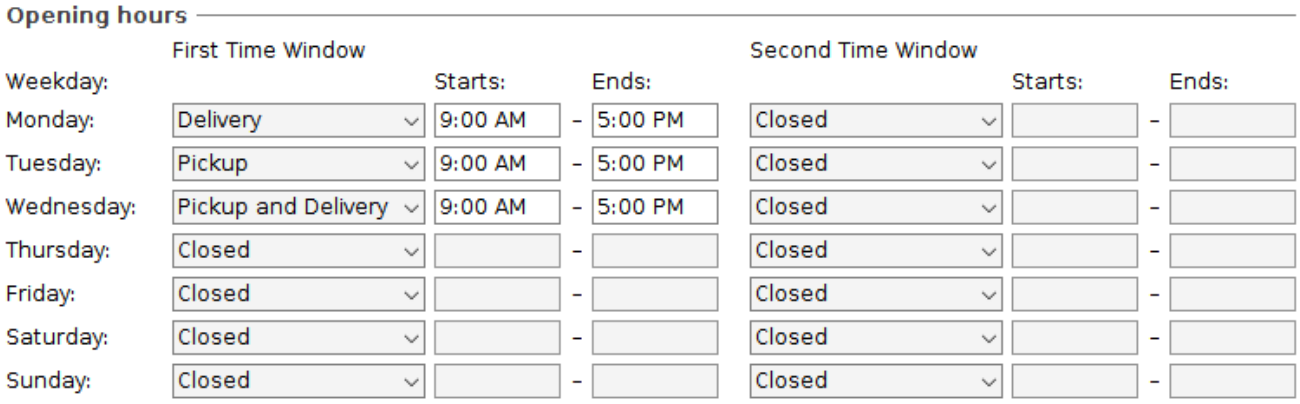
Now adjust the details to show the new address:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Next, define if the new address is a pickup or delivery location, or both. In the example below, depending on the day of the week, the location is a Delivery location, pickup location and then on a wednesday it is both a pickup and delivery location.

Use the second time window settings to the right if during the day there is a second set of opening hours and/or type of operation:



Be sure to compliance check the address and save when complete

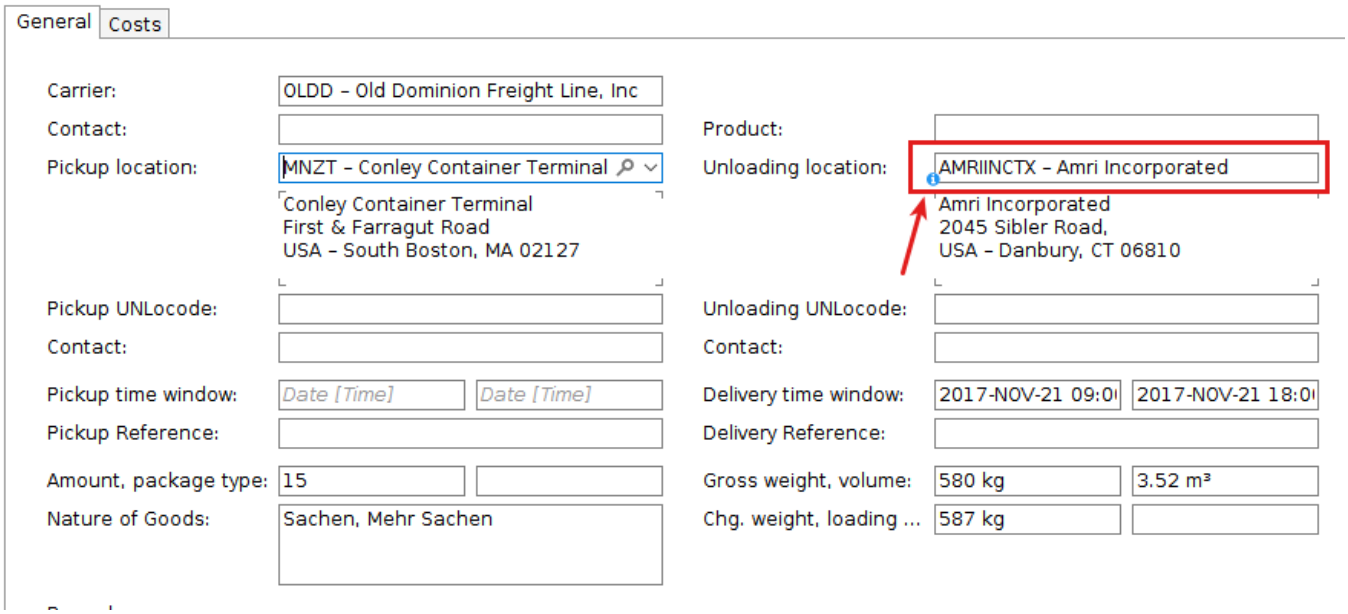
Selecting the right location in a pickup or delivery note

Open the shipment and make a new delivery or pickup order:

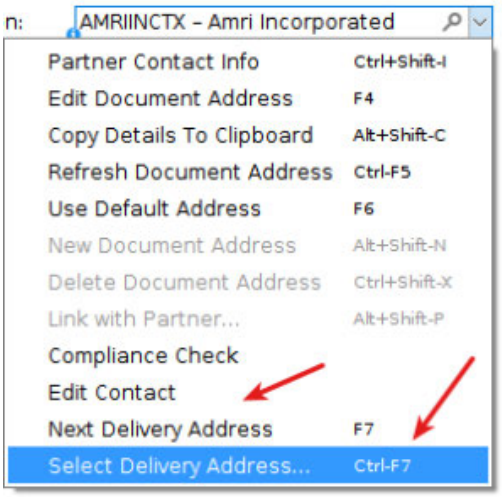
In this example a partner with mulitple delivery locations will be used.

In the Unloading Location of the delivery order we see the partner "Amri Incorporated". We can tell they have multiple delivery locations, because we see the small blue information icon immediatly to the left of thier name:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click the drop-down menu to the the immediate right of the unloading location:

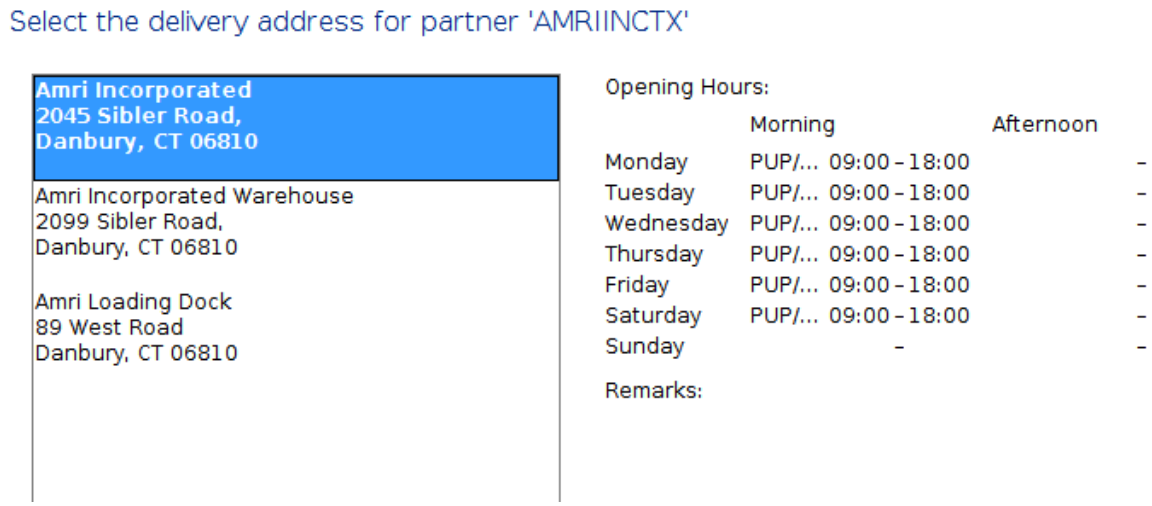


The drop-down presents 2 options:

- Next Delivery Address - use this option to cycle through all available delivery addresses
- Select Delivery Address - use this option to see a list to choose from of all delivery addresses

In the example below, the "Select Delivery Address" is chosen. Select any delivery address, opening hours for each are shown to the right:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



This same functionality is available if the address is a pickup location.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To forward an email to Scope

- Introduction
- Activation
- How to use it
- Unreferenced Emails

Introduction

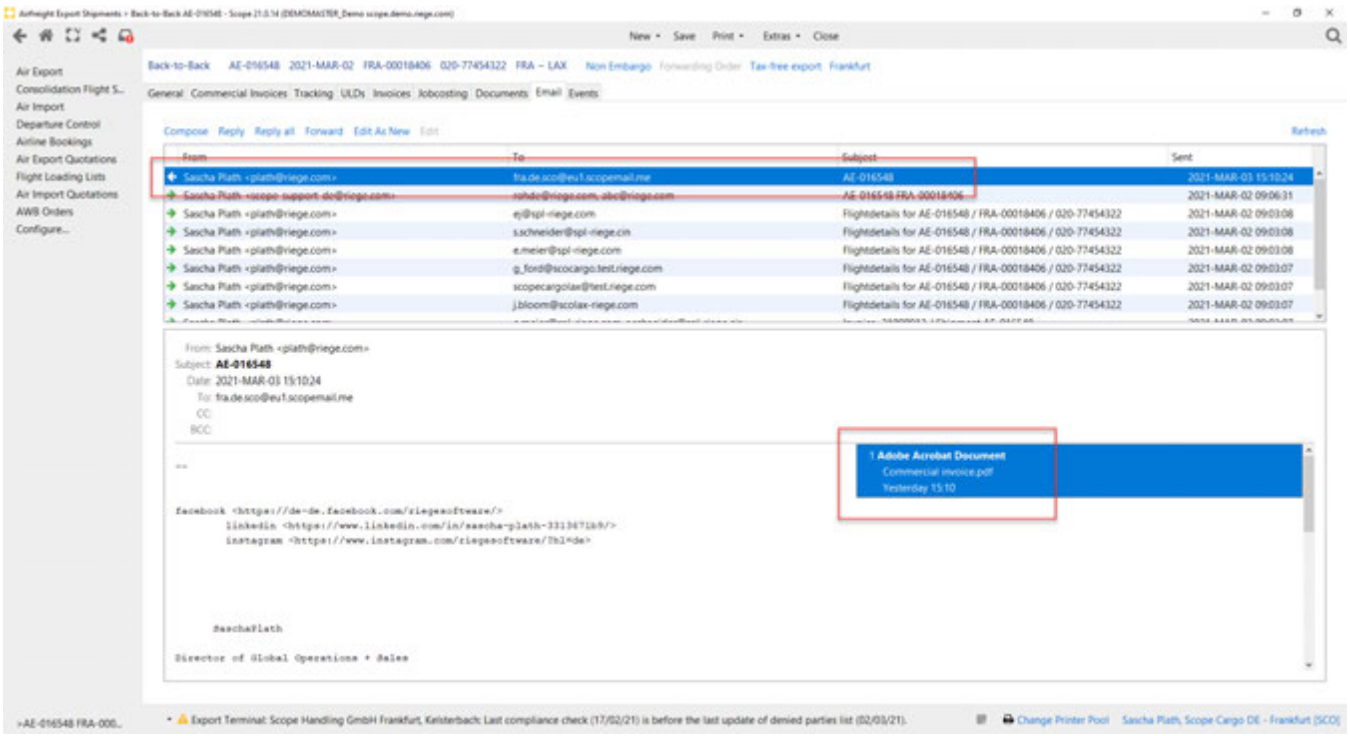
There is an option to create an internal Scope email-address per branch, so external emails can be easily forwarded to the Scope system. The forwarded email will be shown in tab "Emails" of the corresponding order and the attached files will be uploaded in tab "documents". With this function documents can be easily uploaded into the corresponding Scope shipments.

Activation

Contact your Scope helpdesk via support@riege.com to activate this feature for the corresponding branches. Each branch will receive one incoming email-address for usage, eg fra1.de.sco@eu1.scopemail.me This email address is fixed and can not be changed! It includes the branch code, legal entity and the organization.

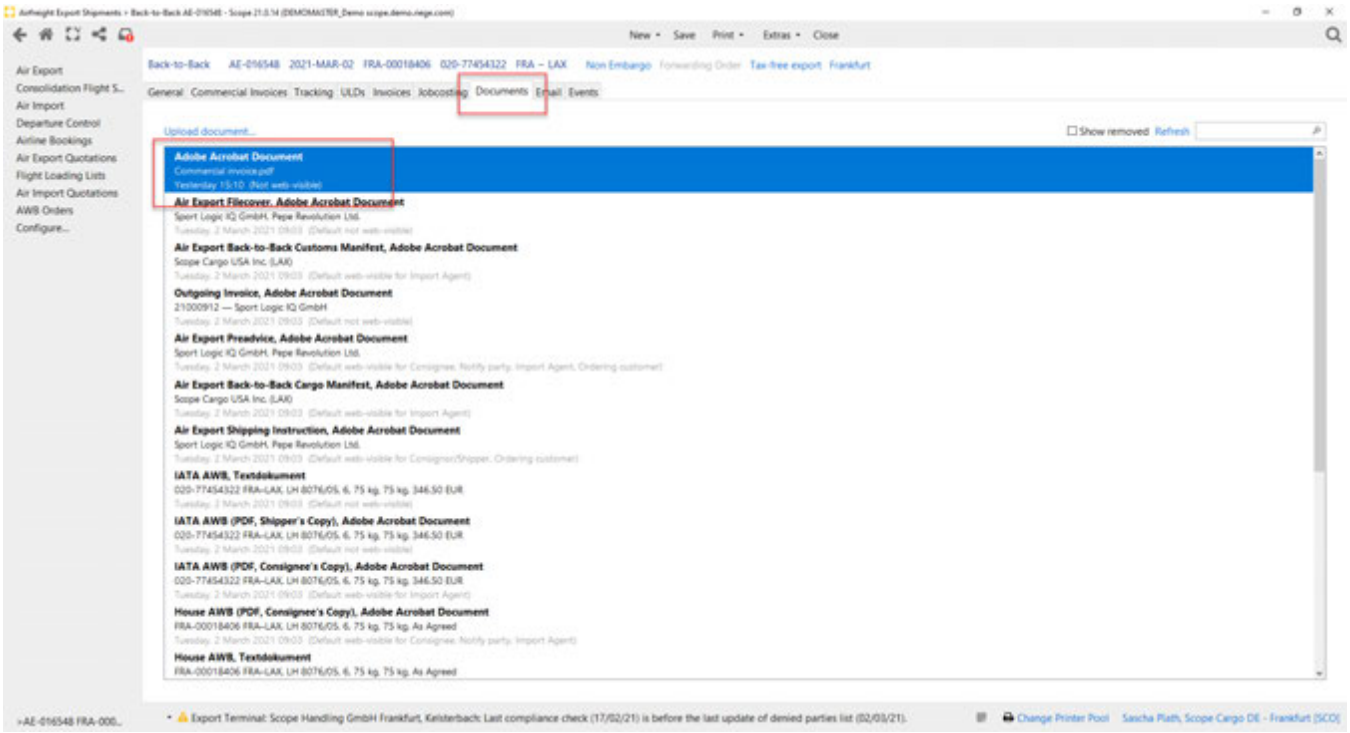
How to use it

Simply use this given email-address and forward your emails with any attachments to this address. Make sure, that **NO** external parties are copied in as well since you do not want to share the email-address and make people reply to your email, which will result in Scope as well then. To link the email to corresponding order or shipment, simply insert the corresponding reference (shipment number, AWB/BL number) in the subject. Scope will automatically attach the received email into tab "Emails"



and its attachments to "Documents":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

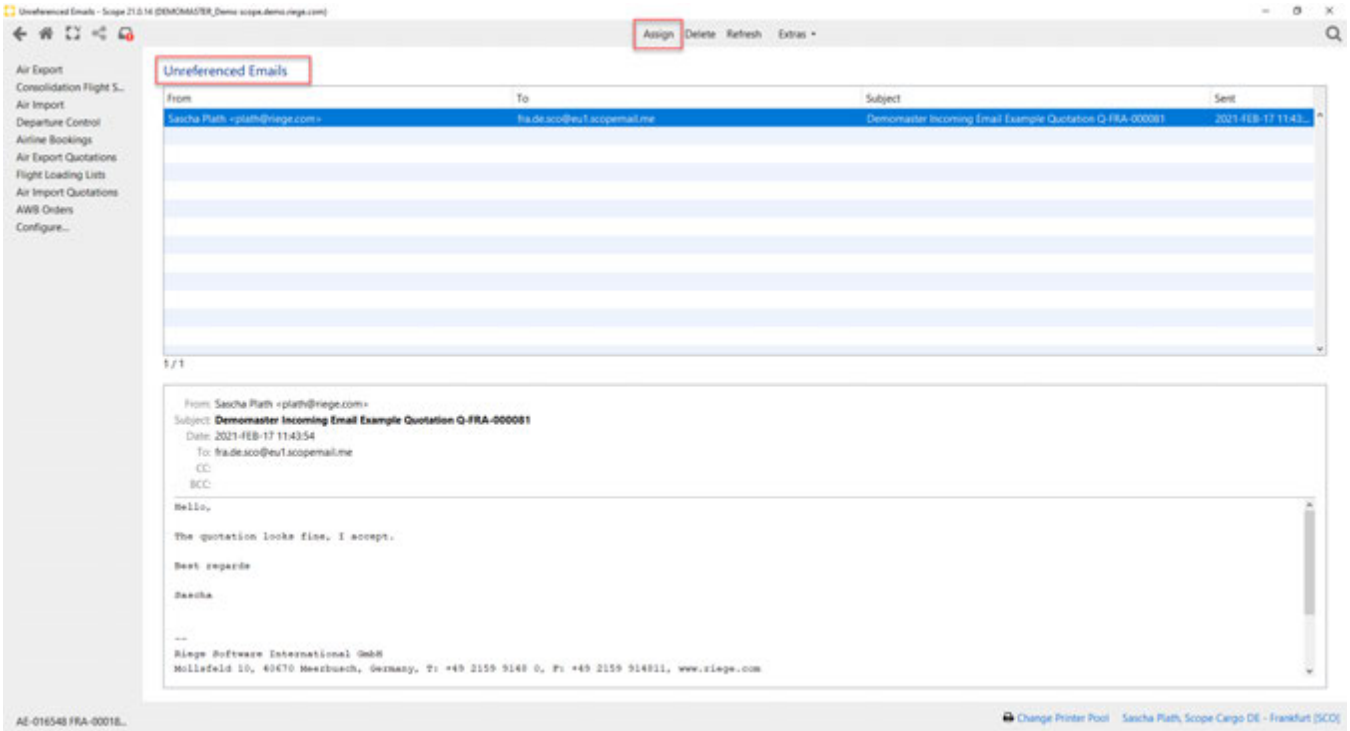


Attachments

Please note, that ANY attachment from the email will be uploaded to tab "documents". Since Scope can not verify each file, you might end up with attachments of your footer in tab "documents". You can manually delete the unnecessary files by marking the file and pressing the "Delete" button or you make sure, that only the corresponding documents are attached to your forwarded email without any problematic footer.

Unreferenced Emails

If the reference is not found, the email with its attachments will be uploaded to module "Unreferenced Emails":



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Here you can decide whether you want to Delete this email in Scope or Assign it to a corresponding shipment by pressing the button "Assign". If the email was sent to the wrong branch by accident, you have to delete the email in Scope and resent it to the correct email-address of the branch.

Via Extras "Subscribe" you can be notified of any new emails in this module.

Spam

In order to avoid any spam and unwanted emails in your Scope system, please follow the rules:

- Do not share this Scope email address with any external party
- Do not CC or BCC any external email receiver to your email forwarding to Scope
- Always make sure, that you do not publish the Scope email address by accident

How-To Forwarding

- How-To for Consignments and Forwarding Orders

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To for Consignments and Forwarding Orders

- What is a Consignment
- What is a Forwarding Order
- Creating Consignments
  - Navigating to Consignments
  - Entering a new consignment
  - The general details of the new consignment
  - The order lines of a consignment
    - Split the order lines of a consignment
  - Documents and Email
  - Consignment status
- Creating and forwarding order and adding consignments to forwarding orders
  - Navigating to forwarding orders
  - Entering the general details of the new forwarding order
  - Adding consignments to the forwarding order
  - Managing the goods from the consignments on the forwarding order
    - Adding a container to the forwarding order
  - Routing the forwarding order
    - Adding transport legs to a forwarding order
    - Changing the status of transport legs
    - Creating shipments from within a forwarding order
  - Tracking

What is a Consignment

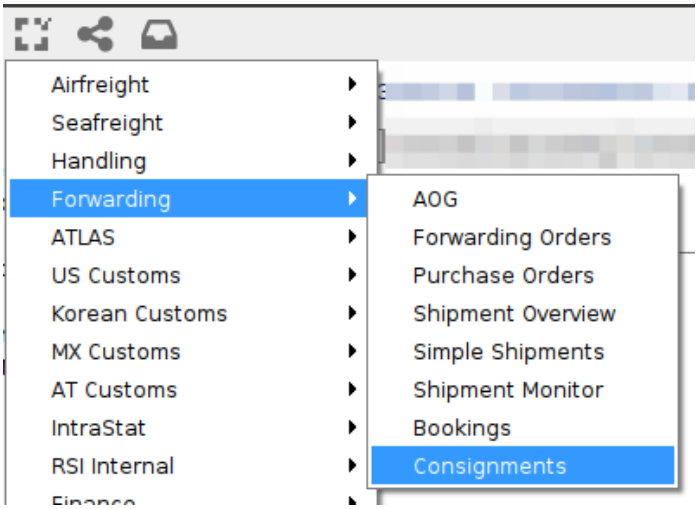
- A consignment is one or more goods consigned to an orderer.
- A consignment is associated with a P.O. Number or Multiple P.O. Numbers.
- Parties - A consignments has a customer (orderer) , a supplier and a consignee
- References - In addition to a P.O. Number, a consignment can have a supplier's reference and a consignee's reference
- Dates - Important dates for a consignment are the "Expected ready date", the "Confirmed ready date" and the "Requested delivery date"
- Transport details - within a consignment are the place of receipt, delivery and basic transport details
- Order Lines - a consignment can have one or more order lines. Each order line describes the item in detail

What is a Forwarding Order

- A forwarding order groups together one or more customer consignments
- Parties - A forwarding order has a customer (orderer) , a supplier and a consignee.
- References - In addition to a P.O. Number, a forwarding order can have a supplier's reference and a consignee's reference
- Dates - Important dates for a forwarding order are the "Expected ready date", the "Confirmed ready date" and the "Requested delivery date"
- Goods - a forwarding, order displays all the goods from all the customer consignments and allows these to be grouped in containers for example
- Routing - a forwarding order can capture the transport legs required to get the consignments from place of receipt to final delivery
- Tracking - a forwarding order provides a tracking view of the transportation.

Creating Consignments

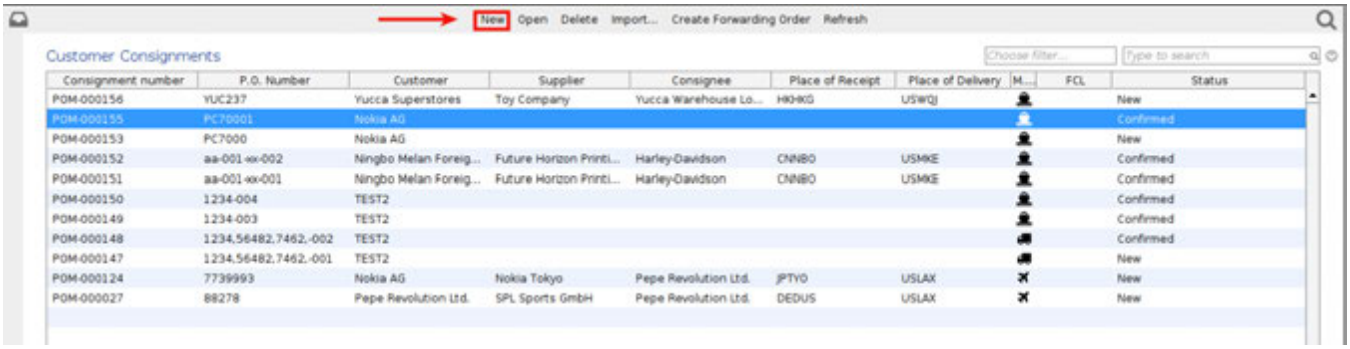
Navigating to Consignments



Entering a new consignment

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

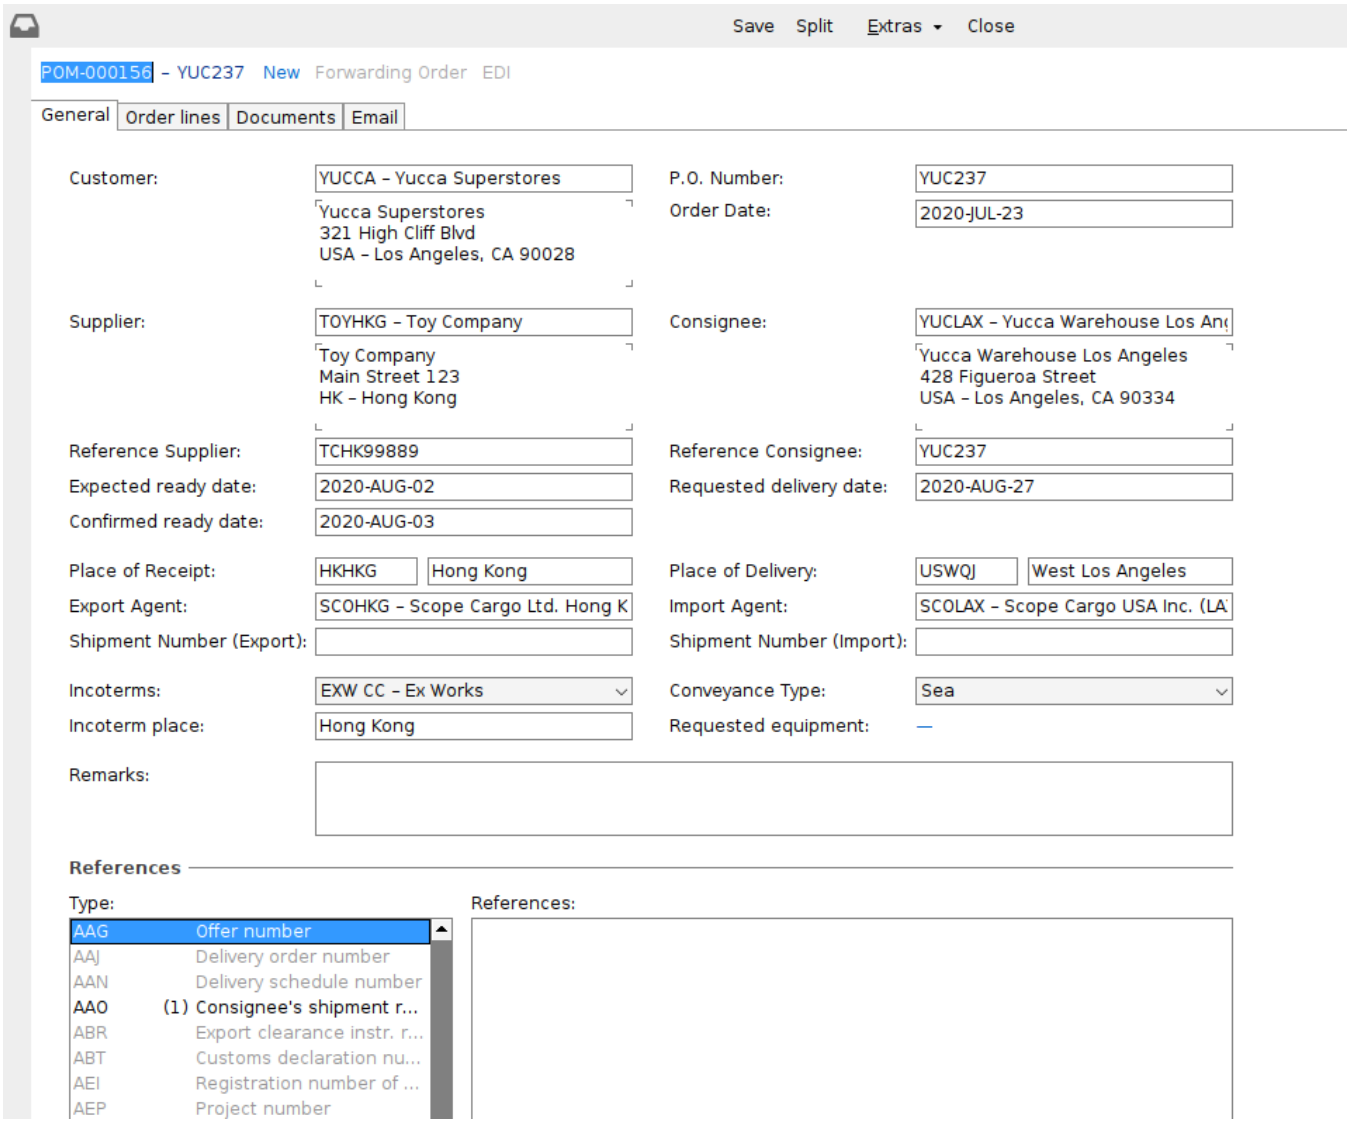
In the overview of existing consignments, choose the "New" option from the tool bar at the top



Note that consignments can also be created as spreadsheets and these spreadsheets can be imported into Scope to automatically created consignments. The save re-keying data into Scope.

The general details of the new consignment

As shown by the screenshot below of a new consignment, the fields for the general tab of the new consignment are self-explanatory.

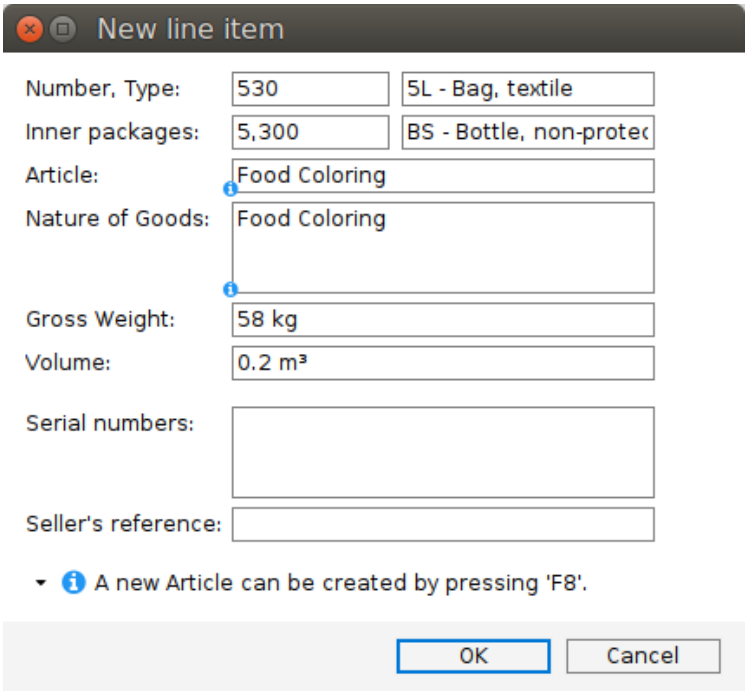


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The order lines of a consignment

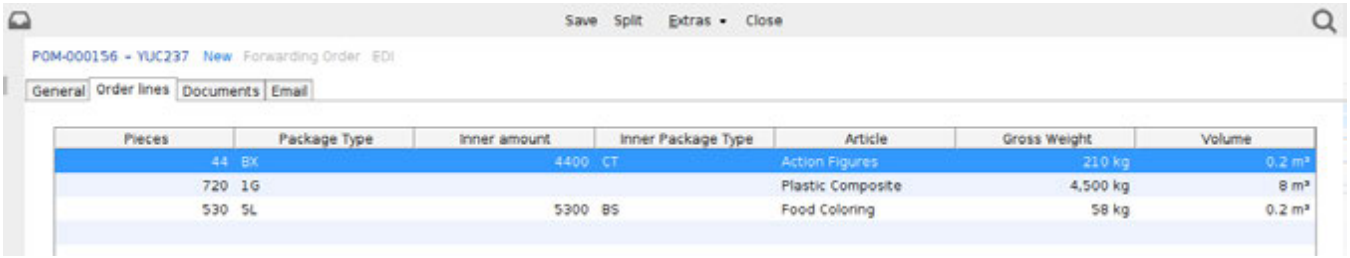
Once the general tab of the new consignment is completed, click the "Order lines" tab and choose the "New" option at the bottom of the screen

The "New line item" editor will appear the the details about the item can be entered



The blue information icon  in the "Article" field indicates that by pressing F8, the article can be saved. When an article is "Saved" it can be assigned to the "Customer", "Shipper" or "Consignee". The article can then be easily recalled for the next consignment on which it occurs. In addition, within article maintenance, extensive further details can be added about the article.

Click "OK" when all the information about the article is complete and the new article will appear in the list of articles in the consignment

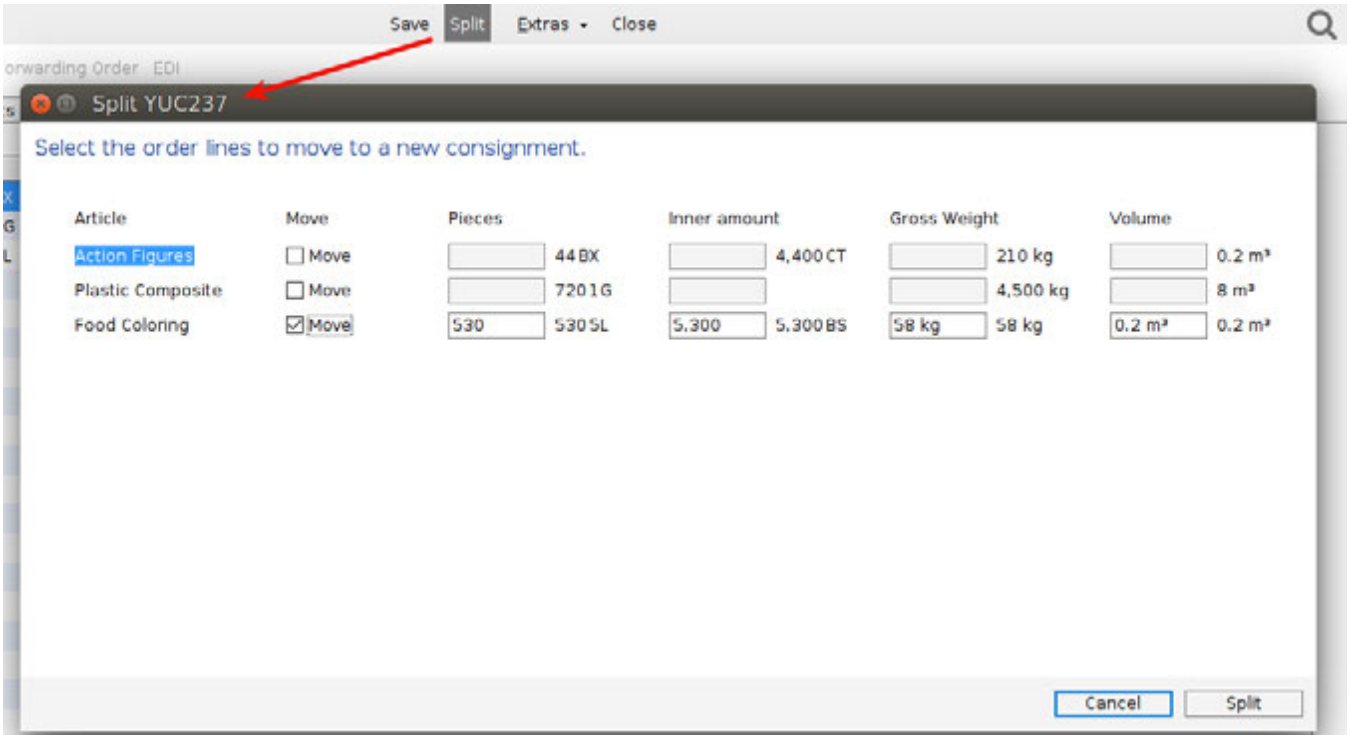


The "Edit", "Delete" and "Delete All" options at the bottom of the screen can be use to further manage order lines. Note that order lines can also be imported from CSV files.

Split the order lines of a consignment

Sometimes articles may have to be removed from a consignment and shifted to a different consignment, this can happen when for example there are delays in manufacturing an article. USe the "Split" option from the toolbar at the top to perform this action:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When "Split" is clicked' a new consignment will automatically be created for the split goods.

Documents and Email

Documents like pdf purchase orders for the consignment can be stored in the documents tab and the email function can be used to communicate updates about the consignment to the parties.

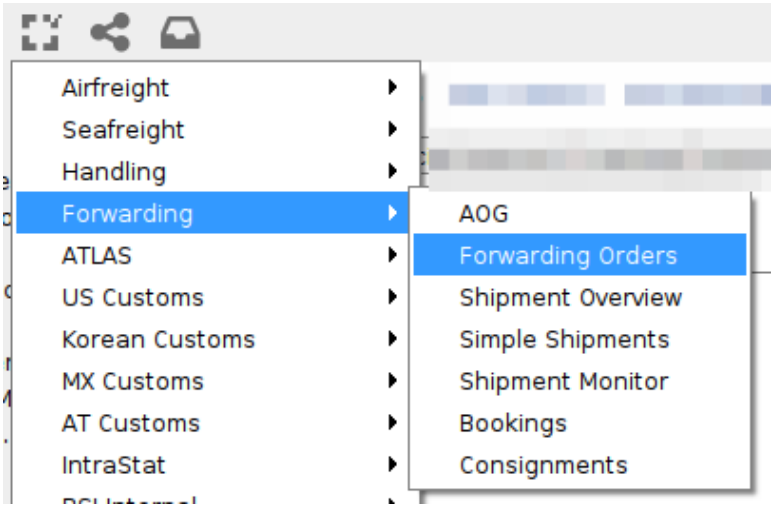
Consignment status

On saving the consignment, a consignment number like "POM-000156" seen in the above example will be issued to the consignment. The status "New" will also be the initial status given to the consignment.

Creating and forwarding order and adding consignments to forwarding orders

Navigating to forwarding orders

To get to the overview of forwarding orders :

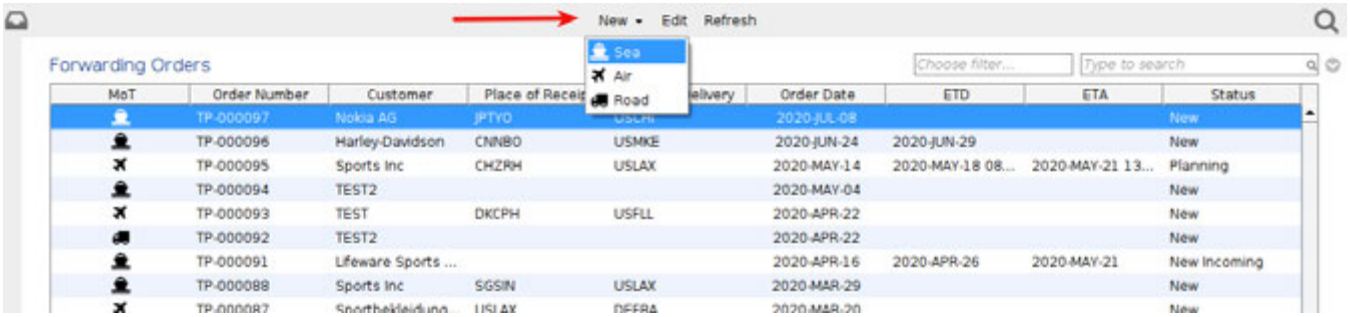


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

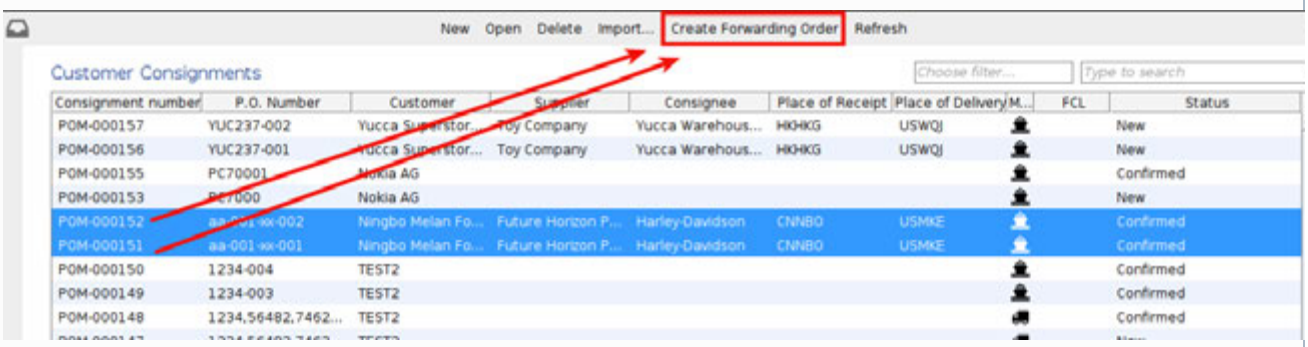
Entering the general details of the new forwarding order

In the overview of forwarding orders, choose "New" from the tool bar at the top and then choose the type of forwarding order to be created

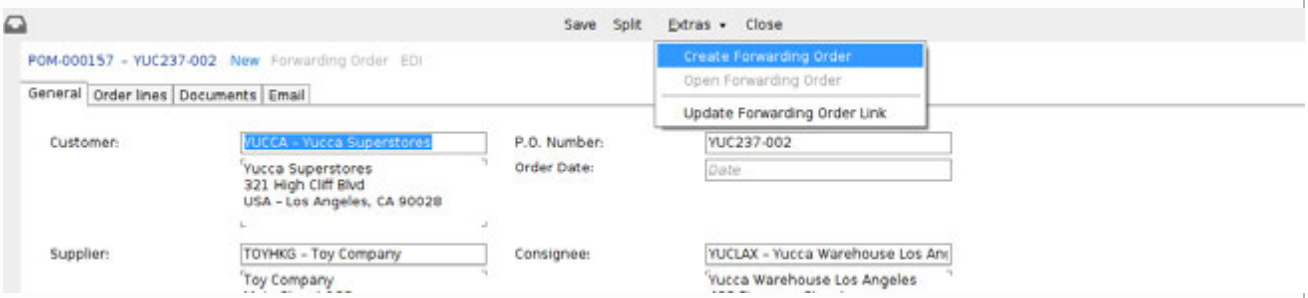
- Sea
- Air
- Road



Note that it is also possible to make a new Forwarding Order in the overview of consignments. This allows multiple consignments to be selected in the overview, them choose "Create Forwarding Order" from the tool bar at the top of the consignment overview and the highlighted consignments will automatically be added to the new forwarding order.

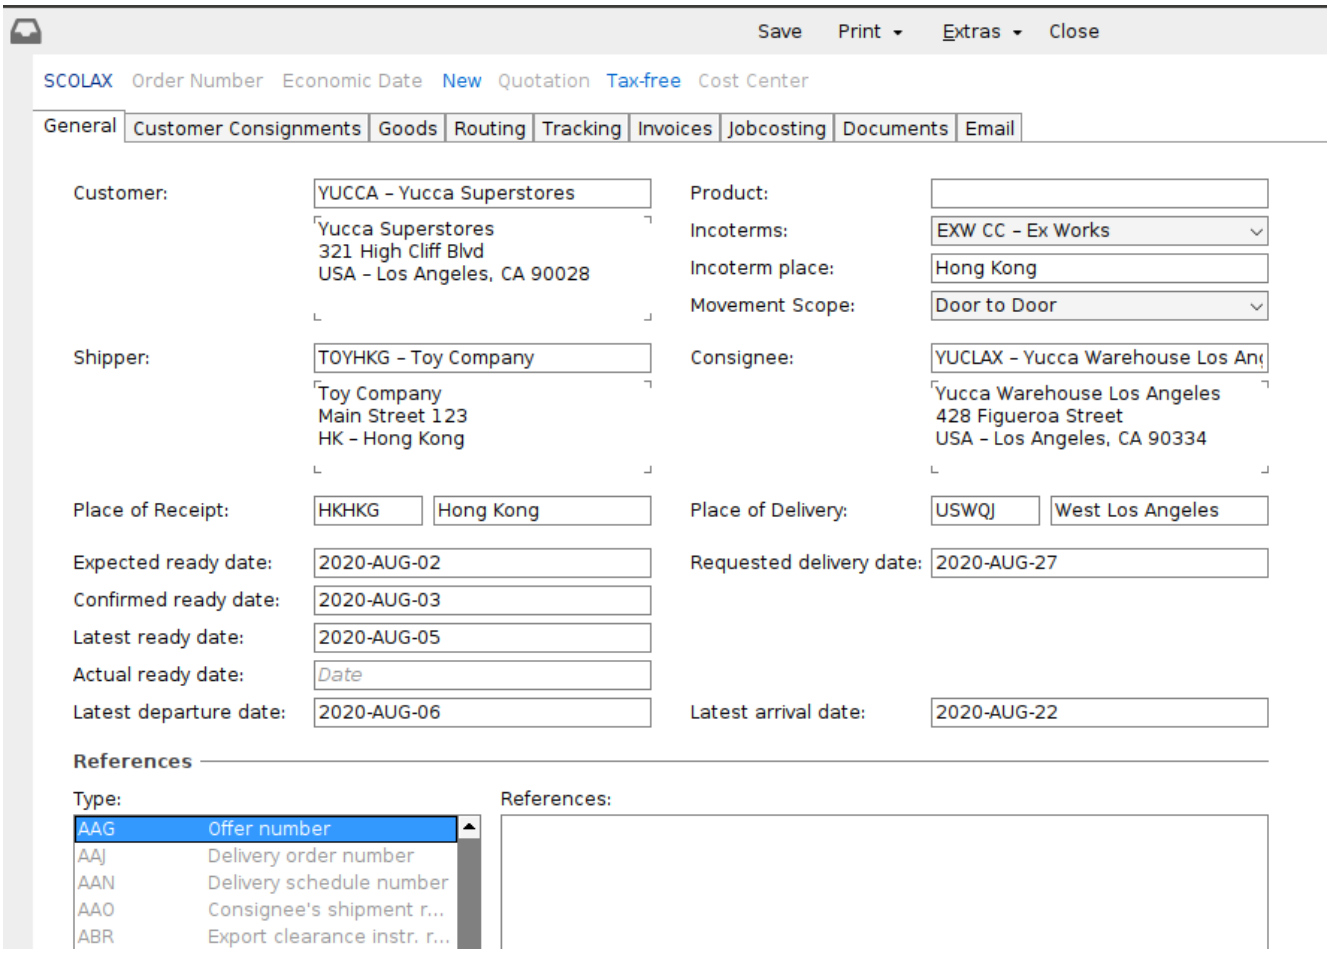


A further way to create a new forwarding order is by opening a consignment and choosing the "Extras" menu. In this menu choose "Create forwarding order" and the opened consignment will be automatically added to the new forwarding order:



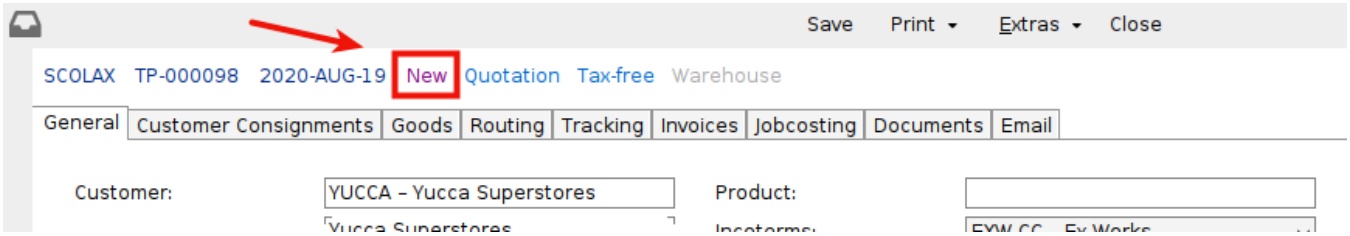
It is probable that the details of the forwarding order on the general tab, will be very similar to the details on the general tab of any consignments that will be added to the forwarding order:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Changing the overall status of the forwarding order

When the forwarding order is created, the status is "New" and this is shown at the top of the forwarding order



As the order progresses, the status can be updated by clicking the current status and selecting the "Change status" option. A status selector will appear and the following status' can be set

- New Incoming
- Planning
- Confirmed
- Booked
- Rejected
- Execution
- Post Execution
- Complete
- Cancelled

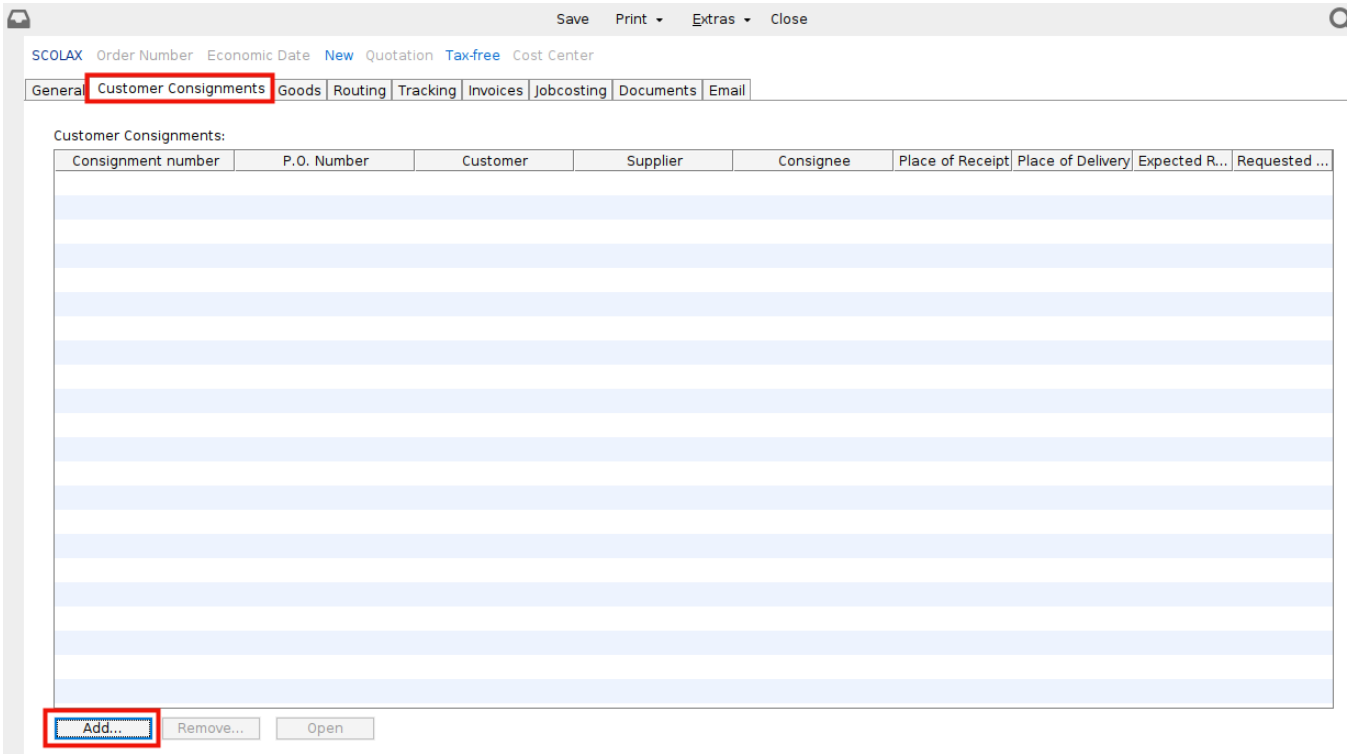
Note that a forwarding order may also have multiple transport legs and as described below, each transport leg can also have a status.

Adding consignments to the forwarding order

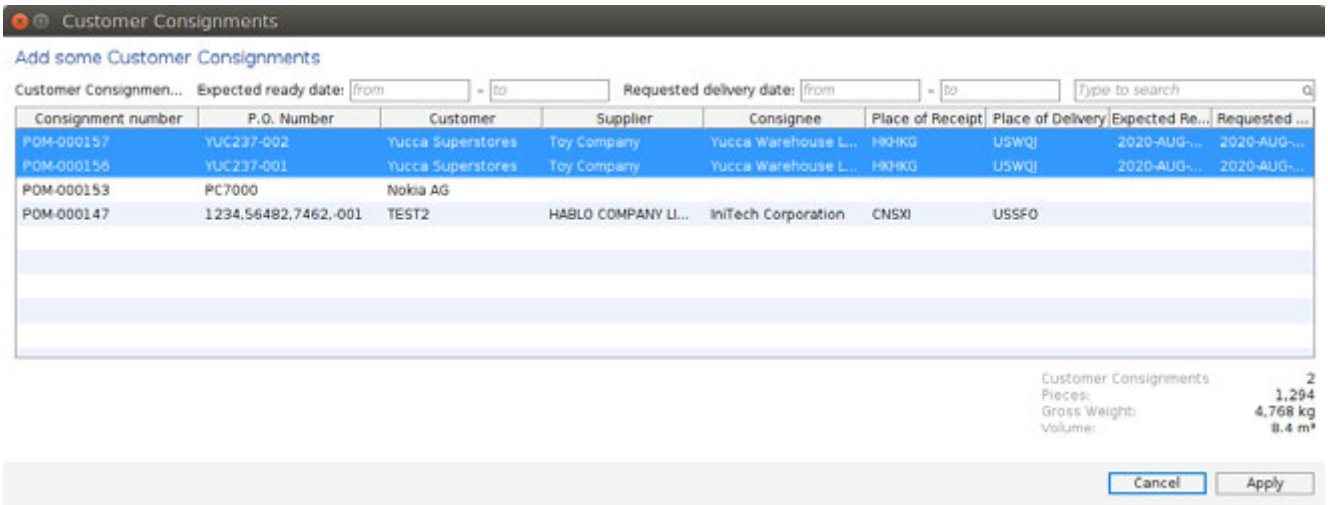
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Once the general details have been added to the forwarding order, click on the "Customer Consignments" tab to apply consignments to the forwarding order.

Click "Add" at the bottom of the overview of customer consignments



A window will appear the displays all the consignments with "New" status that are available to be added to the forwarding order. Highlight the consignments to be added and click "Apply":

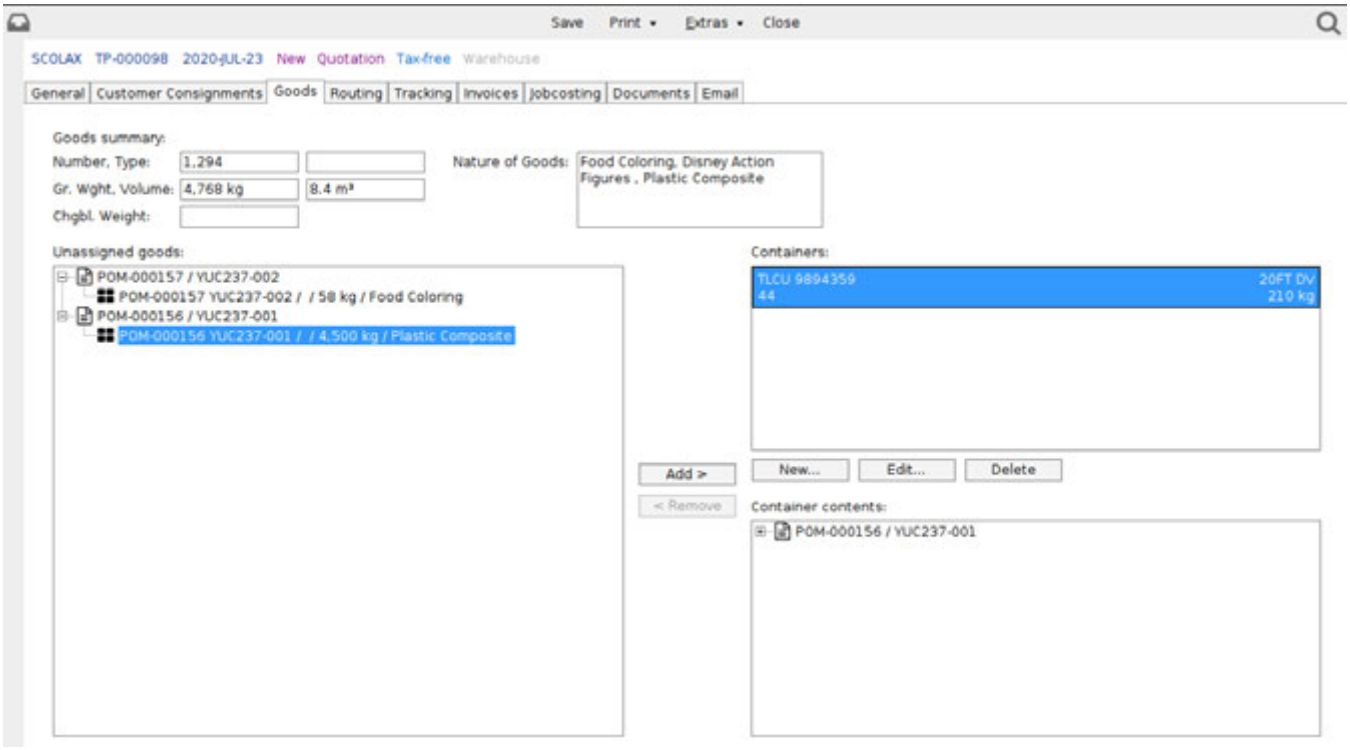


Managing the goods from the consignments on the forwarding order

Once consignments have been added to a forwarding order the goods from the consignment will automatically appear in the "Goods" tab of the forwarding order. In the case of a seafreight forwarding order, containers can be added and the goods can be applied to containers.

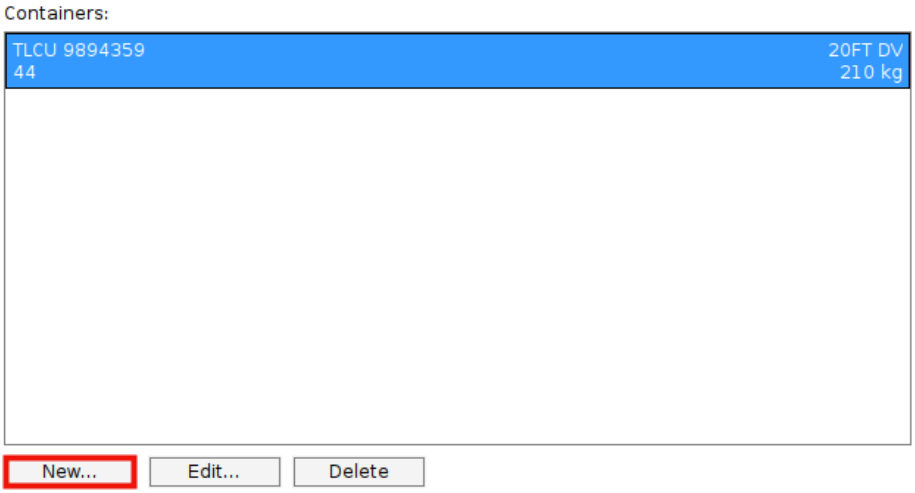
> Note that goods can only be applied to containers once the forwarding order has been saved. This will also apply a forwarding order ID and set the initial status which is "New"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



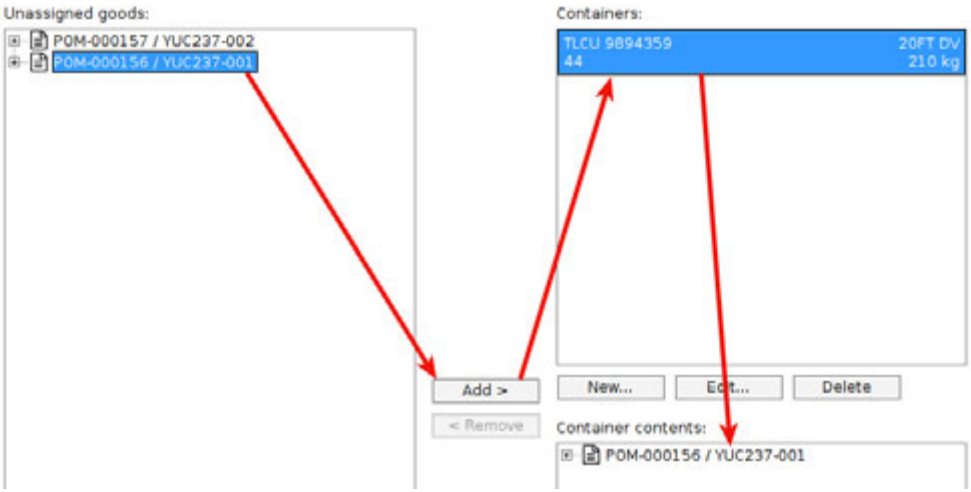
Adding a container to the forwarding order

Once the forwarding order has been saved and the goods appear in the goods tab, use the "New button" to add one or more containers to the forwarding order



When containers have been added, the "Add" button between the unassigned goods and the containers can be used to add goods to a selected container. As containers are highlighted, the goods they contain will appear in the "Container contents" window below the containers.

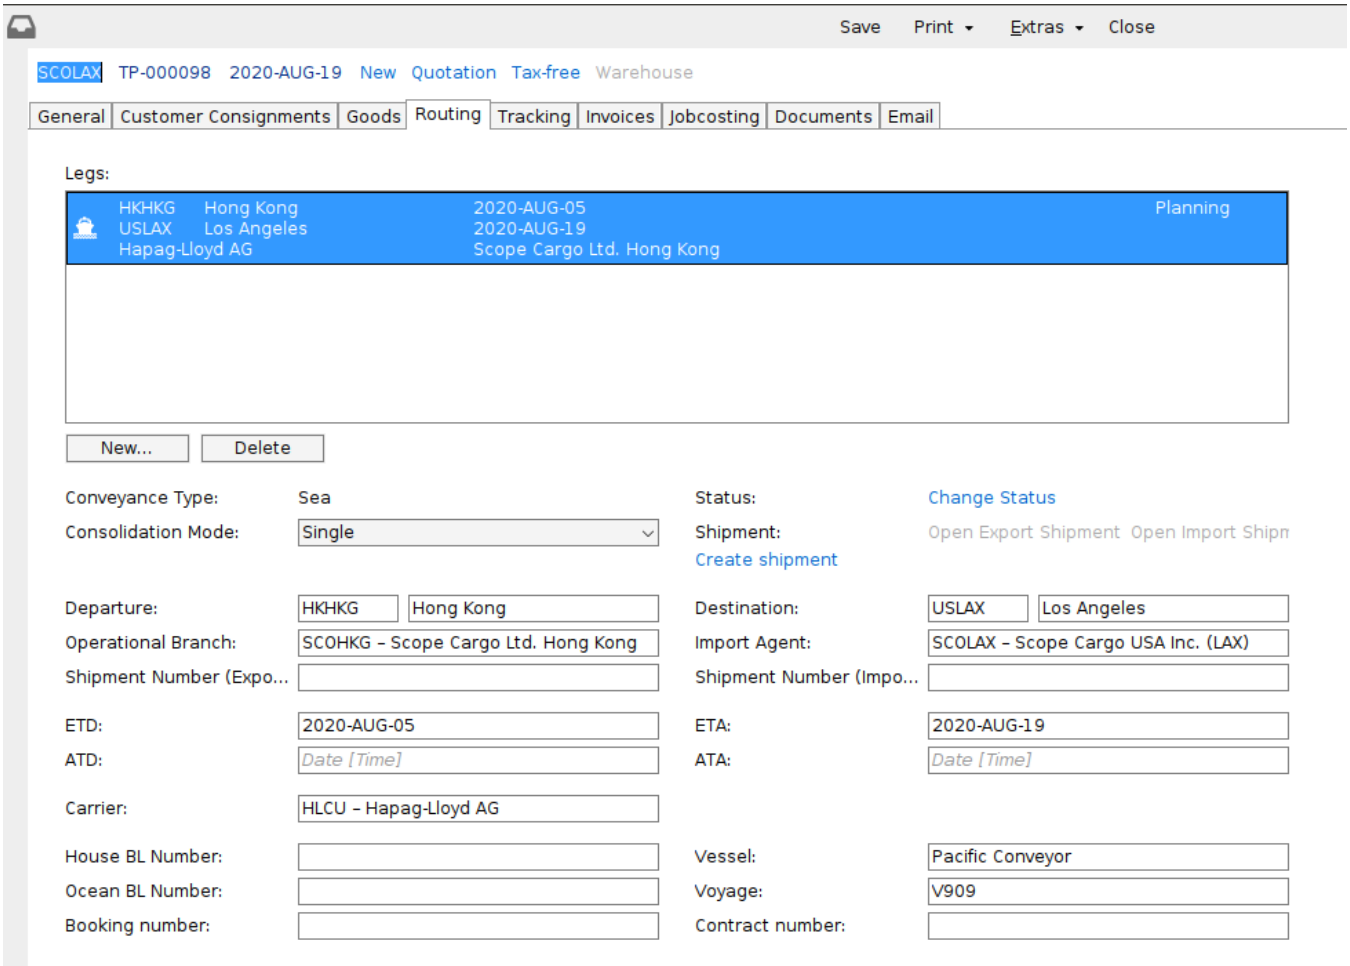
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Routing the forwarding order

The general tab has very basic details about the movement of the forwarding order, such as where it originates from and where it is going to, together with the dates that help plan this movement. The "Routing" tab of the forwarding order is used to plan and record all the transport legs required to move the cargo from place of receipt to final destination. In addition the actual export and import shipments can be created from within this tab.

In the example below, just the details of the planned main carriage from Hong Kong to Los Angeles have been entered

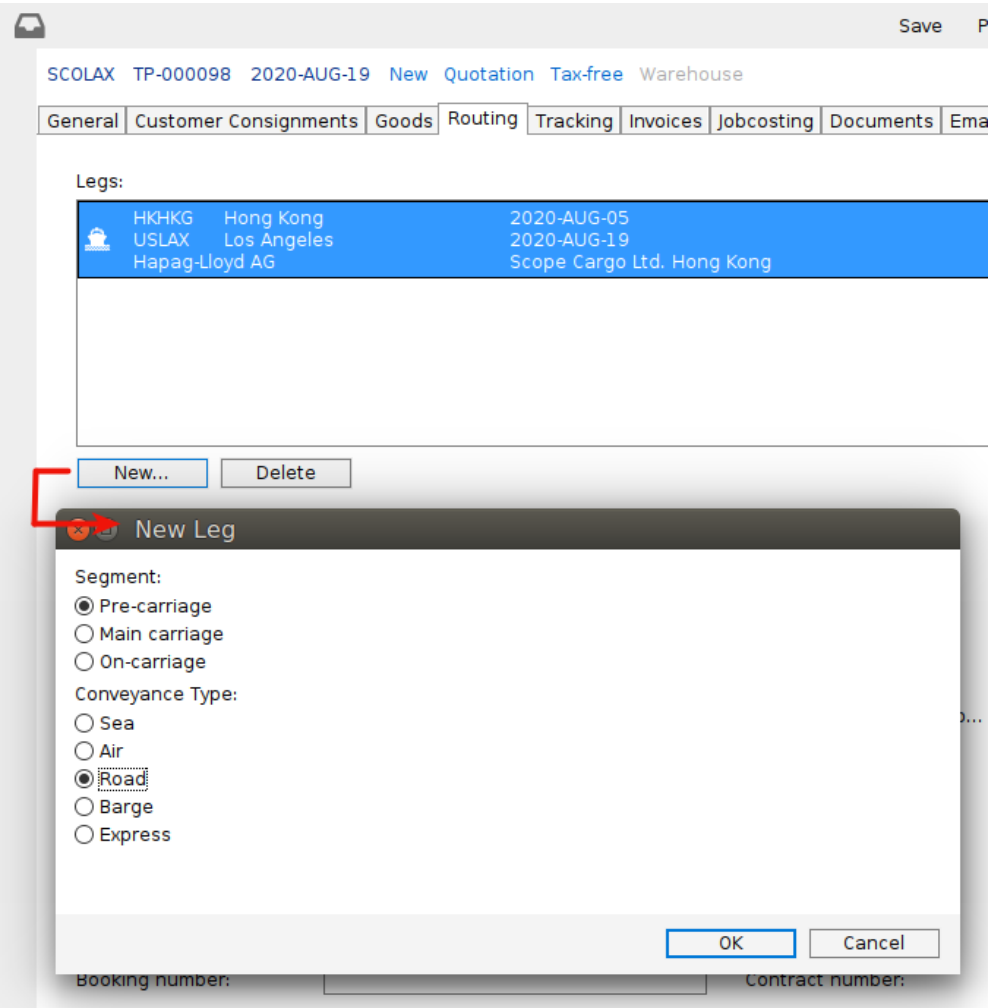


Adding transport legs to a forwarding order

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the example above only the main carriage for the forwarding order is present, but the pre-carriage and on-carriage can also be entered.

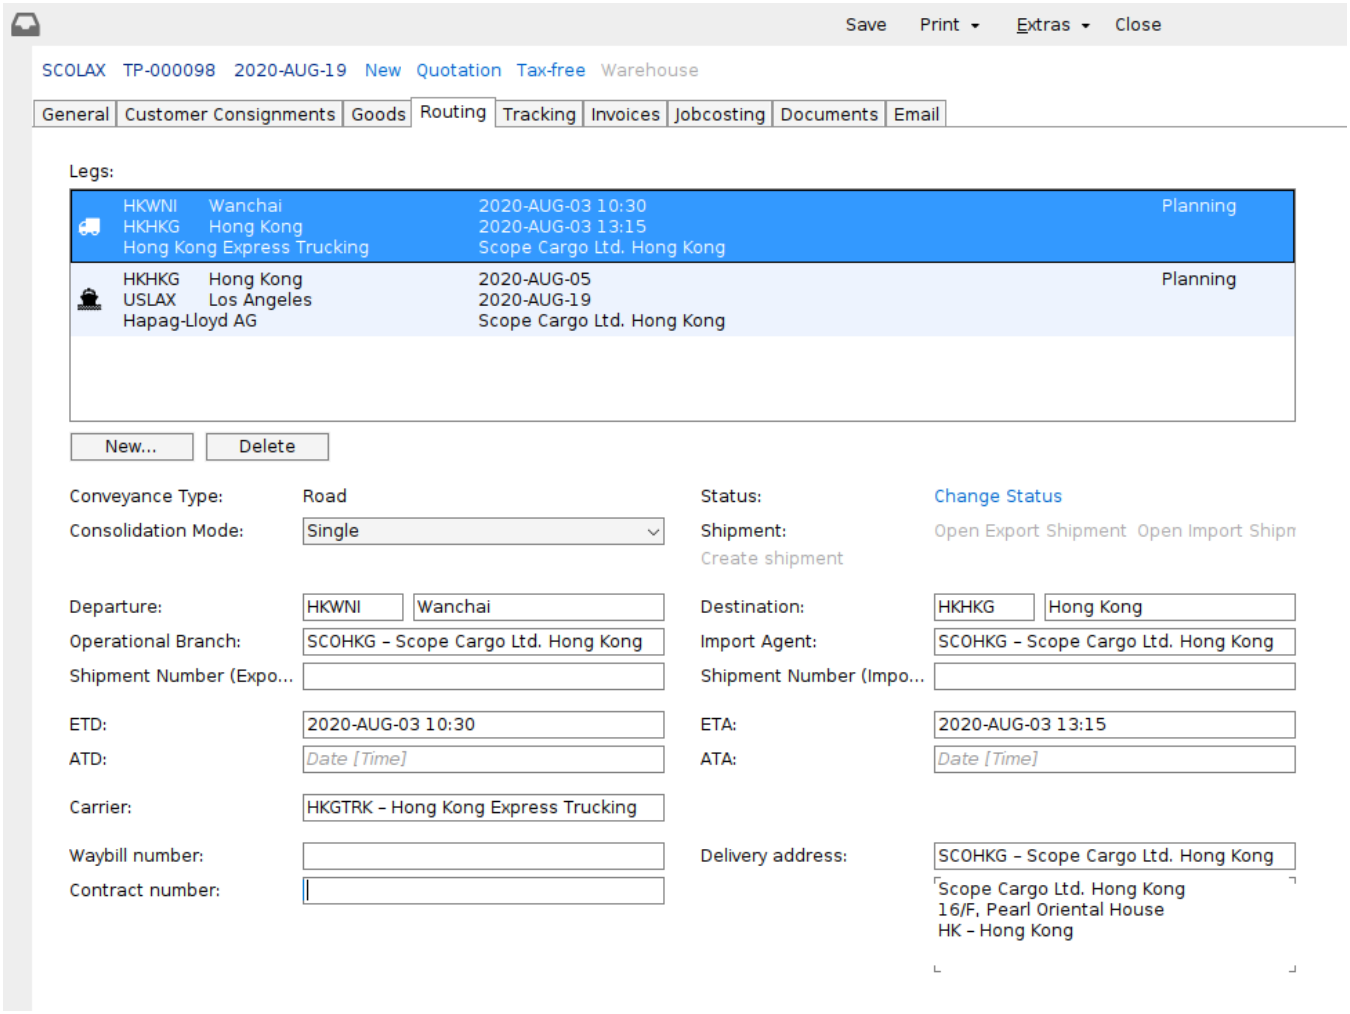
Use the "New" button below the window showing the legs of the forwarding order to add a new leg.



In the "New Leg" pop-up, choose the kind of segment and the conveyance type. In this example the segment is "Pre-carriage" and the conveyance type is "Road"

Now the full details about this pre-carriage leg can be entered and will appear as the first leg in the list of transport legs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



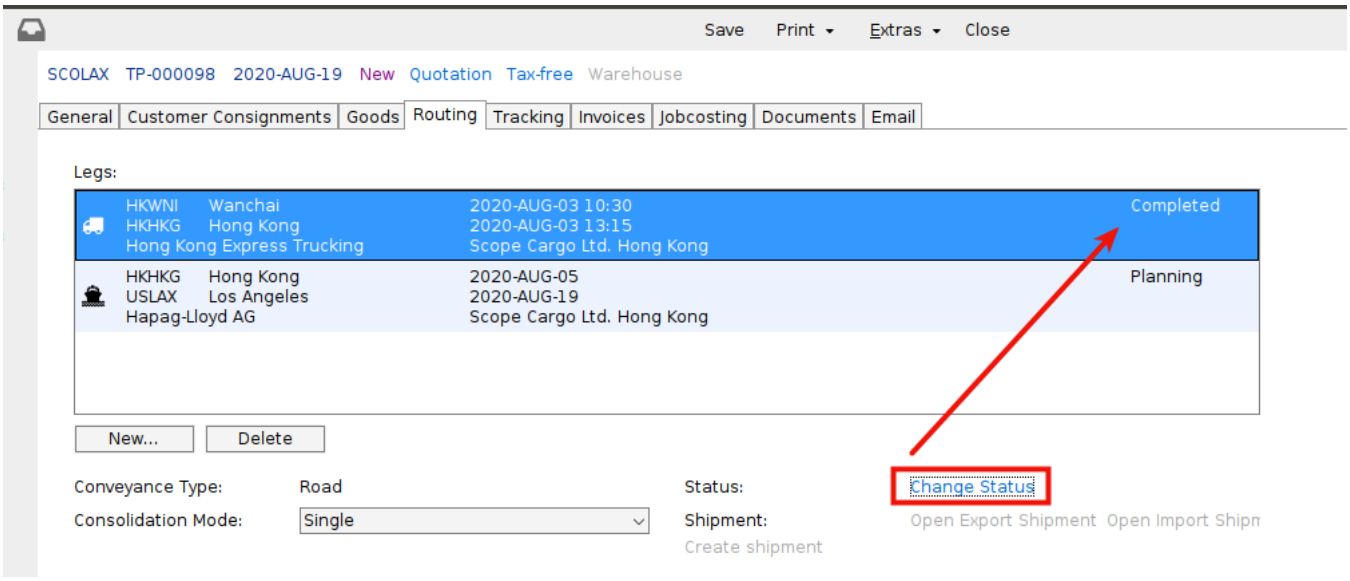
Changing the status of transport legs

Each transport leg can have its own status

- Planning
- Confirmed
- Rejected
- Booked
- Transport
- Completed

To change the status, highlight the leg where the status change will occur and then click the blue "Change Status" below the "Legs" window

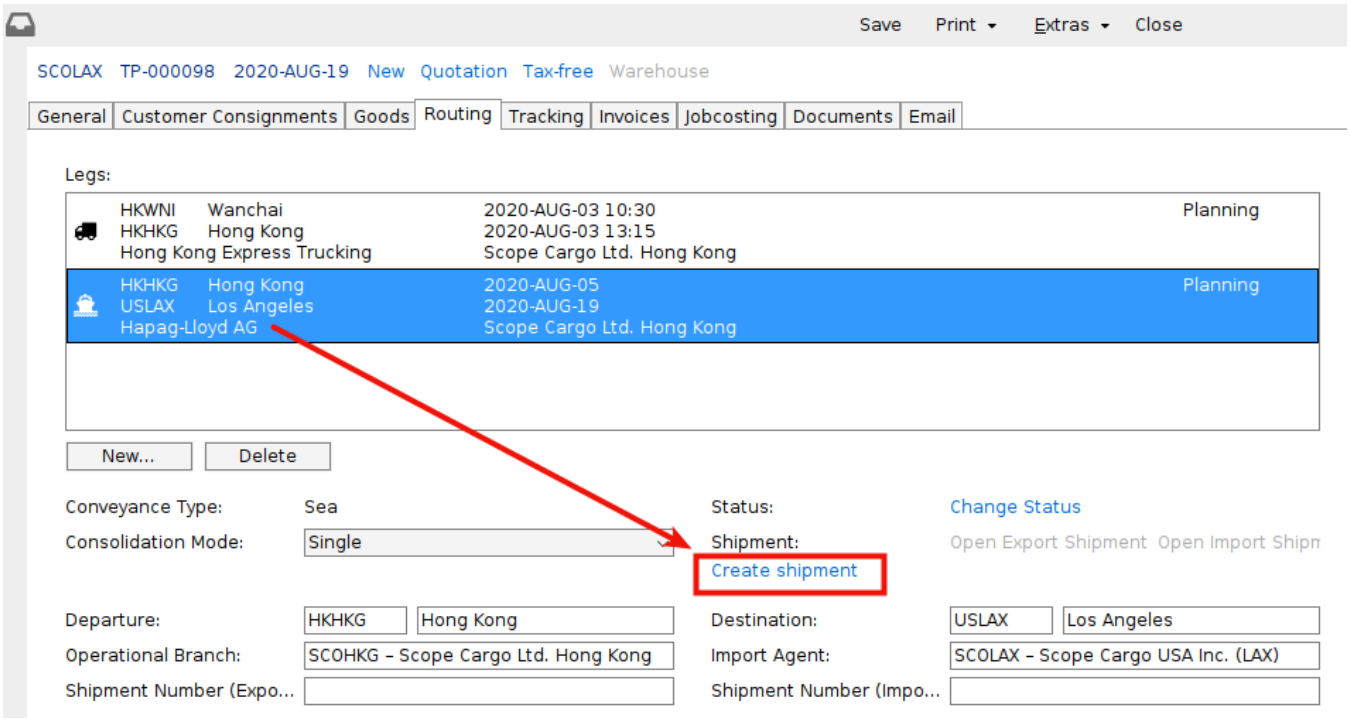
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Creating shipments from within a forwarding order

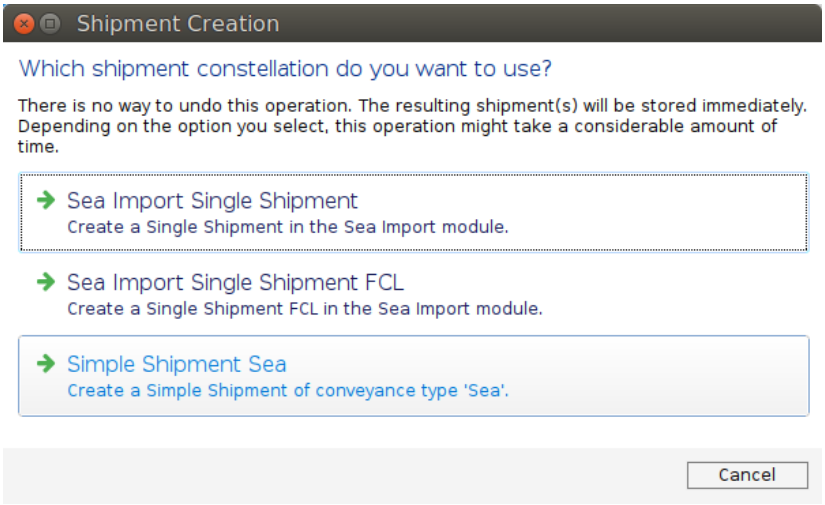
As the forwarding order progresses, it will become necessary to create the shipments for the forwarding order, for example, when the goods are ready to be picked up by the branch arranging the export of the order, a sea export shipment will need to be created in order to produce the documentation required by the customer and the shipping line. A pickup order will also have to be created from within the sea export shipment.

In the example below, the import branch has taken over processing of the forwarding order and needs to create a sea import shipment. This is done by highlighting the main transport leg of the forwarding order and then clicking "Create shipment"

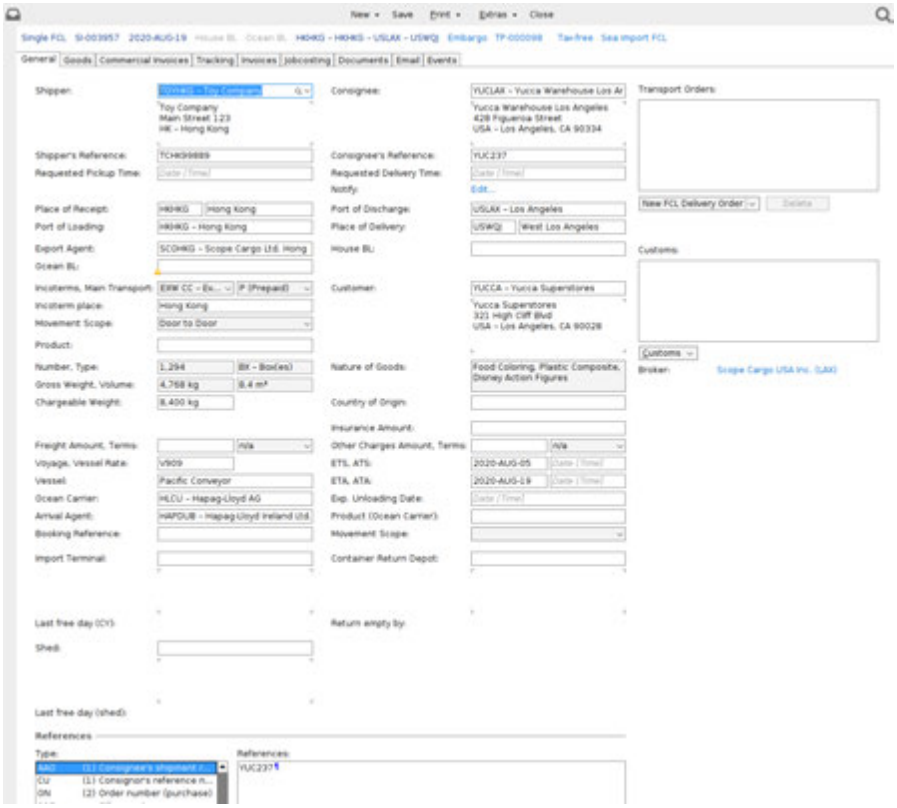


A shipment dialog will appear when the desired type of shipment can be created

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



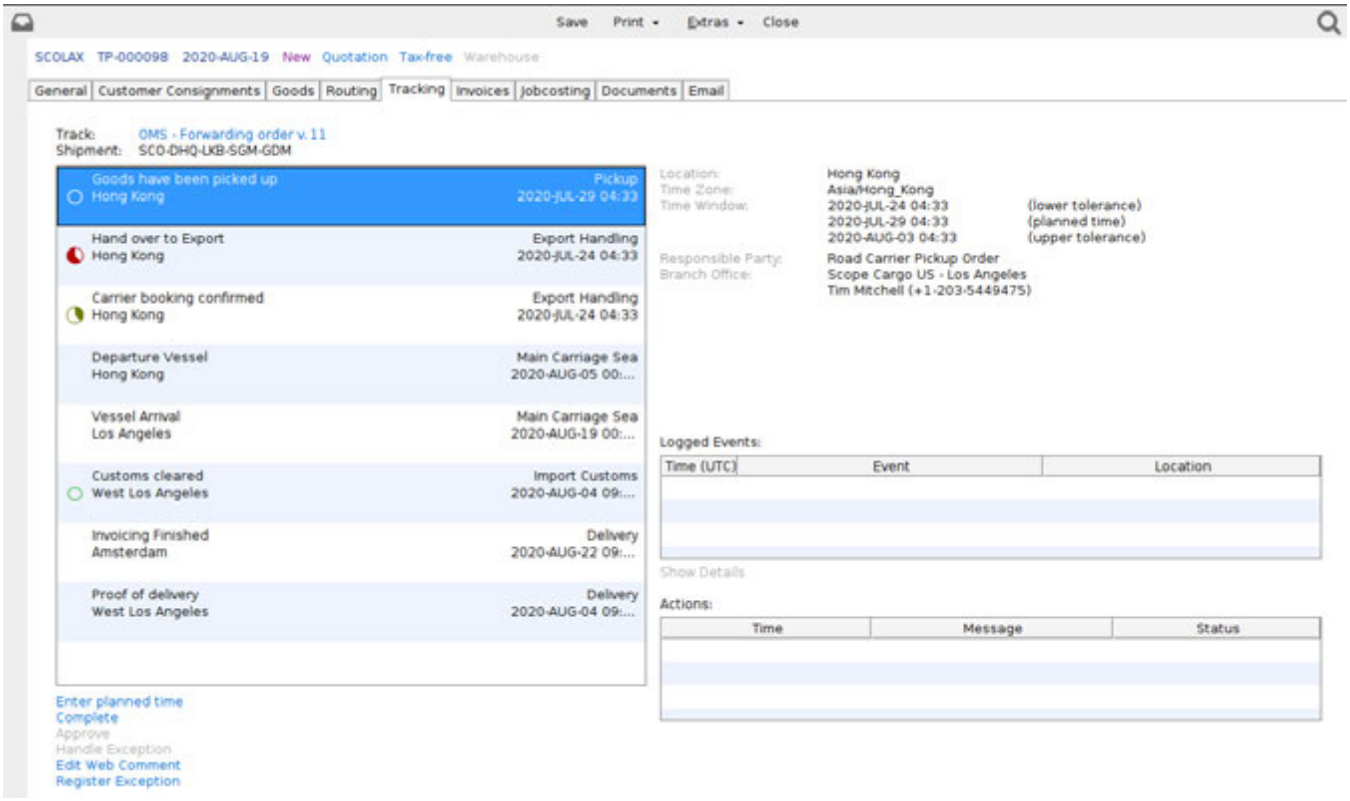
On selecting a shipment type, all the relevant details from the forwarding order will flow into the new shipment which can then be completed in the normal manner



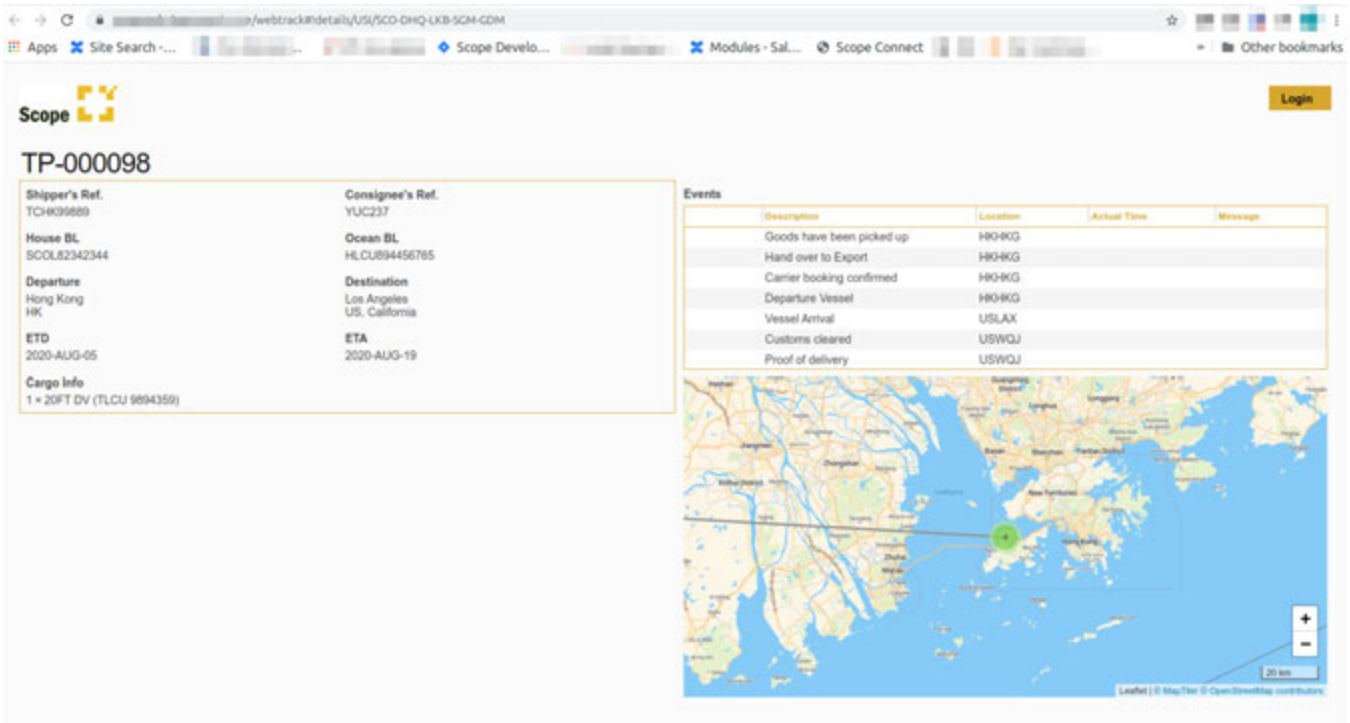
Tracking

Tracking plans can be created for forwarding orders and these are applied automatically on the "Tracking' Tab of the forwarding order. The tracking will show the milestones that occur and are completed in the course of the life-cycle of the forwarding order

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Tracking details are also visible to all partners in the forwarding order using Scope Connect



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Handling

- How-To Create Truck Dispositions
- How-To Handling - Arriving and Delivering

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Create Truck Dispositions

- Maintenance - Route Template
  - Navigating to Route Template Maintenance
  - Creating a new Route Template
- Working with the Truck Disposition Module
  - Navigating to the Truck Disposition Module
  - Creating a new Truck Disposition
  - Printing the Truck Dispo

A Truck Disposition is where a truck will make one or more pickups of cargo followed by stops at one or more addresses where the cargoes will be delivered. At the end of the process a transport order is produced for the trucker detailing these pickups and deliveries, the goods and some shipment details

Maintenance - Route Template

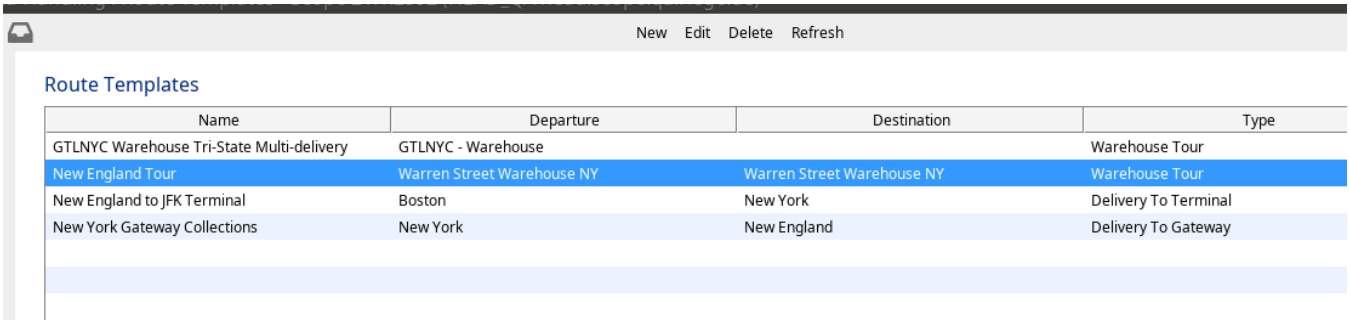
In order to create a Truck Disposition, at lease one Route Template must exist.

Navigating to Route Template Maintenance

Create a Route Template by clicking on "Master Data" , then "Handling" and finally "Route Template"

Creating a new Route Template

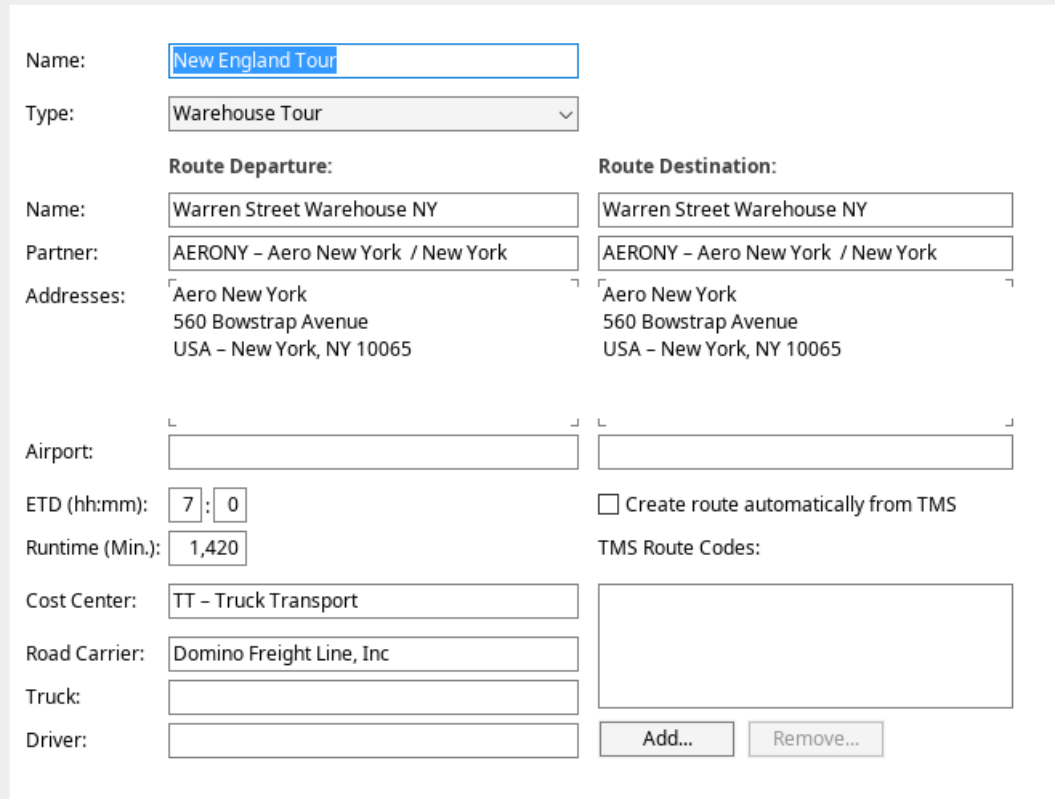
The overview of Route Templates will display any existing Route Templates. To make a new one, click "New" at the top of the overview



A route template assume the delivery route will re-occur regulary, but it can be made very specific by filling in many of the fields, or for a very general route simple minimize the number of fields entered.

In the example below, this route is called "New England Tour" and is for the Trucker "Domino Freight Line", it starts from a warehouse in New York City and then returns to that same warehouse.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Now that we have our Route Template, we can make a truck disposition

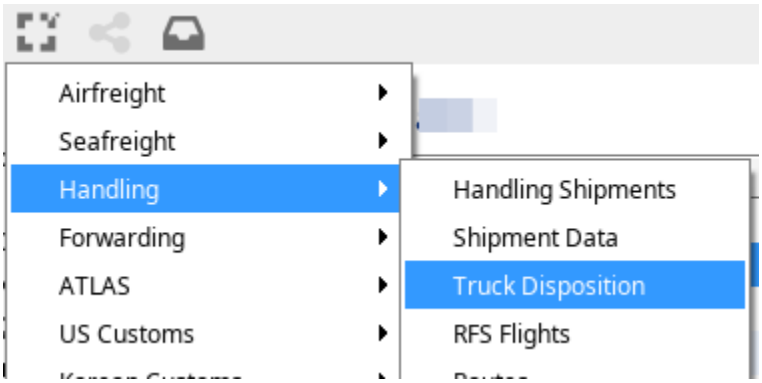
Working with the Truck Disposition Module

In order for a delivery or pickup order to be included in a Truck Disposition, be sure to create and print the delivery or pickup order in the shipment in the normal way.

Now we can open the Truck Disposition module

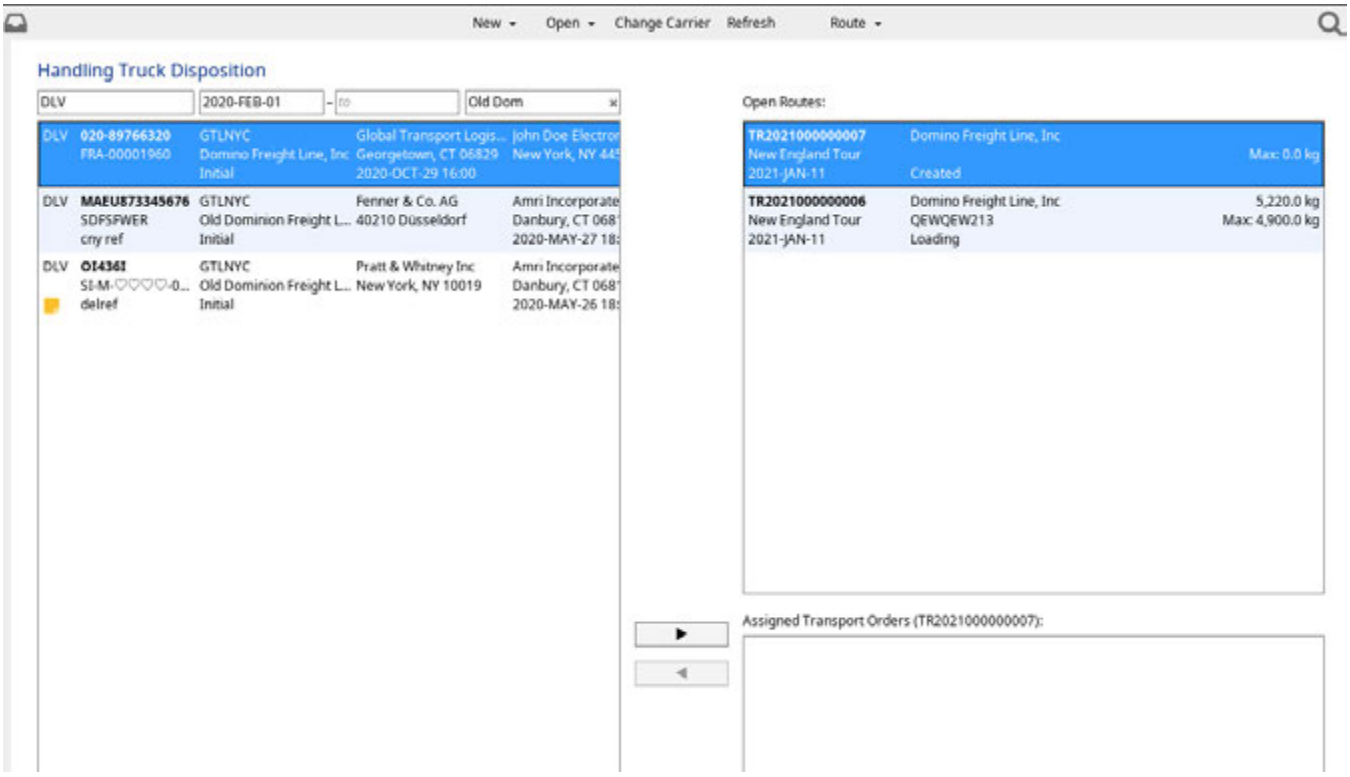
Navigating to the Truck Disposition Module

In the main Scope menu, click on "Handling" and then "Truck Disposition"



The overview of Truck Dispositions will open:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

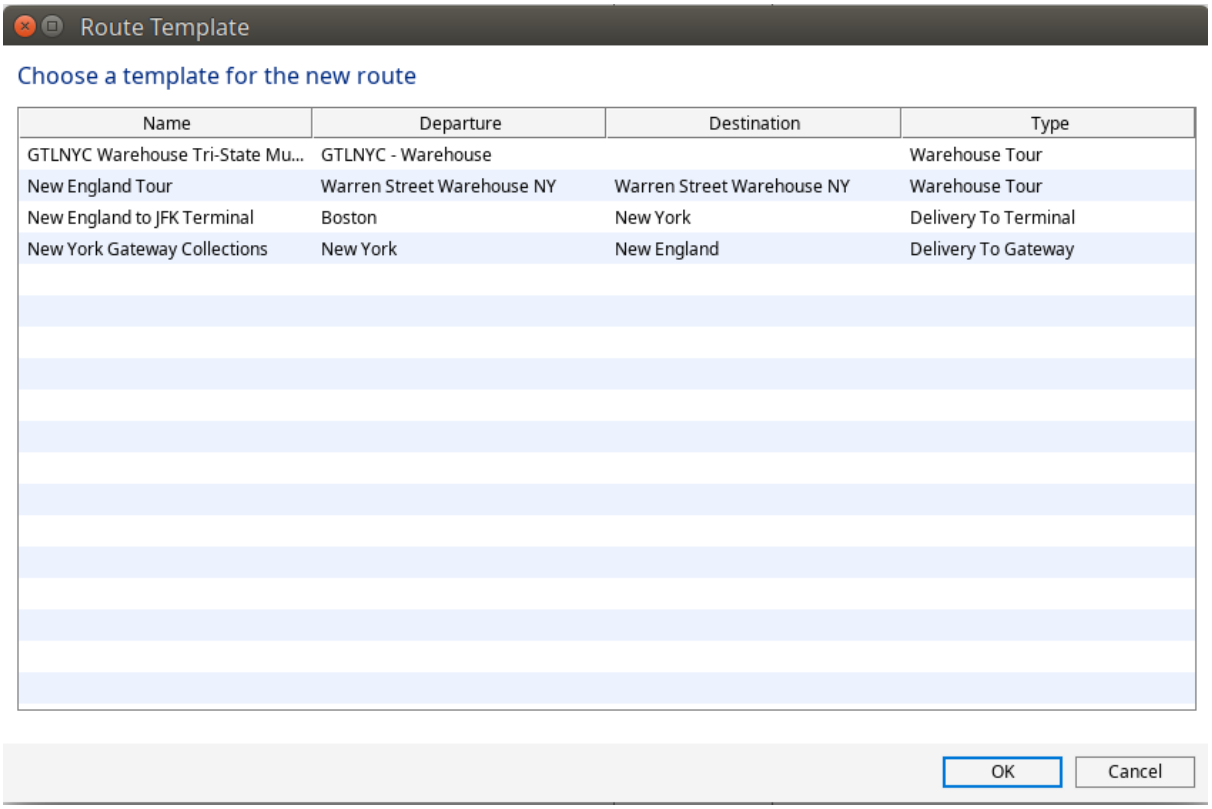


In this example, a a filter at the top has been applied so that in the left-hand window we see only delivery orders (DLV) created for any shipment since February 1st 2020 and where the trucker is "Old Dominion Freight"

Creating a new Truck Disposition

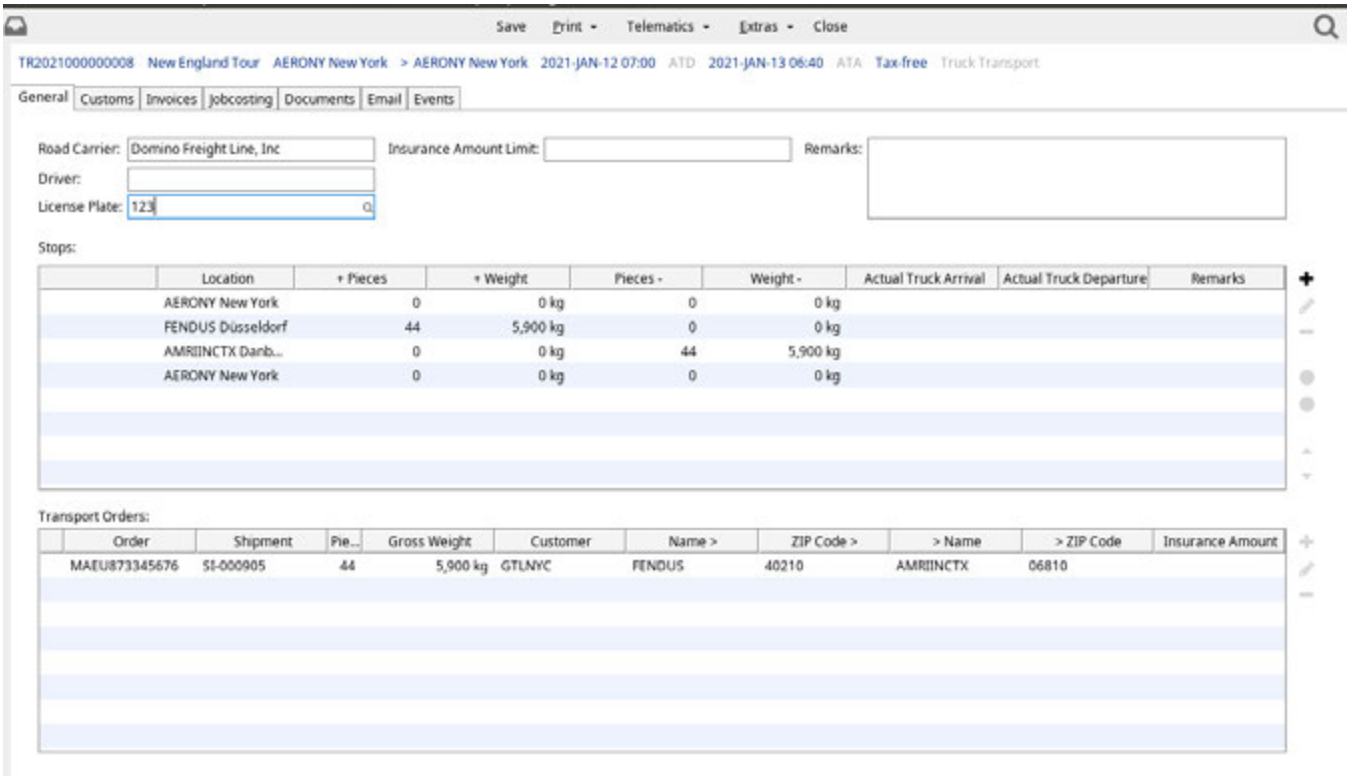
In the Truck Disposition overview, click "New" at the top and then select "Route".

A Route Template selection window will appear where we can select our "New England Tour" template:



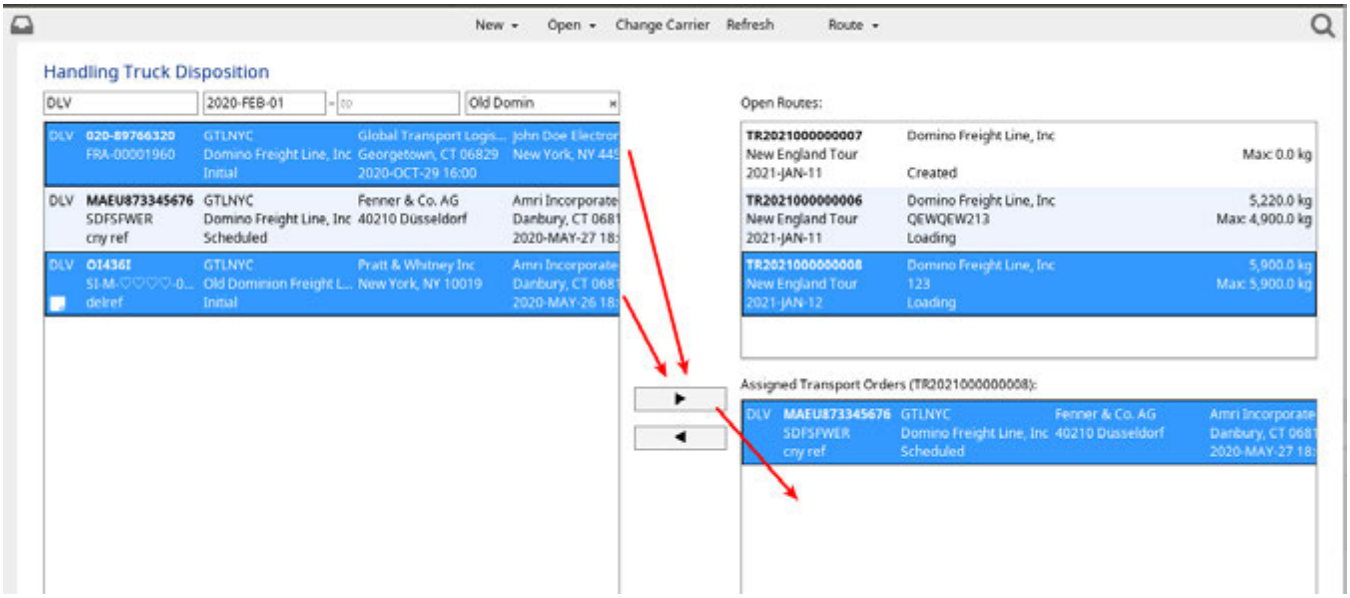
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The new tour will appear and automatically include at least one of the delivery or pickup orders from the filtered selection:



Note that a license plate number of the truck is required, but bogus information such as "123" can be used when a license plate is not required.

Further delivery or pickup notes can be added to the tour in the overview by highlighting the desired tour in the right hand window of the overview and then selecting the delivery or pickup note to be added from the left hand window. Click the arrow pointing right to add these:

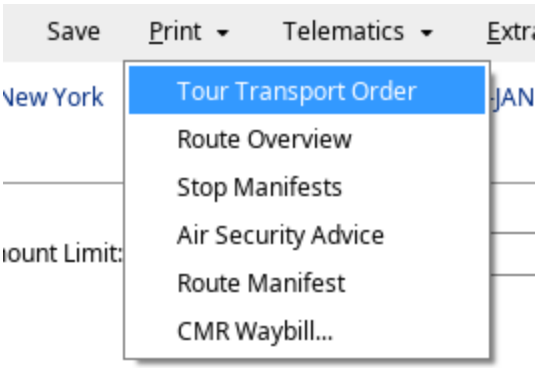


If the tour in the right hand window is clicked, it will open, showing all the Transport Orders it includes, the goods and the pickup and delivery locations.

Printing the Truck Dispo

within the truck tour, click the "Print" option and from the print list choose "Tour Transport Order"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Handling - Arriving and Delivering

- Arrive the goods
  - Registering the truck offload
  - Create the handling shipments
  - Add goods details and confirm the goods are arrived and as expected
  - "Finish" the Import Receipt
- Remove the goods from the warehouse
- Create a delivery order for the trucker
  - Creating a transport order

A handling shipment is a shipment that will arrive in the warehouse for:

- Storage
- Distribution

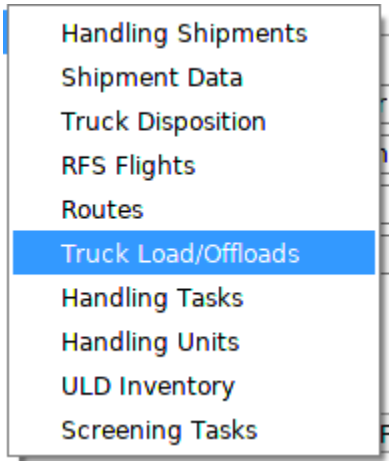
This workflow creates a handling shipment from the moment the truck arrives with the goods at the warehouse. It is also possible to register the goods before they arrive and then link them to the delivery when they are off-loaded from the truck.

Handling goods can also be delivered/picked-up from the warehouse.

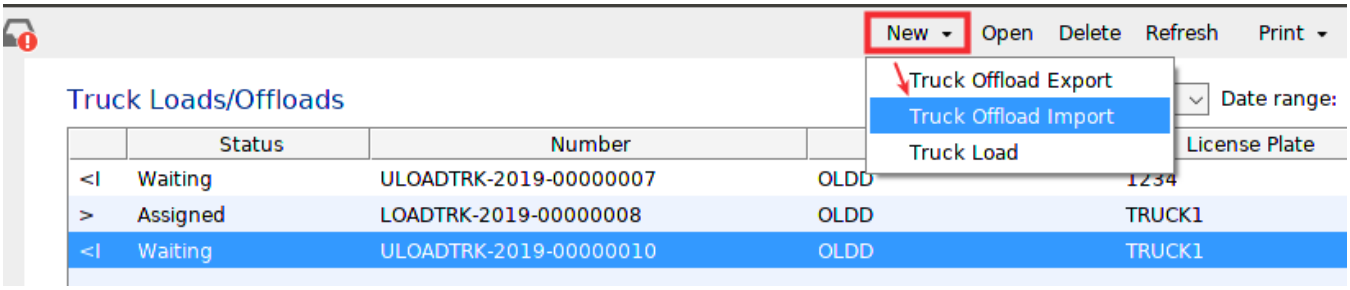
Arrive the goods

When the cargo arrives on the truck at the warehouse the first task is to create a Truck Offload:

From the handling menu select "Truck Load/Offload"



In the overview of Truck Loads and Offloads, choose "New" and then "Truck Offload Import"



Registering the truck offload

In the "Truck-Unloading" complete the details about the arriving truck as desired:

Note: Leave the following dates/times empty until the handling shipments have been created:

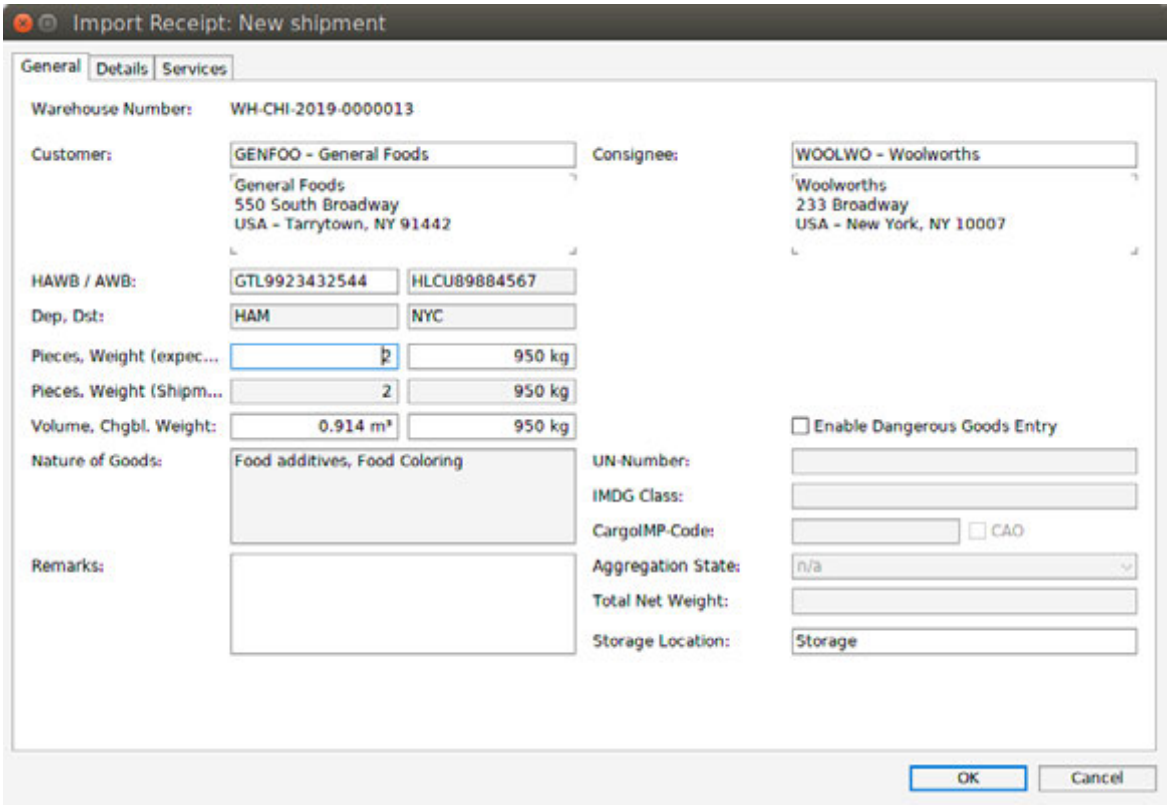
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- End Offload
- Actual Truck Departure

Create the handling shipments

In the "Truck-Unloading" click "New Shipment (Forwarder)" at the bottom of the screen:

Enter the Customer and Consignee in the Import Receipt. Then enter the bills of lading, Scope will immediately try to match the bills of lading to the correct handling shipment:



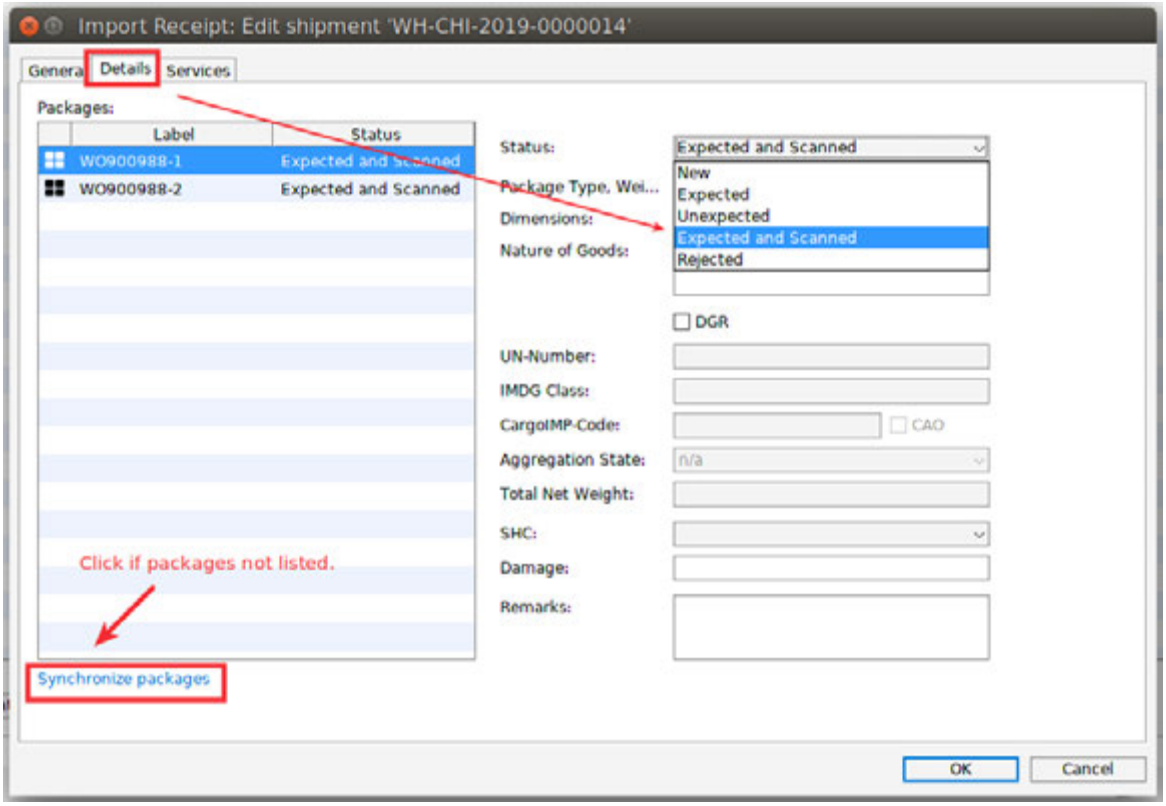
Add goods details and confirm the goods are arrived and as expected

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

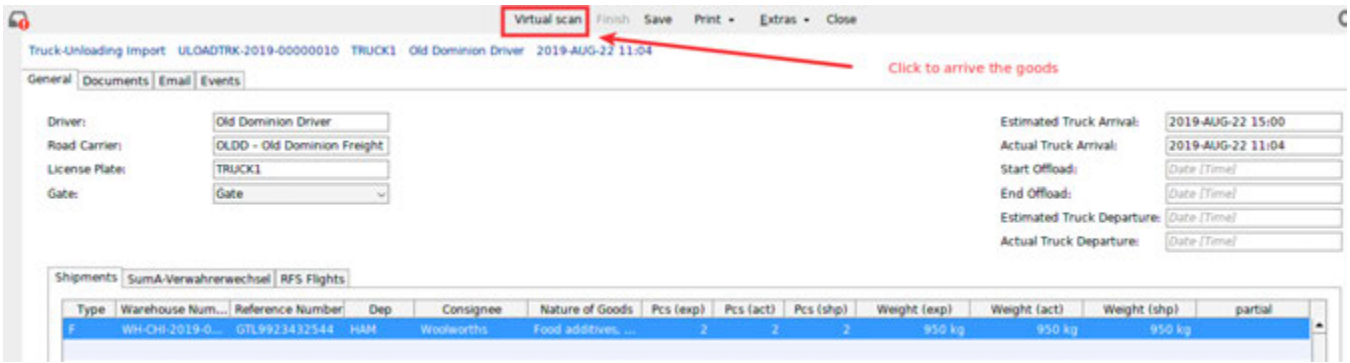
Click the "Details" tab of the import receipt and the expected goods will be shown, or click "Synchronize packages" to make them appear.

Further details for individual packages can be entered.

For each item, use the menu option to the right "Status" to select "Expected and Scanned" in order to show the goods as arrived in the warehouse:



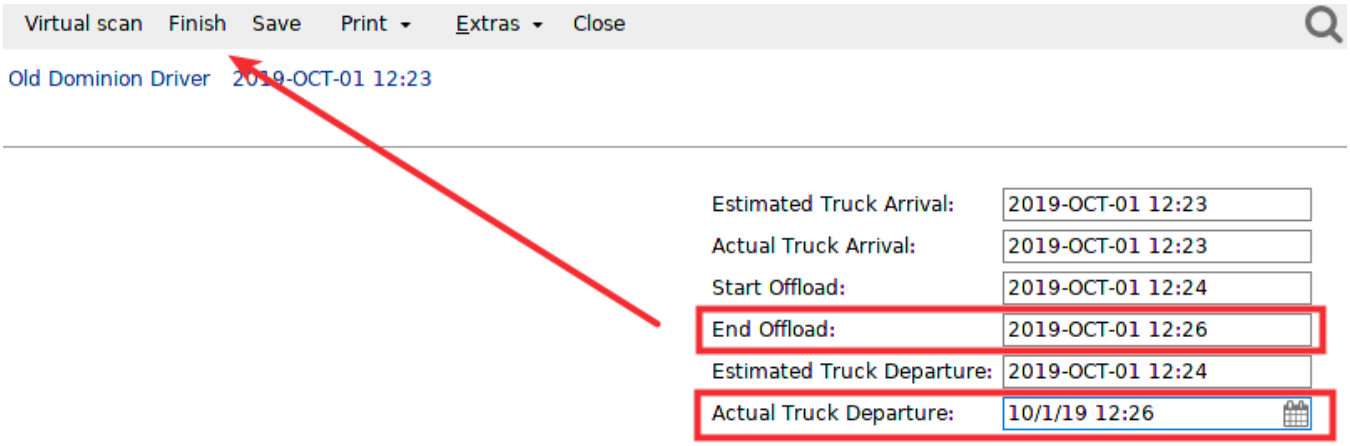
If there is no need to add details about the goods. they can be arrived in the warehouse by doing a virtual scan by clicking "Virtual Scan"



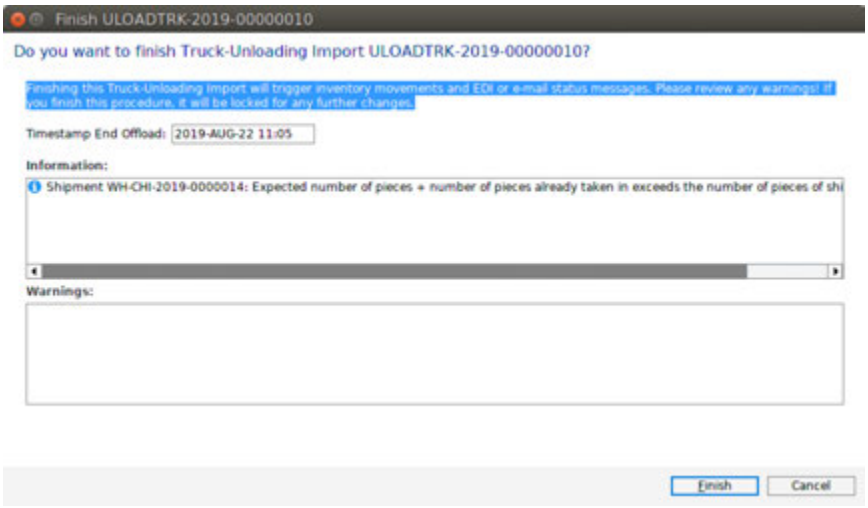
"Finish" the Import Receipt

In order to finalize the off-loading of the goods at the warehouse, the date and time of the end of the offload truck must be recorded and the date and time of the actual truck departure details need to be completed on the general tab of the Truck-Unloading.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

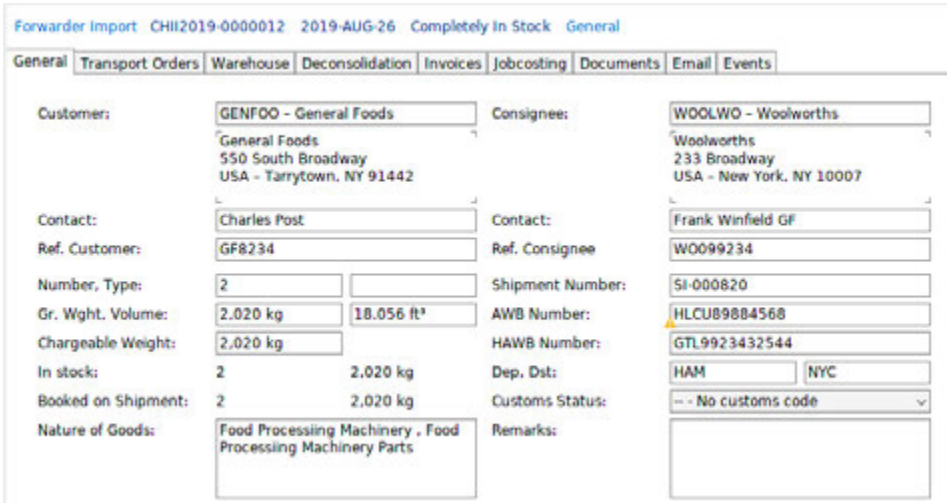


As soon as these details are entered, the "Finish" option on the menu bar become active, click this and then click "Finish" in the confirmation screen:



Now the handling shipment status will be updated to show this off-loading and the status becomes "Completely in stock" .

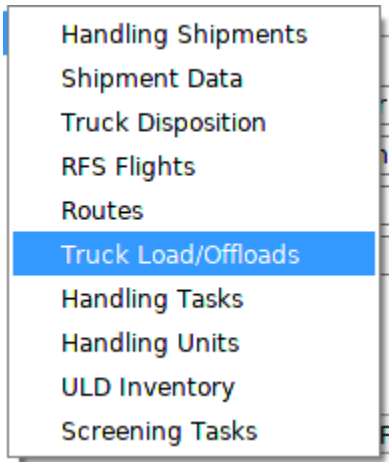
This new handling shipment will also now be visible in the "Handling shipments" together with its status



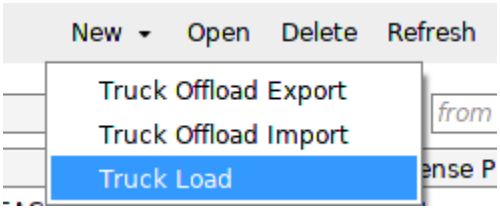
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Remove the goods from the warehouse

When it is time to distribute the goods from the warehouse go back to the "Truck Load/Offloads"



Create a new truckload:



Fill in the truck details and any of the following:

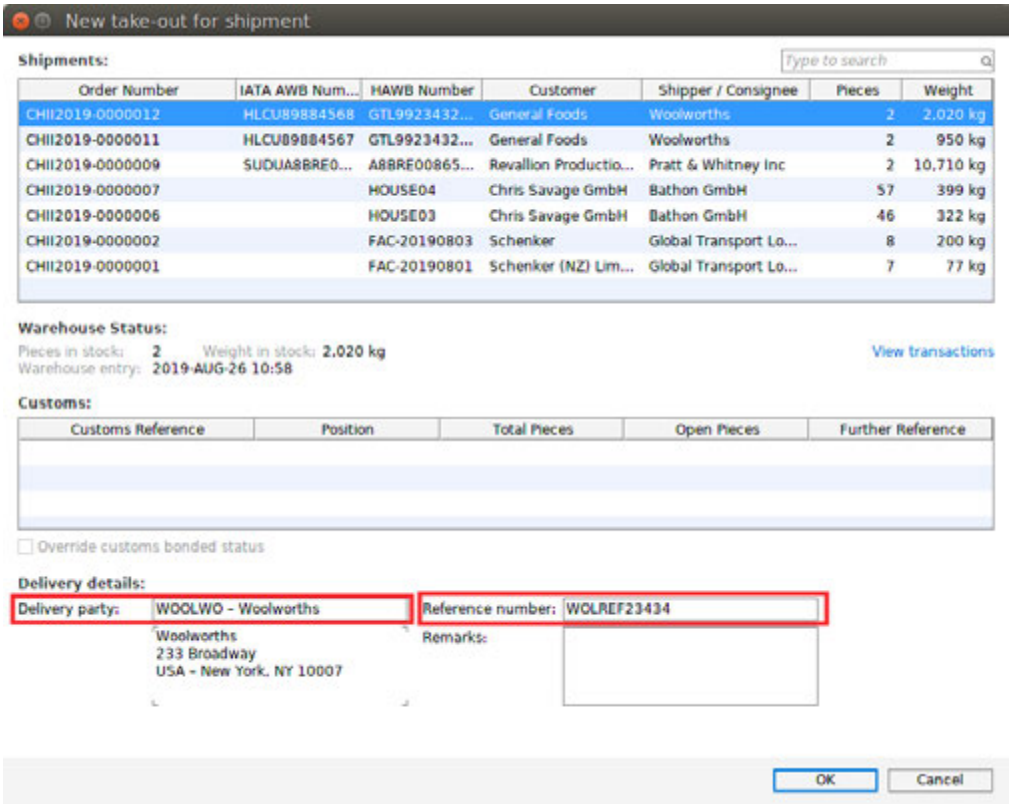
- Estimated Truck Arrival
- Actual Truck Arrival
- Estimated Truck Departure

If the truck is picking up a complete shipment, click "New Shipment Take-Out" at the bottom of the screen:

If the truck is picking up just packages (part-shipment), then click "New Package Take-Out"

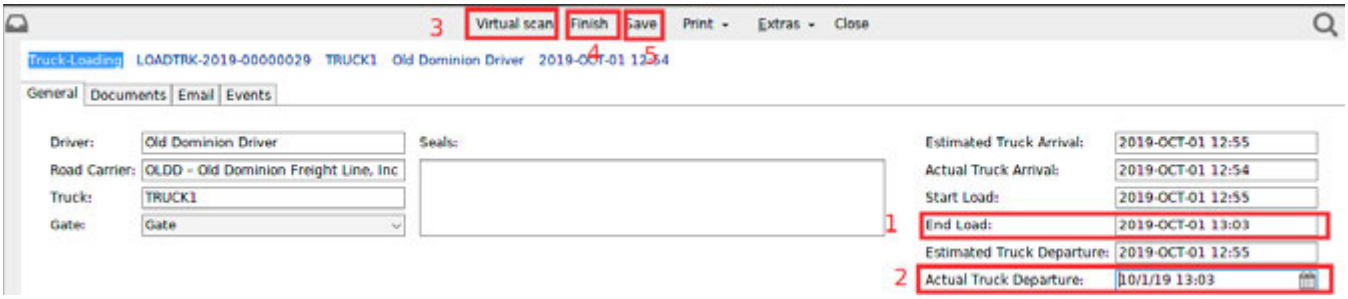
Select the shipment to be delivered and complete the Delivery party details and Reference number:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Now enter take the following steps:

1. Enter "End Load" date and time
2. Enter "Actual Truck Departure" date and time
3. Click "Virtual Scan"
4. Click "Finish"
5. Click "Save"



The goods will now be removed from the warehouse.

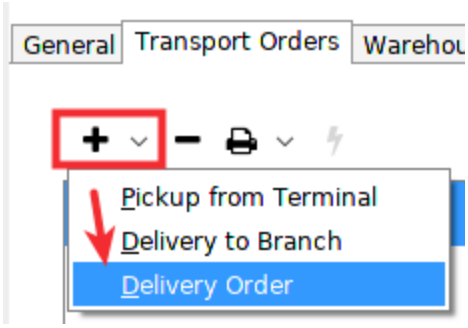
Create a delivery order for the trucker

In addition to removing the goods from the warehouse using the truckload shown above, you can also print a delivery note for the truck from within the handling shipment

Creating a transport order

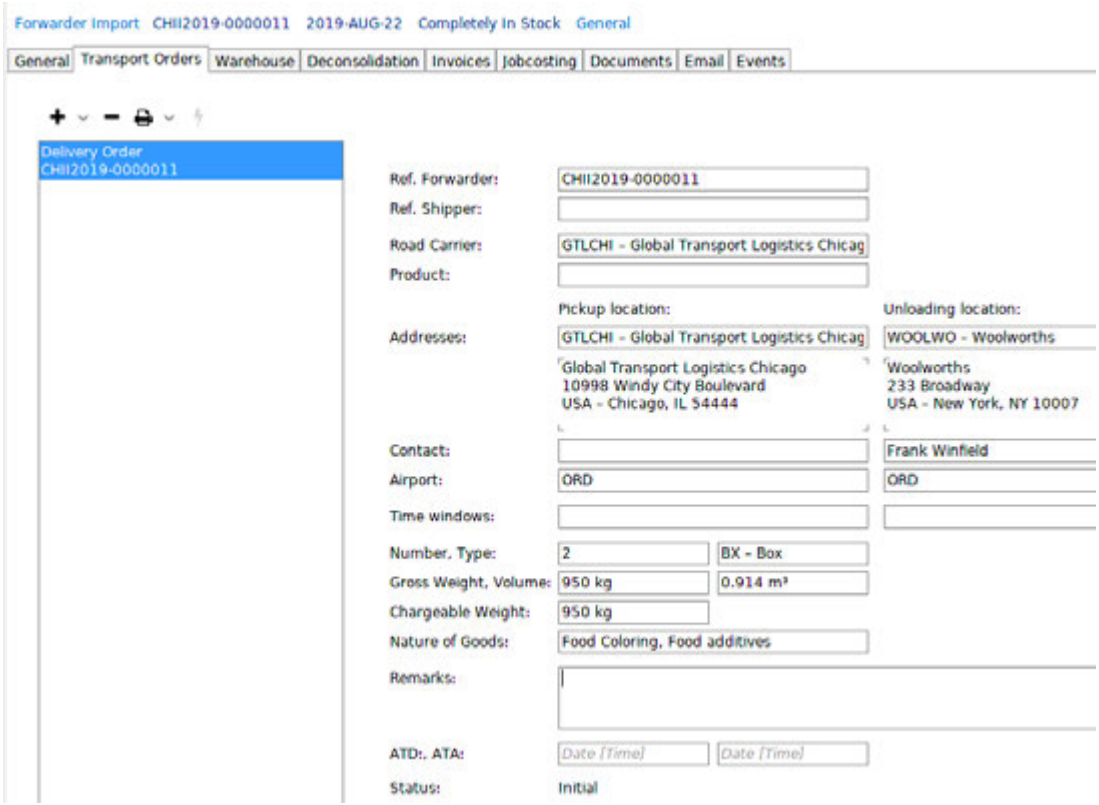
In the handling shipment, choose the tab "Transport Order" and select the plus symbol:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Choose "Delivery Order

Fill in the delivery order details:



When ready, select the printer Icon to print the delivery order.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To Navigate Scope Dashboards

This description will describe the process of logging in to the Scope Dashboards and the subsequent navigation of its features and control points. Please note that all data is fictitious from fictitious data, companies etc. and do not reflect service actuality, capabilities or anything of the like.

Step-by-step guide

1. Logging In
    a. This will be the same user ID and password that is used to log into Scope
    b. 
    c. 
    d. The login screen branding can be configured to match your organization (it uses the same settings as Scope Connect) see example below:
    i. 

2. Permissions
    a. Permissions are required in order to access the dashboards (talk to your Riege Representative)
    b. Views are governed by the users permissions assigned within Scope for what branch the user is permitted to see and governs the associated dashboard as well
3. Printing and Exporting

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

a. Each individual graph may be:
   i. Printed
   ii. Exported in PNG, JPEG, PDF or Vector Format
   iii. 
b. The printed or exported version matches what you see in the graph, so if you have, for example, zoomed in or clicked a drilldown, the currently selected data will be what is exported.

4. Initial Branch Selection
   a. With your first login the system will prompt you for what branch you will want to view. Your selection of this (as well as most other configuration options you select) will be saved using browser cookies for the next time you log in.
   b. 
5. Three Dashboard Boards Currently
   a. Branch Finance: (Revenue by Cost Center, Top Revenue Customers, Historic Monthly Revenue, Profit Margin)
      1. 
      ii. This dashboard contain four charts which provide the following details:
         1. Revenue by Cost Center: A trend chart of the revenue booked on each cost center over the course of the 12 months.
            a. Controls:
               i. Click on the Bottom Cost centers to hide or show the specific cost center to modify the view (eg. Ground Transportation, General, AirFreight, Sea Freight, Domestic)
               1. 
               ii. Hover: Hover over end points will give detailed information on that portion of the chart (see below)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

1. 
2. Top Revenue Customers: An overview of the top 10 customers in the past 12 months, sorted by revenue. All other customers are aggregated into the "Other" column. The percentage of the total is shown above each bar (totals may exceed 100% due to rounding).
    a. Shows the top10 Customers by revenue (hover over each for details)
    i. 
    b. Click On a bar of the interested Customer to drill down to the trend chart for that customer (hover over each for details), showing the revenue earned in each month over the past 12 months.
    i. 

3. Historic Monthly Revenue: This shows the revenue for the given period and will compare it to the revenue from one year prior if there is data from the prior year

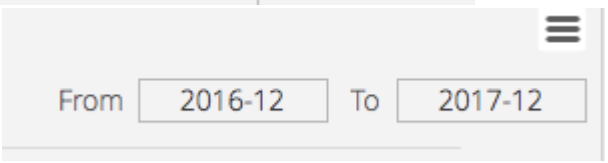
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

a. 

b. The slider can be used to define the date period, or you can use the date selection or the Zoom Shortcuts at the top left select the period of time to look at.
   i. Slider:

   ii. Zoom Shortcuts (YTD = Year to Date):

   iii. Date Range:



4. Profit Margin: This chart shows the booked revenue and expenses in Scope (Hovering will provide detail at each point detailing margin, income and expense)

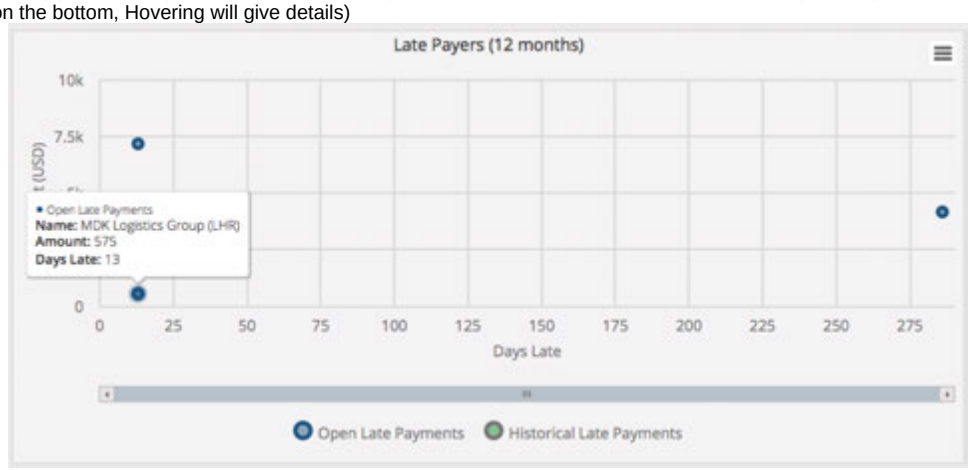
a. 

b. Same options for the slider, date range and duration options exist as in the previous chart

b. Legal Entity - Finance
   i. This dashboard contain four graphs which provide the following details

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

ii. 
1. Late Payers (open Late Payments - Historic Late Payments - Enable and disable each of the two by clicking on the bullets on the bottom, Hovering will give details)

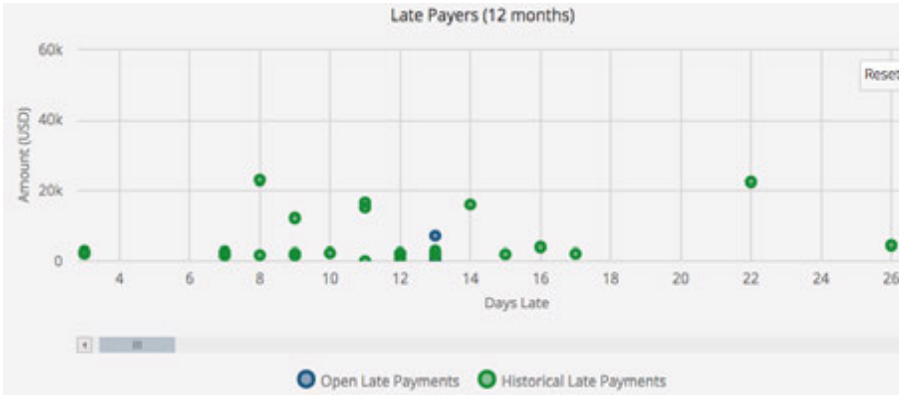


a.

b. If you highlight a range by clicking and dragging, it will zoom into the period provided. You can then scroll left and right with the scroll bar.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

i. 



ii. Reset the zoom by clicking the button: 

2. Top Vendors - Shows the top 10 vendors for the legal entity provided (hovering will show details), along with the aggregated "other" column. This is analagous to the top revenue customers chart, but is on legal-entity level and focuses on expense.

i. 
b. Clicking on a specific vendor will breakdown the last year of expenses for that vendor, grouping by month.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

i. 

3. Accounts Payable & Receivable
    a. Shows AP and AR broken into 30, 60, 90, and greater than 90days

i. 
    b. Hovering shows details and clicking on either a column of payables or receivables will break down that item details by customer or vendor

i. 
4. Operational Cash Flow
    a. This chart demonstrates the projected cash flow based on the existing estimates for income and expense that exist within Scope. Hovering will show the income, expense detail and net results. The date, duration and slider works as per the charts above.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

i. 
c. Org Level - Forwarding (review Configure Button items below)
   i. This dashboard contain four charts which provide the following details at the Organization level.
      1. 

   ii. Configure Button provides to limit the overal chart by branch or by module and all charts within will adapt to the given selection. See example of the chart above with only one branch and Air Export selected.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

1. 
see selection to the right for the chart below:

2. 
iii. Shipments (12Mos)
   1. This chart details the type of shipments in Scope based on the shipments that exist in Scope by module (remember the selection under the configuration button will dictate the results on all charts)
      a. 

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

2. By clicking on the bottom headers, it will remove the item to show the chart without the data (eg. click on Sea Import in example below)

a. 

3. Example below click all but Simple Shipments

a. 
iv. Top Agents at Top Locations (12Mos)

1. High level details, with hover providing details as shown below

a. 
2. Clicking on the items below will eliminate the items on the chart that you dont want to review and can be eliminated by clicking on the indicator.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

a. 
v. 12 Month Trend for Prior Years Top Carriers
   1. This chart shows the trend of your carriers top carriers over the past year. The top ten carriers from the prior year are chosen. So if the report is run in July 2018, the carriers chosen are the top ten from July 2016 - July 2017, and then the trend over the period July 2017 - July 2018 is used to compare.

a. 

vi. Top Carriers by Top Destinations (12 Mos)
   1. This chart details the top carriers by top destinations

a. 

   2. By clicking the items on the bottom, you can remove undesired carriers to look specifically at options availalbe. By clicking on all carriers except American the chart then looks like this:

a.

How-To Quotes

- How-to check if a quote is linked to a file and how to link a quote to an already existing shipment
- How-To make a Quote

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

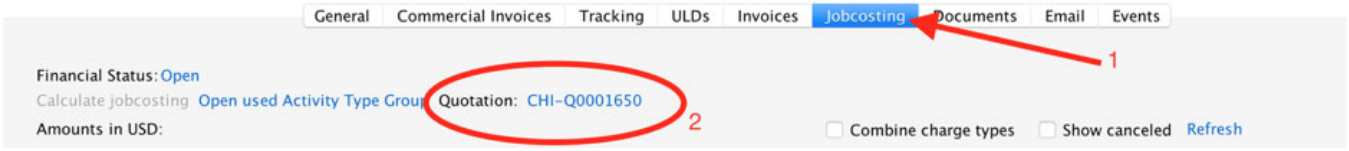
How-to check if a quote is linked to a file and how to link a quote to an already existing shipment

Explains how to link a quote to an existing shipment and also how to check if a quote is already linked with a shipment. The benefit of this feature is to be able to open a shipment without having a quote first and then the ability to link to a quote later.

Step-by-step guide

Check if there is a quote linked

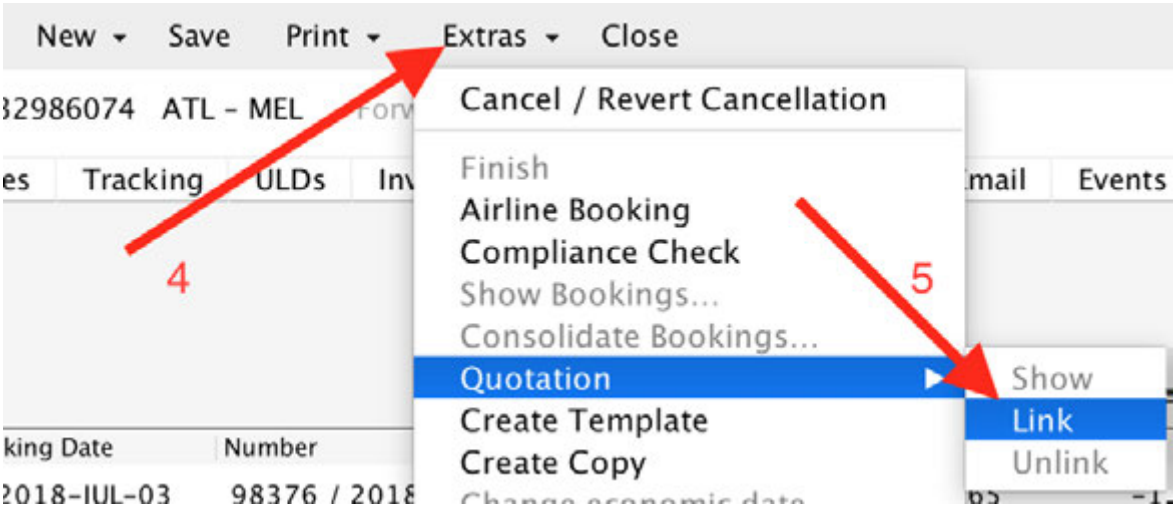
Open a file and click on the job costing tab (1). There you will be able to see if there is a quote linked to the file. If there is a quote it will show as a blue hyper link with the quote number (2). Clicking on the quote link will take you to the quote and allow you to check what the specifics are. This is useful if you want to make sure the right quote is linked to the right shipment before you import the charges into the file.



If there is no quote linked, then the quote link space will be blank (3)

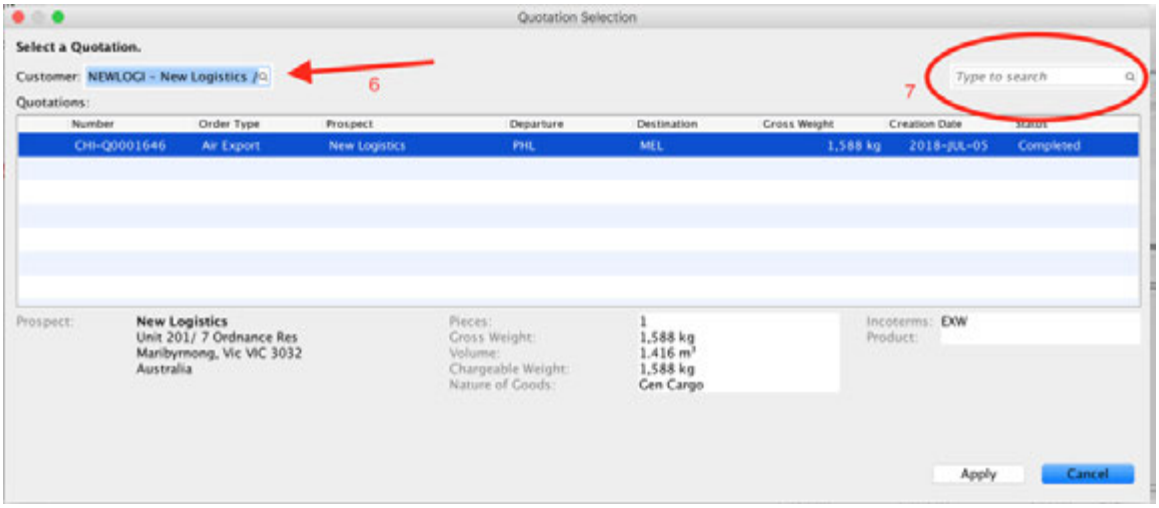
Linking a quote to a shipment

If a shipment doesn't have a quote on it, you have the option to link an existing quote to it. To do this click on the extra button at the top (4) and select quotation from the pull down menu, then click the link option (5). Do note that currently the unlink option doesn't work but should be an option on in future scope releases.



Once you select Link, a new window will open which will allow you to browse and find the quote you would like to associate with the shipment. By default, it will put the customer of the shipment into the customer search field (6). You can change this to a different customer or leave it blank to see all available quotes. There is also a second broader search option to help you narrow your quote search (7).

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Once you find the quote that you would like to link, select it (8) and click on the Apply button (8) to add it to the file. After that the quote is linked to the file and you can add the charges to your file as you normally would.

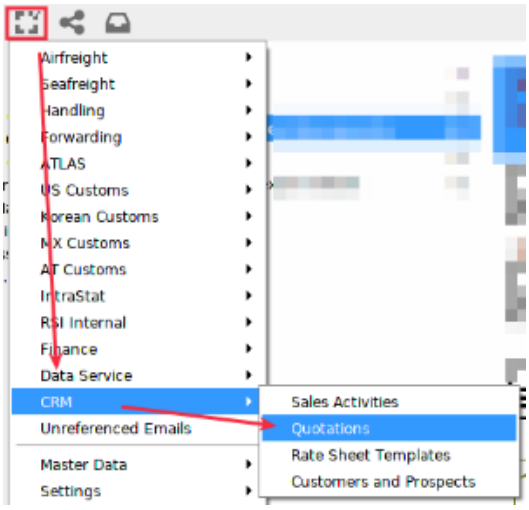
How-To make a Quote

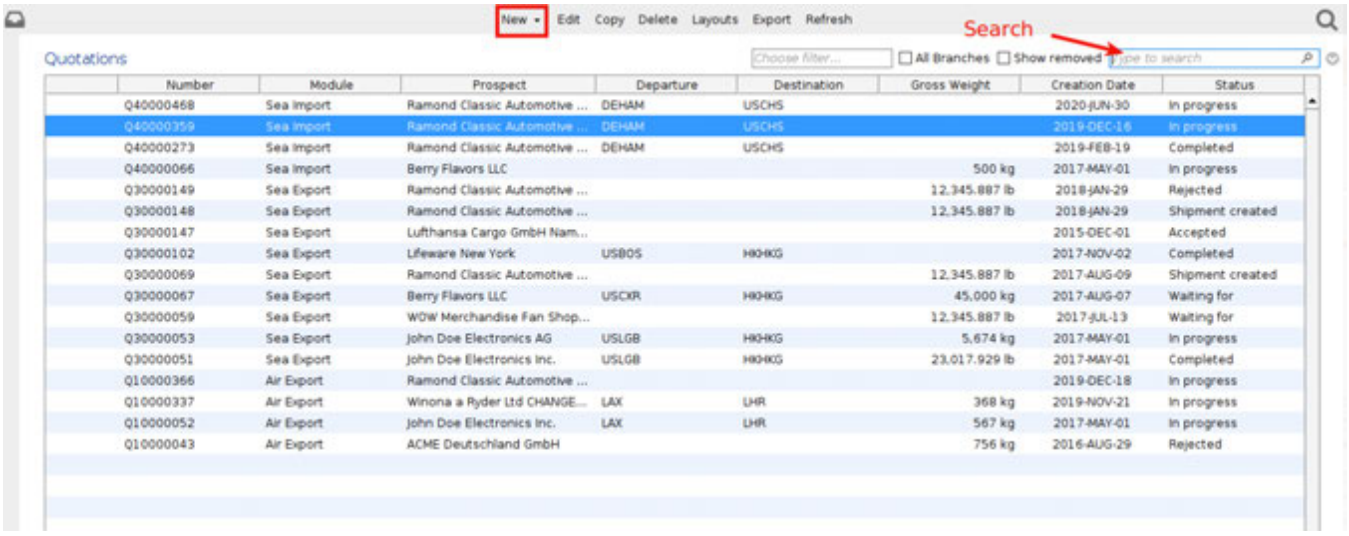
Navigating to the Quotations module

1. From the Scope menu,
2. Choose "CRM"
3. Then choose "Quotations"



Overview of all quotes

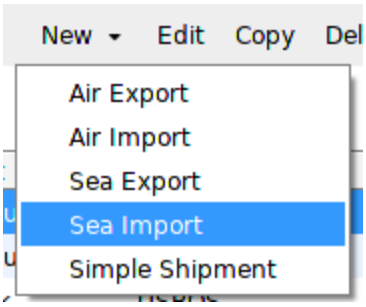
When you open the Quotations module, you will see an overview of all quotations. Use this screen to search for existing quotations or create new ones:



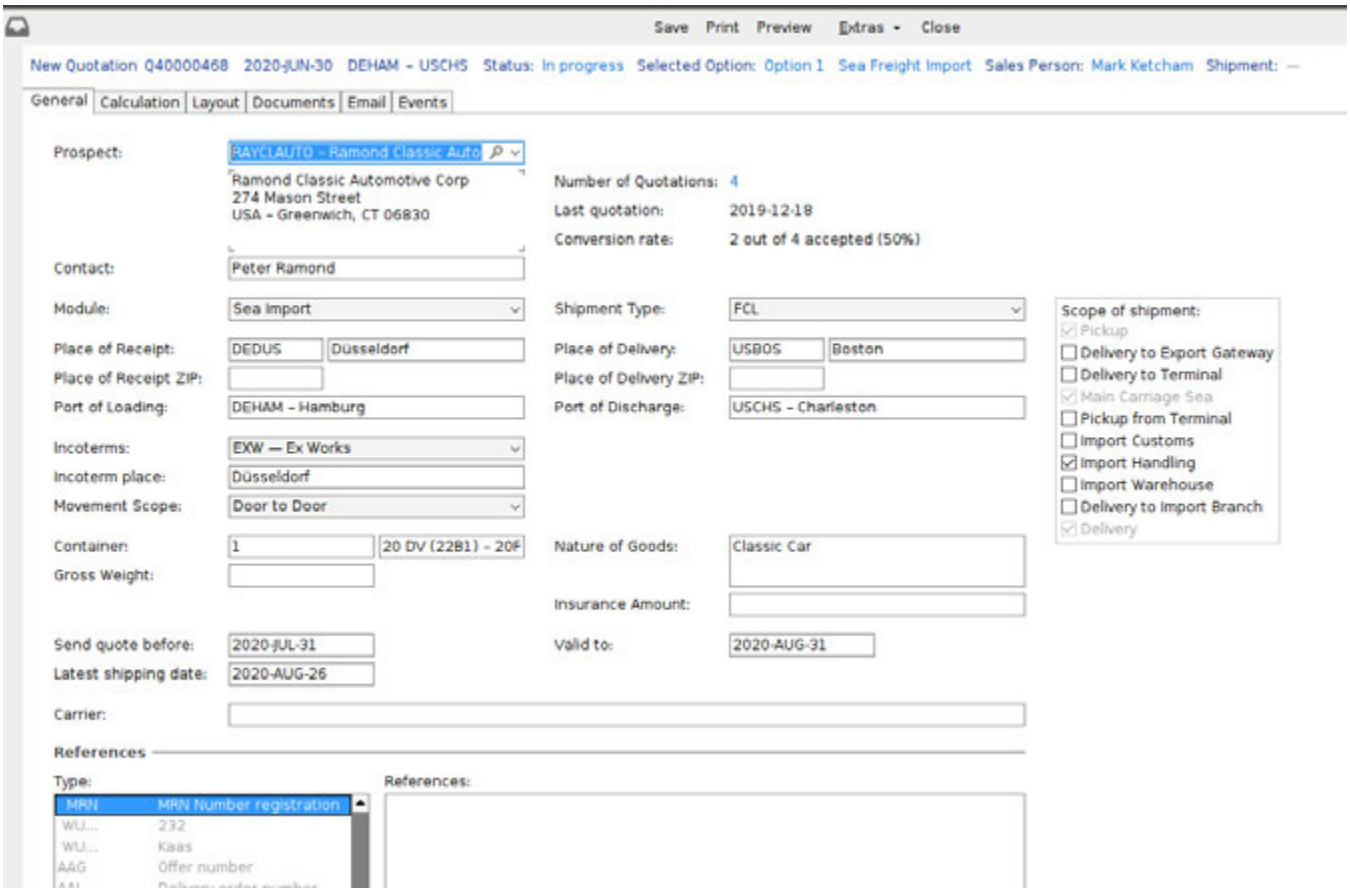
Making a new Quotation

Click the "New" button at the top of the overview of quotes and they choose the type of quote:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Entering the general details for the quote



Note that very few fields are mandatory

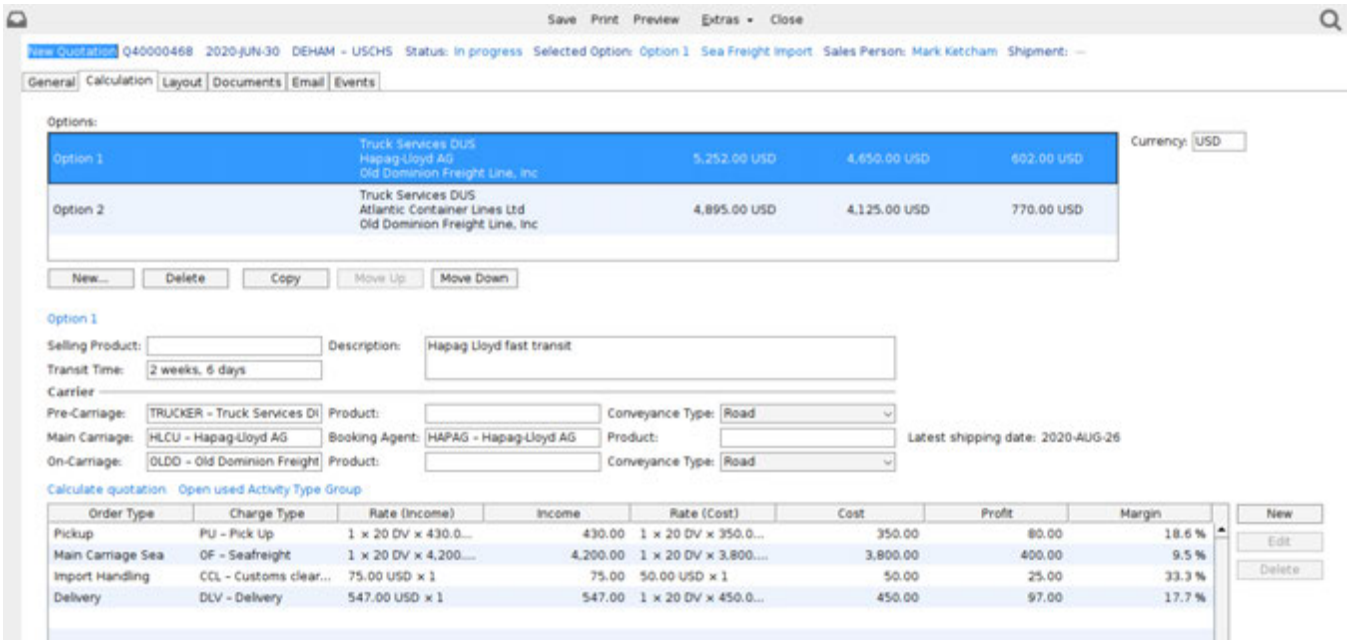
- **Prospect:** This is the party to whom you will present the quote. If you do not want to save the prospect as a partner, click on the on the drop-down arrow in the right of the field and choose to make a "Document Address"
- **Contact:** The name of the person who will receive the quote
- **Module :** This will automatically match the type of movement you selected when you created the quote
- **Shipment type:** In the case of sea shipments, you will be able to indication if this quote is for an LCL or an FCL shipment
- **Place of Receipt:** This is where the goods will be received from the shipper
- **Place of Receipt ZIP:** This is the ZIP code where the goods will be received from the shipper. Use this or the Place of Receipt Name or both
- **Place of Delivery:** This is the place where the goods should finally be delivered
- **Place of Delivery ZIP :** This is the ZIP code of the place where the goods should finally be delivered. Use this or the Place of Delivery Name or both
- **Port of Loading:** The port the goods will depart from
- **Port of Discharge:** The port where the goods will be discharged from the vessel
- **Incoterms:** The terms for the shipment . Choose N/A if these are not required for the quote.
- **Incoterm Place:** If needed for the shipment enter the place where the incoterms apply.
- **Movement Scope:** The type of movement. This might be important to the quote, in this case "Port to Door" is selected. To the right, the check boxes in the "Scope of Shipment" list will indicate the legs of the quote that are being quoted on.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **Container:** The number of containers required and in the 2nd field you can enter the type of container, for example 20' DV
- **Nature of Goods:** A description of the cargo
- **Gross weight:** The gross weight of the cargo
- **Insurance Amount:** If required, the insurance premium needed for the cargo
- **Send quote before:** This indicates the latest the quote can be presented to the prospect
- **Valid to:** The date on which the quote will expire if not accepted
- **Latest shipping date:** The latest date the cargo can ship for the quote to be valid.

Entering the calculation of the quotation

Use the "Calculation" tab to enter the amounts that will be quoted to the prospect



Use the "New" button below the "Options" window to make additional quote options. In this case 2 different prices are offered depending on the steamship line used and the transit time.

- **Currency** - the default currency for the quote will be used, or can be changed to a different currency if you work with multiple currencies
- **Selling Product** - for a service like seafreight imports a defined set of selling products may be created, for example the product may automatically include basic import customs clearance
- **Description** - this section can be used to describe this option and is useful in making clear to the customer how various options may differ for example
- **Transit Time** - an indication of how long transit of the goods may take

Carrier section of the calculation

When each option is highlighted, the carrier details and charges for that option become visible and may be edited.

- **Pre-Carriage** - If the quotation includes the pickup of the cargo, then the pre-carriage field allows the trucker who will perform the service to be entered.
- **Product** - This product field is associated with the pre-carriage field and allows stored pickup product types to be specified.
- **Conveyance Type** - The pre-carriage may be via Road, Rail or Barge. Select the correct type
- **Main Carriage** - If the quote is specific to a carrier, identify the carrier in the "Main Transport" field. In this example this quote can only be used if the container moves on the carrier MSCU
- **Booking Agent** - the partner for the carrier who will bill carrier related costs for the quotation
- **Product** - If you have various products offered for main carriage, enter the appropriate product in this field
- **On-Carriage** - When the quote includes delivery, the trucker responsible for delivery can be stored
- **Product** - If you have various products offered for On-Carriage, for example "Expedited", these can be selected in this field
- **Conveyance Type** - The On-carriage may be via Road, Rail or Barge. Select the correct type

Auto-calculating charges

- Calculate quotation - If you have stored tariffs, click the blue "Calculate quotation" to automatically apply stored tariffs to the quote. This is a way to automatically generate quotes without having to manually enter each charge.

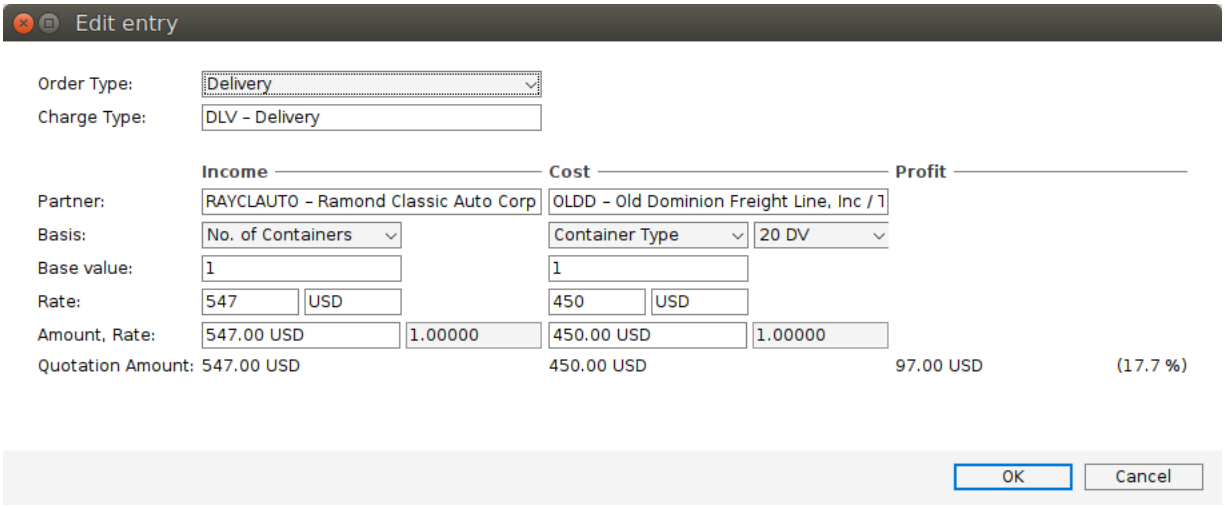
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Open used Activity Type Group - This will show the group of other charges that might be applied automatically to this quote

Manually adding charges

If the quote is not calculated automatically, use the "New" button to the right to add individual charges to the quote.

When "New" is selected, a window appears where the individual charge details can be recorded:



- **Order Type** - use this field to identify which segment of the shipment lifecycle the charge belongs to. In this example of a sea import quote, you can choose from "Import Handling" , "Main Carriage Sea" or "Delivery". You can have multiple different charges under each of these segments.
- **Charge Type** - Enter the actual charge you are quoting on. In the example above this is the Delivery charge.

Income and Cost amounts

- **Partner** - this will normally be the prospect who you are creating the quote for.
- **Basis** - select from the list basis for calculation of the charge. In this case it is based on the number of containers to be delivered
- **Container Type** - Because the basis "No.of Containers" has been selected , it is necessary to indicate the type of containers. In this case a "20' DV" container will be delivered. This field will dynamically change according to the type of basis selected
- **Base Value** - Since the basis "No.of Containers" has been selected , it is necessary to indicate the number of containers to be delivered. In this case 1 container will be delivered and so the base value is "1" .
- **Rate** - This is the rate per unit. In this case "547" "USD" means a selling cost of $574.00 per container delivered. "450" "USD" , indicates the trucker will charge $450.00 per container.
- **Amount, Rate** - This will be the total amount to be charged based on the basis, the base value and the rate.

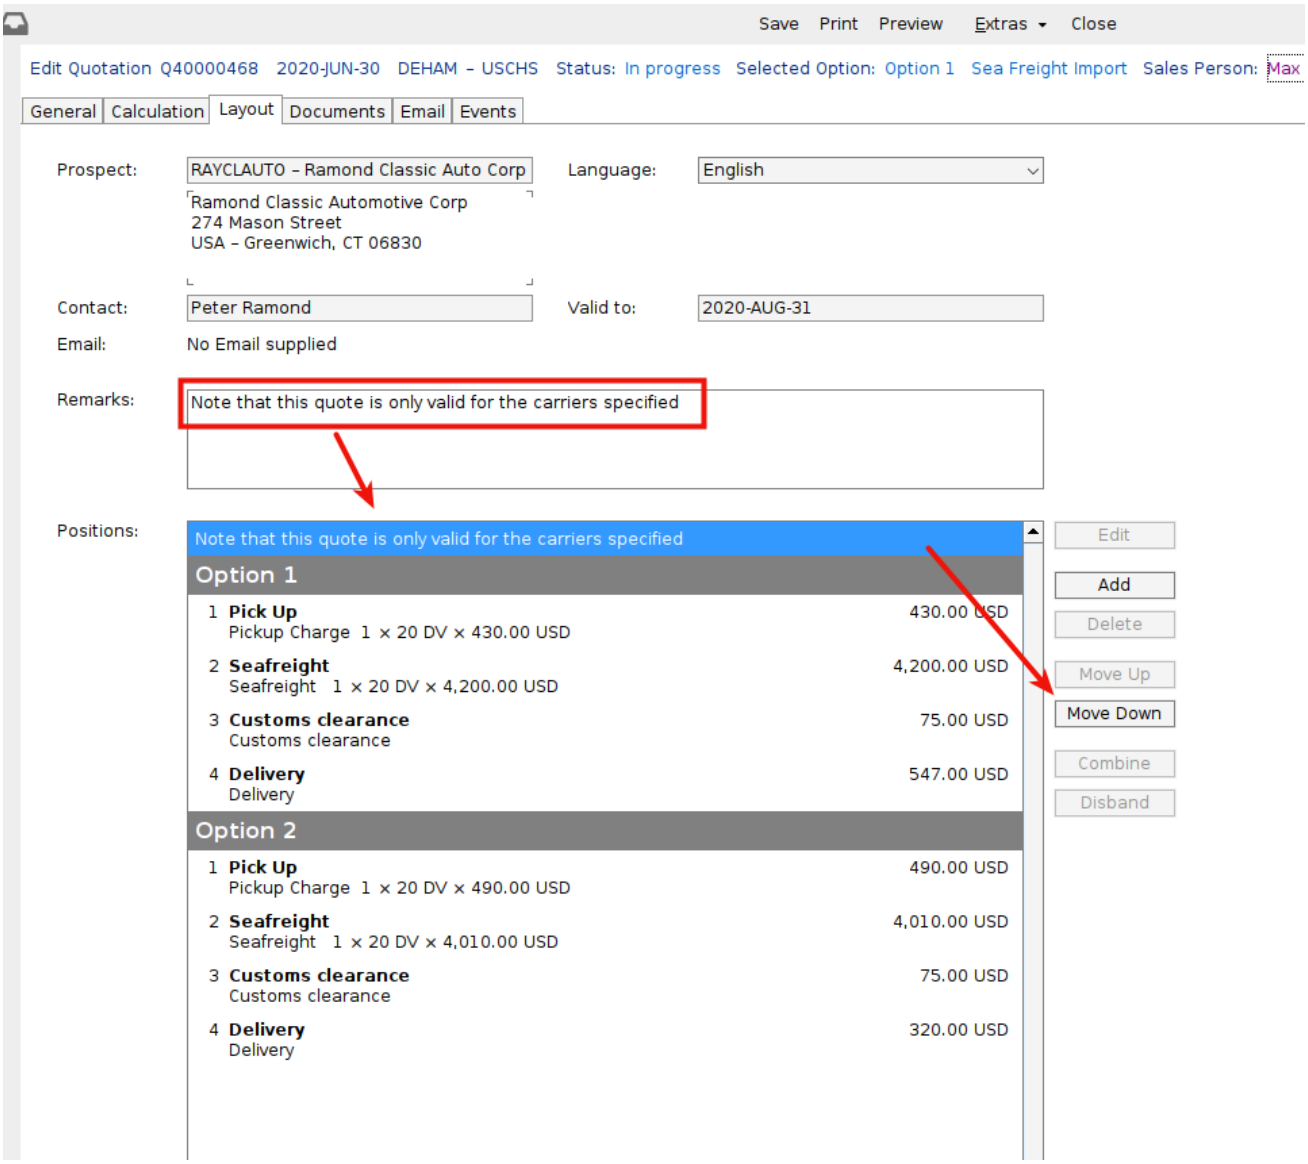
Click ok with any income and costs have been completed.

When all income and costs are entered, the total income, costs and profit can be seen at the bottom of the calculation tab.

Arranging the layout of the quote

The "Layout" tab of the quote allows you to arrange the charges and any remarks in the order your would like them to appear on the final quote:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



- **Prospect** - the party who will receive the quote will automatically appear in this field
- **Language** - If the prospect is a partner, the quote will use the preferred language of the partner. The language can be changed to other languages supported by your system.
- **Contact** - the name of the person who will receive the quote
- **Valid to** - A reminder of when the quote expires
- **Email** - if the partner has been stored with an email, the email address will appear here. If not, an email can be manually entered when you send the quote.
- **Remarks** - enter any remarks that should appear on the quote. Note that when remarks are entered, they appear in the "Positions" and can be moved up an down.

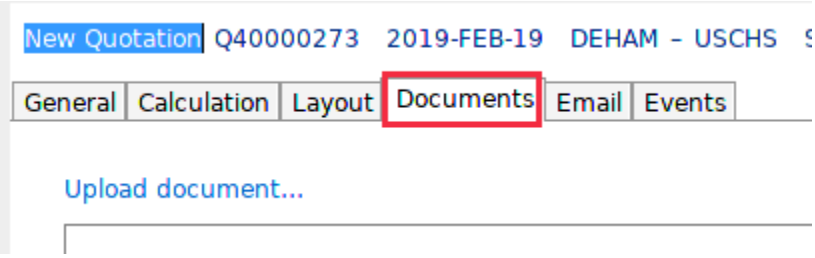
Positions

This window shows all the charges entered on the "Calculation" tab. Any remarks also appear in this tab and this can be seen in the example above. Note, that by highlighting the remark and then using the "Move Up" and "Move Down" buttons, the remarks can be positioned atop the charges, at the bottom of the charges or anywhere in-between.

- **Edit** - this button will allow you to edit how the charge is described on the quote in case the standard description is not satisfactory
- **Add** - Use this button to add further text blocks. For example if a charge needs further description, a text block can be added immediately above or below it.
- **Delete** - A text block can be removed by deleting it
- **Move Up** - this will move the highlighted item up the list of positions
- **Move Down** - this will moved the highlighted item down the list of positions
- **Combine** - highlight 2 or more charges and use the "Combine" button to group them together as one and apply a description to this new single charge.
- **Disband** - highlight a combined group of charges and use this button to break them out again to individual charges.

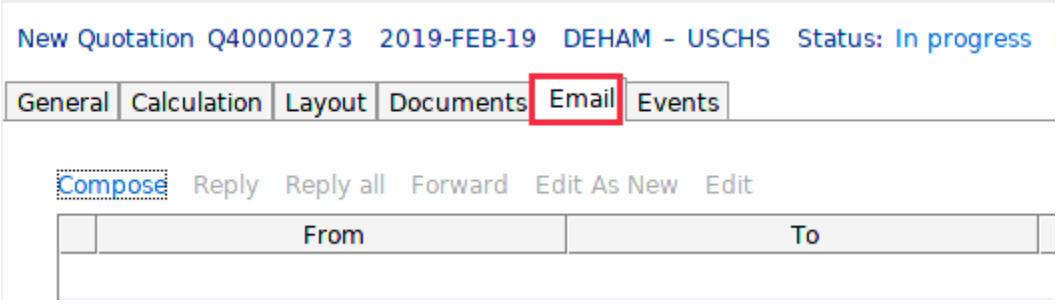
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Documents



use the documents tab of the quote to upload any documents you want to associate with the quote. When the quote is printed, a pdf copy will appear in the documents tab.

Email



The email tab is used to create an email to the prospect with the quote attached as a pdf.

Finishing the Quote & converting it to a shipment

- **Save** - Use the "Save" option on the menu bar at any time to save the latest changes to the quote
- **Print** - The"Print" option on the menu bar will finalize the quote and the status will change from "In Progress" to "Completed"

- **Preview** - use the "Preview button to view how the quote will appear to the customer. Use the layout tab to make any further adjustments
- **Extras, Convert to shipment** - In the extras menu is the option to convert the quote to a shipment. This is done when the quote is accepted and the status of the quote will change to "Accepted".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To register, find and handle damaged shipments in Scope

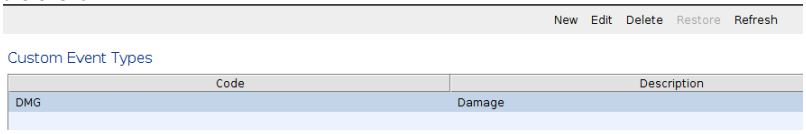
- Step-by-step guide
  - Setup the Scope shipment monitor to be able to register damages.
  - Setup response codes
  - Apply a damage exception
  - Find shipment with damages
  - Resolve exceptions

When a shipment is damaged, you need to register it as damaged. Later you may need to find any damaged shipments for reporting purposes and you will also need to log how the damages were handled. This How-To covers these tasks.

Step-by-step guide

Setup the Scope shipment monitor to be able to register damages.

1. Go to "Maintenance"
2. In "Maintenance select the menu item "Event Types"In "Custom Event Types", make a new event, in this example the code "DMG" is used for the event.

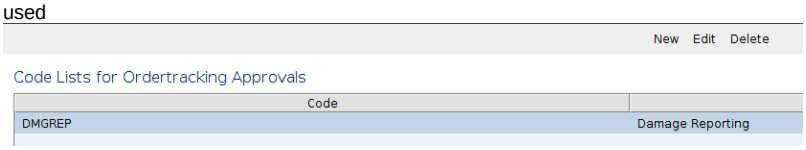


3. This event can now be used to report damaged shipments.

Setup response codes

Next setup the shipment monitor so that response codes can be applied to damaged cargoes to indicate how these damages were handled

1. Go to "Maintenance"
2. In "Maintenance" select the sub-menu "Forwarding"
3. In "Forwarding" select the menu item "Approval Reason Codes"
4. In "Code Lists for Ordertracking Approvals" create an approval for damaged goods. In this case the code "DMGREP" is used



5. Give the approval reason a code like the example "DMGREP"
6. Give the approval reason a name that is a description of the approval reason, in the example this is "Damage reporting"
7. Use the "New" button to add the kinds of actions that are allowed to resolve the damaged shipment. In this example there is "Damage Report" and "Write off goods"

Apply a damage exception

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

1. Open a shipment where damages have occured
2. In the shipment open the "Tracking" tab
3. In the "Tracking" tab select the option at the bottom of the screen "Register Exception" and complete the exception report.

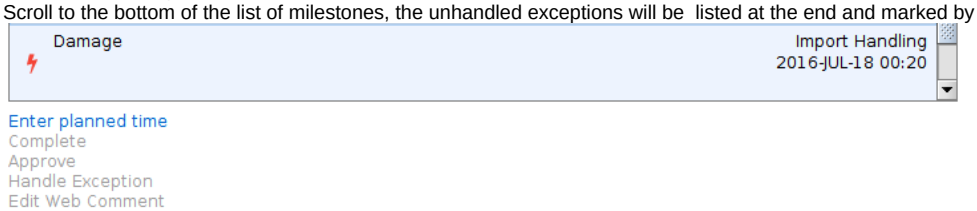
Find shipment with damages

1. Go to "Maintenance"
2. Select "Forwarding"
3. In the "Forwarding" sub-menu, select "Shipment Monitor"
4. In the "Shipment Monitor" , clear the "Choose filter" search field
5. Add the new filter "Unhandled Exceptions" + "Yes"

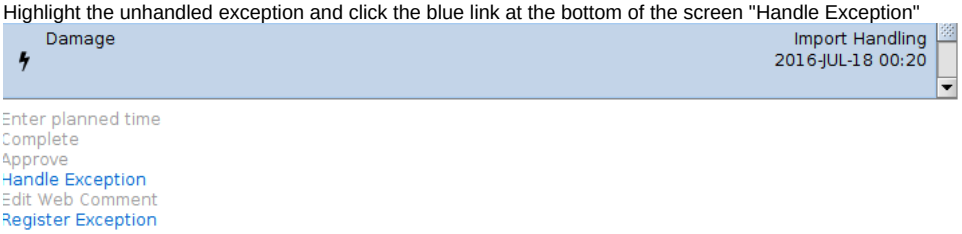
6. The shipment monitor will list all shipments that have unhandled exceptions like those with damage reports.

Resolve exceptions

1. Open the shipment that has an unhandled exception such as those listed in the "Unhandled Exceptions" list described above.
2. Go to the "Tracking" tab
3. Scroll to the bottom of the list of milestones, the unhandled exceptions will be listed at the end and marked by a red lightning strike.



4. Highlight the unhandled exception and click the blue link at the bottom of the screen "Handle Exception"



5. Complete the "Handle Exception" report and click "Submit".

How-To save a filter

- Opening the Filters application
- Creating a new filter
- Applying a saved filter

In the Scope shipment overviews, you may do searches need to repeat on a frequent basis.

The example above shows a set of filters applied in the shipment overview the look for shipments from Hong Kong to New York. If this is a frequent search it makes sense to save the filters used in this search so that they are easy to recall and resuse, rather than re-build the search filter. This how-to explains how to save a set of filters and then reuse them later.

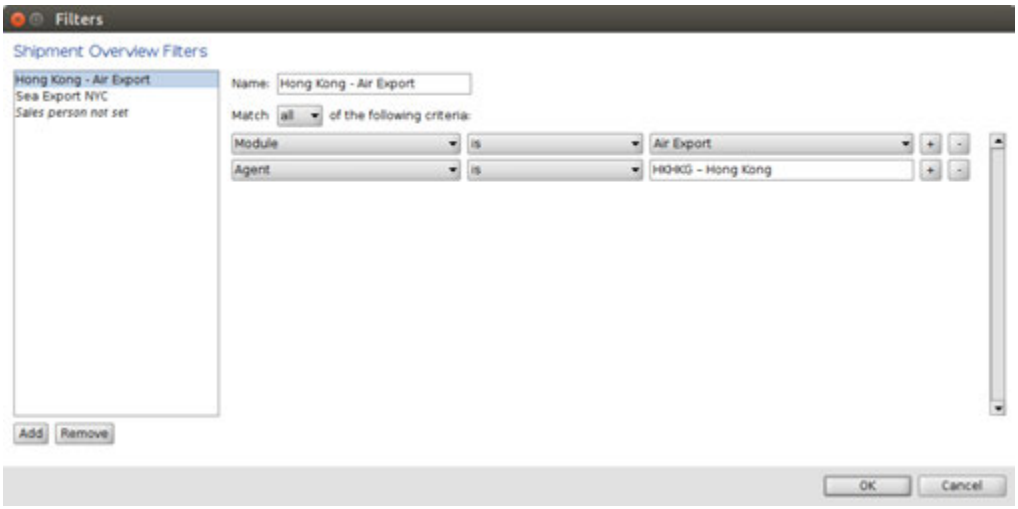
This example will use the shipment overview, but any overview with the *Choose filter* search box can be used.

Opening the *Filters* application

Navigate to the shipment overview

1. Click the Scope button 
2. Select *Forwarding* and then *Shipment Overview*
3. In the shipment over view, click the drop-down option to the left of the *Choose filter* search box

4. The Filters application will open



Creating a new filter

The filters application shows a list of all existing saved filters.

Click the *Add* button to create a new saved filter:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Give the filter a descriptive name:

Use the All button to indicate all the elements of the filter must be matched in the shipments:

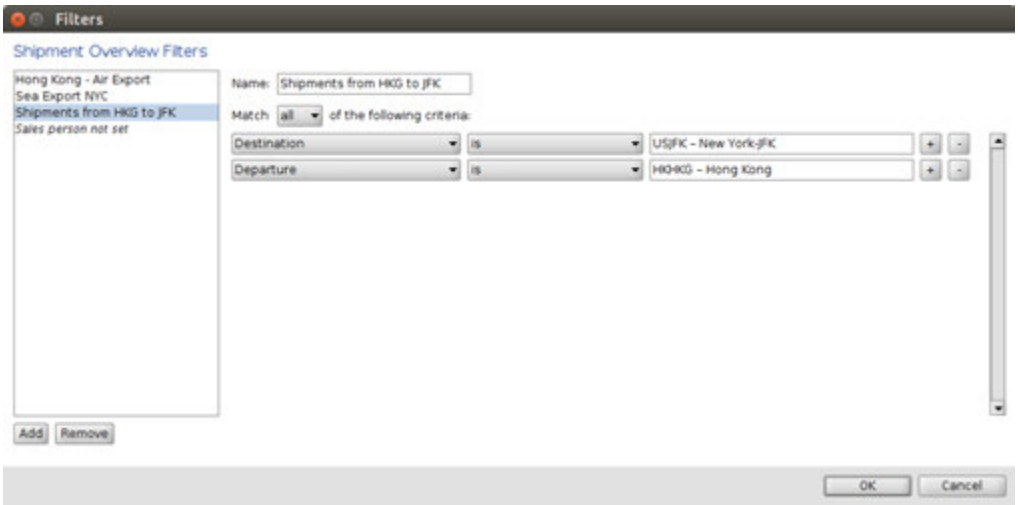
Alternatively, if any of the filter elements are to be used to find matching shipments, then use the drop-down arrow next to all to change this to one:

Now use the plus button to start building the filter:

In the example below the filter line restricts the results to shipments for the destination JFK:

Now an additional filter line is added that also restricts the results to shipments departing from Hong Kong:

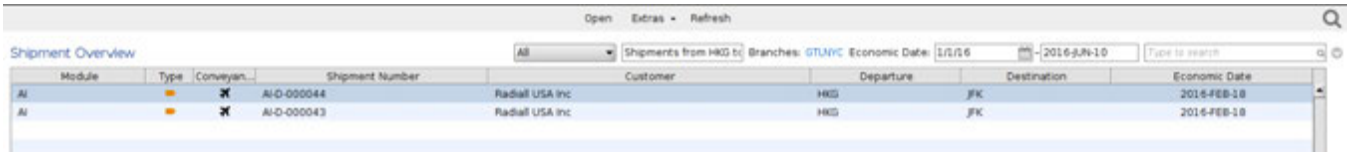
Now the filter is ready. Click OK to save it.



Applying a saved filter

In the shipment overview type the name of the saved filter in the *Choose filter* field

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



In the example above, the new filter is used and some additional search criteria is applied:

- Search across all Shipment types
- The date range of 1/1/16 to 2016-JUN-10
- Search only in the branch GTL-US, GTLNYC

The results are shown below the search criteria

FAQ How-To add charges to an arrival notice

When an import shipment arrives it may be necessary to include the charges the customer can expect to pay on the arrival notice. This How-To shows how to create these charges and include them on the arrival notice.

Step-by-step guide

1. Open the shipment
2. Go to the Jobcosting tab
3. 
4. Click on "New Income"
5. 
6. Complete the "New Income" window, using the name of the customer as the recipient
7. 
8. Add as many charges as required until the Jobcosting tab shows all the estimated income from the customer
9. 10. Now select "Notice of Arrival" from the print menu , and choose "Consignee" or "Customer"
11. The "Complete the Notice of Arrival!" editor will appear showing the estimated income to be included on the arrival notice.

FAQ How-To add In-Transit (IT#) details to a shipment

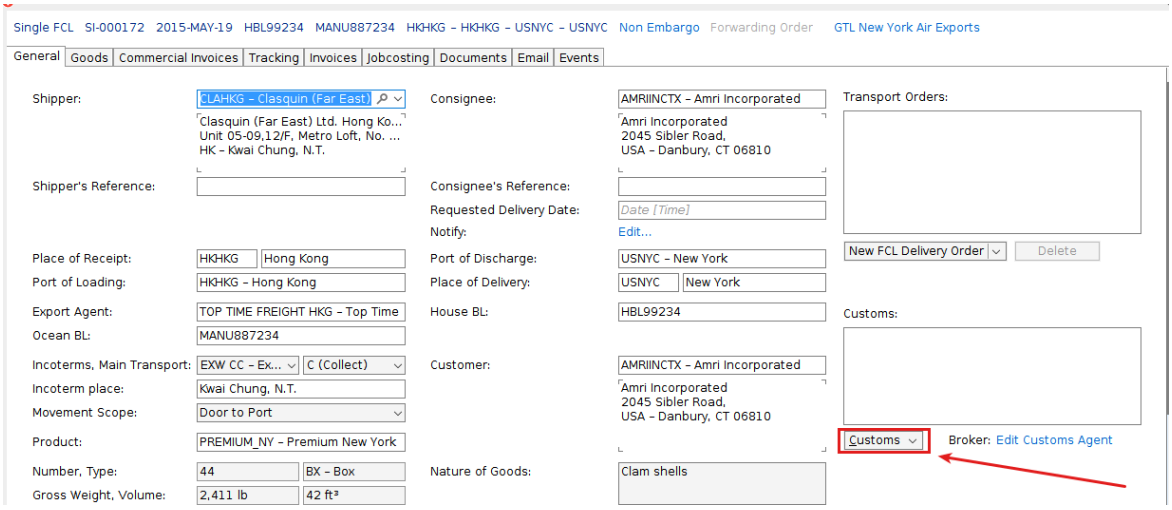
When goods are moving within the USA under bond, you will have to register the In-Transit details within the Scope shipment. This is done using an IN-Transit customs order and this document explains how to do this.

Creating the air or sea import shipment

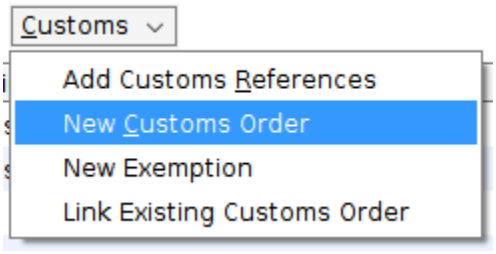
Create your air or sea import shipment in the normal way. You can apply your IT details to any type of shipment (house, master, FCL, LTL etc.)

Creating the IT customs order

Once the shipment has been created and saved, the "Customs" button to the right of the general tab of the shipment should be active:

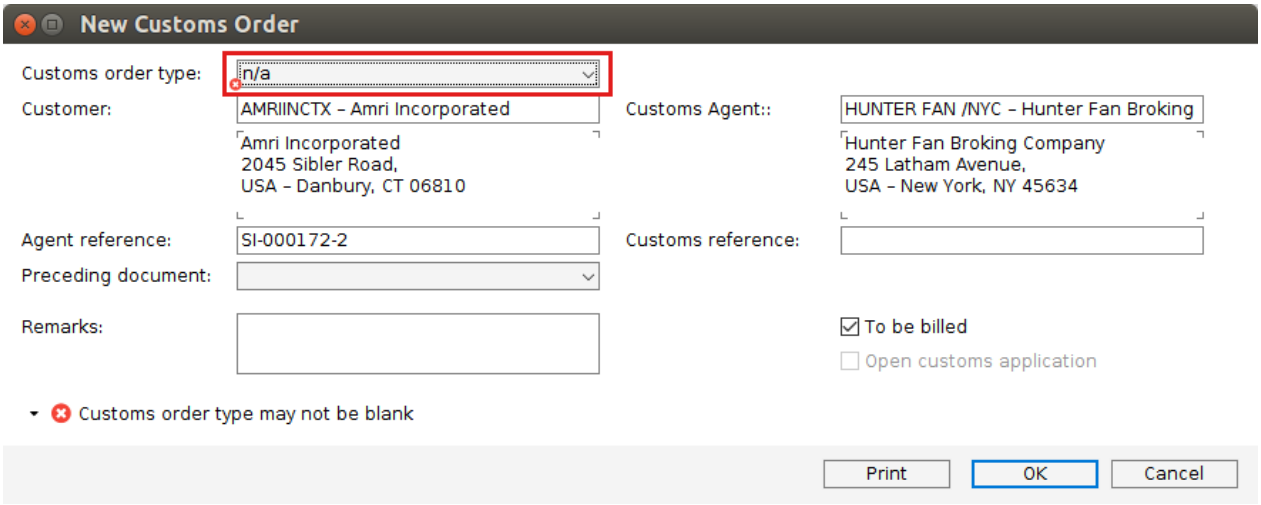


Click the customs button and from the drop-down menu choose "New Customs Order"

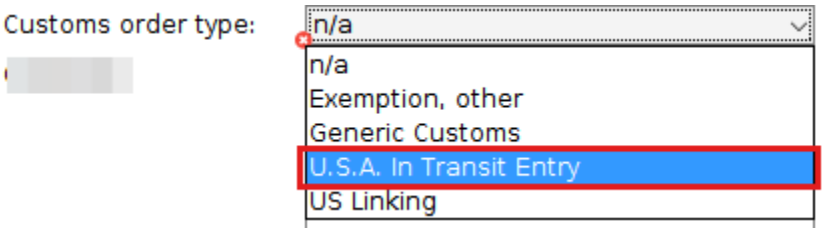


The "New Customs Order" will open. The first task is to choose the type of customs order:

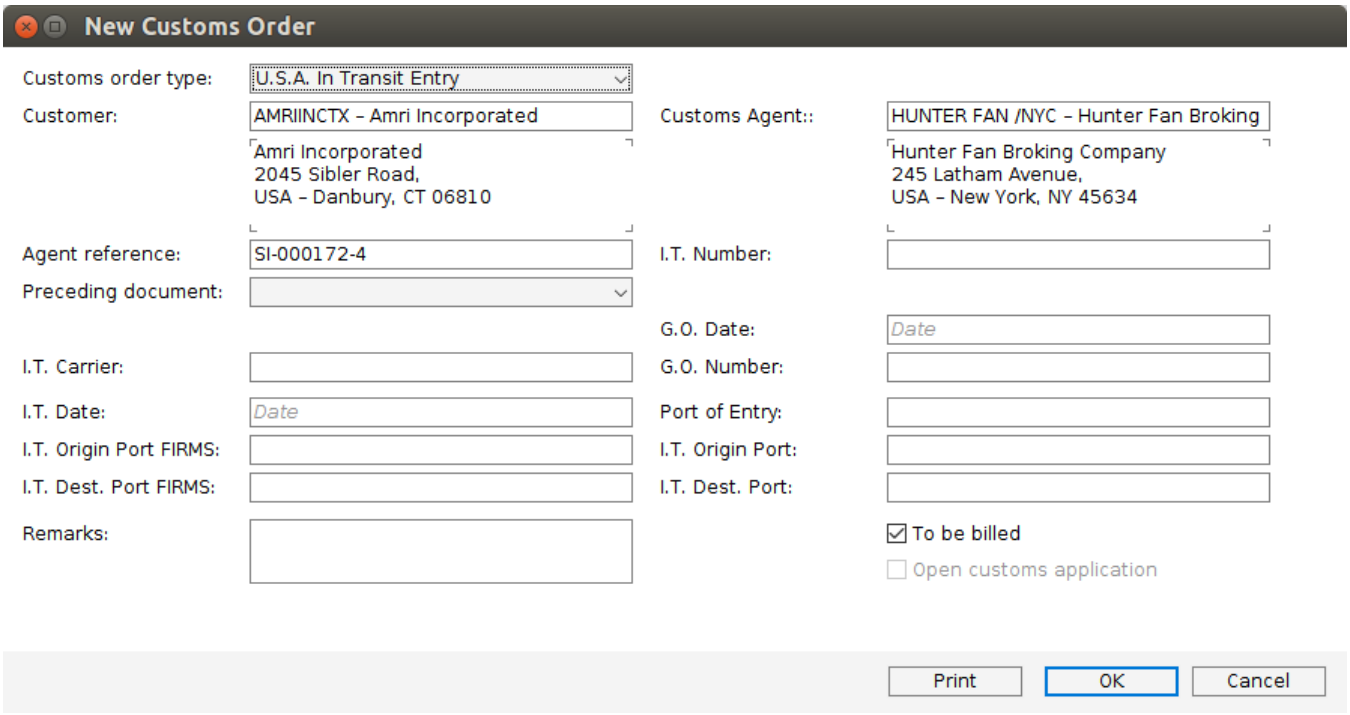
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click on the "Customs order type" drop-down menu and choose "U.S.A. In Transit Entry":



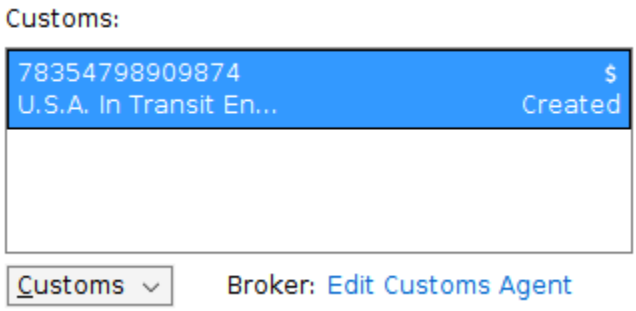
When the "U.S.A. In Transit Entry" is selected all the possible fields for an IT will appear:



Fill in the desired IT details. The most important of these will probably be the I.T. Number, the I.T. Date, the I.T. Carrier and the I.T. Origin Port

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click "OK" when all the required details are complete. The IT customs order will now close and you will return to the shipment. You will see in the customs window on the general tab of the shipment a summary of the IT details:



Editing an existing IT

If you need to open and change an existing IT, right click on the summary information of the IT and then select "Edit Customs Order"

FAQ How-To book and send a shipment with Inttra in Scope

- Introduction
- Accessing the carrier booking
- Creating the carrier booking
    - Spot rates
- Saving and Sending the carrier booking
- Booking Confirmation from the Carrier
- Amending or Canceling and Inttra booking
- Sending B/L instructions
- Carrier tracking information

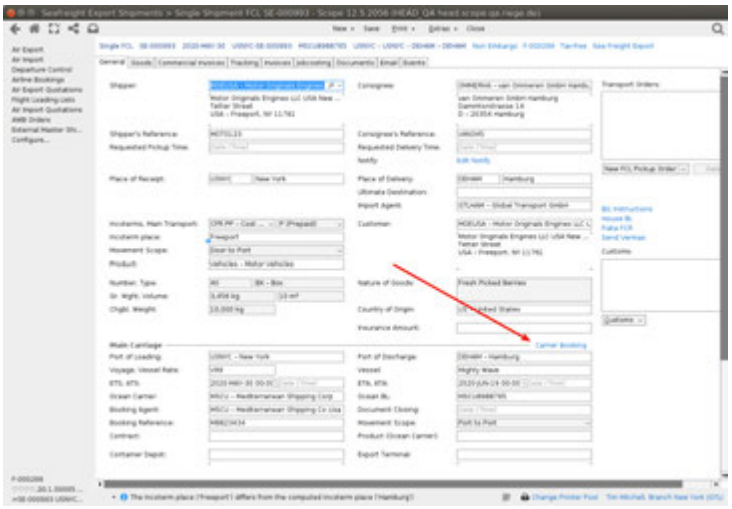
Introduction

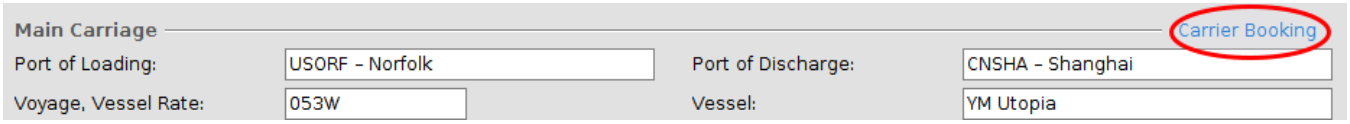
Booking sea export FCL shipments via Inttra is a great idea because it is:

- Much faster
- More accurate
- Confirms almost immediate booking with the line
- Pulls in all the line's tracking details for the shipment

Accessing the carrier booking

Once your Scope system has been connected to Inttra, on the "General" tab of a sea export shipment you will see the "Carrier Booking" link becomes active to the left of the "Main Carriage" section:



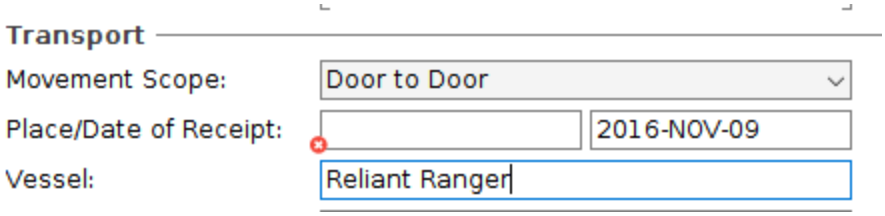


Click this "Carrier Booking" link

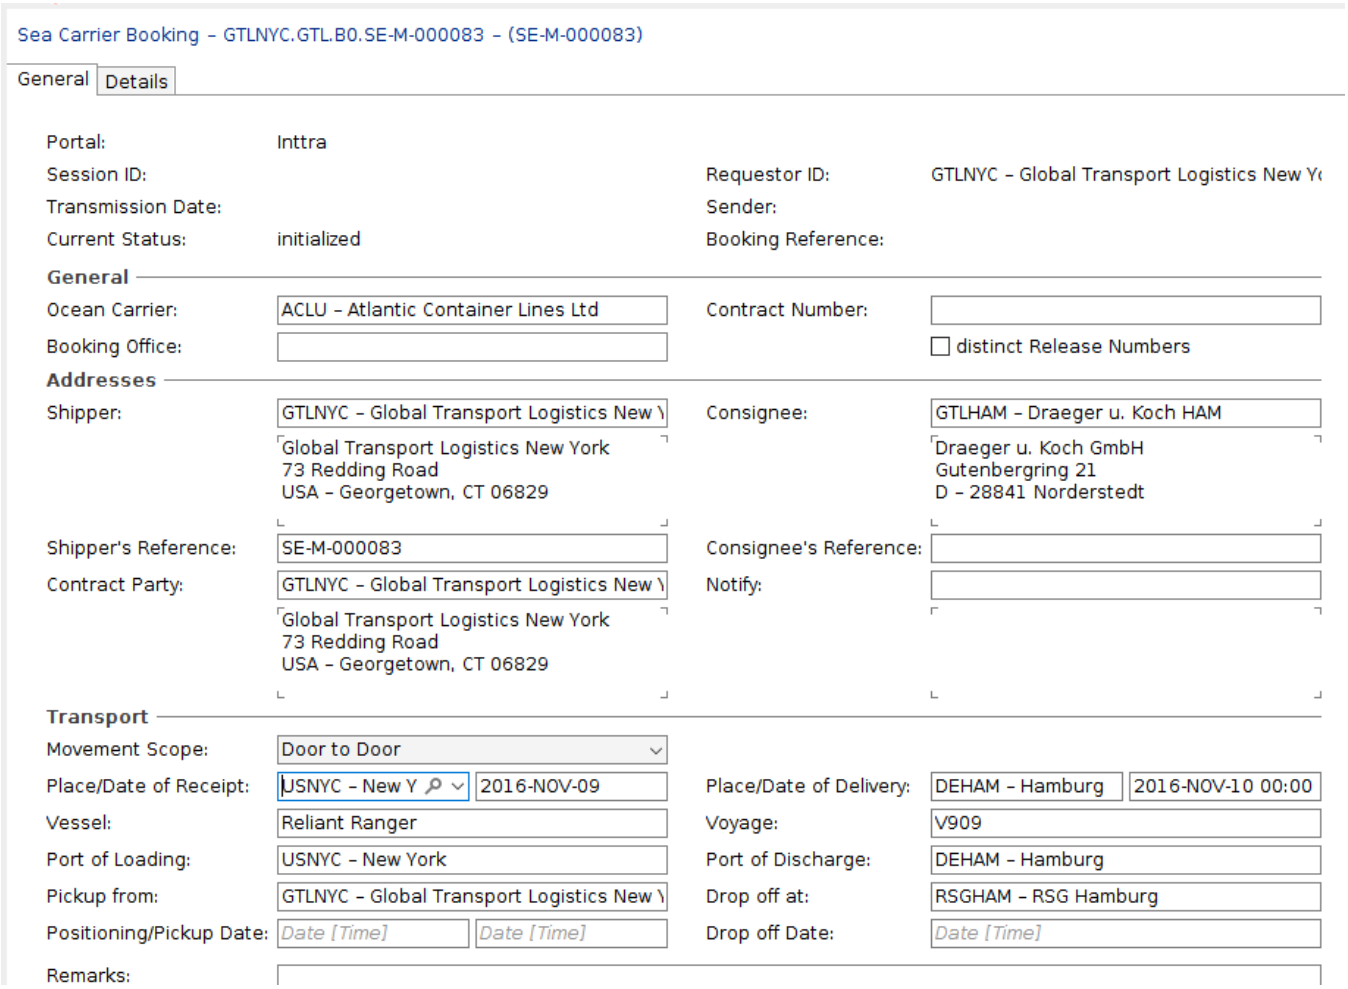
Creating the carrier booking

Most of the details from the shipment will default into the carrier booking. Check these details and amend any that need changing. If there are mandatory fields missing that must be transmitted to the carrier, these will be clearly marked by the red error icon:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Once all errors are resolved the carrier booking should look similar to the example below:



Spot rates

If you have a spot rate with the carrier, enter the spot rate number in the "Contract Number" field.

Saving and Sending the carrier booking

Once all the required fields of the carrier booking are complete, use the menu bar options to save the booking or send it to the carrier via Inttra:

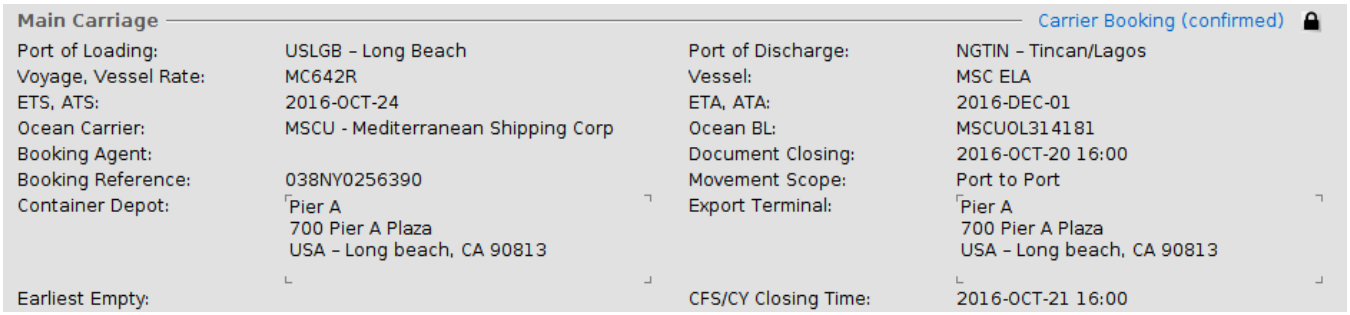
If the carrier booking is saved but not sent, then it will be shown in the general tab as "initialized":

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Booking Confirmation from the Carrier

Once the carrier booking is sent to the carrier via INTTRA, the carrier should respond via EDI and confirm the booking. When this response is received, which should occur very quickly, it will be shown in the general tab as "Carrier Booking (Confirmed)".

When a carrier booking is confirmed, the "Main Carriage" details will be automatically updated by the carrier:



if it is necessary to make manual adjustments to these main carriage details, the click the lock icon to the right of the blue "Carrier Booking (confirmed)" link:

As in the above example, the carrier has sent the container depot and export terminal. These can be mapped to Scope partners in order to automatically add these locations to the shipment entry. Ask your Scope support department for assistance with this.

Amending or Canceling and Inttra booking

Click on the "Carrier Booking (confirmed)" link to open it, then from the menu bar select, amend booking or cancel booking:

In the case of amending a booking, be sure to send it again to the carrier when ready.

Sending B/L instructions

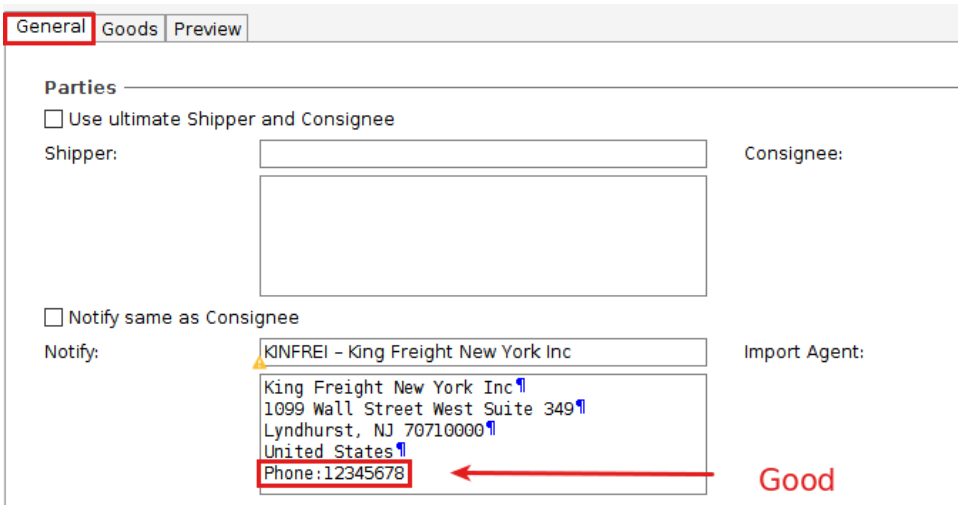
Once the booking is confirmed by the carrier, B/L instructions can be sent to the carrier.

On the general tab of the shipment, click the B/L intructions as usual:

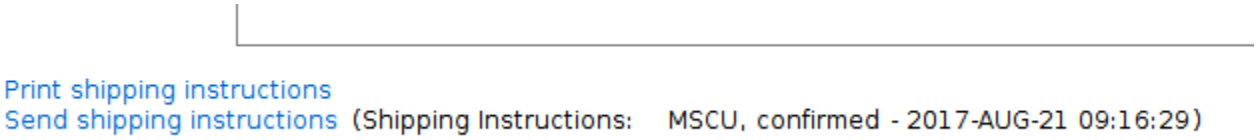
Now complete the B/L instructions as normal.

NOTE! If you wish to include extra information on the B/L Instructions, like phone numbers for shippers and consignees, these must be added to the shipper and consignee addresses on the general tab of the B/L instructions editor. They should **NOT** be added to the preview. Information manually added to the preview is not sent to the carrier. Information added to the General and Goods tabs of the B/L instructions editor will automatically show up in the preview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When the B/L instructions are ready to transmit, on the "Preview" tab of the B/L instructions editor, click the blue link "Send shipping instructions". As per the screenshot below, when the carrier receives and these, a date and time the carrier confirmed will be shown:



Carrier tracking information

once a shipment is booked via EDI with a carrier, the carrier will automatically update the shipment with tracking events and these can be shown in the tracking tab of the shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

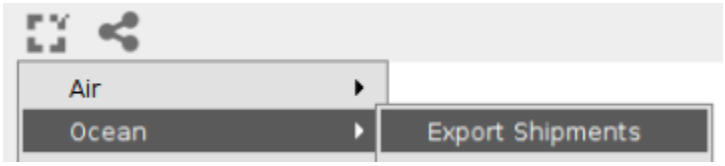
FAQ How-To build a sea export consolidation

- Create the House shipments
- Create the Master Shipment
- Adding House shipments to an existing Master

When you have sufficient freight to create your own master shipment, you will need to consolidate all your individual house shipments on the master shipment. This how-to explains how both house LCL and house FCL shipments can be consolidated on a master shipment.

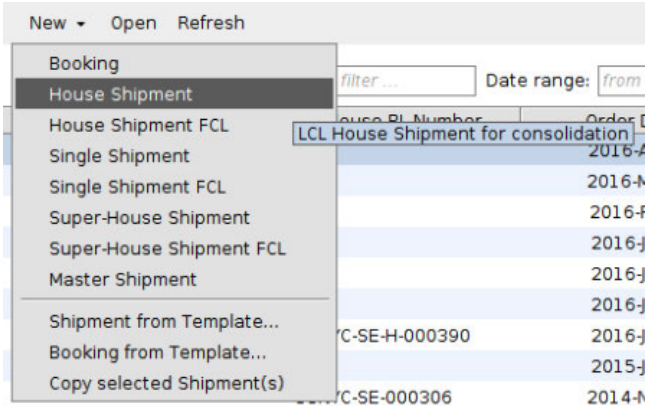
Create the House shipments

Navigate to the sea export shipment application:

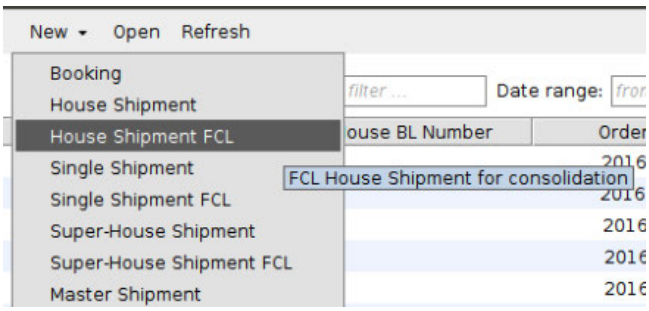


A master shipment can be all LCL shipments or it can be all FCL shipments, or it can be a mixture of both. The important thing is that if an LCL or FCL shipment is going to be consolidated on a master, then it must be the correct shipment type.

If the shipment for consolidation is a house LCL, then from the *New* menu option choose House Shipment. This is the only kind of LCL shipment that can be consolidated on a master.



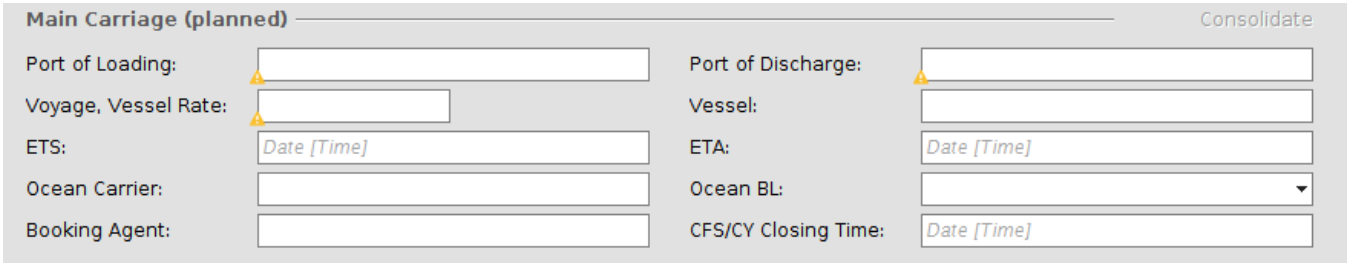
If the shipment for consolidation is a house FCL, then from the *New* menu option choose House Shipment FCL. This is the only kind of FCL shipment that can be consolidated on a master.



Create these LCL, or FLC shipments in the normal way.

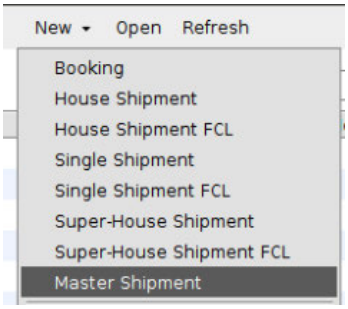
> Note that in both a house LCL and house FCL, there is a section where you can enter the master shipment details and this is called the *Main Carriage* and is shown below. This can be completed, but keep in mind that as soon as this house shipment is consolidated on a master, all of this information will be replaced by the true main carriage information from the master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

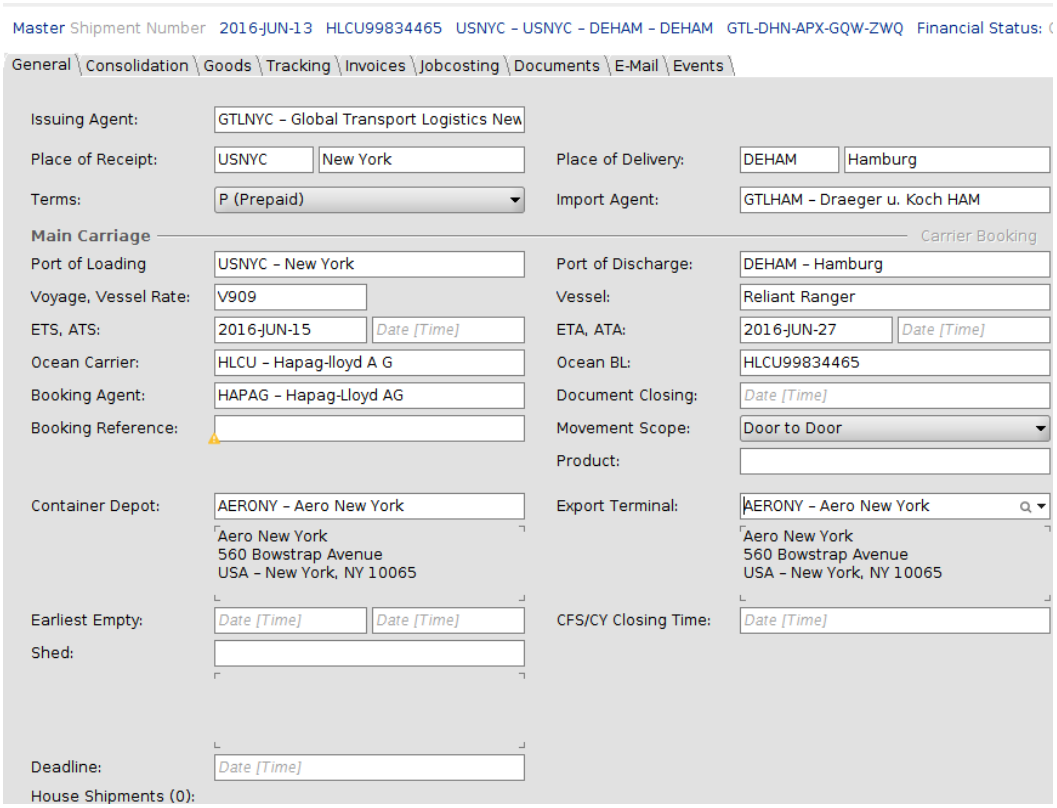


Create the Master Shipment

When the house shipments are ready, it is time to create the master. In the sea export application choose *Master Shipment* from the *New* menu:

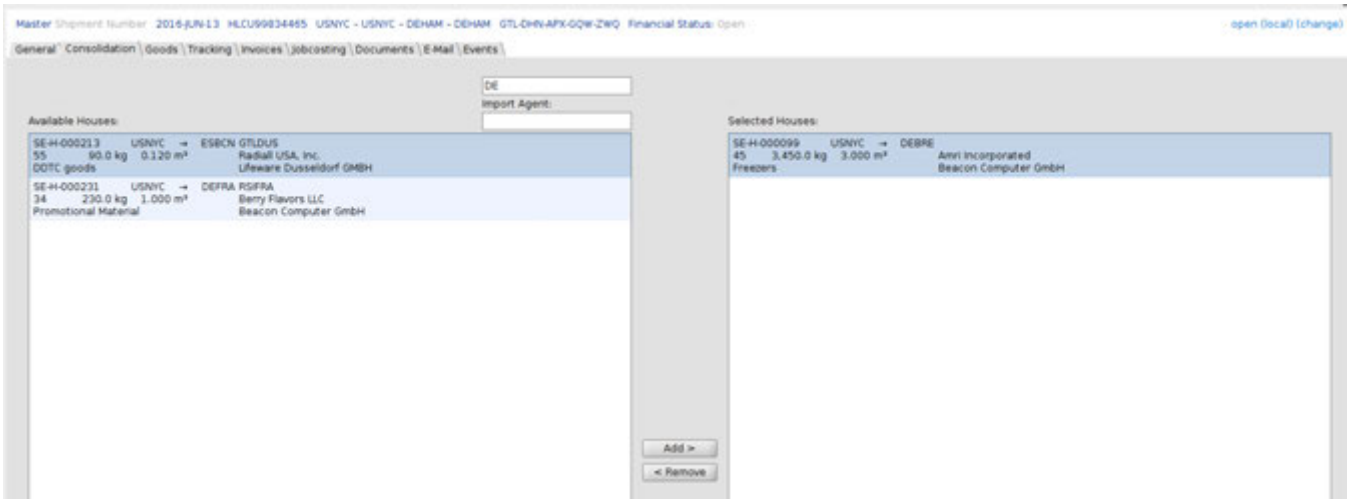


Enter all the master details into the master shipment:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When the master details are entered, click on the *Consolidation* tab to start adding houses to the master. In the example below the search criteria has been shortened to "DE" to display all available house shipments ready for Germany. One of these has been added from the *Available houses* on the left to the *Selected houses* on the right. The house *SE-H-000213* is highlighted on the left and can be added to the *Selected houses* on the right with the *Add* button:

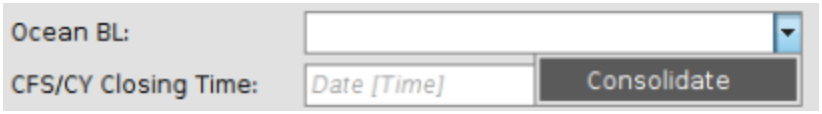


Once all the houses have been selected in this way, click Save from the menu-bar. You are now ready to print master documents and create *B/L instructions* from the *General* tab of the master.

Adding House shipments to an existing Master

The house shipments do not have to be created before the master shipment. It is quite easy to add a new house shipment to an existing master shipment:

1. Open the new house shipment which can be a house or a house FCL
2. Put the cursor in the field *Ocean BL* and click on the drop-down arrow that appears.
3. Click on the option *Consolidate*



the master shipment finder will appear. Use the search fields to find the desired master shipment to add the house to. Click on the desired master shipment and then click on *Consolidate* to confirm the house is on the selected master.

FAQ How-To choose and setup Inttra events in Scope

- Introduction
- Events from Inttra
- Create a Tracking Template that includes Inttra events
- Testing the event
- Common Inttra events

Introduction

When Scope is connected to Inttra and sea export bookings and shipping instructions are sent to carriers via intra, the Scope Tracking tab can display the events sent back by the carrier. This how-to explains how to set this up

Events from Inttra

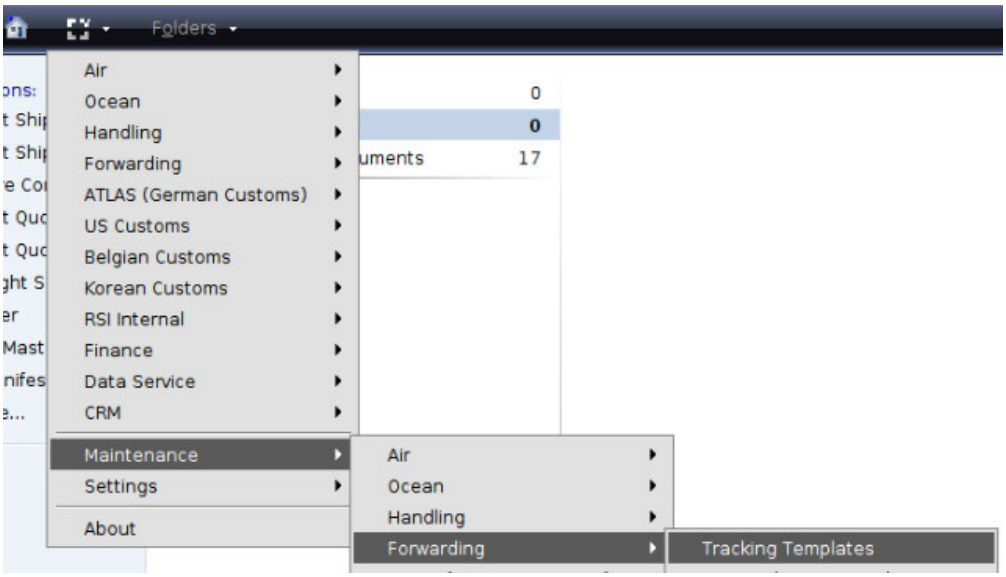
this is a list of events that can be received by Scope from Inttra. Any or all of these can be displayed in the tracking tab of a shipment with correct setup.

INTTRA-code	Event-Description
A	Arrived
AE	Loaded on vessel
AL	Loaded on rail
AM	Loaded on truck
AR	Rail arrival at destination intermodal ramp
D	Completed unloading at delivery location
CR	Carrier release
EE	Empty equipment dispatched
I	In-gate
L	Loading
OA	Out gate
RD	Return container
T	At terminal; INTTRA-terminal movement
UV	Unloaded from vessel
VA	Vessel arrival
CU	Carrier and customs release
VD	Vessel departure

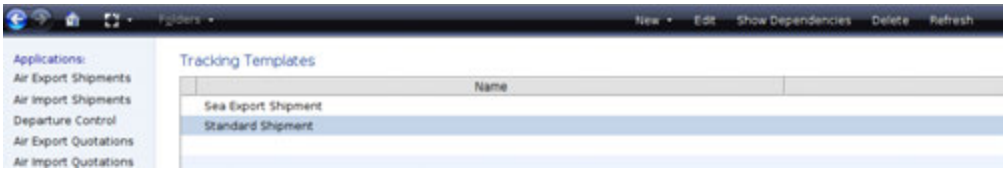
Create a Tracking Template that includes Inttra events

From the main menu choose "Maintenance" and then "Forwarding". From the maintenance Forwarding sub-menu choose "Tracking Templates"

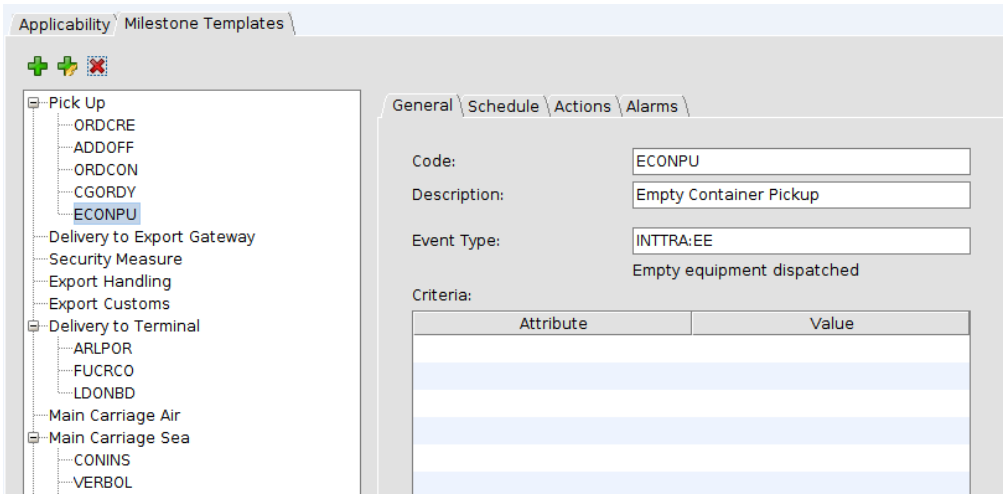
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Choose the Standard Shipment template



Select the "Milestones Templates" tab



Each leg of the shipment is shown, for example "Pick-up" and for each leg, events may be defined. Select the event that corresponds to the Inttra event and in the "Event Type" field for that event, insert the Inttra event. This is a search field that should assist finding the correct Inttra event

Testing the event

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If no event is finalized in a shipment, then the new tracking template can be tested. Open the "Events" tab of the shipment which automatically shows all Inttra events, highlight an Inttra event and right click it to choose "Replay Event". The event should now appear in the tracking tab of the shipment.

Common Inttra events

the following events are the standard set received in the USA

UV	Unloaded from Vessel
VD	Vessel departure
AE	Loaded on Vessel
I	In-gate
CU	Carrier and customs release
OA	Out-gate
EE	Empty equipment dispatched

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To Complete Sea Import Arrival Locations

- Arrival Locations
  - Import Terminal
  - Shed
  - Container Depot
- Terminal Entry
- Terminal Exit and Container Depot Entry
- Warehouse Entry

Arrival Locations

A sea import shipment entry provides 3 arrival locations:

- Import Terminal
- Shed
- Container Depot

In addition a Terminal Entry can be made for each container detailing :

- Unloading Date
- Demurrage Date
- Terminal Reference
- Customs reference
- Remarks

For each item in the container a warehouse entry can be created detailing:

- Date and Time (in warehouse)
- Storage Free until date
- Warehouse Reference
- Customs reference
- Remarks

This How-To explains the purpose and us of these arrival details

Import Terminal

This is the terminal where the container is unloaded from the Vessel. In some cases There is no need to register a shed or create a terminal entry for the container, because the container is collected directly from the terminal for delivery. In this case enter just the Import Terminal and use the "Detention Deadline" field to indicate when demurrage will occur. In this case the Import Terminal is the freight location.

Shed

When the container is moved from the terminal to a storage location, this location is the Shed. In some cases the goods may be devanned at the Shed. The "Detention Deadline" field is used to indicate when demurrage will occur at the shed. In this example the Shed is the freight location.

Container Depot

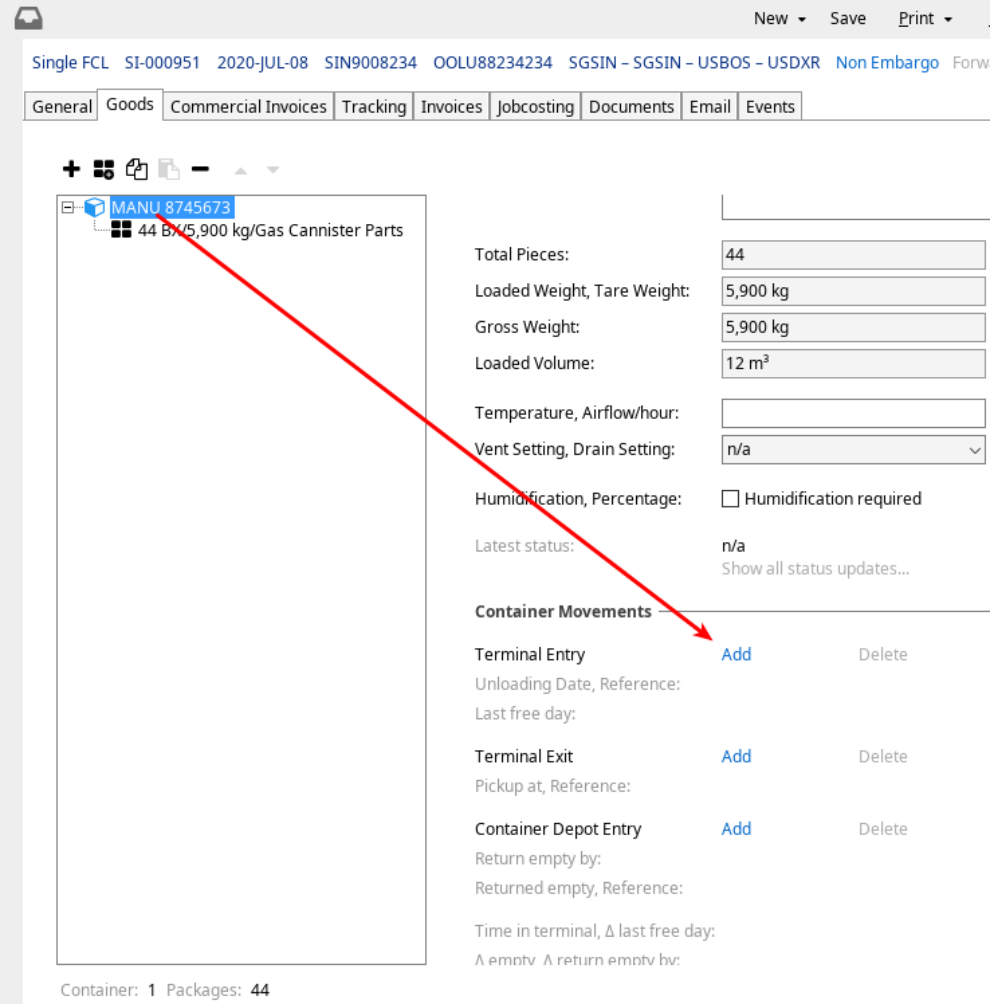
This is the depot to which the container should be returned.

Terminal Entry

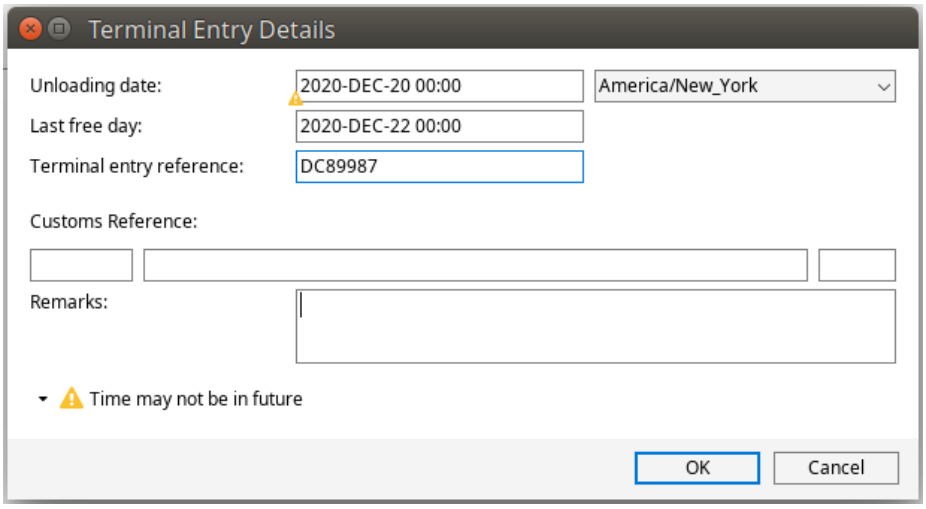
Where a shipment is made up of multiple containers or more detailed arrival details need to be created for a specific container, then a terminal entry is created.

1. The first step in creating a terminal entry is to make sure the "Import Terminal" on the general tab of the shipment is eneted.
2. Next, go to the goods tab of the shipment, highlight the desired container and in the lower section "Container Movements" click the blue Add link that appear to the right of the "Terminal Entry" label

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



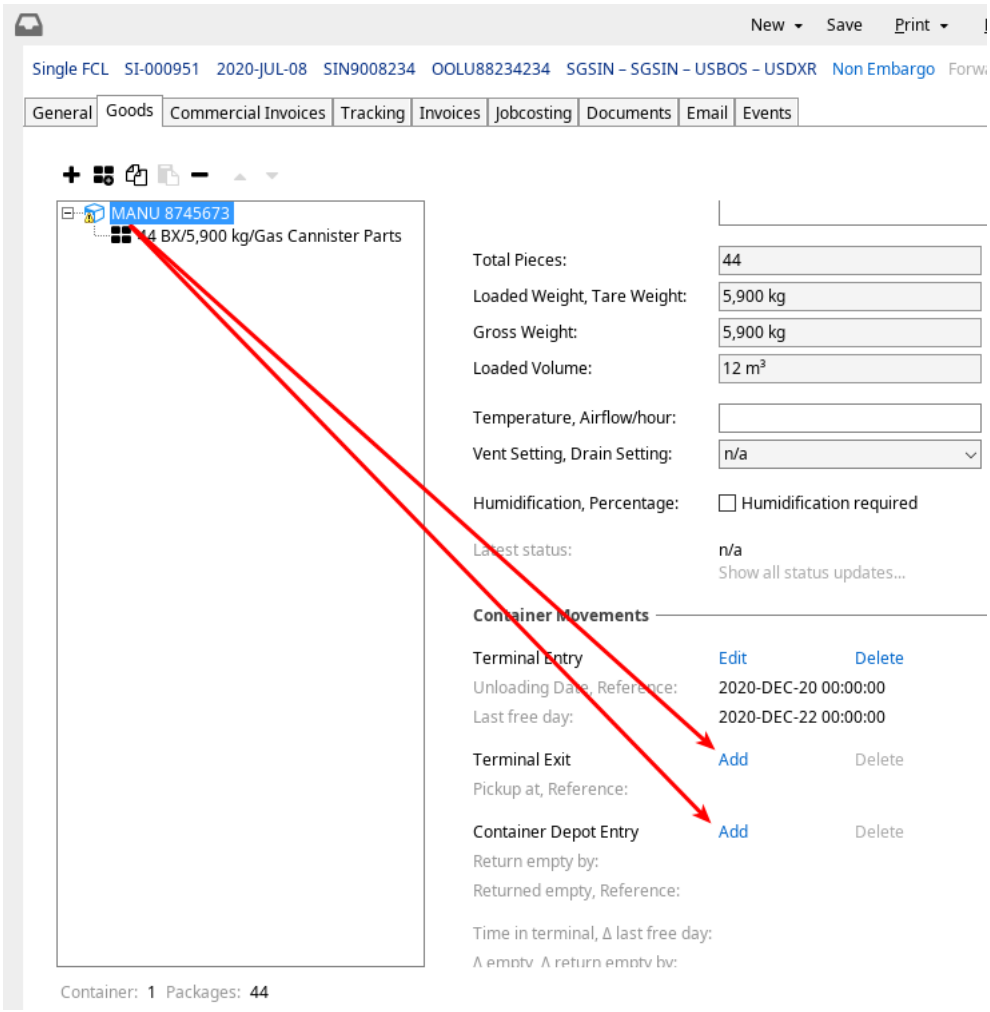
Now complete the desired fields of the terminal entry

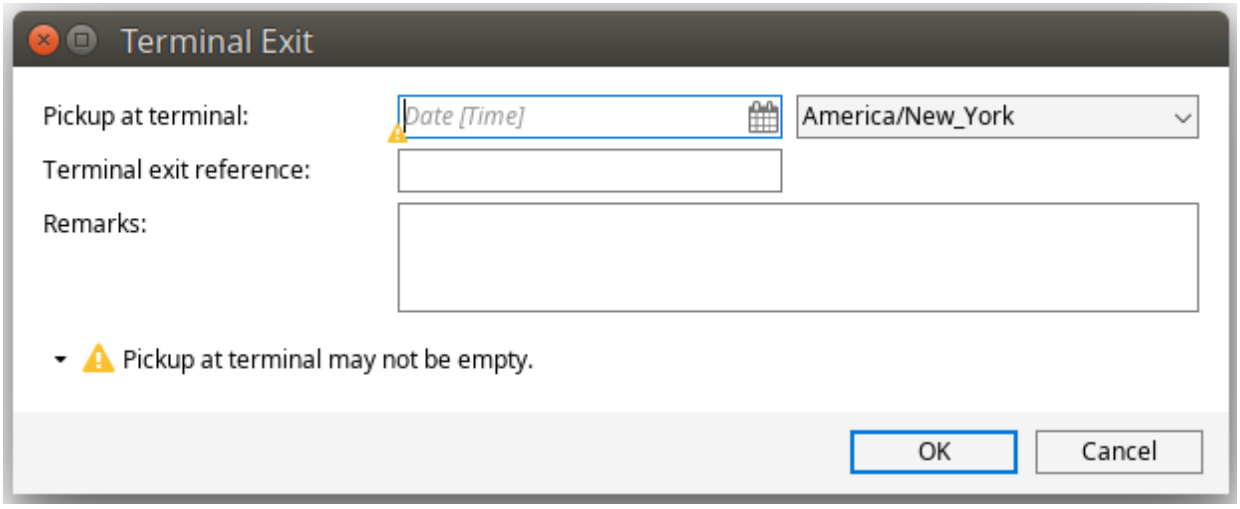


Terminal Exit and Container Depot Entry

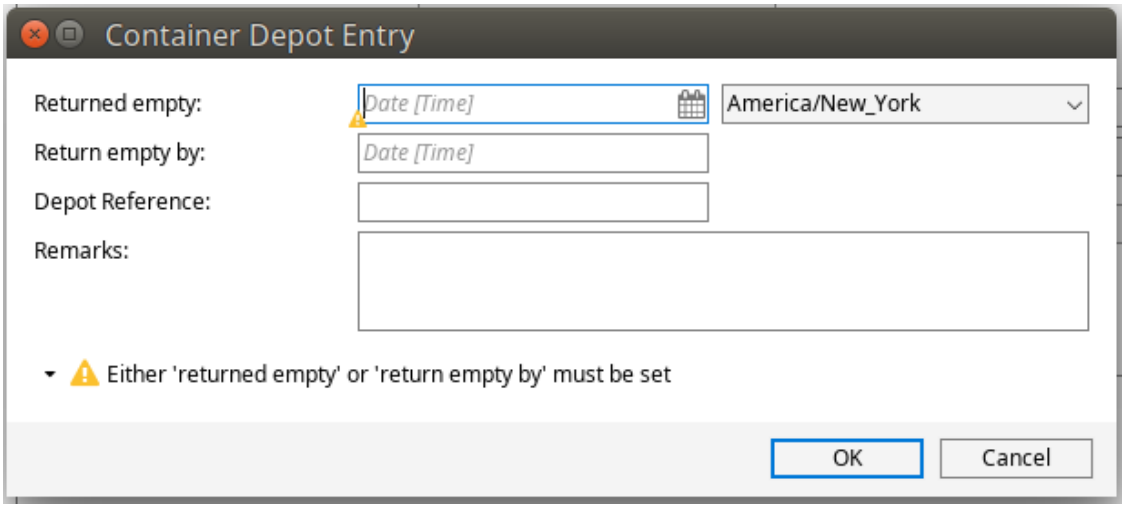
Note that in addition to terminal entry details, for each container, Terminal Exit and Container Depot Entry details can also be added

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





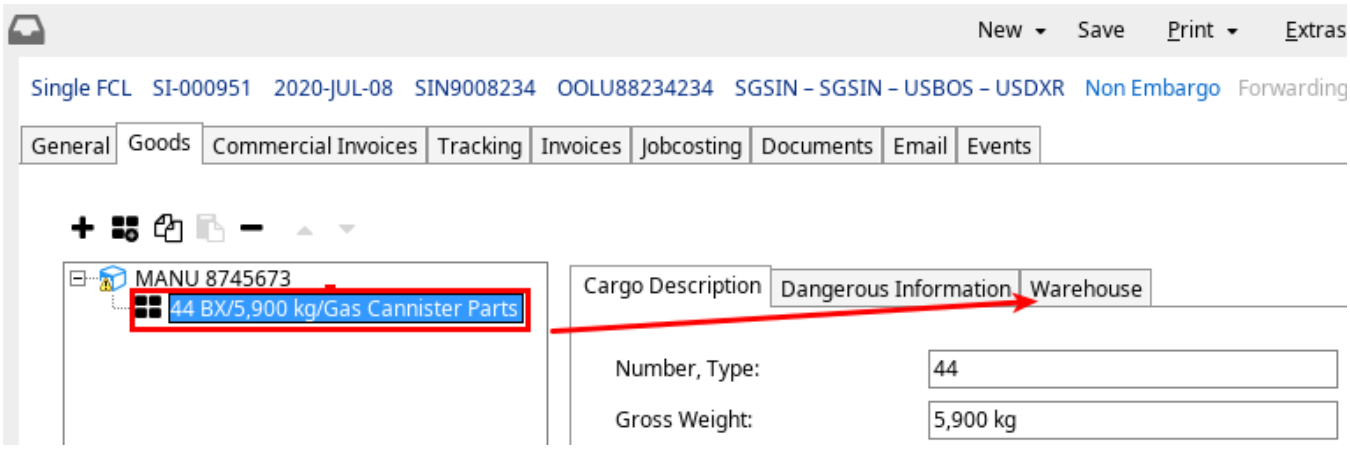
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Warehouse Entry

When goods are devanned from a container, it may be necessary to store warehouse details for each set of goods. For example each set of goods may have a specific warehouse reference, customs reference etc.

To create a warehouse entry go to the goods tab of the shipment, highlight the desired goods and then click the "Warehouse" tab for the goods and make new "Take-In" or "Take-Out" entires for the goods.



Note

A warehouse entry cannot be created until a terminal entry has been created for the container in which the goods arrived.

FAQ How-To register a terminal entry in Sea Imports

- Register the import terminal
- Register the terminal entry
- Register the warehouse entry

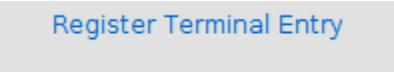
The terminal entry in sea imports is used to capture the terminal where the import container will be located including important details like the unloading date and the demurrage date. Customs references for the container are also stored. Once a terminal entry has been created, warehouse entries for all of the goods in the container may also be created.

Register the import terminal

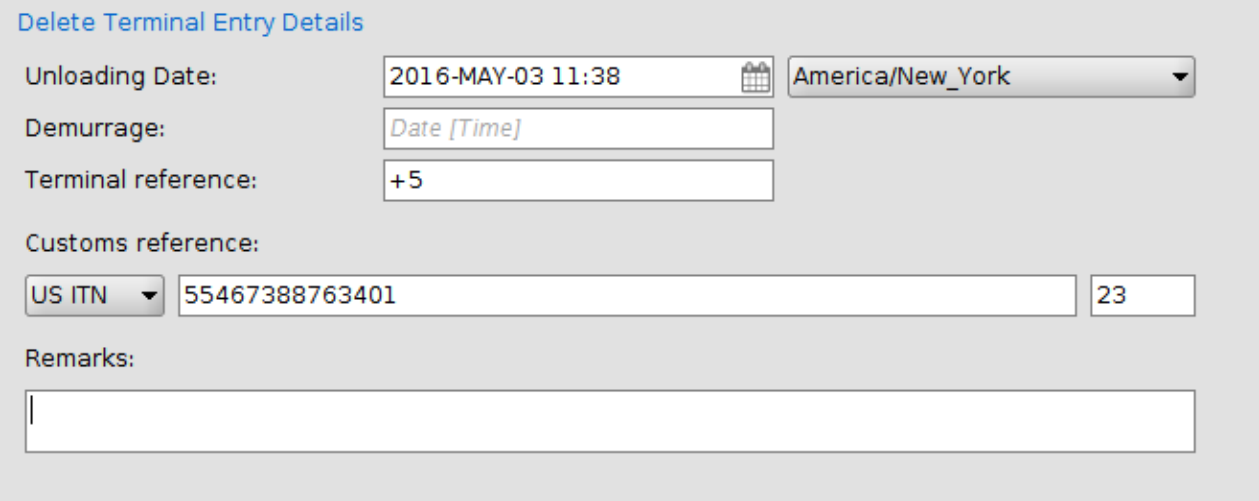
a terminal entry cannot be created unless the sea import shipment has an import terminal entered in the general tab of the shipment.

Register the terminal entry

Now that the import terminal has been entered, on the goods tab, highlight the container that requires a terminal entry and click the blue action link "Register Terminal Entry".



Click on this action link and the details about the storage of the container in the terminal can be entered.

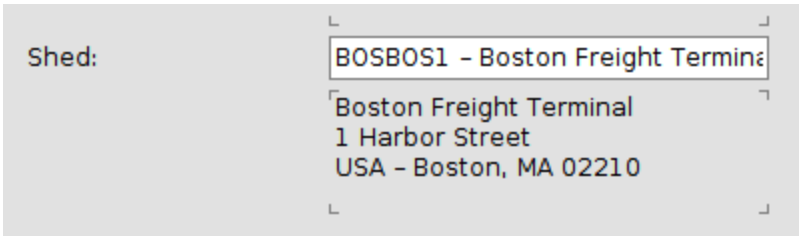


To remove a terminal entry, click the "Delete Terminal Entry Details" link

Register the warehouse entry

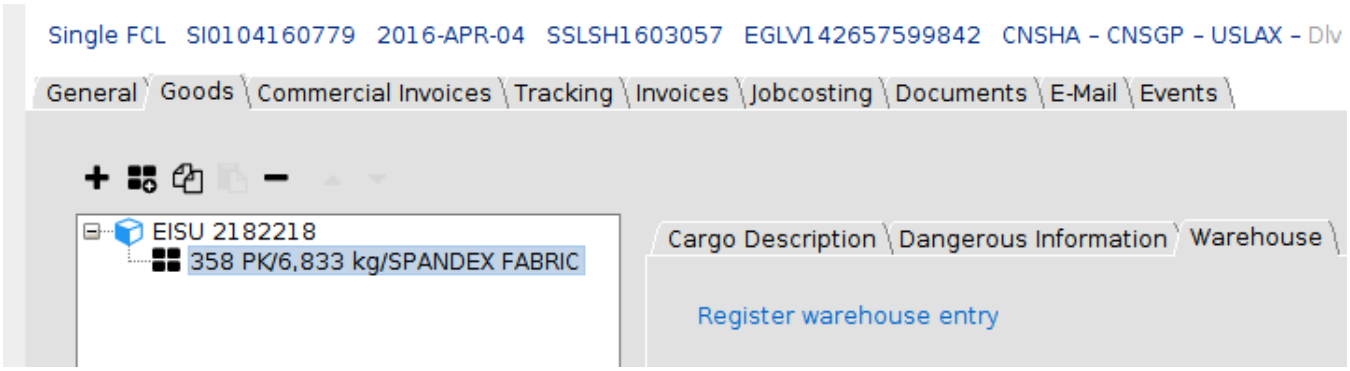
In order to create a warehouse entry for the goods in the container, the steps above registering the container must be completed. In addition a "Shed" location must be entered on the general tab of a master shipment, or in the case of single and single FCL shipments, the shed must be entered on the general tab of these shipments.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

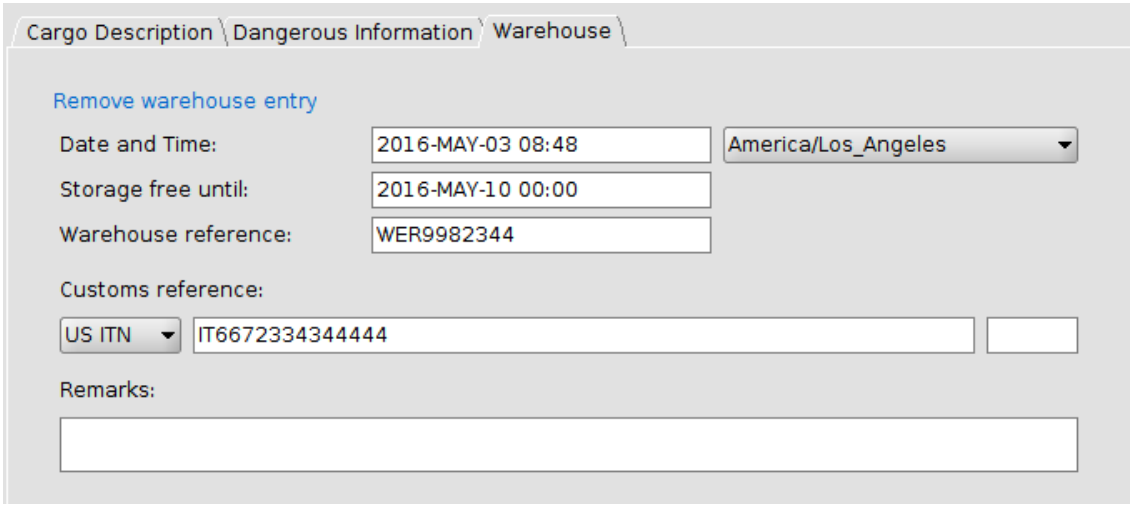


Once this is done, it is possible to create warehouse entries for all the goods in the container.

On the goods tab, highlight the cargo that requires a warehouse entry, the blue action link "Register warehouse entry" should be active.



Click the"Register warehouse entry " link to enter the warehouse details



All details entered for both the container and goods can be printed on documentation

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To create an ISF entry in Scope

- Background
- Starting the ISF program
- Navigating to an ISF entry in Sea Exports
- Navigating to an ISF entry in Sea Imports
- Creating a stand alone ISF entry or viewing and searching all existing ISF entries
- Entering the ISF fields
- Printing or transmitting the ISF entry

Background

All sea import shipments going to the USA must have an ISF filing completed in advance of the arrival of the freight in the USA. These ISF filings can be done it Scope

Starting the ISF program

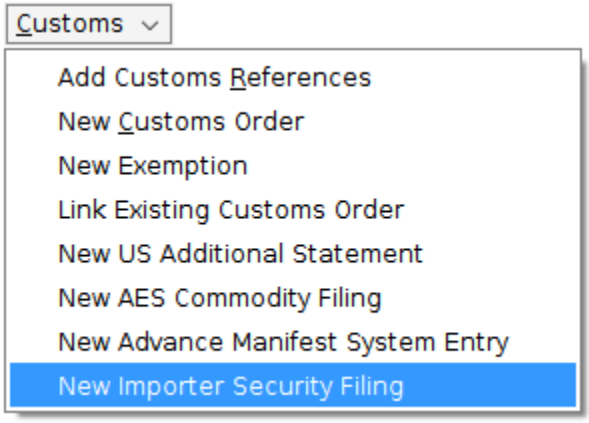
There are 3 ways to create an ISF entry

- In a Sea Export Shipment
- In a Sea Import Shipment
- As a standalone ISF entry

Navigating to an ISF entry in Sea Exports

The ideal time to create the ISF filing is when the sea export shipment is being created. This will ensure the ISF is available before the freight arrives in the USA and if the exporting branch is connected to the importing branch, the ISF entry will automatically be available to the import branch.

1. Create the Sea Export shipment, on saving this shipment the Customs button will be active
2. From the Customs menu choose "New Importer Security Filing"

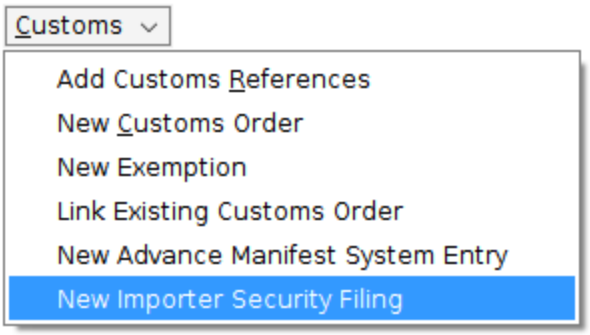


3.
4. Scope will ask if an ISF-10 or ISF-5 is to be created. Choose ISF-10 if all details are to hand. Choose ISF-5 if only partial details of the shipment are ready.
5. Next, select a template for the filing. If no template should be used, then choose "No Template"
6. Now the full ISF entry will open.

Navigating to an ISF entry in Sea Imports

1. Create the Sea Import shipment, on saving this shipment the Customs button will be active
2. From the Customs menu choose "New Importer Security Filing"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

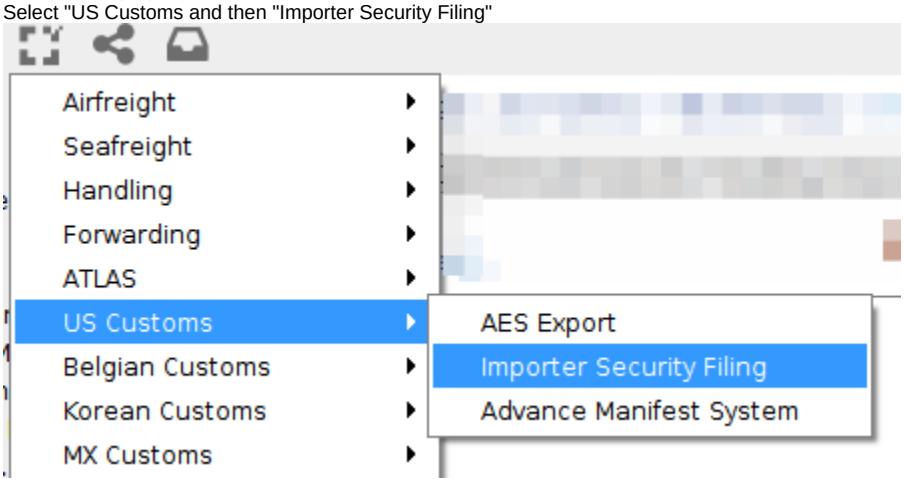


3.
4. Scope will ask if an ISF-10 or ISF-5 is to be created. Choose ISF-10 if all details are to hand. Choose ISF-5 if only partial details of the shipment are ready.
5. Next, select a template for the filing. If no template should be used, then choose "No Template"
6. Now the full ISF entry will open.

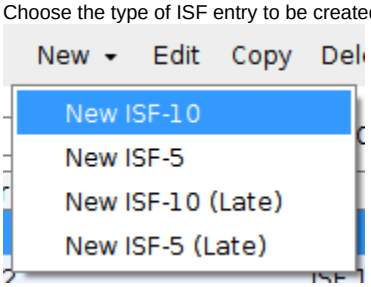
Creating a stand alone ISF entry or viewing and searching all existing ISF entries

If there is no shipment in Scope to link to the ISF entry, then the ISF entry can be created as a stand-alone

1. Click the Scope program Icon
2. Select "US Customs and then "Importer Security Filing"



3.
4. An overview of all ISF entries will appear
5. Click "New"
6. Choose the type of ISF entry to be created



7.

Entering the ISF fields

Complete all the ISF fields. Keep an eye on the error and warning messages at the bottom of the screen, this will advise which fields should be filled in.

A brief description of the fields:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Importer of Record - the party responsible for the import of the goods into the USA
- Buyer - the buyer of the goods
- Seller - the seller of the goods
- Consignee - the party to who the goods will be consigned on arrival in the USA
- Stuffing Location - the place where the goods were loaded into the container, or the port where break-bulk goods were loaded on the vessel
- Consolidator - the export party responsible for consolidating the goods into a container at the place of export
- Ship to - The FIRMS facility that the goods will be shipped to (if known)
- Bill of Lading - enter at least 1 bill of lading in the shipments section
- References - depending on the shipment and entry type, Scope will advise the references that should be entered.
- Manufacturer - the manufacturer of the goods
- Harmonized tariff Schedule - enter at least one commodity

Printing or transmitting the ISF entry

On completion of the ISF entry, it can be saved and printed.

If the Scope system is connected to CBP and the user is authorized to submit ISF entries, the "Send" button can be used to transmit the entry to CBP. All warnings must be removed in order to transmit an ISF entry.

FAQ How-To create a sea import master consolidation

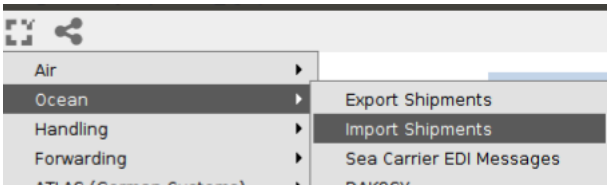
- Creating the master shipment
  - Adding containers to the master
- Creating and adding house shipments to the master
- Managing containers on the master
- Adding previously created house shipments to a new master

When an incoming sea import shipment is a master with more than 1 house it is called a consolidation. This how-to describes how to create the master and house shipments and then add the house shipments to the master.

It is possible to create the master shipment first and then the house shipments, or the reverse, the house shipments can be created first and then added to the master. This document first illustrates creating the master followed by the houses and in the last section explains how to add previously created houses to a new master.

Creating the master shipment

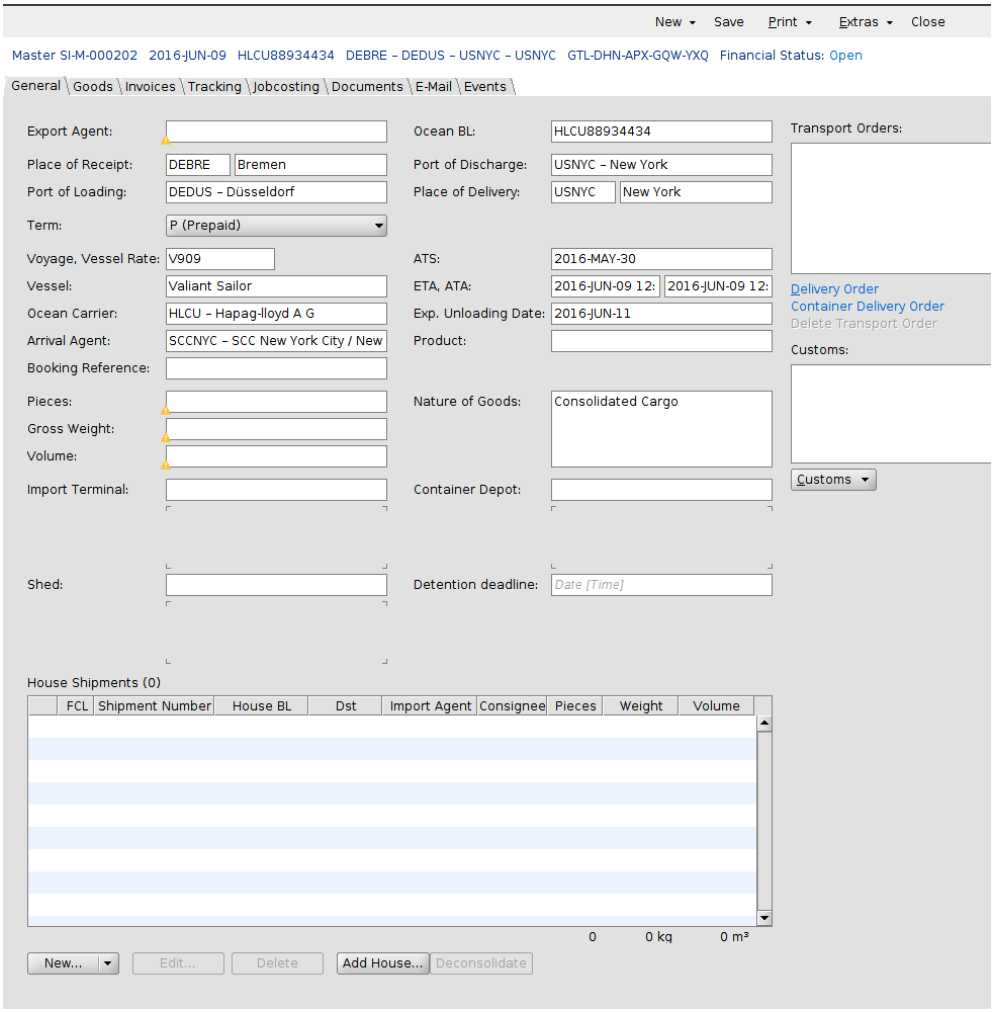
From the Scope menu select *Ocean* and then *Ocean Imports*



In the Overview of ocean imports select *New* on the menu-bar

This will open the master shipment entry. Enter all the details about the master shipment.

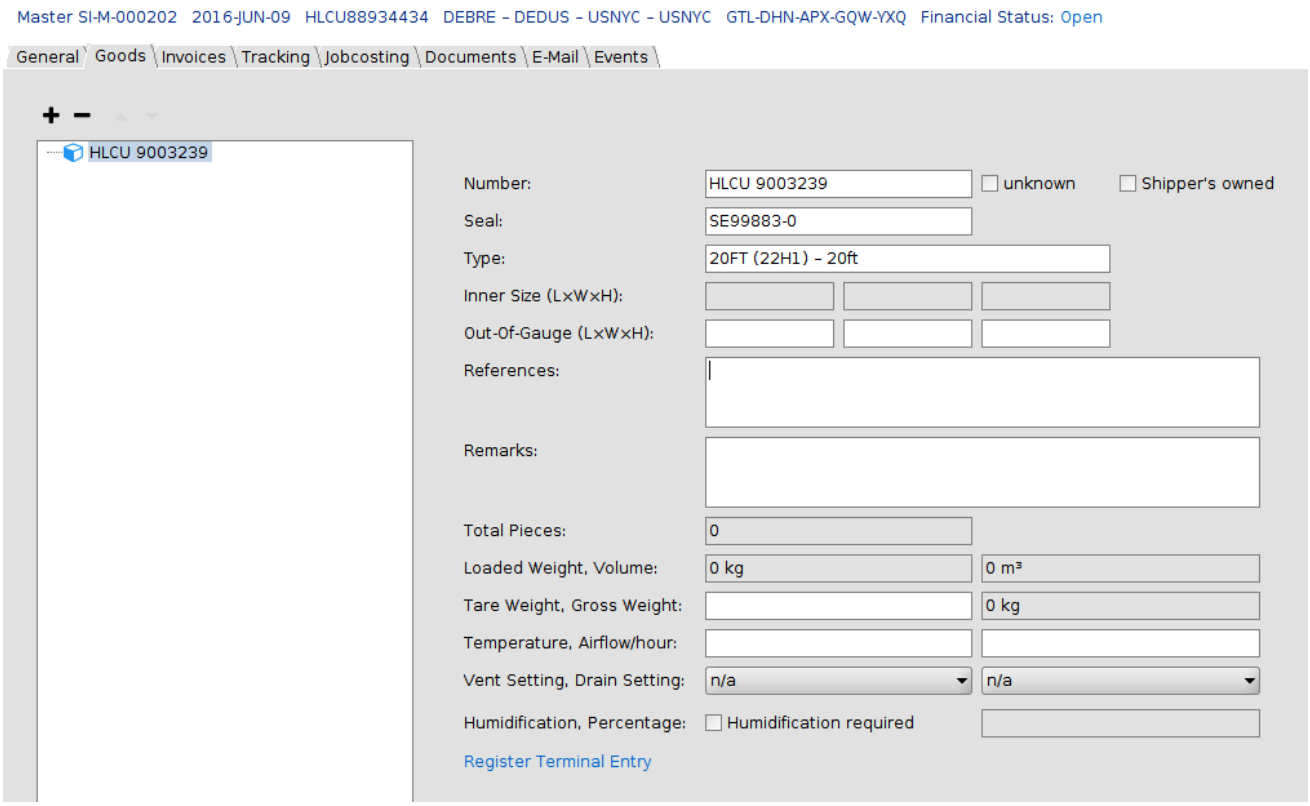
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Adding containers to the master

If the master has LCL shipments, then click on the *Goods* tab of the new master shipment to add the containers that hold the LCL shipments

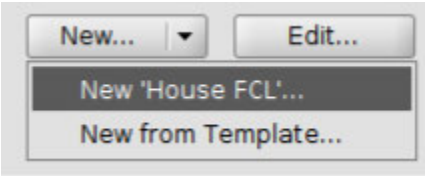
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Once all the master details are created and the containers are added, click *Save*

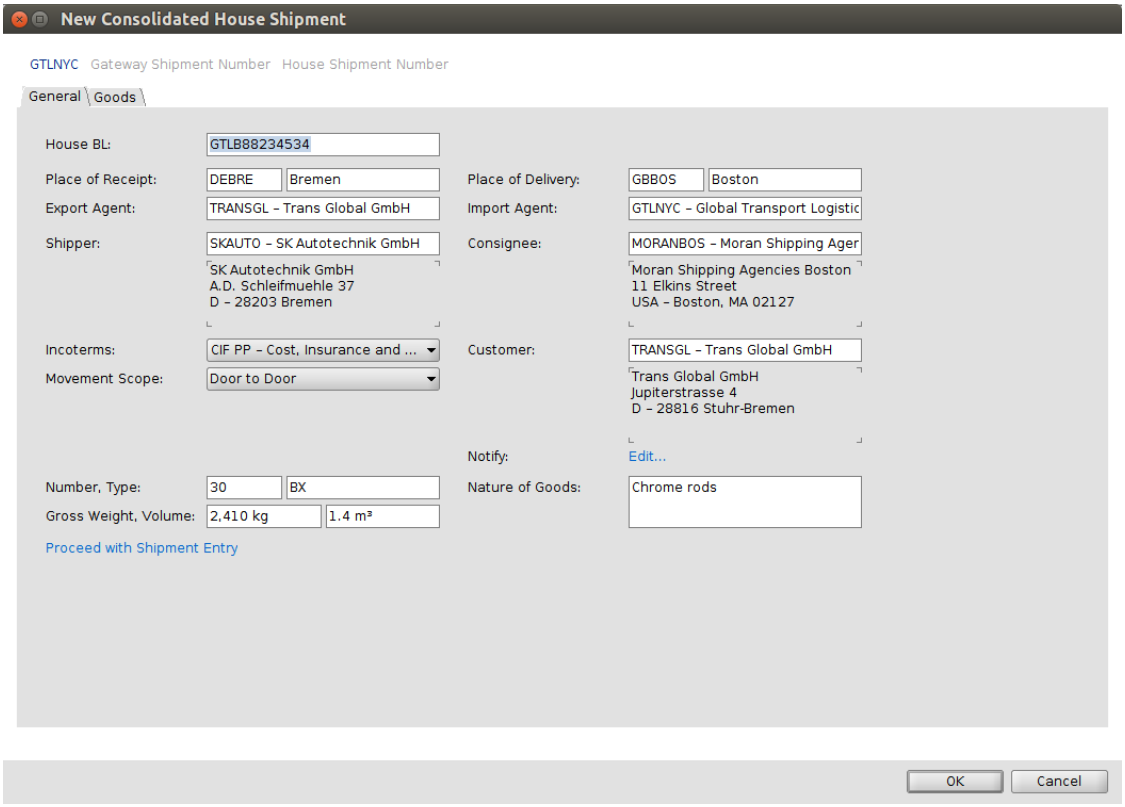
Creating and adding house shipments to the master

At the bottom of the new master shipment on the left, there is a button called *New*. For a new LCL shipment click this *New* button. If the house shipment is an FCL then use the drop-down menu option to the right of *New* and select *New 'House FCL'*

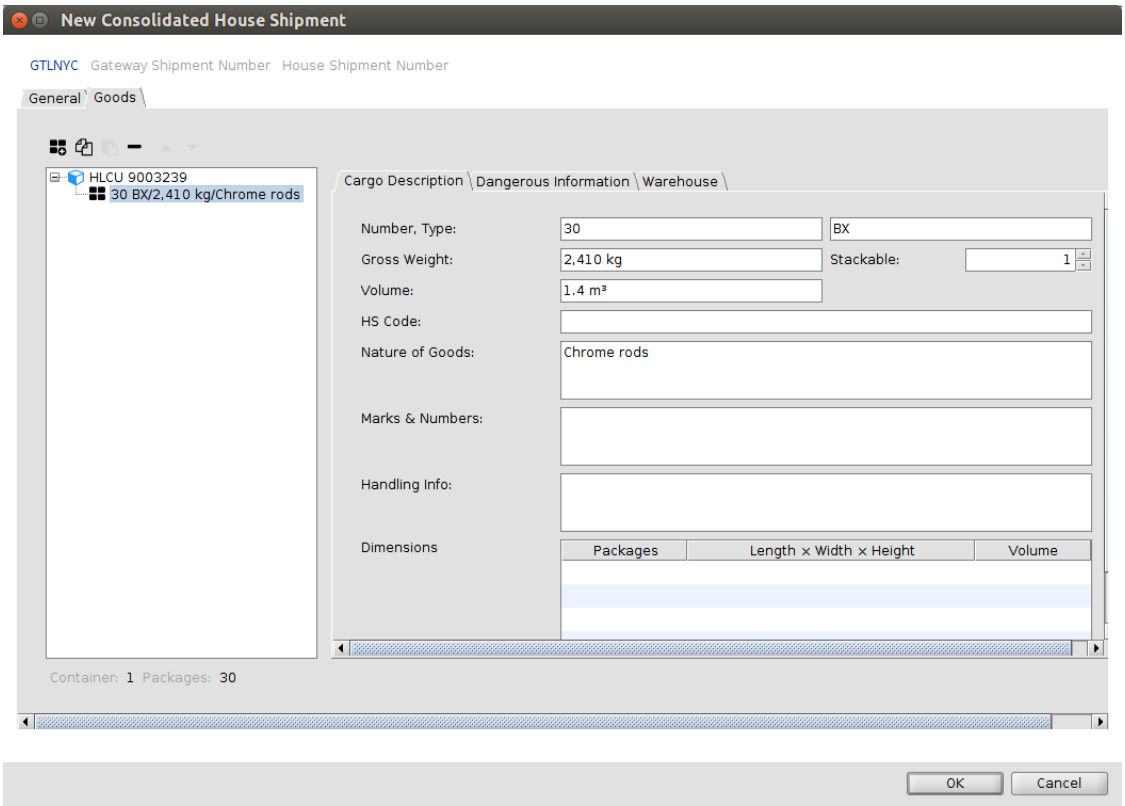


After clicking *New*, the quick house shipment entry screen appears. Complete all the details about the house shipment in this screen.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



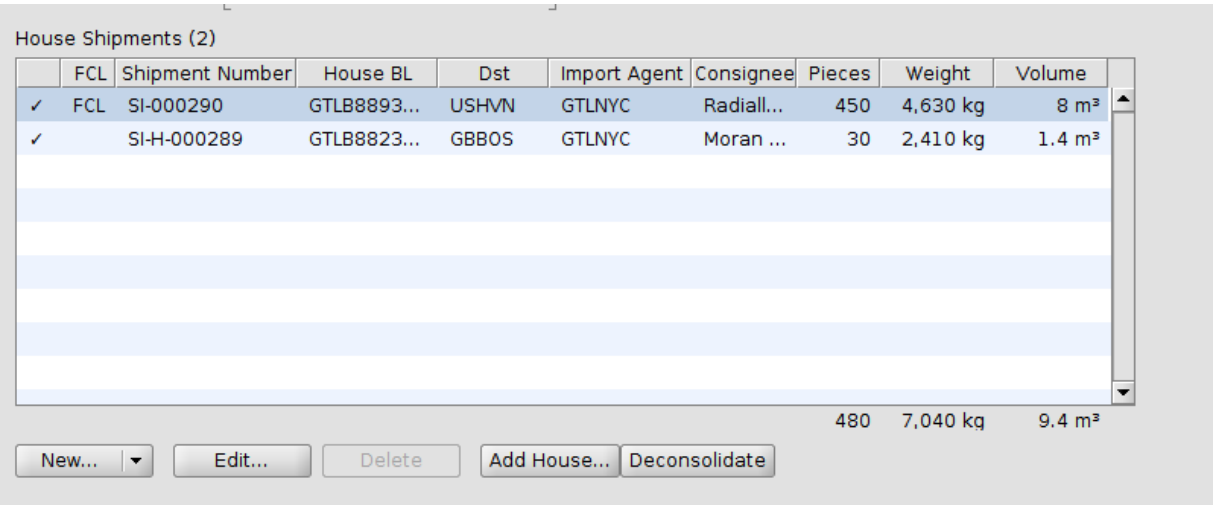
Once the basic details about the house shipment are entered, click the tab *Goods* and enter the goods details. If the house shipment is an FCL, then use the "+" symbol to enter the container and then add the goods to this new container:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

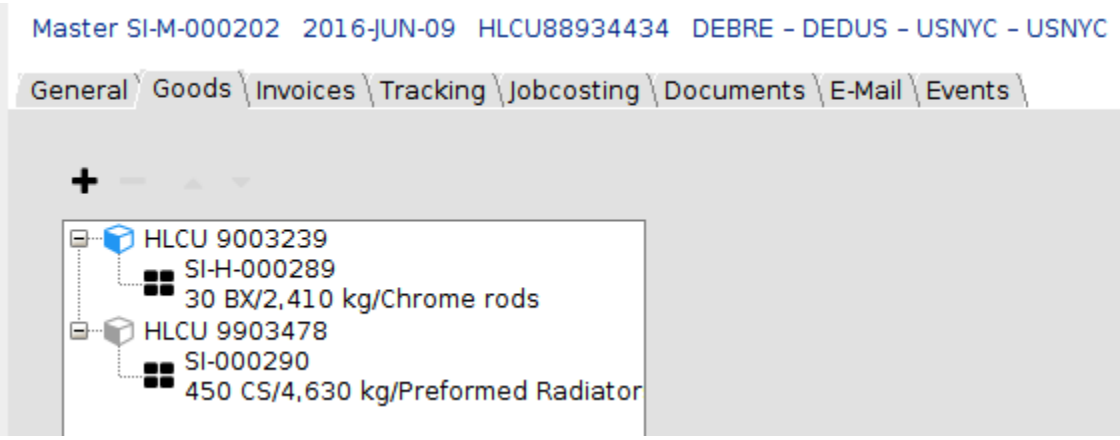
Once the basic details and goods are entered for the house shipment, click *OK*. The house shipments are now saved and ready for further activities like invoicing and delivery orders.

Returning to the master shipment after clicking OK, the new house is now added to the master and can be seen in the list of houses attached to the master in the master screen:



Managing containers on the master

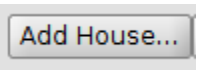
Use the *Goods* tab on the master shipment to view and add containers. Once all the LCLs have been added to the master, the *goods* screen will show all the house goods and the containers. Drag and drop the house goods into the correct containers. If there are FCL house shipments on the master, these will appear in grey because they are already full and goods cannot be dragged into them.



Adding previously created house shipments to a new master

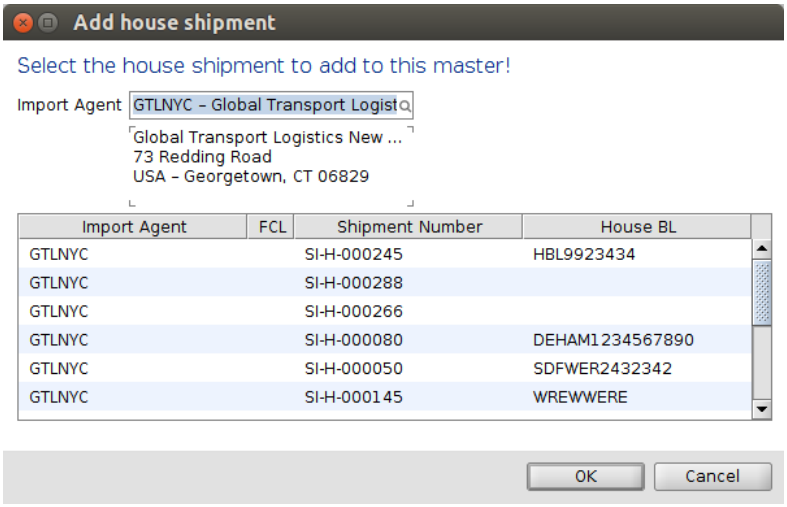
If the house shipments were created before the master shipment, these can be added to the master as soon as the master is created.

At the bottom of the *General* tab of the master is the *Add house* button.



This will open a search window where you can search for previously created houses and add them to the master:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To create a sea import super-house shipment

- Creating the super house sea import
  - Using the lead shipment method to make a super-house
- Adding house shipments to the super-house
- Creating a super house from the sea import menu
- Related articles

A sea import super house is normally created when you have a "buyers consol". Typically this means the importer of the goods has ordered numerous goods, often from different suppliers overseas. All these goods are often collected at the export agents warehouse and then shipped on the same sailing to the import agent. The export agent cuts a house bills for each of these cargoes and therefore they arrive at the destination country as multiple individual house shipments. The import agent is required to consolidate them all together in order to present them as a single shipment to the importer. A super-house import shipment is used to create this special consolidation.

Creating the super house sea import

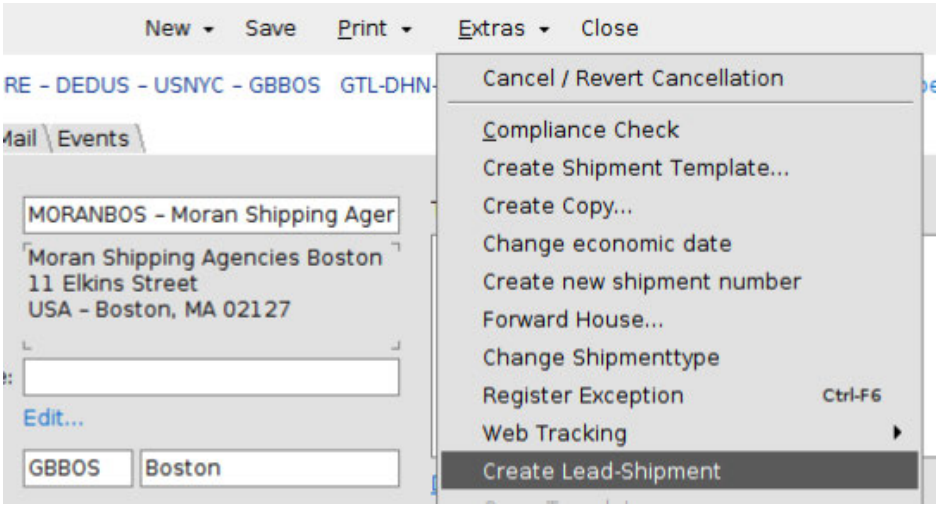
There are 2 ways to create a sea import super house:

1. Use and existing shipment as a "Lead shipment"
2. Create a super-house from scratch

Using the lead shipment method to make a super-house

Open an existing sea import shipment that is to be used as the "Lead shipment" for the super house

From the Extras menu of the selected shipment choose "Create Lead-Shipment"



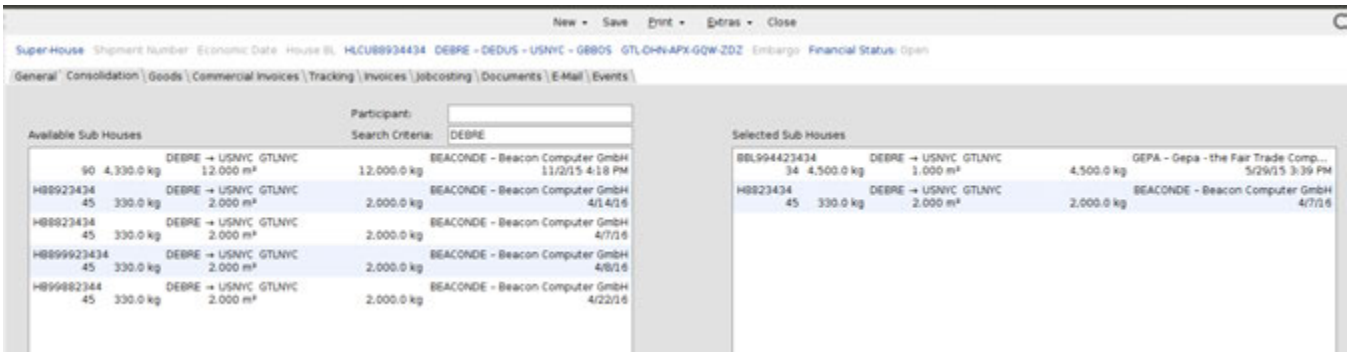
The new super-house will open and all the details from the chosen shipment will be used in this new super-house shipment. Change any details as required.

Adding house shipments to the super-house

Once the general details about the super-house are complete, click on the *Consolidation* tab to begin selecting the house shipments to be added to the super-house.

In the *Consolidation* tab, use the *Participant* field to restrict the search to a specific party. Use the *Search Criteria* to search by more general rules, in the example below the search finds all available shipments from the port of Bremen:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Use the *Add* button on the consolidation screen to add sub-houses on the left of the screen to the selected Sub-houses on the right of the screen.

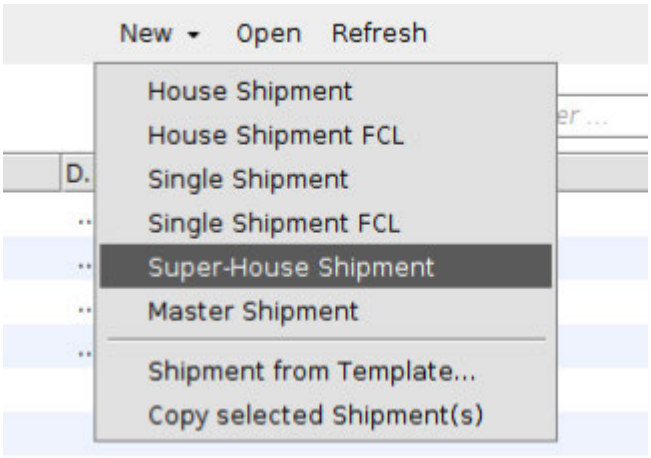
Use the *Remove* but to remove sub-houses from the super-house.

Save the super-house when all the required sub-houses are added. Now it is possible to print regular sea import documents for the super house from the print options. Invoices can also be created on super-house shipments.

Creating a super house from the sea import menu

A super-house shipment can be created from scratch. This means there is no lead shipment.

From the sea import overview, select *New* from the menu-bar, and then select *Super-House Shipment*.



Now the super-house opens, complete all the shipment details and consolidate sub-houses on the super-house as previously described.

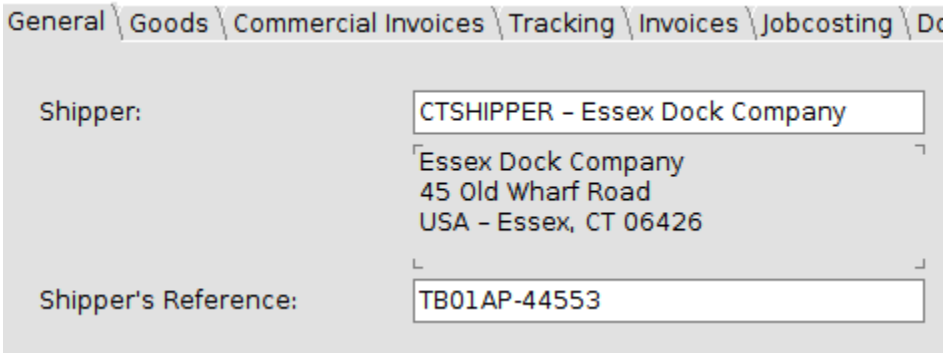
FAQ How-To insert shipment references and dimensions into a B/L

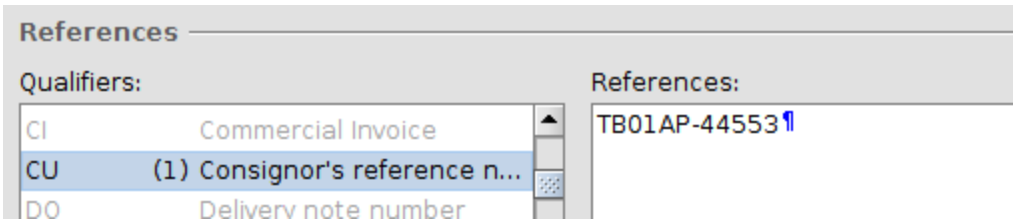
- Insert references
- Insert Dimensions
- Open the B/L Editor
- Open the Goods tab of the B/L Editor
- Insert a new Textblock to insert references
- Right click in the Free Text Editor
- Choosing references
- Inserting dimensions in the B/L

Insert references

Open the shipment and enter the reference. In the example below a shipper's references is inserted:



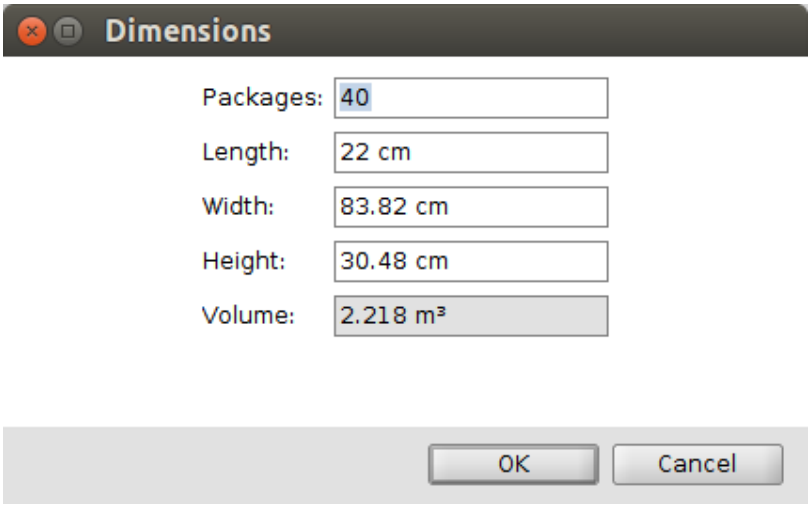
This reference will also appear in the references table and further references can be inserted in the references table:



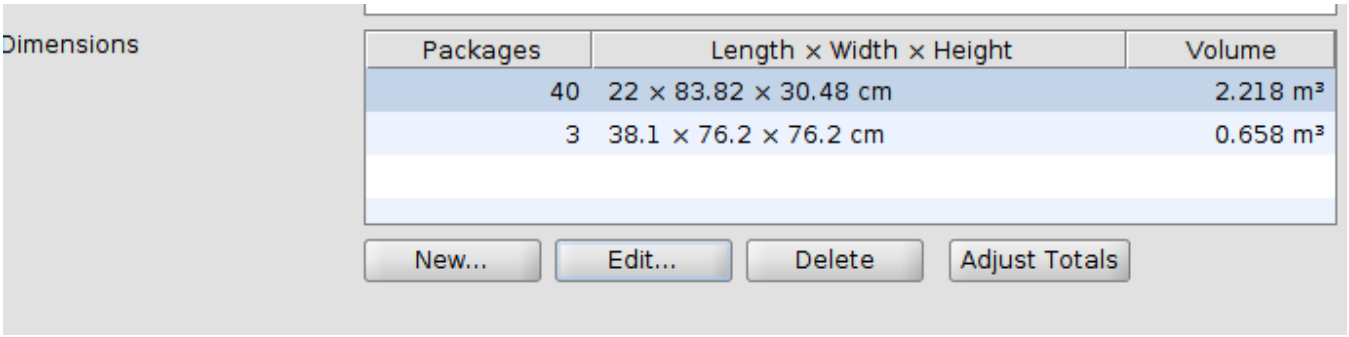
Insert Dimensions

In the goods tab of the shipment, insert the goods and then insert the dimensions of the goods by clicking "New" in the dimensions section of the goods:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Now the dimensions of the goods can be seen:



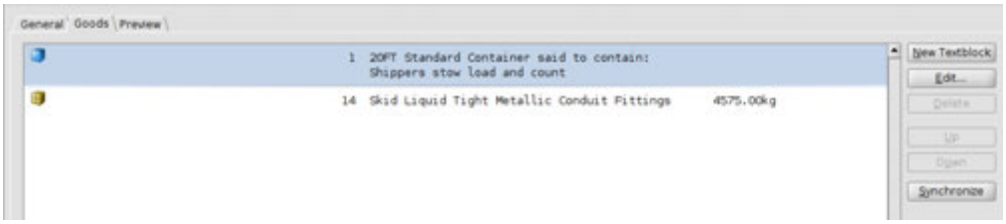
Both the references and goods dimensions are now easy to insert in the B/L.

Open the B/L Editor

Use the blue links in the shipment to open the HBL, the B/L Instructions or the FIATA B/L

Open the Goods tab of the B/L Editor

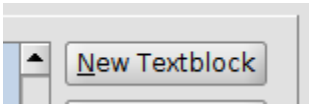
Click on the "Goods" tab of the B/L editor



Insert a new Textblock to insert references

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

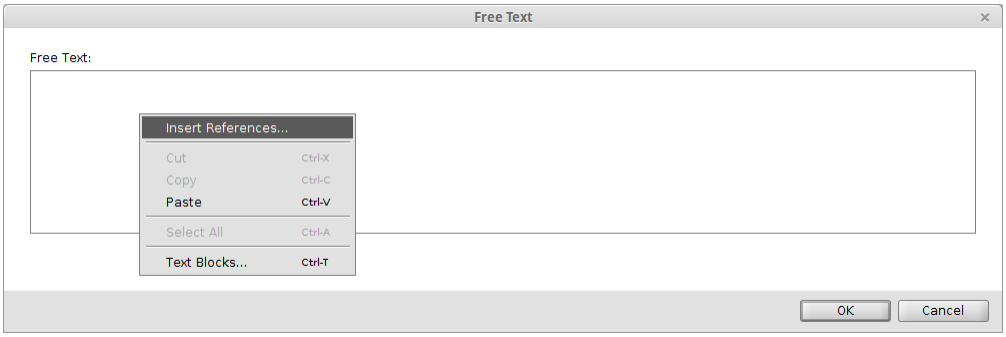
Click on the "New Textblock" button on the right of the goods tab



Right click in the Free Text Editor

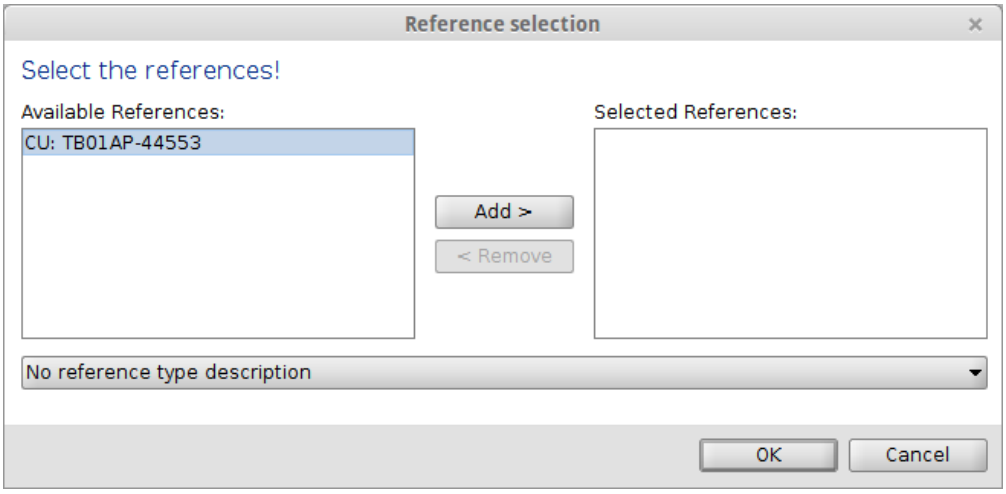
On selecting the "New Textblock" , a window appears where any free text for the HBL can be entered. Right click in this free text area and a context menu appear.

From the context menu select "Insert References"



Choosing references

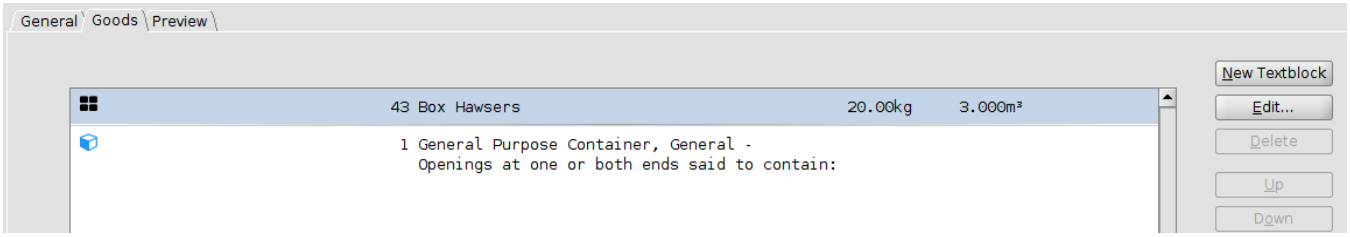
When "Insert References" is clicked, a reference selector appears showing all the references on the shipment. Add the ones that should print on the B/L and click OK. The references will now appear in the B/L preview.



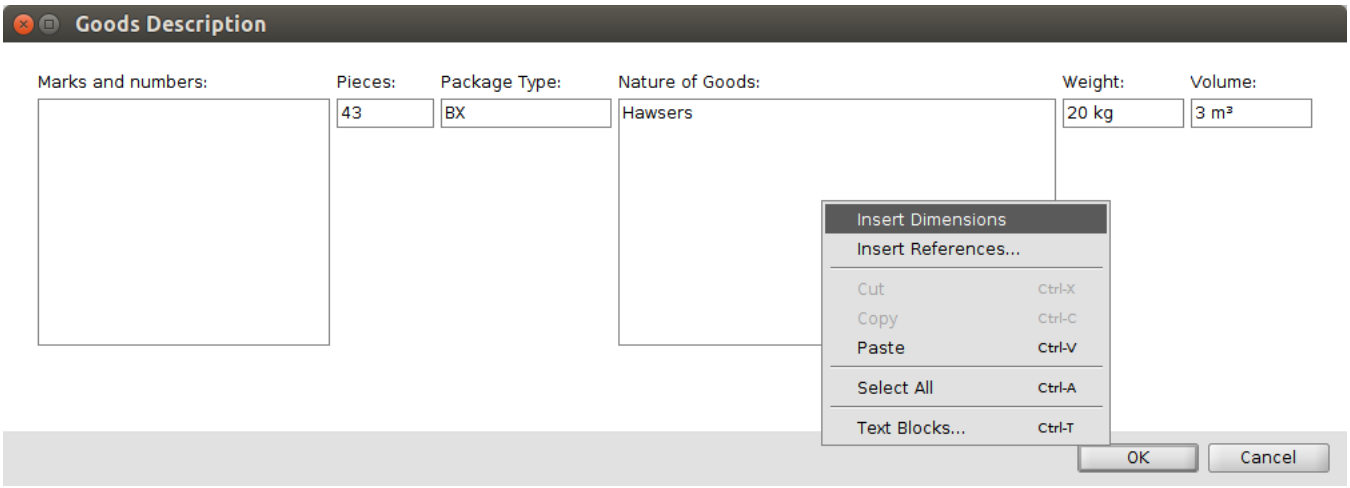
Inserting dimensions in the B/L

In the "Goods" tab of the B/L, highlight the goods which have dimensions

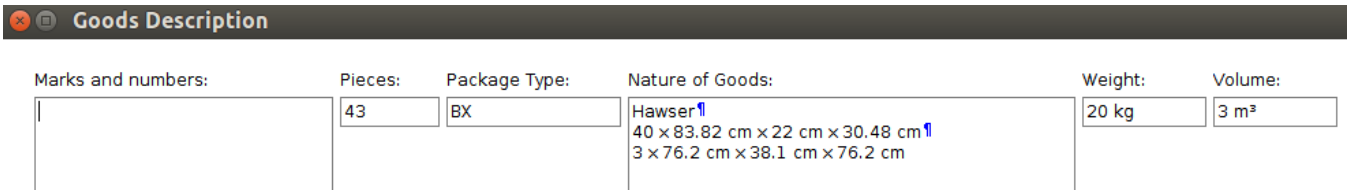
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



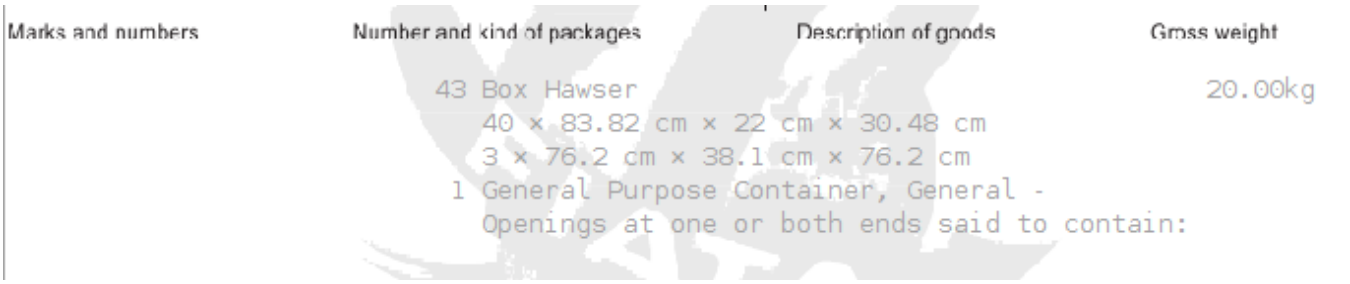
Now click "Edit". In the "Nature of Goods" window, right click and select "Insert Dimensions" from the context menu:



The dims will appear:



In the preview screen of the B/L the dims can be seen:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

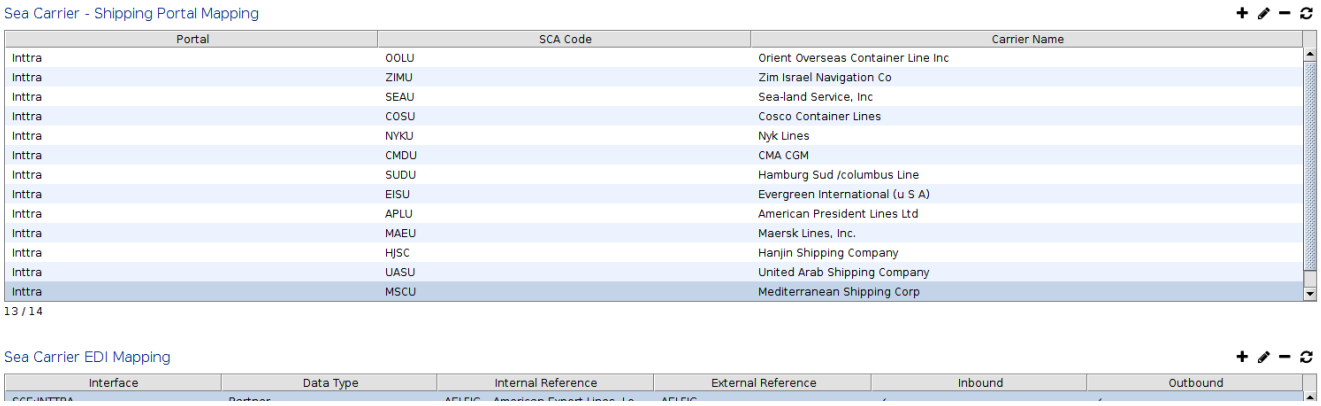
FAQ How-To map a Sea Carrier address to a Scope Partner

When receiving booking confirmations from Sea Export Carriers via Inttra or GTNexus, these booking confirmations may contain partner addresses such as export terminals and container terminals. These partners can be mapped to Scope addresses if the carrier supplies their UID for the address. Creating these mappings enables Scope to automatically replace the carriers partner address with the full Scope partner.

Step-by-step guide

Navigate to the "Sea Carrier EDI Setup"

1. From the Scope menu select "Settings"
2. In the "Maintenance" menu select "Seafreight"
3. In the "Ocean" menu select "Sea Carrier EDI Setup"



In "Sea Carrier EDI Setup" the top window displays all the carriers that have been created and the portal used. Select or add the sea carrier/portal combination that has transmitted to Scope partner address information.

The lower window "Sea Carrier EDI Mapping" will show the partners currently mapped for the selected sea carrier/portal combination.

Check if the messages returned by the carrier contains a map-able UID.

In the example below "NAD+TR+USOAKOA" indicates the carrier's UID for Oakland International Terminal is "USOAKOA" and this can be mapped to a Scope partner.

Check in the RSI CC for these codes in the booking confirmation from the carrier. These do not appear in the shipment.

Create the mapping

FAQ How-To register and send VGM details (GTNexus)

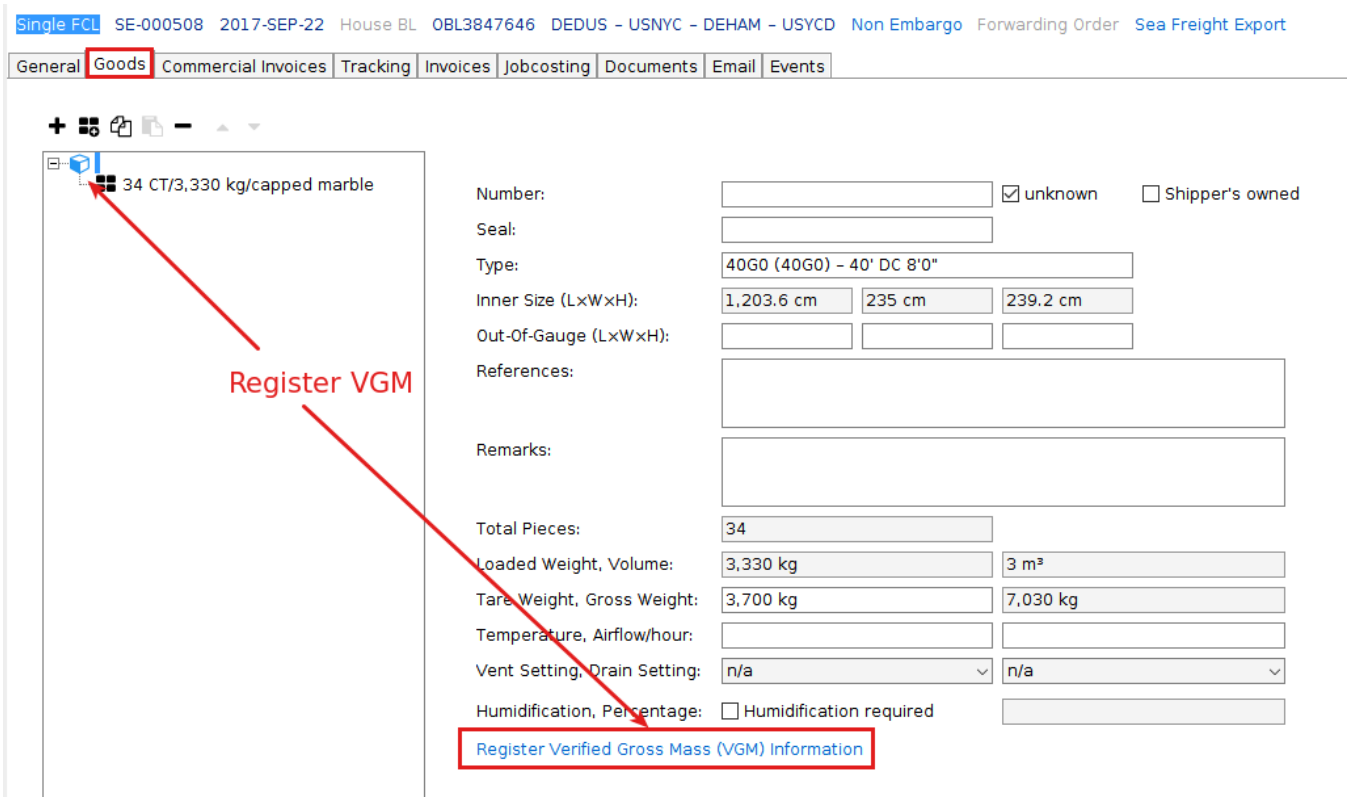
- Registering the VGM details
- Sending the VGM details
- VGM Confirmation

This document describes how to electronically transmit VGM containers details to the carrier using the GTNexus portal

Registering the VGM details

Open your sea export shipment and click on the "Goods" tab

In the "Goods" tab, click on your container to select it. To the right, at the bottom of the screen, the blue link " Register Verified Gross Mass (VGM) Information."



Now enter the details for the container:

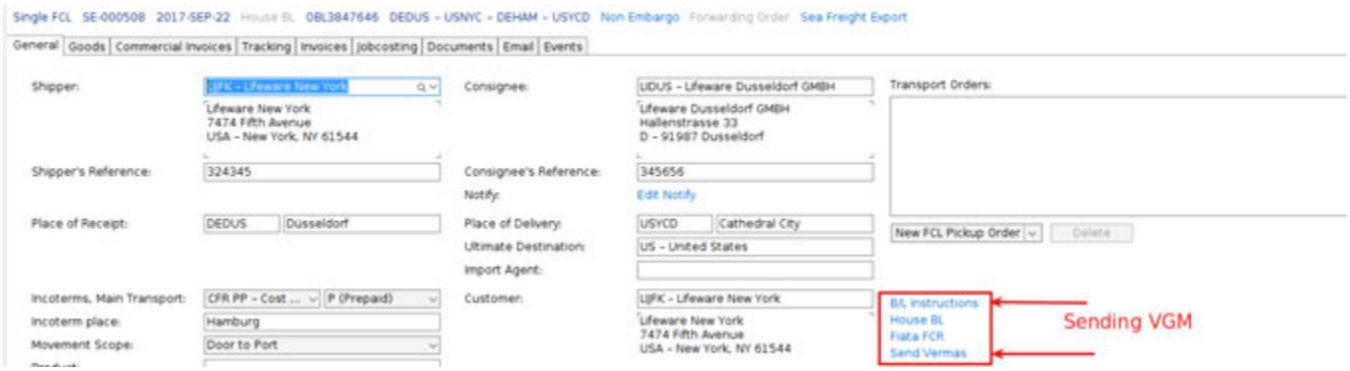
Sending the VGM details

Once all the VGM details have been entered for all the containers on the shipment as described above, return to the "General" tab of the shipment.

Now that the VGM details have been entered, if the B/L Instructions are created and sent to the carrier via GTNexus, the VGM details will also be automatically included.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The VGM details can be sent separatly by clicking the blue link "Send Vermas"



VGM Confirmation

Once the VGM details have been sent, when they are accepted by the carrier, to the right of the "Send Vermas" link, the carrier and the date and time the carrier confirmed will appear

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To register and send VGM details (Inttra)

- Registering the VGM details
- Sending the VGM details
- VGM Confirmation

Inttra Contract

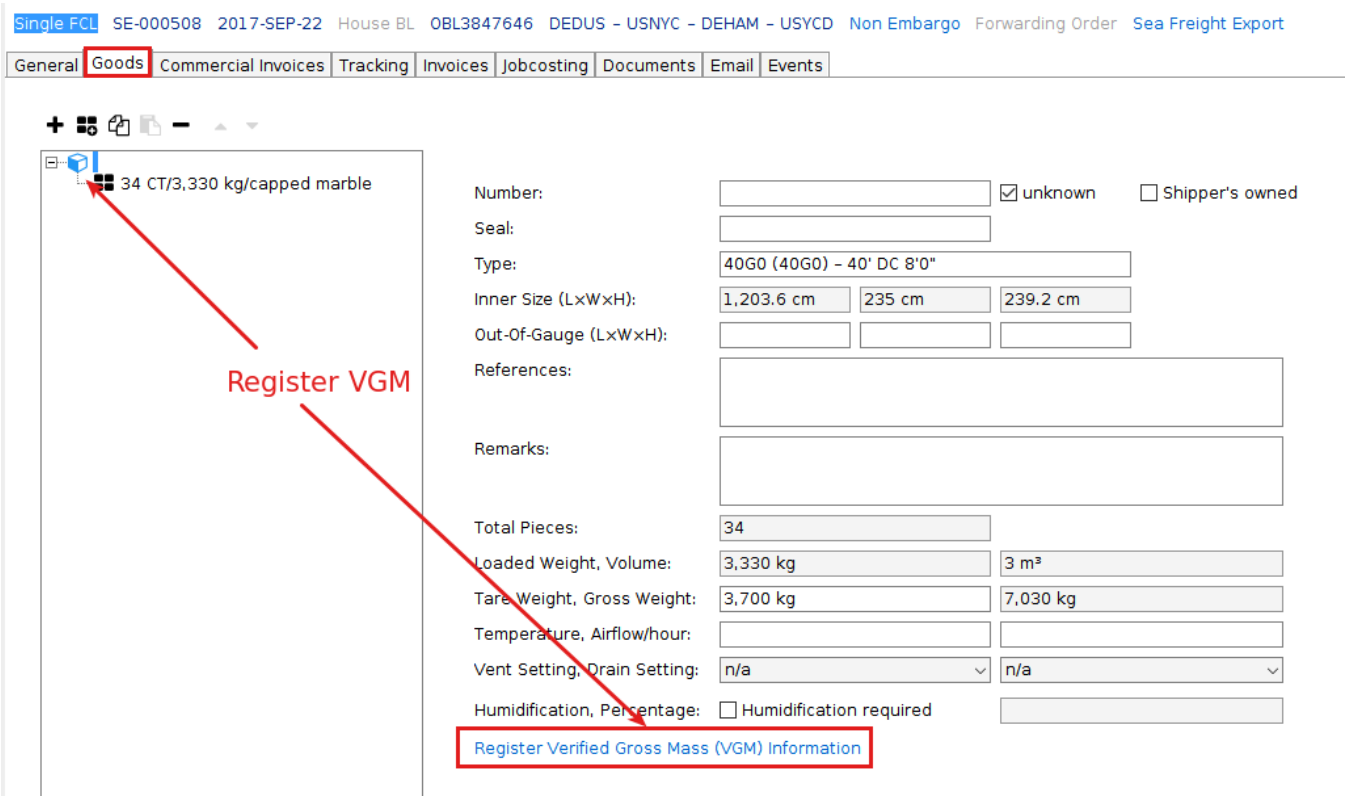
Note: You can only send VGM details to inttra if you have a contract to do so with Inttra. Check with your system administrator to confirm this prior to sending VGM information to Inttra

This document describes how to electronically transmit VGM containers details to the carrier using the Inttra portal

Registering the VGM details

Open your sea export shipment and click on the "Goods" tab

In the "Goods" tab, click on your container to select it. To the right, at the bottom of the screen, the blue link " Register Verified Gross Mass (VGM) Information."



Now enter the details for the container:

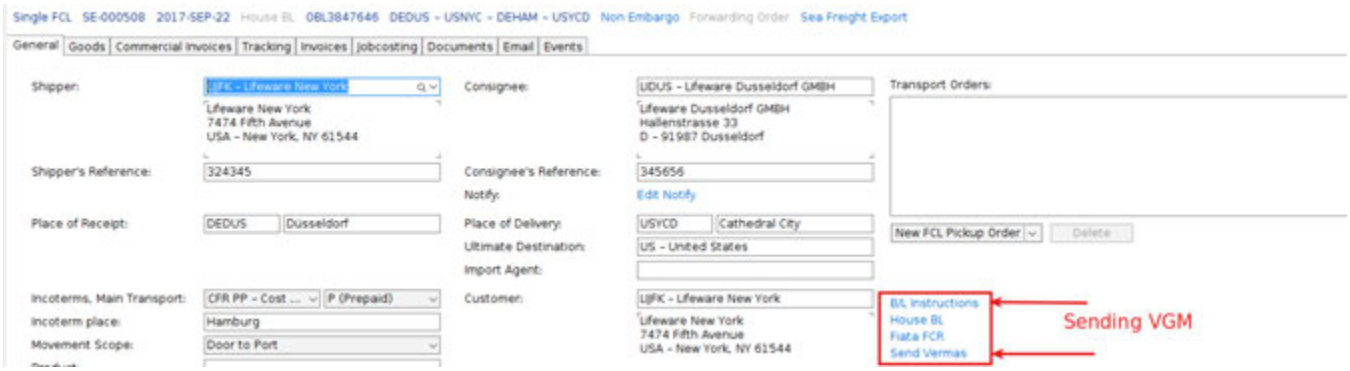
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Sending the VGM details

Once all the VGM details have been entered for all the containers on the shipment as described above, return to the "General" tab of the shipment.

Now that the VGM details have been entered, if the B/L Instructions are created and sent to the carrier via Inttra, the VGM details will also be automatically included.

The VGM details can be sent separately by clicking the blue link "Send Vermas"



VGM Confirmation

Once the VGM details have been sent, when they are accepted by the carrier, to the right of the "Send Vermas" link, the carrier and the date and time the carrier confirmed will appear

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To send export pre-alerts and convert them to import shipments

- Introduction
- The Export Shipment
- Managing the documents that are sent to the Import Agent
  - Automatically sending manually uploaded documents to the import agent
  - Automatically sending documents printed by Scope to the import agent
- Pre-Alerts
  - Viewing only Pre-Alerts
    - The "Pre-alert" filter
    - Pre-Alerts (ready to convert)
- Updating Pre-Alerts
- Converting a Pre-Alert to a shipment
  - The Hand-over time
  - To convert a pre-alert to a shipment:

Introduction

When an export agent and their import agent are both using Scope, the export agent can send export pre-alerts to the import agent. The import agent can see these pre-alerts and at the right time, the import agent can convert these pre-alerts to import shipments. This how-to explains this process.

It is also possible for an export agent who is not using Scope to transmit export pre-alerts to an import agent who is using Scope, but check with your administrator to see if this is possible for your export agent.

The Export Shipment

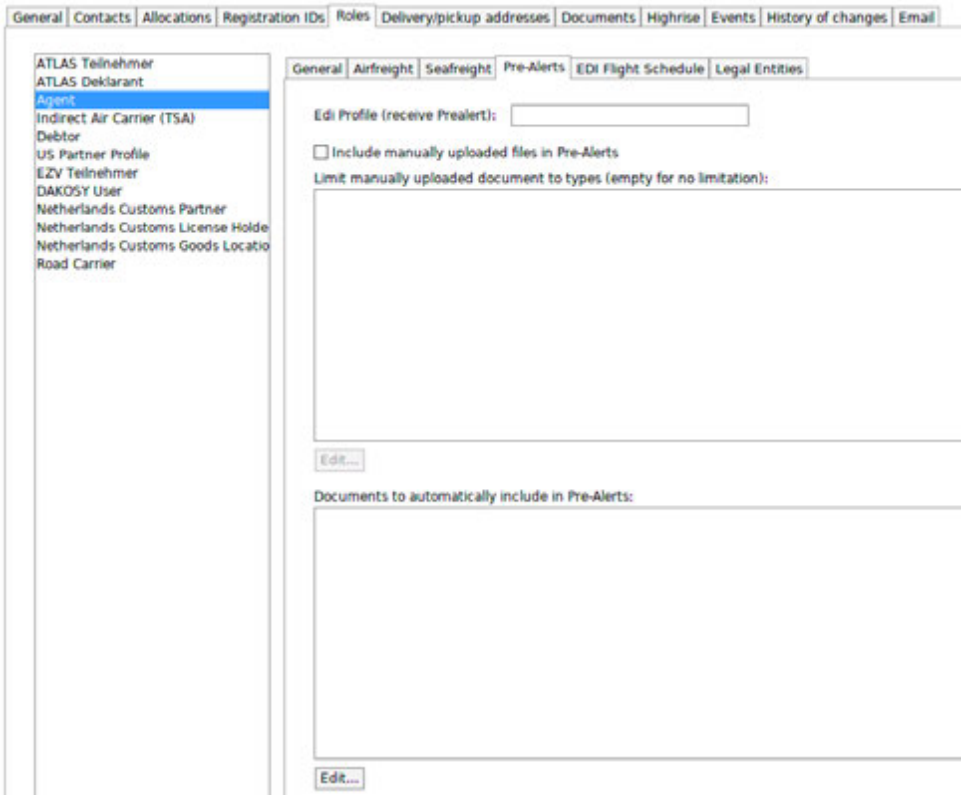
The export agent enters the basic export shipment details in Scope and as soon as the export agent saves these basic details, Scope will create an export shipment number and an HBL number. This will immediately be sent to the import agent as a pre-alert

Managing the documents that are sent to the Import Agent

When an export shipment is transmitted from an export agent to an import agent, the export documents can be included. You can control which documents to automatically send to the import agent:

1. Open the partner maintenance application
2. Open the partner who is the agent receiving the pre-alerts
3. Go to the roles tab and click on the role "Agent"
4. In the "Agent" role, click on the tab "Pre-Alerts"

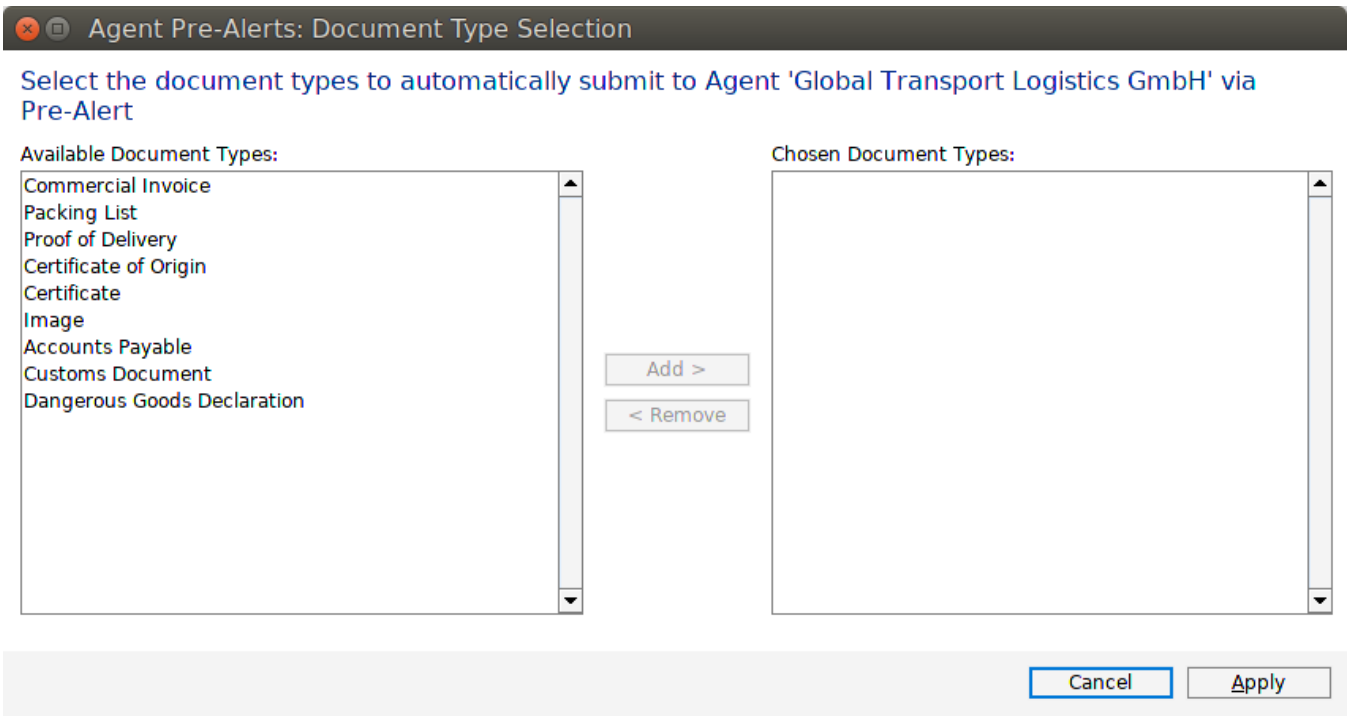
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Automatically sending manually uploaded documents to the import agent

In the "Pre-Alerts" tab, check the box "Include manually uploaded files in Pre-Alerts"

Now click the "Edit" button and select the available document types in the left hand column that should be added to the right hand column "Chosen Document Types"

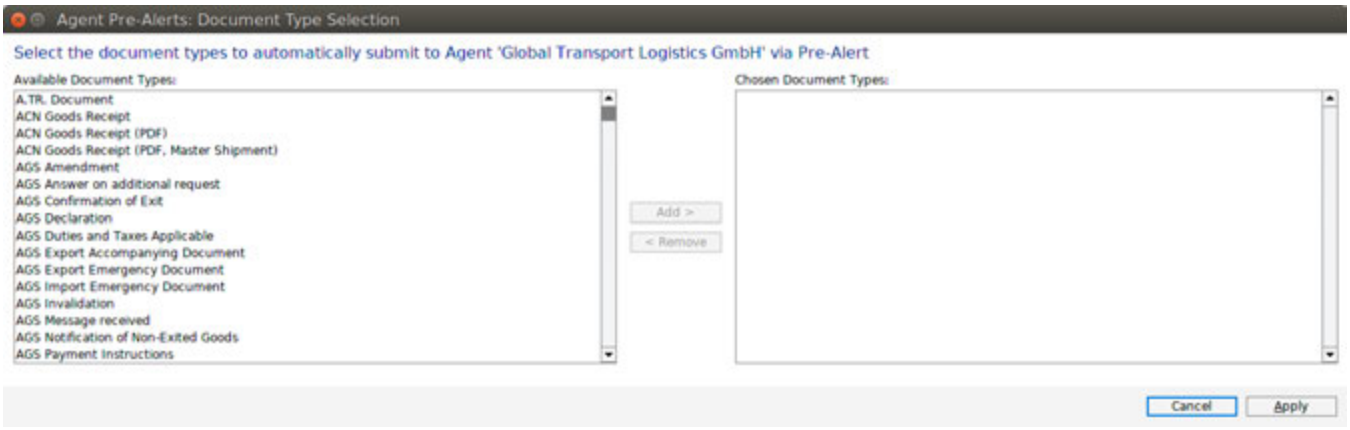


Automatically sending documents printed by Scope to the import agent

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

In the "Pre-Alerts" tab, click the "Edit" button below the window "Documents to automatically include in Pre-Alerts"

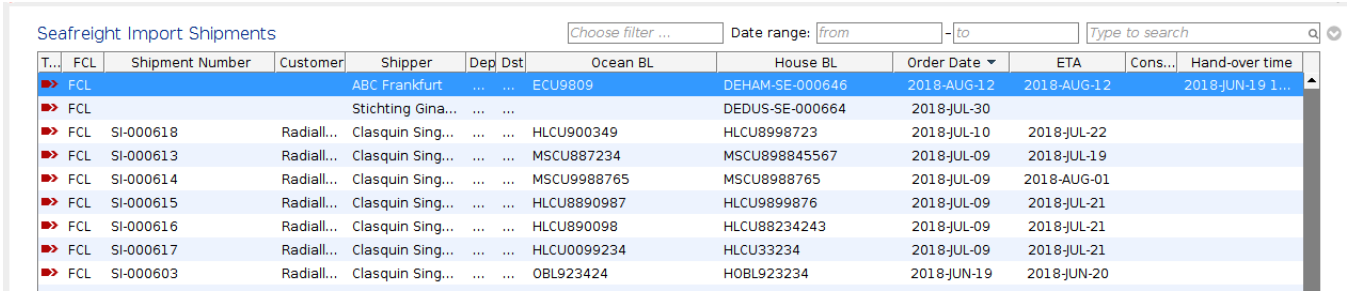
Now selected the available document types from the left hand column of the document selection in order to add them to the right hand column of "Chosen Document Types".



Once manually uploaded documents and Scope printed documents have been selected, save the partner profile and exit. The selected documents will now be automatically sent with the pre-alert if they existing when the pre-alert is created.

Pre-Alerts

The import agent can see the pre-alert in the sea import shipment overview. The import agent can see these shipments are still at the pre-alert stage because they have no sea import shipment number. The example below, the top 2 shipments are still pre-alerts, because they have no "Shipment Number", there are also other details still missing which the export agent has not yet completed.



T...	FCL	Shipment Number	Customer	Shipper	Dep	Dst	Ocean BL	House BL	Order Date	ETA	Cons...	Hand-over time
	FCL			ABC Frankfurt	...	...	ECU9809	DEHAM-SE-000646	2018-AUG-12	2018-AUG-12		2018-JUN-19 1...

Viewing only Pre-Alerts

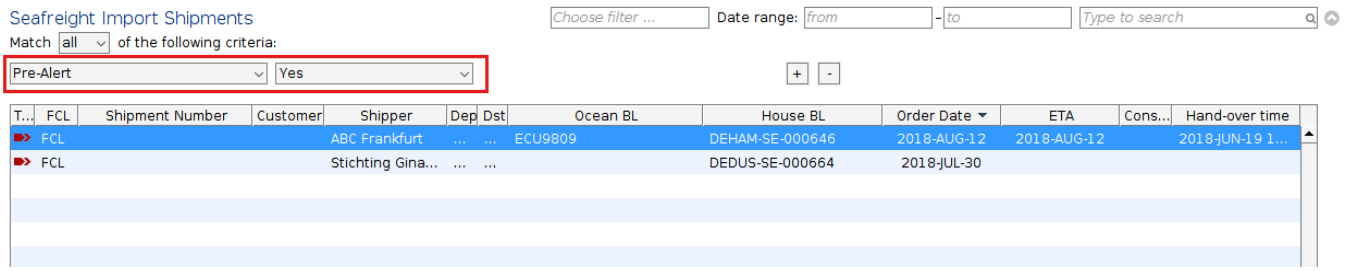
If you want to only see pre-alerts in the shipment overview, there are 2 ways to do this:

The "Pre-alert" filter

To only see all prealerts, click the grey filter button to the right of the general search field:

This will drop down the filter options. From the list of possible filters, choose "Pre-Alert". Change the box to the immediate right of "Pre-Alert" to "Yes". As per the example below, now you will only see pre-alerts in the overview:

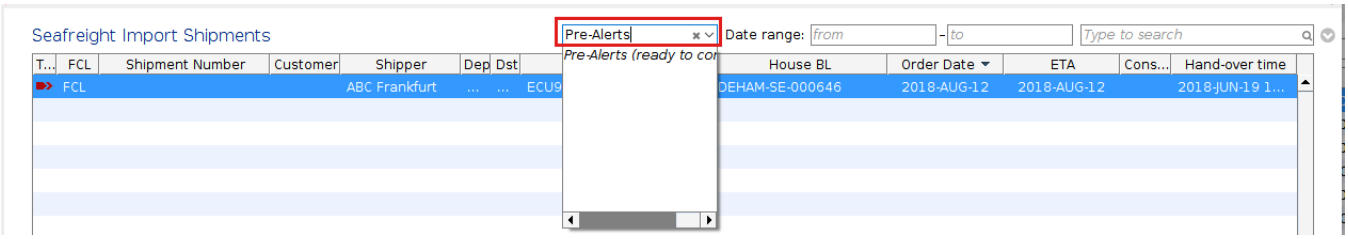
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



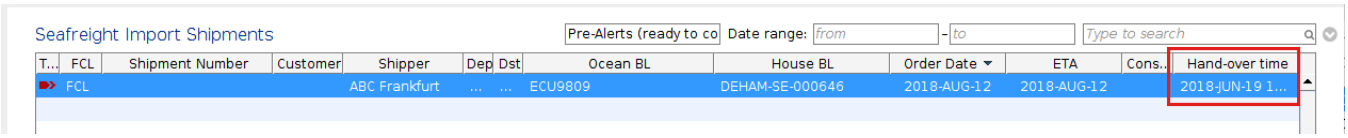
Pre-Alerts (ready to convert)

The second way to view only pre-alerts in the shipment overview, is to use the built-in filter "Pre-Alerts (ready to convert)". This goes further than showing all pre-alerts because it will show only pre-alerts that the export agent has confirmed are ready to convert to import shipments.

Activate this filter by typing the word "Pre-alert" in the saved filters field:



As per the screen-shot below, the "Pre-Alerts (ready to convert)" filter finds a pre-alert that is ready to convert to an import shipment and the field "Hand-over time" shows the date and time when the export agent first indicated the pre-alert was ready to convert to an import shipment:



Updating Pre-Alerts

As the export agent adds more details to the export shipment, these details will automatically update the pre-alert information sent to the import agent. For example, when the export agent first creates the export shipment, the export agent might not have the container numbers for the shipment and so when the pre-alert first arrives in the the import agent's branch, the container details may be missing. As soon as the container information is added by the export agent, this information also appears automatically for the import agent in the pre-alert.

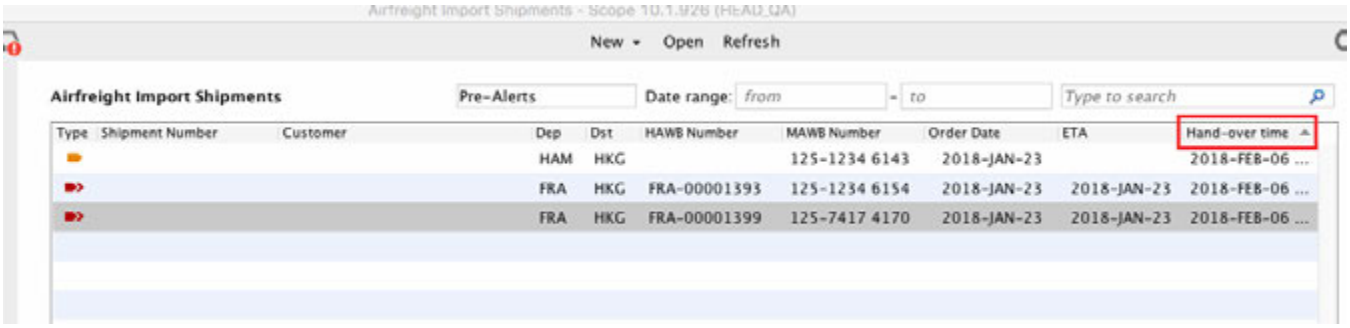
Converting a Pre-Alert to a shipment

It is best to convert a pre-alert to an import shipment when it appears on the "Pre-Alert - ready to convert" listing. This will occur as soon as the export agent prints or sends the B/L Instructions for the ocean carrier and the import agent will be able to see the date and time when this occurred because it will appear as the "Hand-over time" in the pre-alert. The same applies to Air Imports, the shipment will be transmitted from the export agent to the import agent as soon it is first saved by the export agent. As soon as the export agent prints the MAWB or Direct AWB, the prealert will be updated to "Pre-Alert - ready to convert".

The Hand-over time

When the Export Agent finalizes the shipment by printing the MAWB or Direct AWB (Airgfreight) or printing the Shipping Instructions/Receiving EDI shipping instructions confirmation from the carrier (seafreight), the shipment becomes "Pre-Alert- ready to convert". The date on which this occurs is referred to as the "Hand-over time". It is possible to include the "Hand-over time" in the import overviews of both sea and air:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

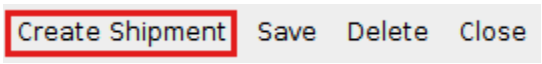


If there is a date and time in the "Hand-over time", this means the pre-alert is ready to convert to a shipment.

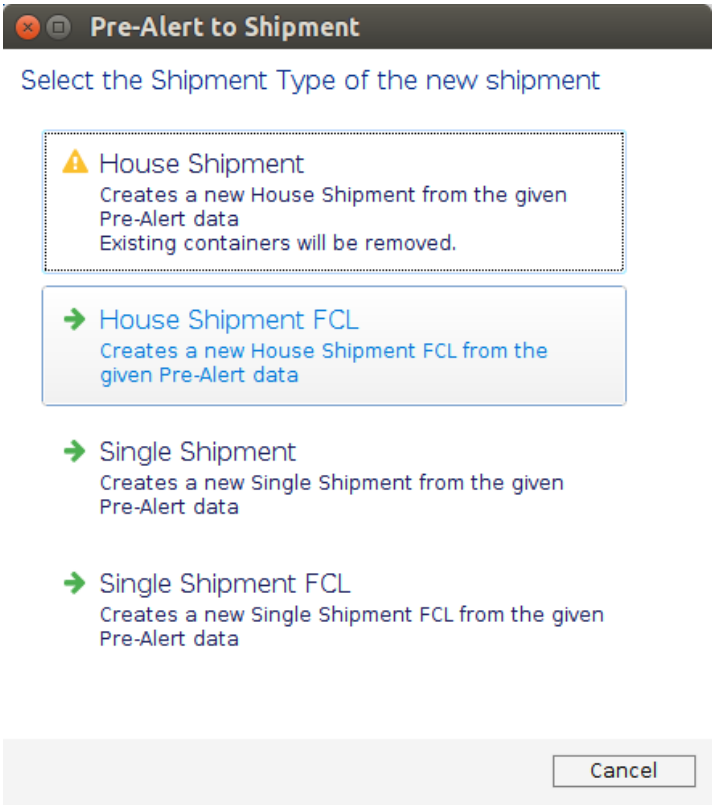
There is also a filter for "Hand-over time" to help search for pre-alerts:

To convert a pre-alert to a shipment:

1. Open the pre-alert
2. From the action menu at the top of the open pre-alert, choose the option "Create Shipment"



The action "Pre-Alert to Shipment will appear, choose the type of shipment that you would like to convert the pre-alert to:



It is possible to convert a pre-alert to an import shipment before there is a hand-over time, but in this case there will be a warning in the conversion process that "The pre-alert is not marked ready for takeover yet" :

FAQ How-To use the new Sea Export Booking Confirmation

When printing the sea export booking confirmation, a preview of the details appears. This document describes where these details appear from and how some of these dates can be changed.

The Sea Export Booking Confirmation Preview

Containers

In the listing of containers, use the check box to select the containers that will appear on the printed sea export booking confirmation

The container listing also shows for each container the details below. Click on a column to order by that column. Drag the column edges to expand or shrink the column width:

- Container type
- Trucker (Carrier)
- Container Pickup Depot (Pickup Depot)
- Loading address
- Loading Reference
- Loading Date/Time
- Delivery CY
- Earliest Delivery
- Latest Delivery

Charge Lines

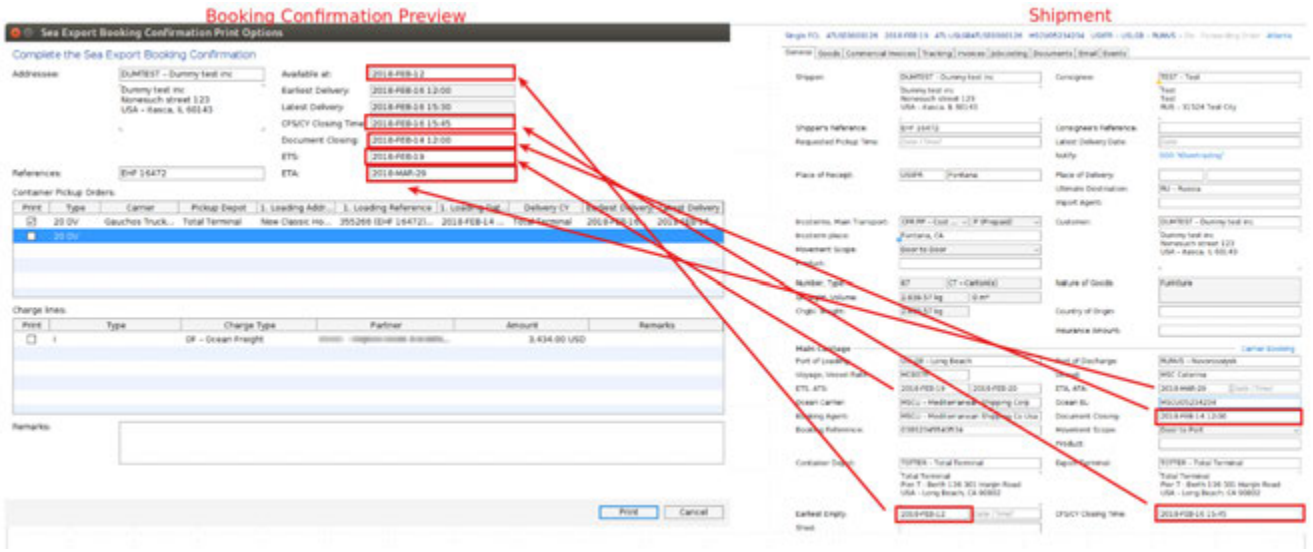
The charge line window lists all the available charges that can be printed on the sea export booking confirmation. Use the check box to select the correct charges to print.

- 
Dates from the shipment

The screen-shot to the left shows the sea export booking confirmation and to the right is the shipment with arrows linking the date fields.

All of the highlighted dates can be changed and on printing the document, these dates will also update in the shipment.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Dates from the Container Pickup Order

To the left is the sea export booking confirmation preview and to the right is the container pickup order, showing both the general tab and the container tab. The arrows link the dates used in these screens:

These dates cannot be changed in the booking confirmation and must be changed in the container pickup order.

How-To add a FIRMS to Scope and apply a FIRMS in a shipment

Background

A FIRMS is a code applied to a customs bonded facility where cargo may be located. This document explains how to add a FIRMS to Scope and then how this FIRMS can be applied in a shipment.

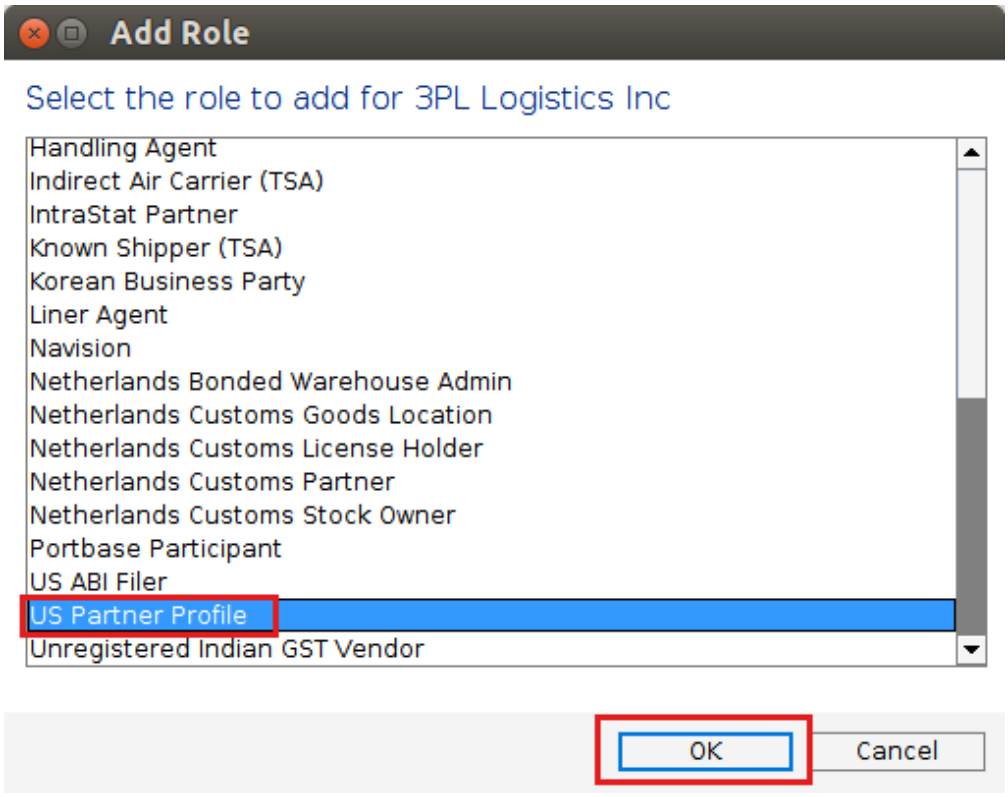
Adding a FIRMS code to a Scope partner

1) Create the FIRMS facility as a partner in Scope, entering their full name and address details

2) Once the partner is created, click on the "Roles" tab of the partner

3) In the "Roles" tab, you need to add to the partner the role "US Partner Profile". Do this by clicking "Add" at the bottom left

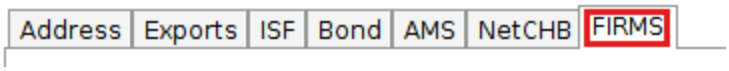
4) When you click "Add", a list of roles will appear. Look for the role "US Partner Profile" and click "OK" to add it



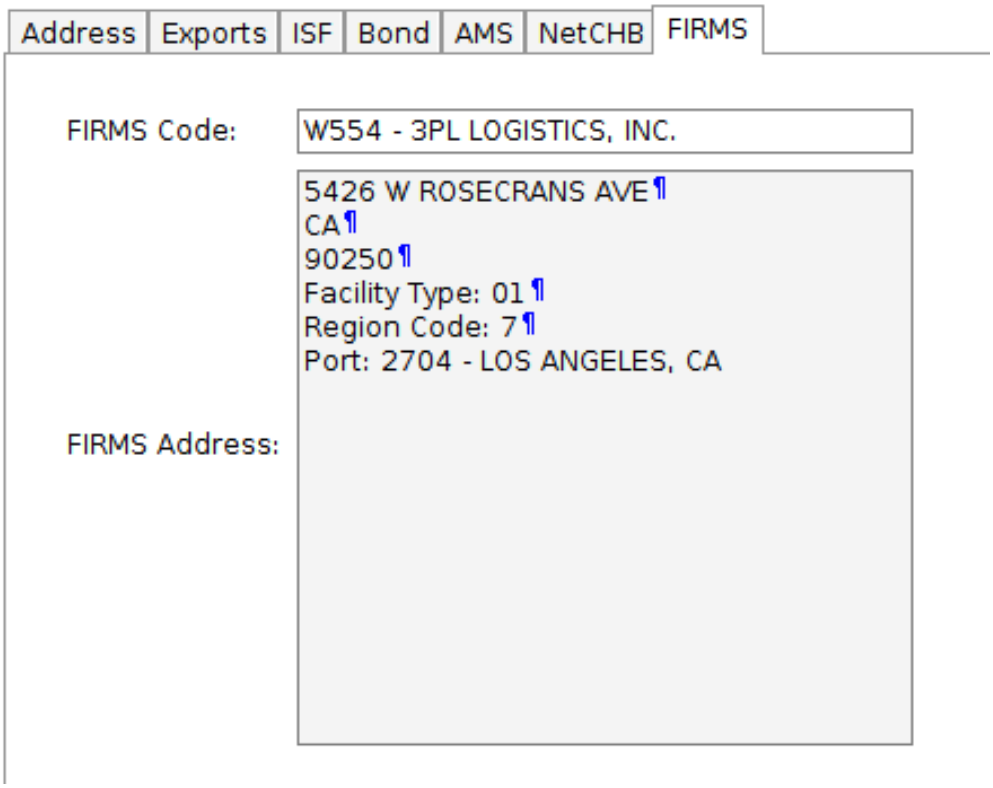
.

5) Now that the role "US Partner Profile" is added to the partner, you will see this role has a set of sub-tabs. Choose the last one on the right called "FIRMS"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



6) You can now enter your FIRMS code in the field "FIRMS Code". Scope should search for this FIRMS code from the official listing and find it. Click on the FIRMS code that is found and the official FIRMS address will appear automatically in the field below call "FIRMS Address".



7) Now save your partner to store your new partner and the FIRMS details.

If Scope cannot find your FIRMS code, notify your Riege support center.

Using a FIRMS in a Scope shipment.

You can use your FIRMS code in the following fields:

Module	Field
Sea Imports	Import Terminal
Sea Imports	Shed
Air Imports	Import Terminal

When you are in any of the above fields, you can apply your FIRMS either by typing in the FIRMS code directly into the field, or you can use any part of the name or address of the FIRMS to search for it.

Once the FIRMS is applied to the shipment in this way, the official FIRMS name and address can automatically be printed on any document.

How-To choose and setup Inttra events in Scope

- Introduction
- Events from Inttra
- Create a Tracking Template that includes Inttra events
- Testing the event
- Common Inttra events

Introduction

When Scope is connected to Inttra and sea export bookings and shipping instructions are sent to carriers via intra, the Scope Tracking tab can display the events sent back by the carrier. This how-to explains how to set this up

Events from Inttra

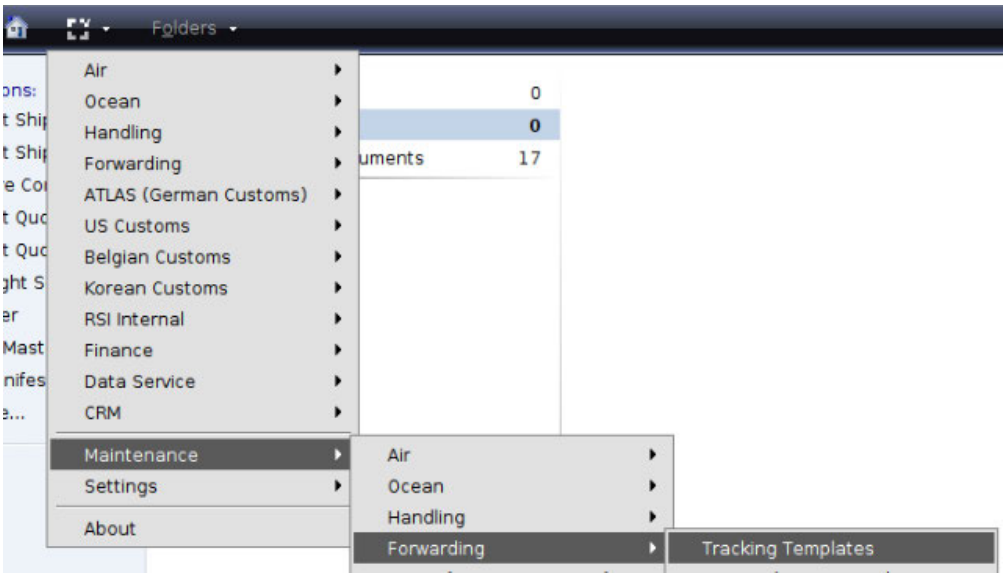
this is a list of events that can be received by Scope from Inttra. Any or all of these can be displayed in the tracking tab of a shipment with correct setup.

INTTRA-code	Event-Description
A	Arrived
AE	Loaded on vessel
AL	Loaded on rail
AM	Loaded on truck
AR	Rail arrival at destination intermodal ramp
D	Completed unloading at delivery location
CR	Carrier release
EE	Empty equipment dispatched
I	In-gate
L	Loading
OA	Out gate
RD	Return container
T	At terminal; INTTRA-terminal movement
UV	Unloaded from vessel
VA	Vessel arrival
CU	Carrier and customs release
VD	Vessel departure

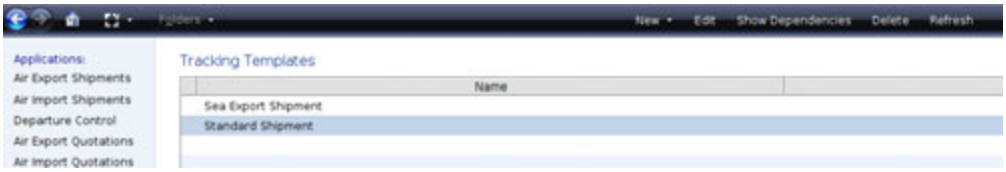
Create a Tracking Template that includes Inttra events

From the main menu choose "Maintenance" and then "Forwarding". From the maintenance Forwarding sub-menu choose "Tracking Templates"

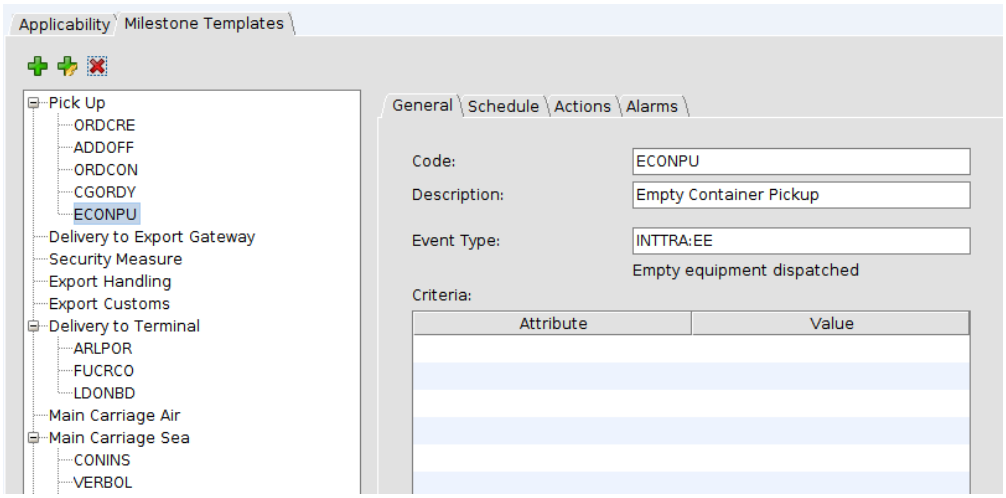
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Choose the Standard Shipment template



Select the "Milestones Templates" tab



Each leg of the shipment is shown, for example "Pick-up" and for each leg, events may be defined. Select the event that corresponds to the Inttra event and in the "Event Type" field for that event, insert the Inttra event. This is a search field that should assist finding the correct Inttra event

Testing the event

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

If no event is finalized in a shipment, then the new tracking template can be tested. Open the "Events" tab of the shipment which automatically shows all Inttra events, highlight an Inttra event and right click it to choose "Replay Event". The event should now appear in the tracking tab of the shipment.

Common Inttra events

the following events are the standard set received in the USA

UV	Unloaded from Vessel
VD	Vessel departure
AE	Loaded on Vessel
I	In-gate
CU	Carrier and customs release
OA	Out-gate
EE	Empty equipment dispatched

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To do a Seafreight Warehouse Entry

- Warehouse entry details
  - Take-In
  - Take-Out
- How-To enter ware house take-in and take-out details

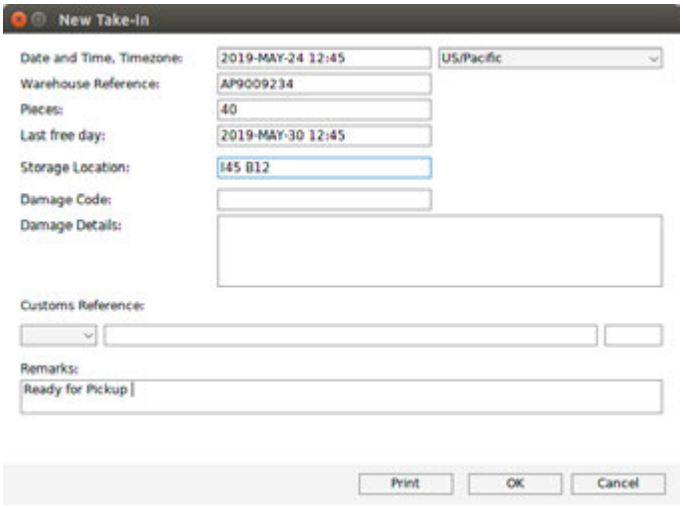
Warehouse entry details

For a sea freight shipment, you can enter some warehouse details for the cargo:

Take-In

When the goods are received by the warehouse you can record:

- The data and time the cargo was received
- The warehouse reference
- The number of pieces relating to this warehouse reference
- The last free day before storage charges occur
- The location of the goods within the warehouse
- Damage details
- Customs details
- Remarks

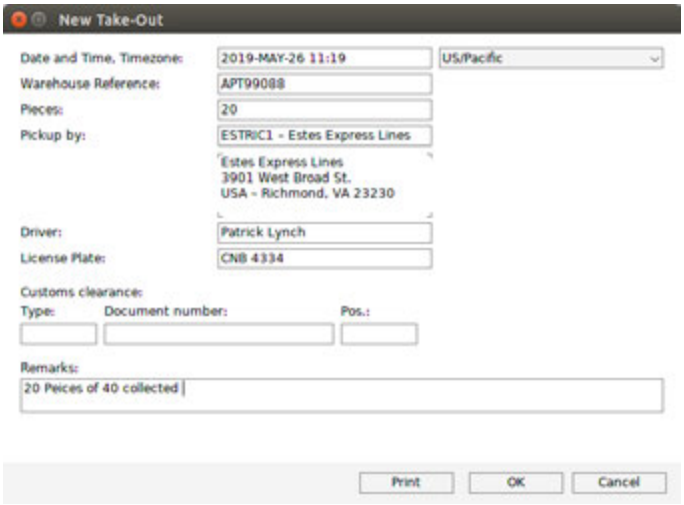


Take-Out

When the goods are removed from the warehouse you can record:

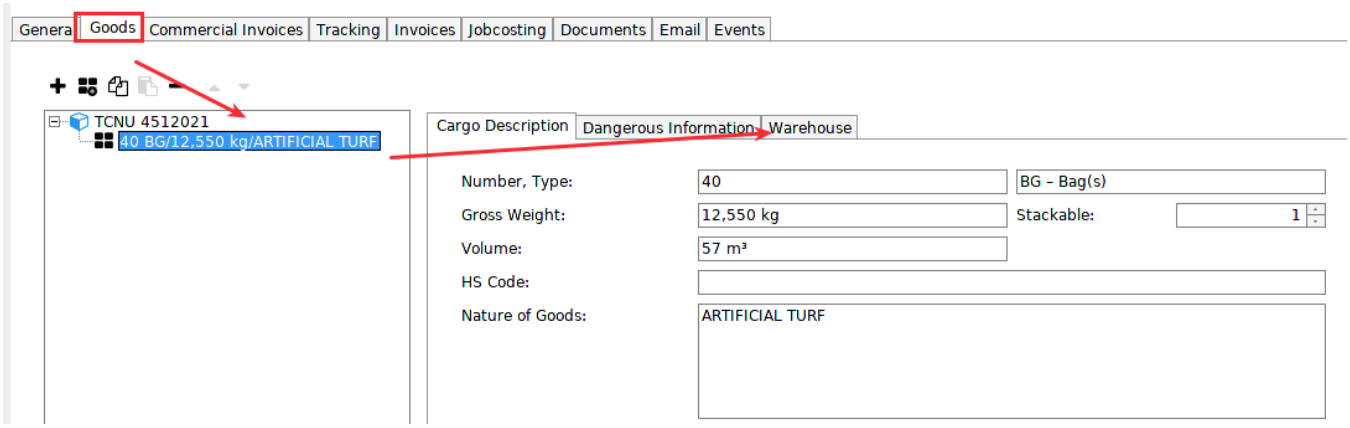
- The date and time the goods were taken
- The warehouse reference for the removal
- The number of pieces taken
- The party who picked up the goods
- The name of the driver who picked up the goods
- The licence plate of the pickup vehicle
- Customs details for the goods
- Remarks

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

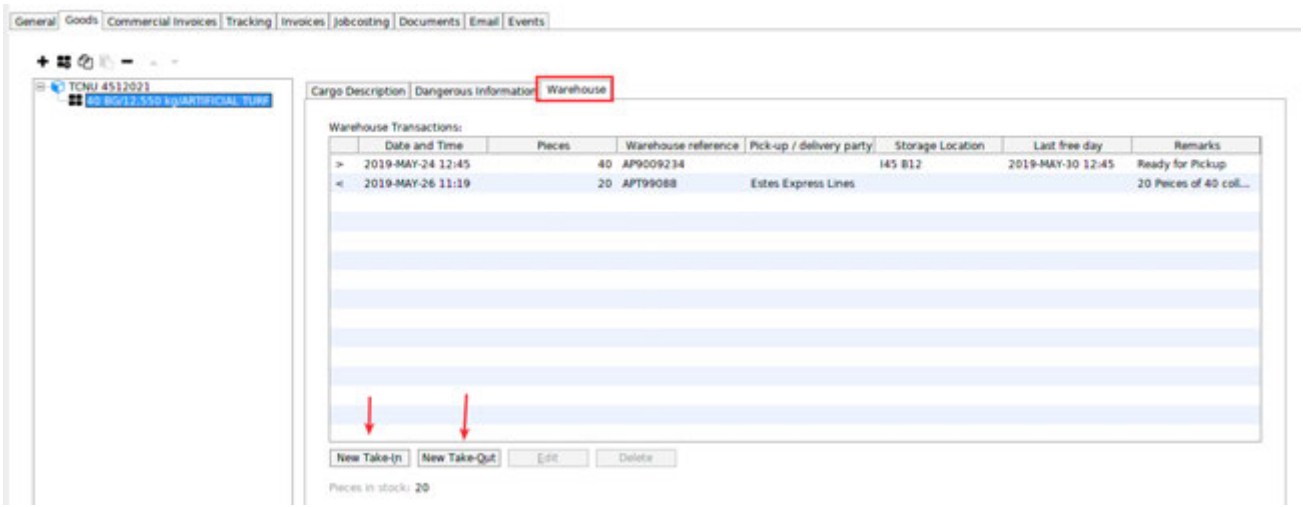


How-To enter ware house take-in and take-out details

1. Create a sea freight shipment
2. On the general tab of the shipment, be sure to enter a "Shed" location.
3. On the goods tab of the shipment, highlight a goods line.
4. Now click the "Warehouse" tab of the goods



On the warehouse tab of the goods, use the "New Take-In" or the "New Take-Out" to create the take in or take out events.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Use the "Print" option on the take-in or take-out to print a record of the event.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To US Customs, ISF, AES, IT and AMS

- How-To enter I.T. information
- How-To for AES
- How-To send customs entries and get customs updates
- How-To US AMS

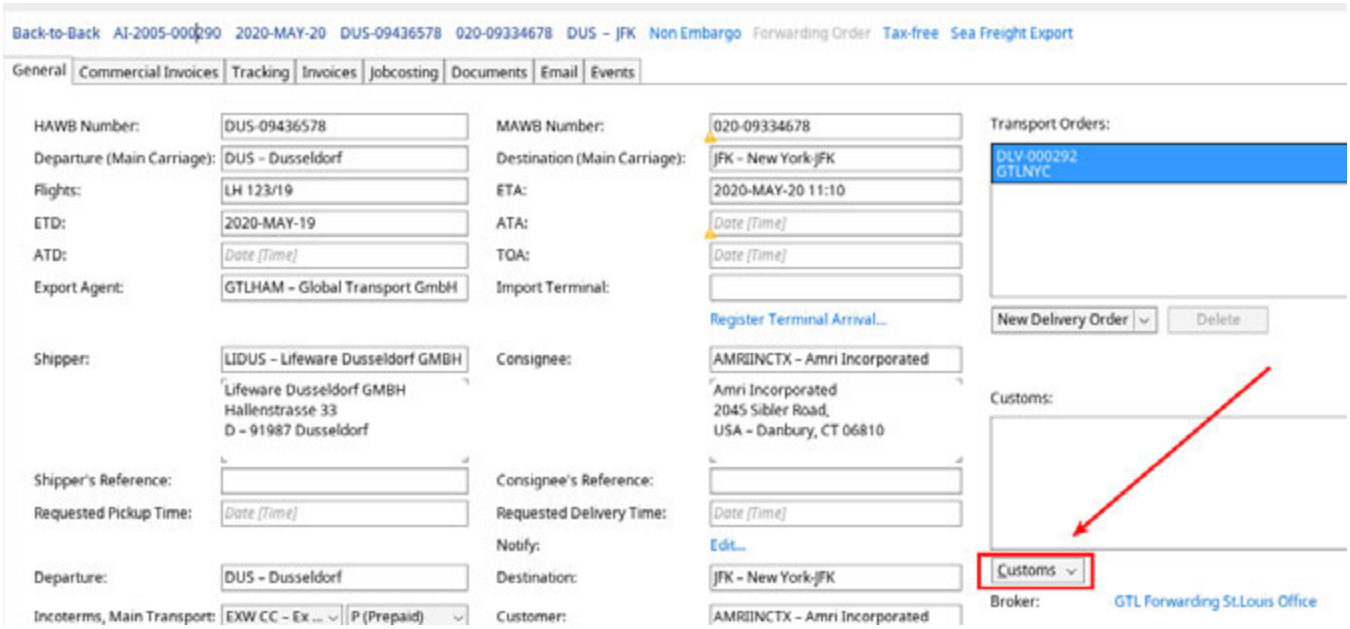
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To enter I.T. information

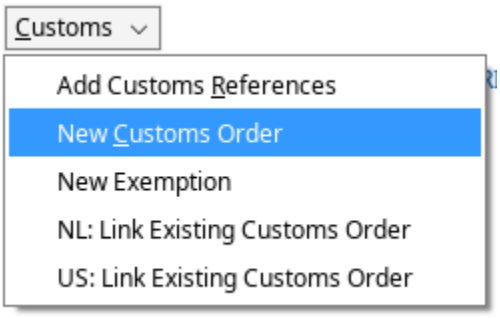
This how-to explains how customs In-Transit details can be entered in a shipment

Opening Customs Orders

Open the shipment and on the right hand side of the screen on the general tab of the shipment, click on the "Customs" button:



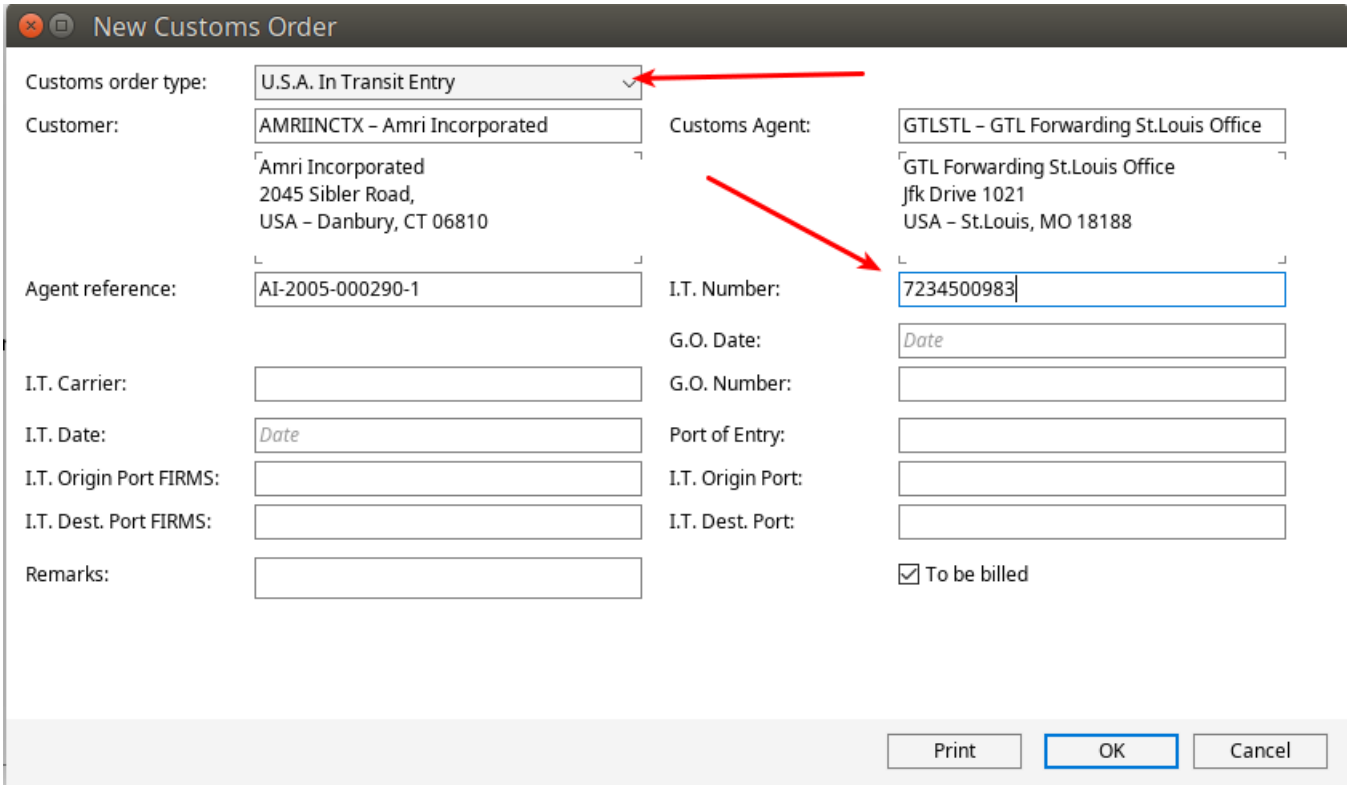
The "Customs" menu will open, choose "New Customs Order"



Making a U.S.A. In Transit Entry

In the "New Customs Order" editor, click on the first field "Customs order type" and from the drop down menu choose the option "U.S.A. In Transit Entry". Note this has a field for the I.T. Number and other I.T. specific information.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Fill in the I.T. details and click "OK". The I.T. customs order now appears in the list of "Customs" orders in the shipment and the I.T. details can be printed on documents.

How-To for AES

- FAQ How-To Cancel AES entries with CBP
- FAQ How-To create AES entries from a Scope export shipment
- FAQ How-To enter additional AES statements on US Export shipments

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

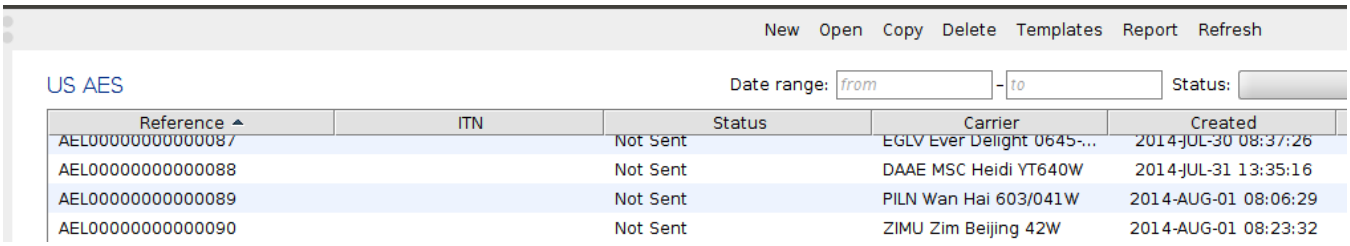
FAQ How-To Cancel AES entries with CBP

When to use the Delete function

When an AES entry is created in Scope, it can be be deleted at any time provided it has not been transmitted to CBP.

To delete an AES entry:

1. Highlight any AES entry in the Overview that has the status "Not Sent"
2. Now press the "Delete" function on the toolbar, this will delete the AES entry.



Which AES entries can be Cancelled?

Once an AES entry has been transmitted to CBP from Scope, if you want to cancel the entry with CBP, then the AES Cancel function must be used. The AES cancel function in Scope is only available once the AES entry is on file with CBP. This means only entries with the following status' can be cancelled:

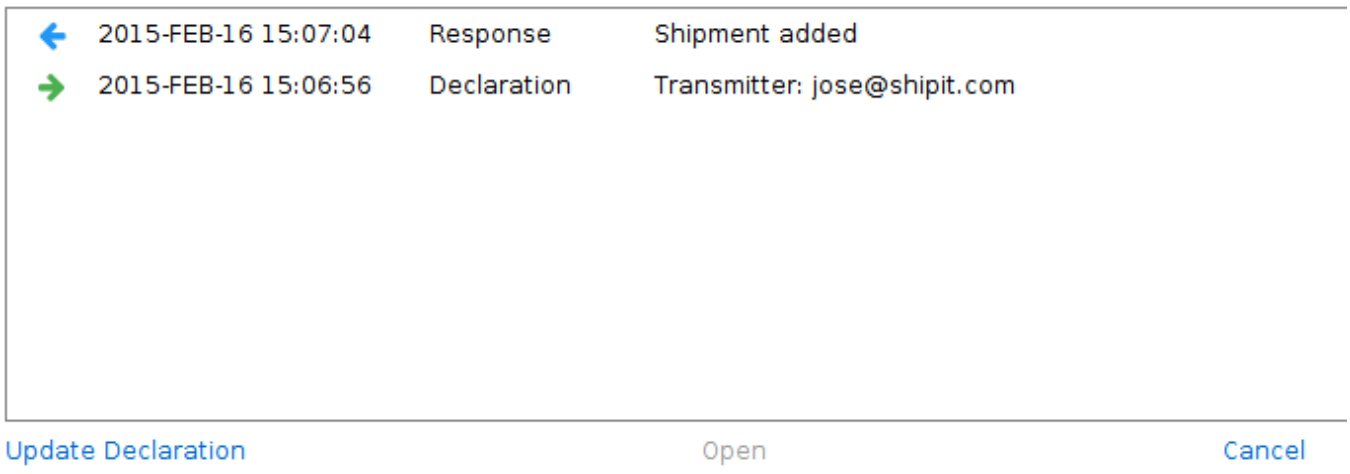
- Accepted
- Accepted with Warnings
- Accepted; Must Verify
- Updated
- Update Rejected
- Rejected

How To cancel AES entries with CBP

By cancelling the entry you are indicating to CBP that the shipment will not be exported and CBP will remove it from their records. Once an AES entry is cancelled, you can start fresh with a new AES entry for the goods.

To cancel an AES entry:

1. Highlight the desired AES entry in the overview (not that it must have one of the status' listed above)
2. The transmission details for the entry will appear in the transmissions window at the bottom of the screen.
3. Click the blue "Cancel" button to cancel the highlighted AES entry



You should get a response from CBP that says "Shipment Cancelled".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To create AES entries from a Scope export shipment

When creating and air export shipment from the USA, you will need to either create an export declaration (EEI) or you will need to insert into the shipment an additional statement like an exemption statement. This ensures there is in ITN or exemption statement visible to CBP on the export documents.

Step-by-step guide - Full Export Declaration

For an full export declaration, take the following steps

1. Open the export shipment
2. On the left hand side of the general tab, click the "Customs button"
3. From the drop-down menu choose the option "New AES Commodity Filing"
4. 
5. Now choose if you would like to use a template to create your AES export declaration, or select "No Template" for none.
6. 

7. Now, complete the full export declaration. When the ITN is returned by CBP, this will automatically be printed on the export documents.
8. 
Step-by-step guide - Exemption Statement

For an exemption statement or an ITN provided by the shipper or other agent, take the following steps

1. Open the export shipment
2. On the left hand side of the general tab, click the "Customs button"
3. From the drop-down menu choose the option "New AES Commodity Filing"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

4. 
5. Click the "Statement Type" to see the kinds of additional statements that can be created. In this case an existing ITN will be entered (EEI Option 2)
6. 
7. Now complete the addition statement details this will automatically be printed on the export documents
8. 
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

FAQ How-To enter additional AES statements on US Export shipments

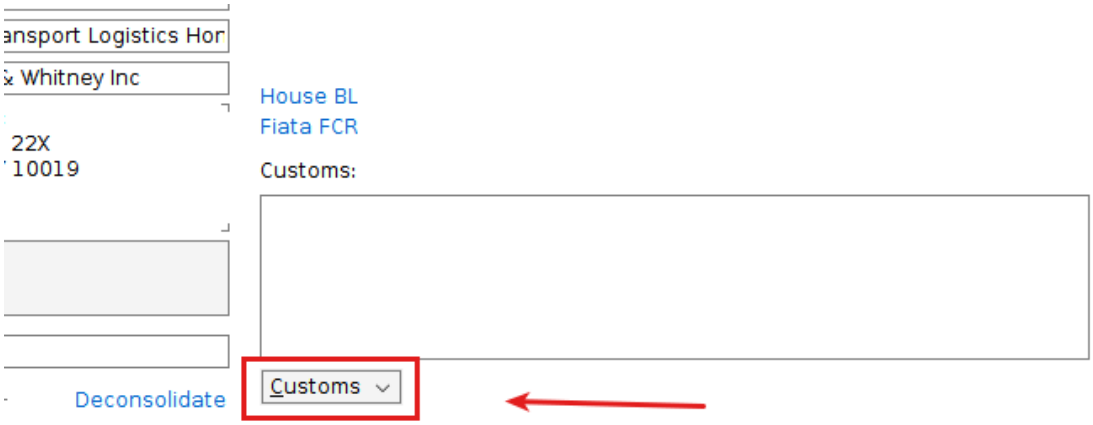
- Introduction
- Adding and Additional Statement to an Export Shipment
- EEI option 2 - A third party has already done the full export declaration
- FTSR - special exemption
- Saving and viewing the additional statement

Introduction

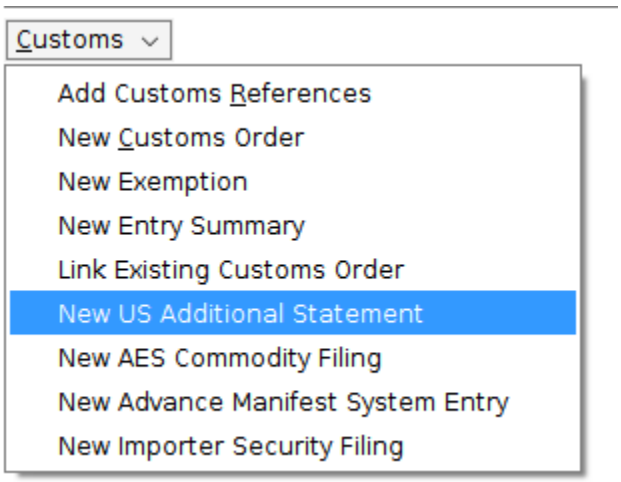
When exporting goods from the USA, all goods must have an export declaration or an exemption statement that explains why they do not need an export declaration (AES). This How-To explains how these exemption statements can be created when you do not need to make a full export dec.

Adding and Additional Statement to an Export Shipment

In the shipment, select the button "Customs"

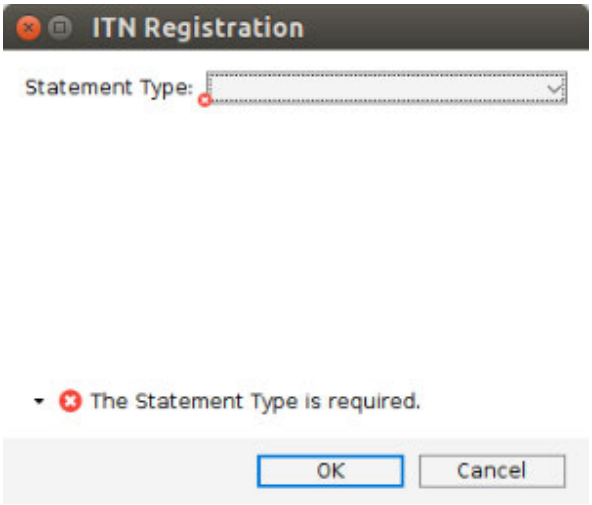


From the drop-down menu, choose "New US Additional Statement"

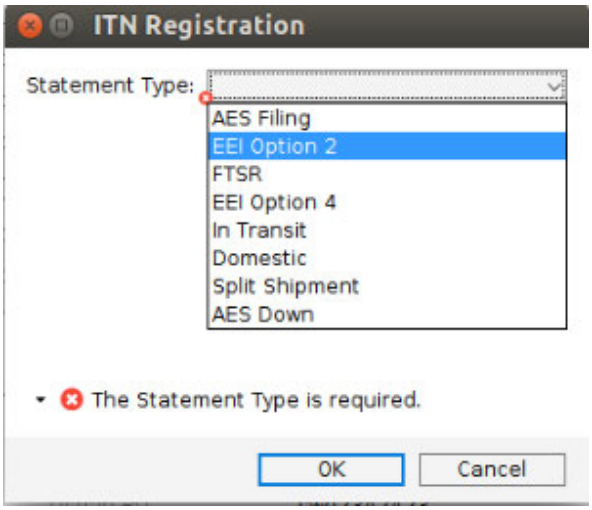


The ITN registration will open:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Now choose the correct statement type:



The possible statement types are:

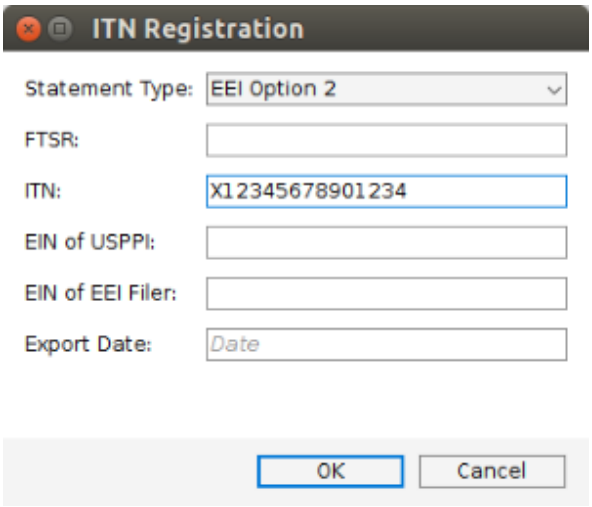
Type	Description
AES Filing	a full AES entry
EEI option 2	Choose this option if a third party has already done the full AES entry and has provided the ITN number
FTSR	Choose this option if the export qualifies for a special exemption, for example FTSR 30.37a (Low value goods)
EEI Option 4	Choose this option if the USPPI is an option 4 exporter and you wish to enter their ID details
In transit	A statement to indicate the goods are transiting the USA
Domestic	A statement to indicate the goods will not leave the USA
Split Shipment	A statment to indicate the goods are part of a split shipment
AES Down	A statement that indicates AES is down and a full export declaration could not be completed.

EEI option 2 - A third party has already done the full export declaration

EEI option 2 is frequently used because often some other party may have already done the export declaration and will supply the ITN.

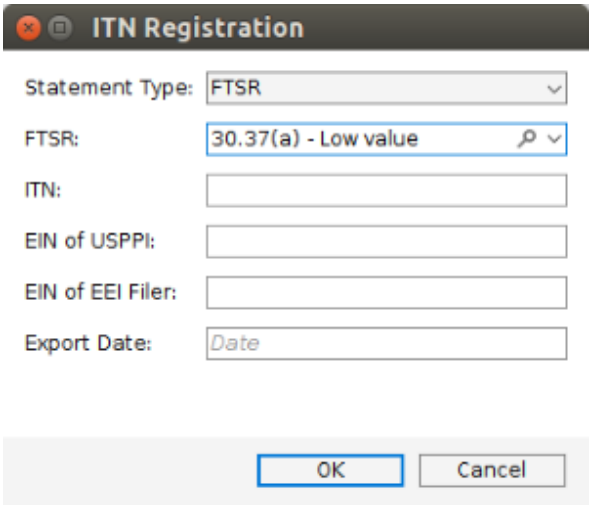
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

The example below shows the ITN filled in, it must start with an "X" and in total must be 15 characters



FTSR - special exemption

When "FTSR" is selected as the statement type, the field "FTSR" must be completed. This is a search field and will show all possible FTSR statments. Choose the correct one.

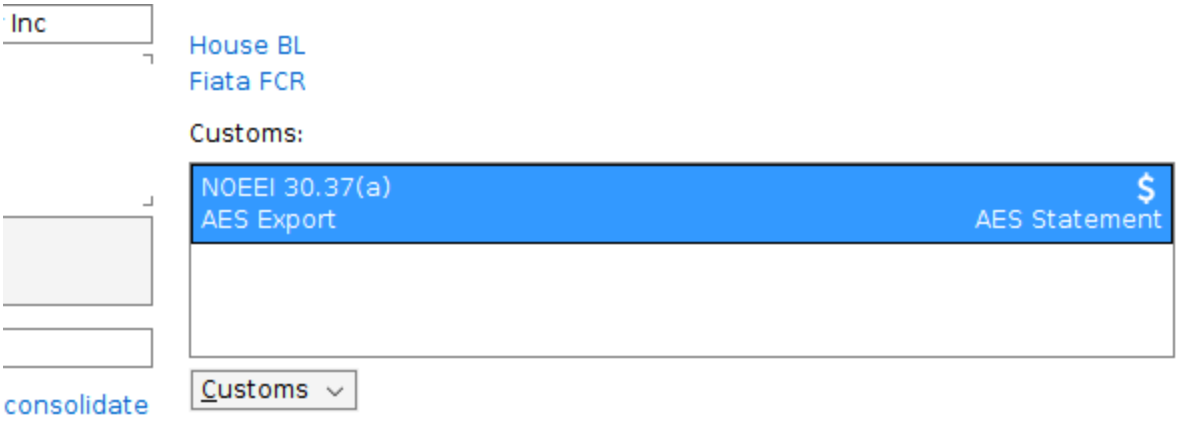


Saving and viewing the additional statement

Once the correct statement has been entered click "OK" to save it.

Now the statement will be visible when viewing the general tab of the shipment:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To send customs entries and get customs updates

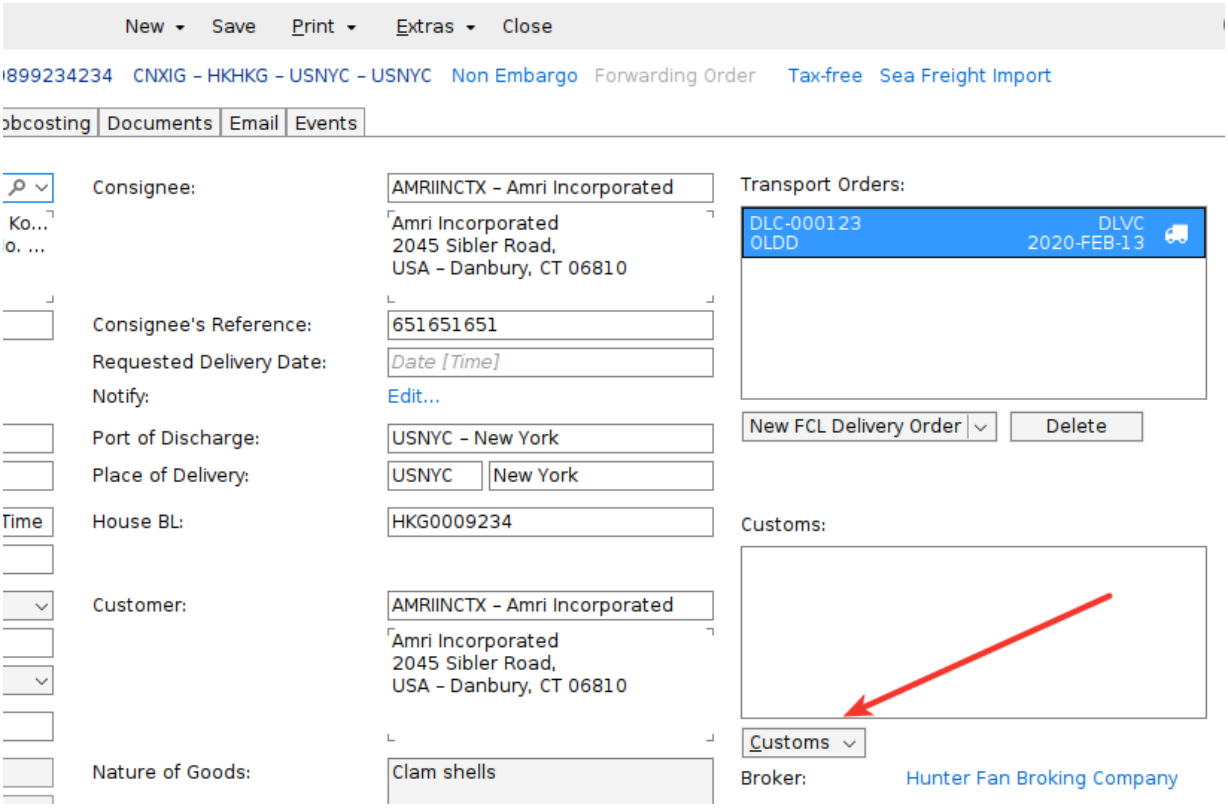
- Sending Import shipment entry summary data to a customs system
- Processing the Scope Arrival Notice information in the customs system
- Receiving Customs updates
- Editing and existing customs order
- Overview of all customs entries

You can send entry summary data to customs system like NetChb, in return the customs system will transmit back to Scope:

- The entry entry number and date
- The status of the customs entry, for example entry release dates and times
- The estimated duties and taxes, these will appear in the job-costing
- The final duties and taxes, these will appear in the job-costing

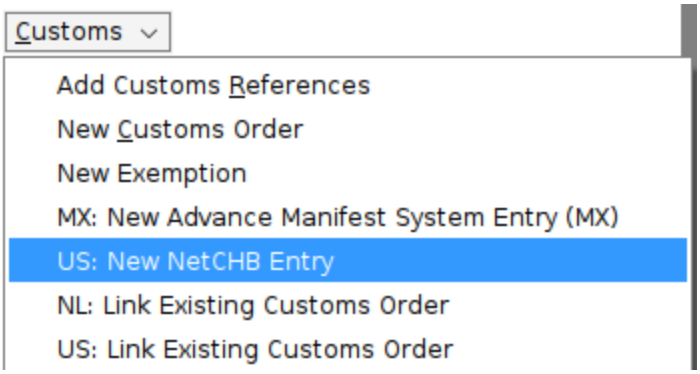
Sending Import shipment entry summary data to a customs system

On the general tab of the import shipment, click the "Customs" button below the "Customs" window:

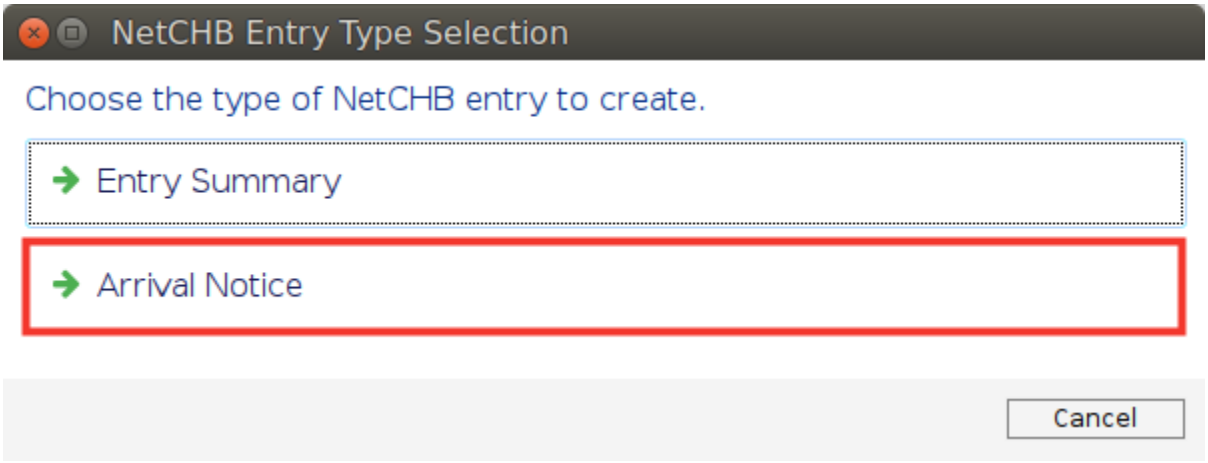


Next, click the type of customs action, in this case "US: New NetCHB" entry is selected because the entry summary data will be sent to the NetCHB customs broking system

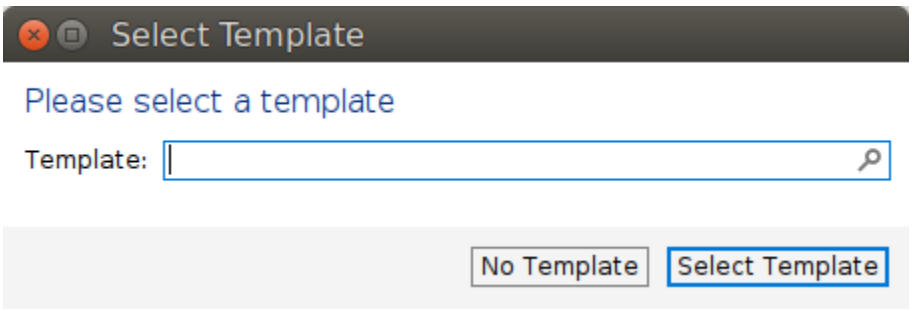
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



From the 2 options that appear, choose "Arrival Notice" to send entry summary data to NetChb



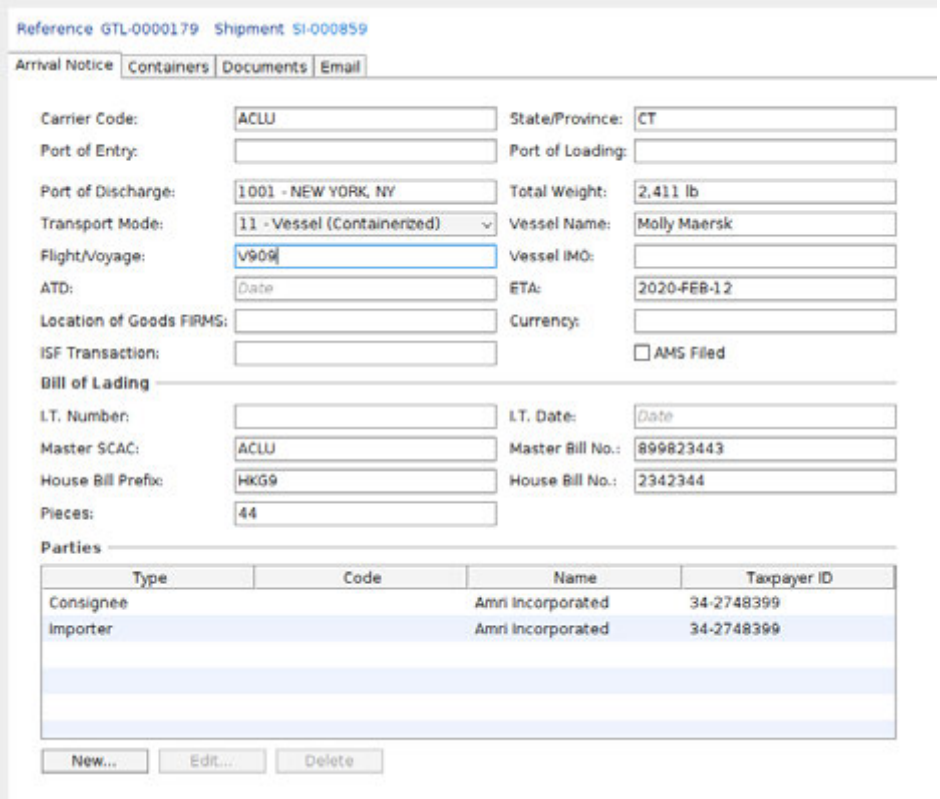
You can create entry summary templates for repeat shipments, if you do not have one, then select "No Template" in the select template screen:



Now the import shipment data that will be sent to NetChb as entry summary data will appear. You can amend this as required and add further data.

If you want to send additional entry summary parties to NetChb, choose "New" at the bottom of the screen to add parties to the "Parties" listing

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When all the data is complete, click "Send" on the toolbar above the arrival notice to transmit the information to NetCHB

Processing the Scope Arrival Notice information in the customs system

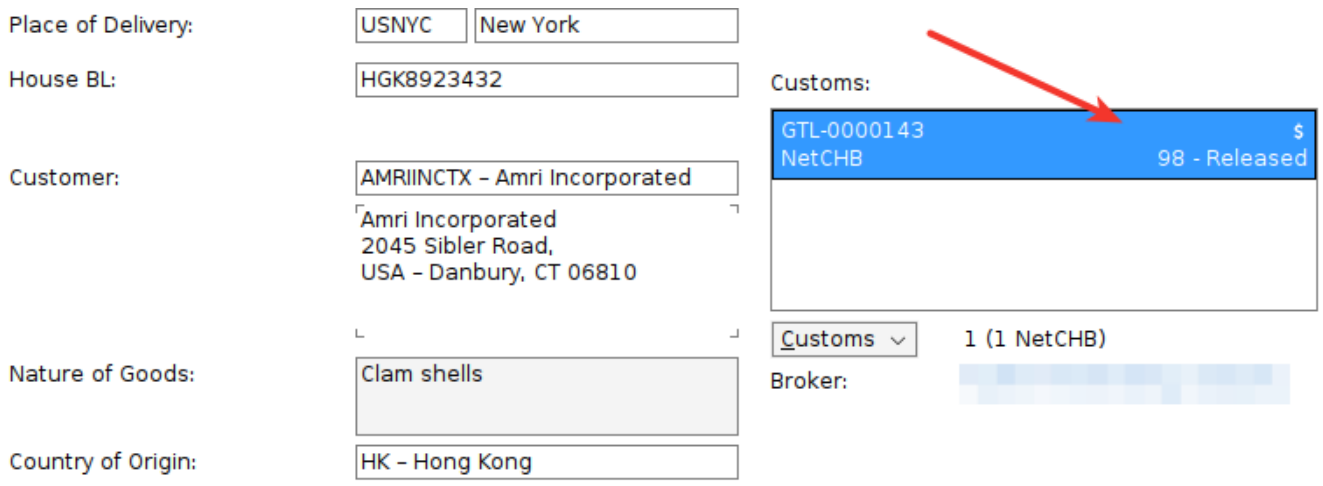
In the NetCHB system, you can import the Scope information into the entry summary by making a new entry, next, in the "Cargo Manifest Query" section, enter the "Master SCAC" and the "Master B/L" that you used in the Scope shipment.

NetChb should automatically find your Scope date and pull it into the entry summary.

Complete the entry summary as normal

Receiving Customs updates

Status updates and duty amounts will automatically flow back into the Scope import shipment from NetChb. These can be seen on the general tab of the shipment in the "Customs" window:

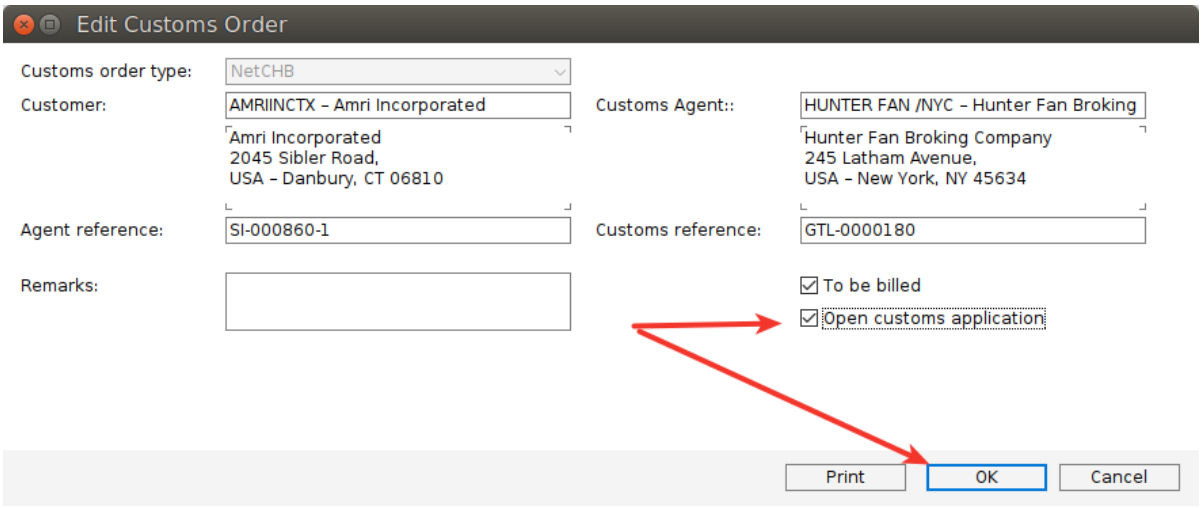


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Editing and existing customs order

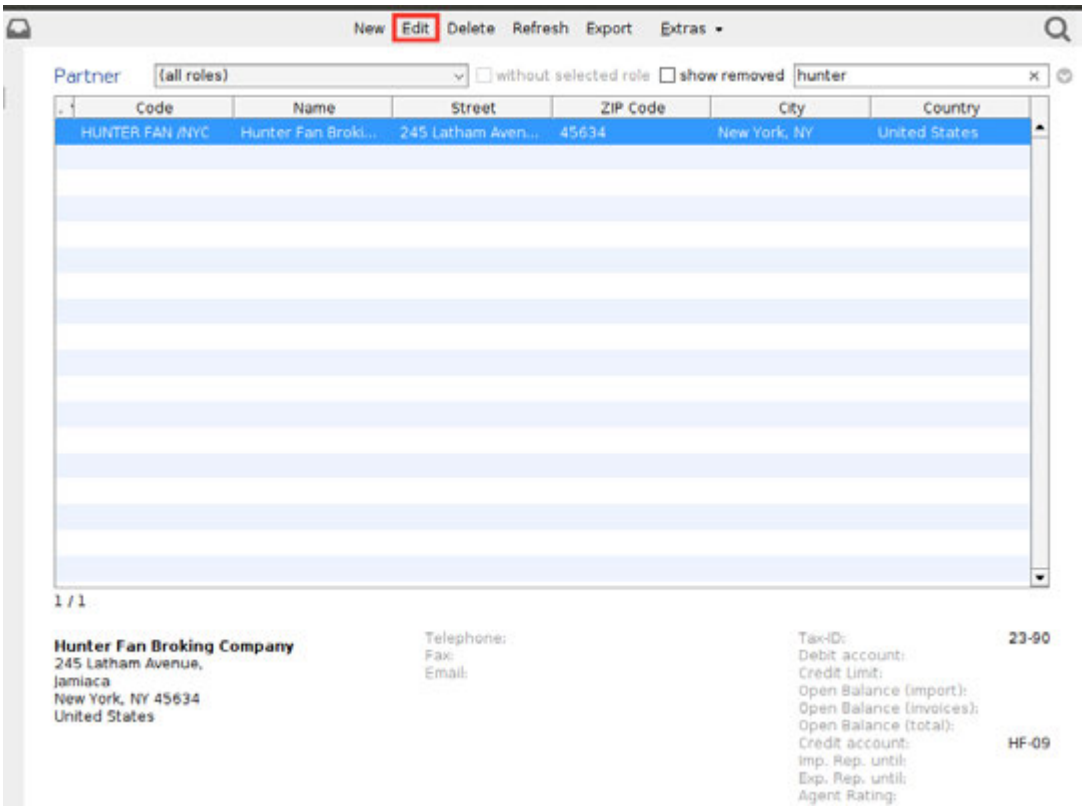
You can edit a customs order, by double clicking it in the customs window

A summary of the customs order will appear:



Check the box "Open customs application" and then click "OK"

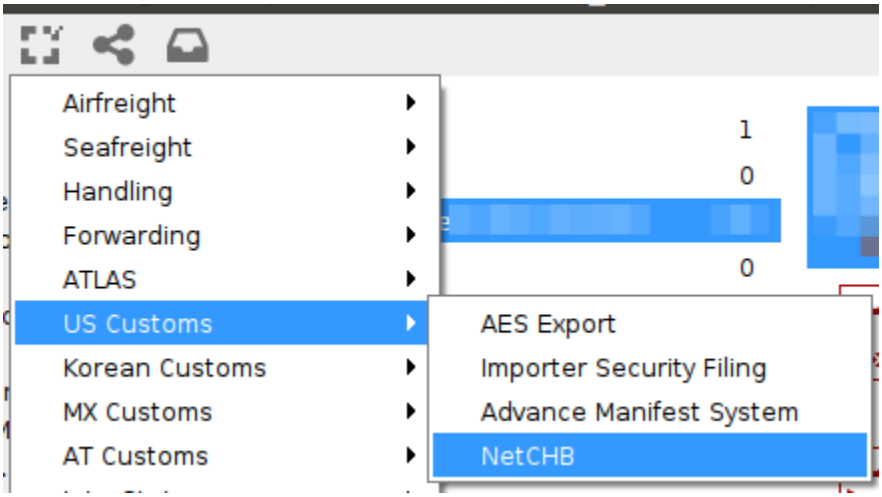
In the Overview of the entry click "Edit"



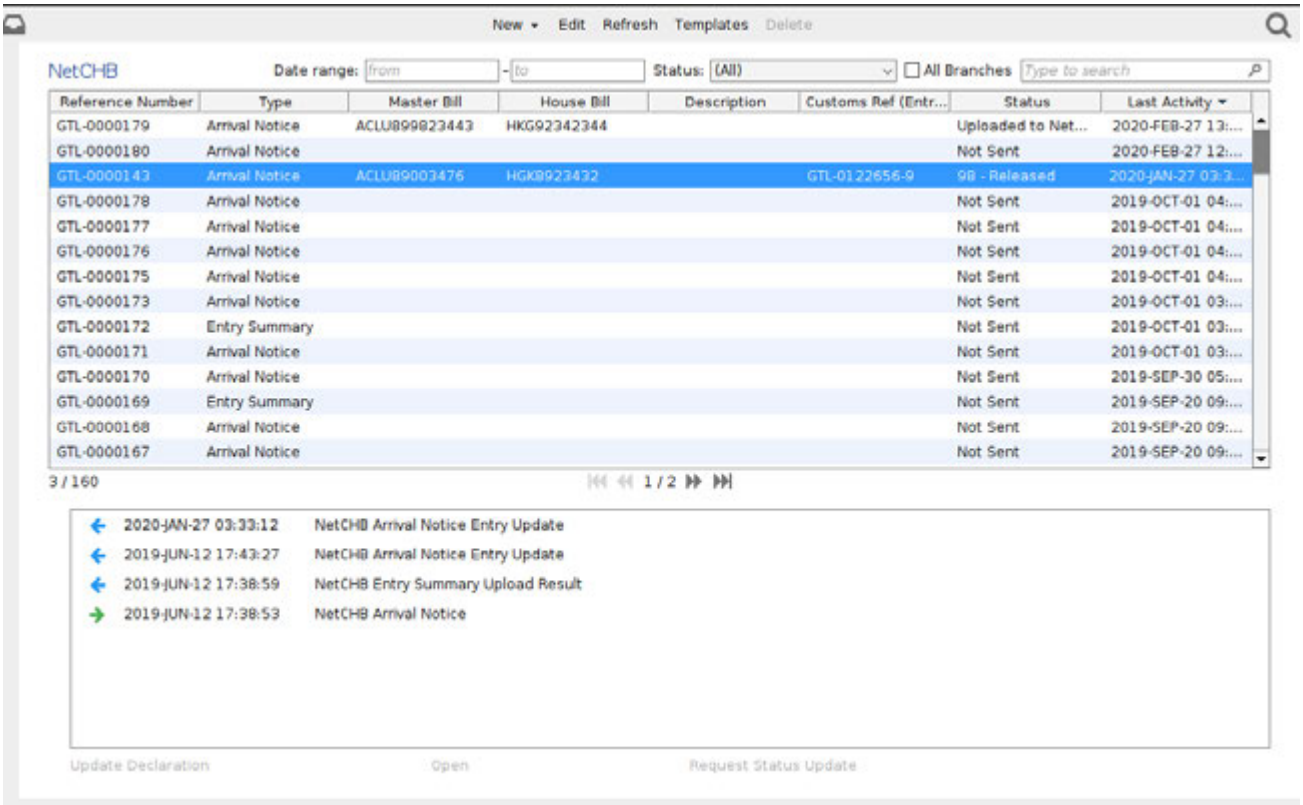
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Overview of all customs entries

From the Scope menu choose "US Customs" and then "Netchb"



You will get an overview of all entries and you can search, filter or edit them



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To US AMS

- Navigating the the AMS application
- Creating a new AMS entry
- General tab of the AMS entry
- Entering AMS House Bill details
  - Enter the bill of lading details
  - AMS Bill of Lading Parties details
  - AMS Bills of Lading Shipment Information
  - AMS Bills of Lading InBond Information
- AMS Bills of Lading Container information
  - AMS Container Commodity information
  - AMS Hazardous information
  - AMS Bill of Lading Vehicle Details
- Complete the AMS
- Related articles

This how-to describes the steps to create an AMS (Advance Manifest System) for a seafreight shipment going to the USA.

Navigating the the AMS application

From the Scope main menu:

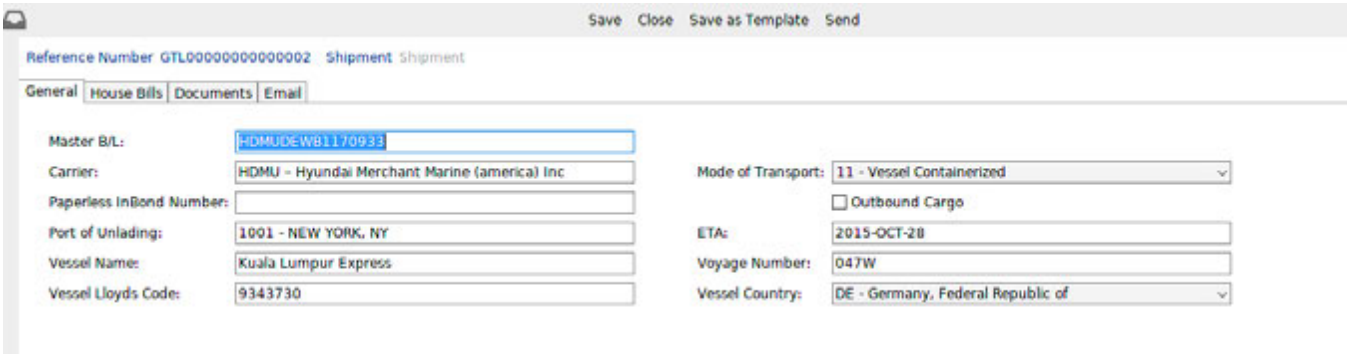
1. Click "US Customs"
2. In the "US Customs" sub-menu click "Advance Manifest System"

Creating a new AMS entry

In the overview of all AMS entries, click "New" and enter the general details for the AMS entry.

General tab of the AMS entry

- **Outbound Cargo** - If the manifest is for export from the USA, then check the box "Outbound Cargo"
- **Paperless InBond Number** - will move to the InBond section
- **Mode of transport** - can be:
  - 10 = Vessel, non-container, or unable to determine if container (Including Lightered, Land Bridge and LASH)
  - 11 = Vessel Containerized (Container)
- **Port of Unlading** - is the 4 digit US port code where the cargo will discharge from the vessel



When the General tab is complete, click the "House Bills" tab

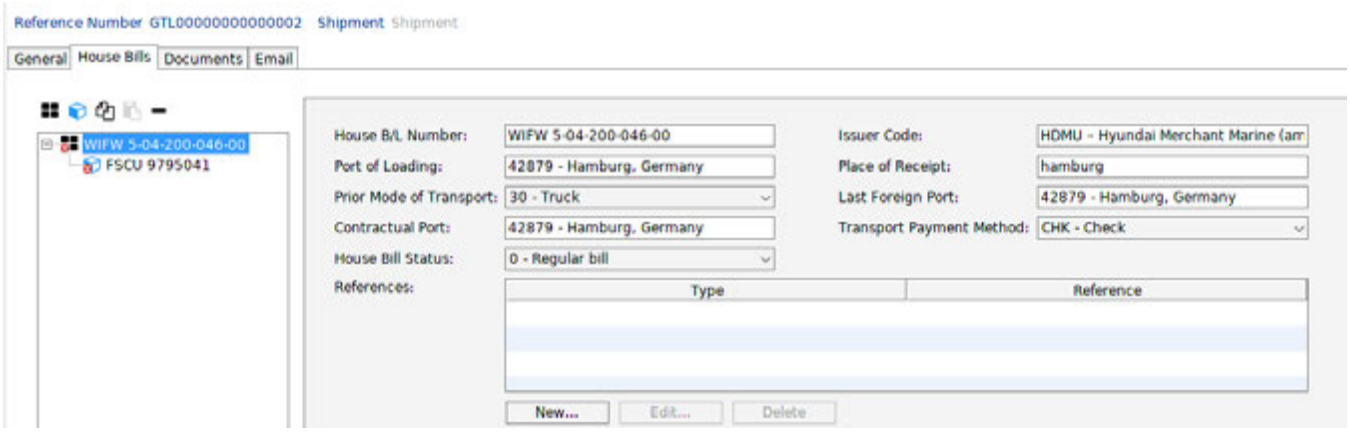
Entering AMS House Bill details

Click the  symbol, top left, to add a bill of lading to the the AMS

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

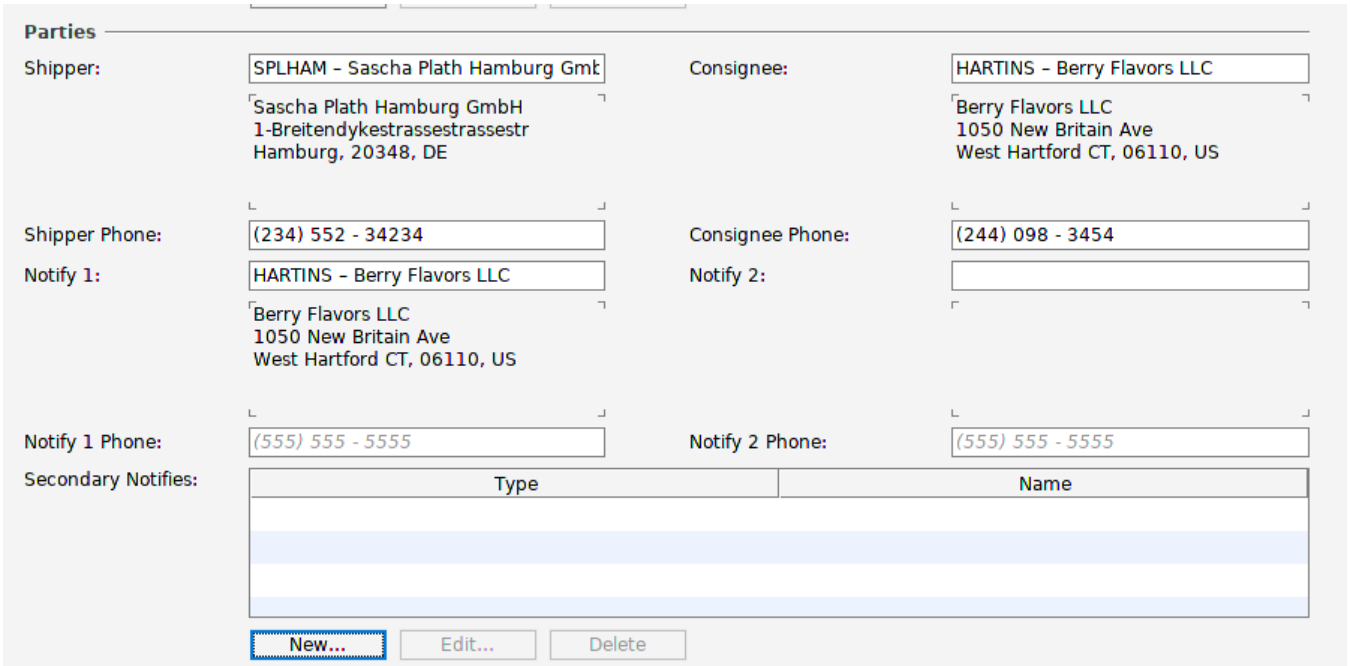
Enter the bill of lading details

- **House B/L Number** - this should not include the 4 digit SCAC code of the issuer
- **Issuer Code** - this is the 4 digit SCAC code of the issuer
- **Port of Loading** - the 5 digit code of the port where the goods were loaded onto the exporting vessel
- **Place of Receipt** - the city or country where the carrier first took possession of the cargo
- **Prior Mode of Transport** - the method of transport used to convey the cargo to the port of loading
- **Last Foreign Port** - the 5 digit code of the last non-US port the vessel departed from before arriving at a US port
- **Contractual Port** - the 5 digit code of the non-US port where the carrier took contractual possession of the cargo
- **Transport Payment Method** - The means by which transportation charges will be paid
- **House Bill Status** - this will default to "0" regular bill, or select from the list of available B/L statuses
- **References** - use the "New" button to add references to the B/L. Choose from the available reference types



AMS Bill of Lading Parties details

For each bill of lading enter the required party details:

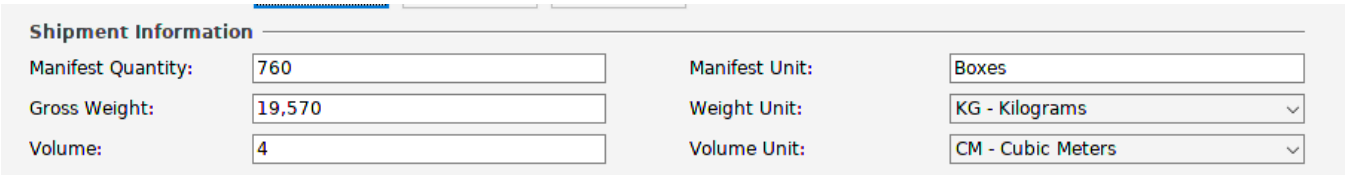


If there are further Secondary Notifies, use the "New" button to add them

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

AMS Bills of Lading Shipment Information

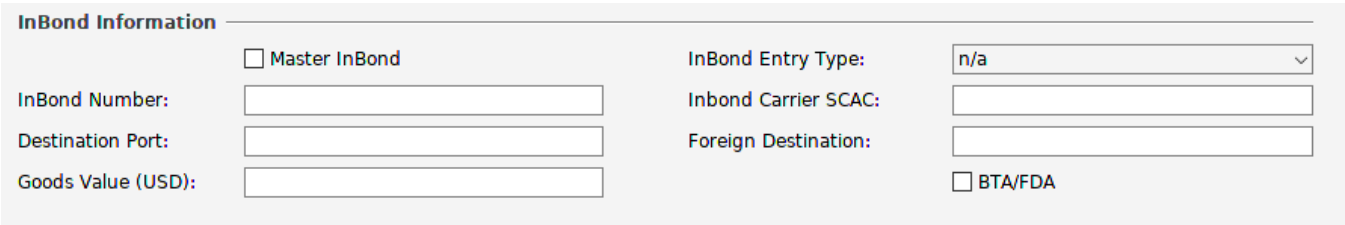
for each bill of lading on the AMS manifest, some goods details must be entered:



AMS Bills of Lading InBond Information

When InBond details exist for a bill of lading, these should be entered in the InBond Information section of the bill

- **Master InBond** - this will be removed
- **InBond Entry Type** - choose from the 3 possible InBond movement types
- **InBond Number** - The CBP assigned InBond control number. Use the Paperless InBond field if the InBond is paperless.
- **Destination Port** - For an InBond type 61, the port of termination for the IT entry. For a type 62, the port of exportation and the port of arrival for a type 63
- **Foreign Destination** - The foreign port of destination for type 62 and 63 InBonds. Not required for a type 61
- **Goods Value** - the value in whole US dollars of the shipment moving InBond
- **BTA/FDA** - Check this box if any of the cargo is subject to the Bioterrorism Act of 2002



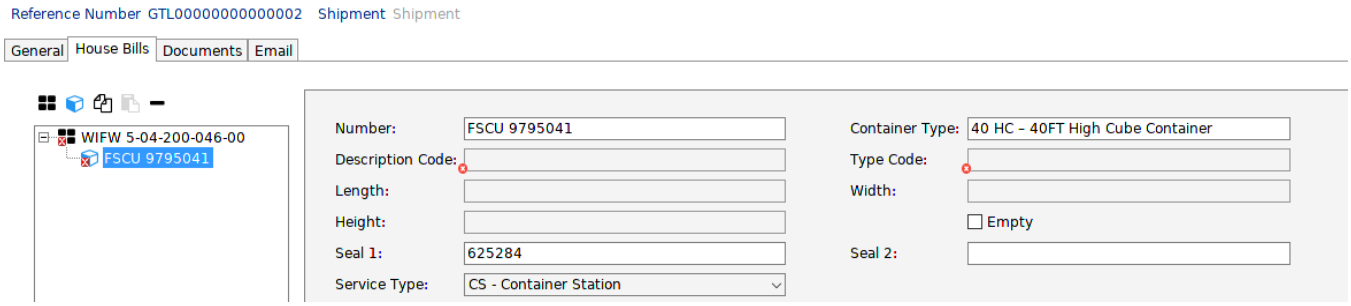
AMS Bills of Lading Container information

For each bill of lading on the AMS manifest one or more containers may be present and these container details are stored within each bill of lading. In addition, within each container, commodity, hazardous and vehicle details may also be entered.

To add container highlight the Bill of Lading that covers the container and click the  icon. Now enter the container details

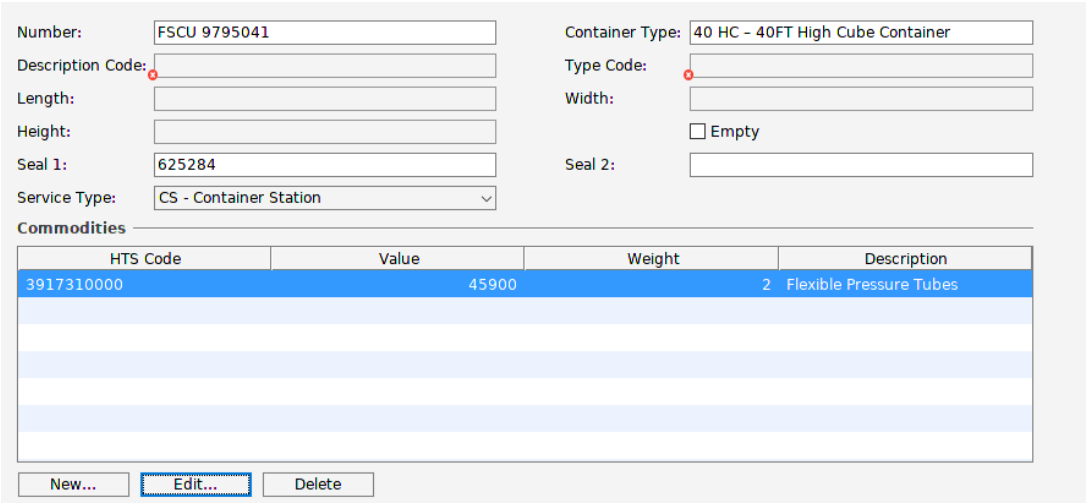
- **Number** - The container number. If the cargo is not containerized, this should be N/A.
- **Container Type** - A code identifying the type of container (not mandatory)
- **Description Code** - The CBP code for the container (not mandatory)
- **Type Code** -
- **Length** - Container length in feet and inches (not mandatory)
- **Width** - Container width in feet and inches (not mandatory)
- **Height** - Container height in feet and inches (not mandatory)
- **Empty** - check this box if the container is empty
- **Seal 1 and 2** - Up to 2 seal numbers may be entered for each container
- **Service type** - A code indicating the extent of the transportation service required for each container, for example CY=Container Yard and RR= Roll on , Roll off

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



AMS Container Commodity information

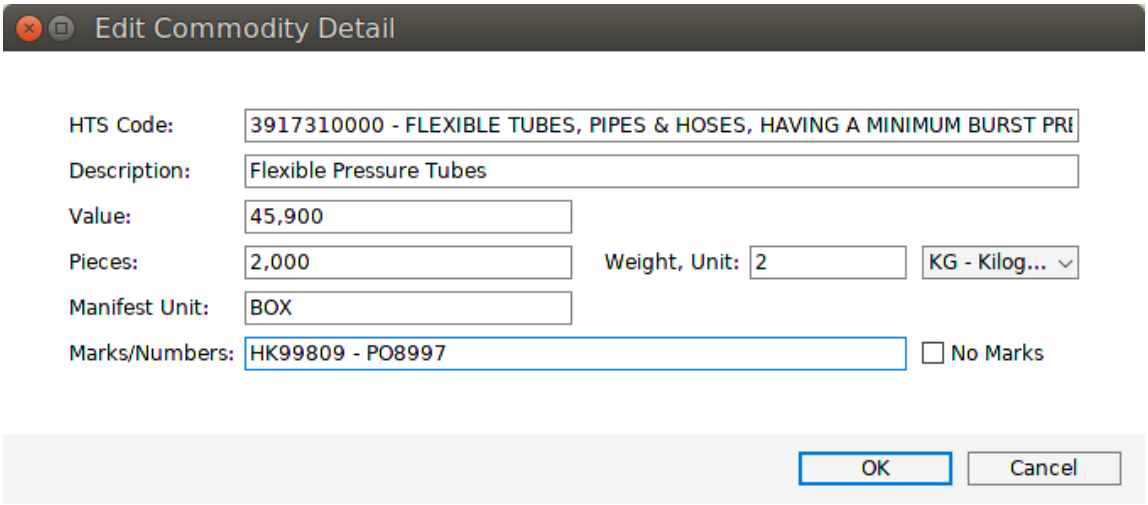
for each container on each bill of lading, 1 or more commodity details can be entered, indicating these commodities are within the container.



Click the "New" button under the commodities window to add commodities

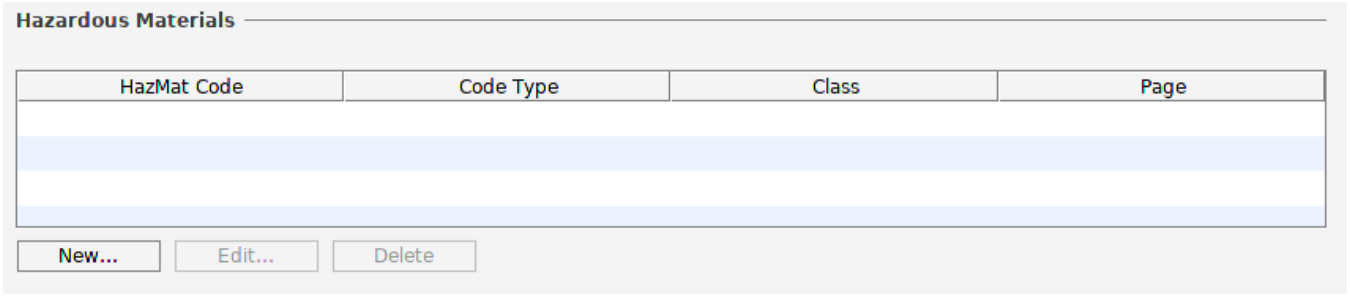
- **HTS Code** - enter the HTS code for the commodity or type the commodity description to search for the correct code.
- **Description** - enter a description of the goods
- **Value** - The value of the commodity in whole US Dollars
- **Pieces** - Total number of pieces in the container
- **Weight and Unit** - The net weight of the commodity (no decimals). Use the drop down menu to select the unit of weight measure.
- **Manifest Unit** - The manifest unit of measure for the smallest package unit for the bill of lading (valid units will be supplied in a drop down menu)
- **Marks/Numbers** - The written description of the symbols and markings that are on the outside of the packaging.
- **No Marks** - Use this checkbox if marks and numbers have already been entered.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



AMS Hazardous information

If there are any hazardous goods on the bill of lading, these can be entered in the hazardous materials section of the goods

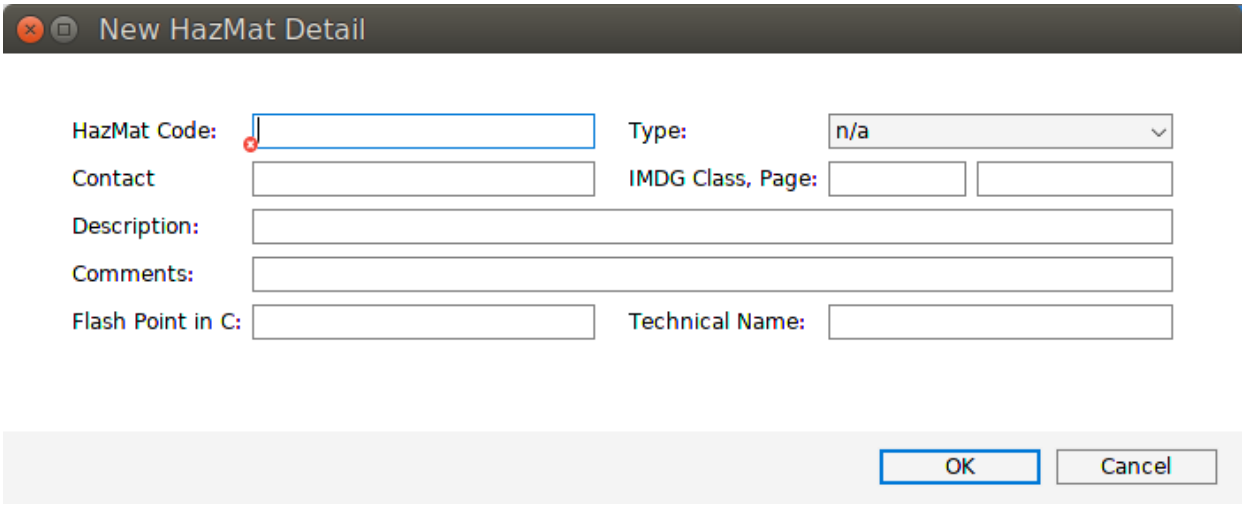


Click the "New" button to add hazardous information

- **HazMat Code** - A code representing the identification number assigned to the hazardous material for example "UN"
- **Type** - Select from the list the the code that describes the hazardous material class:
  - 4 46 Level DOT Code
  - 6 Airline Tariff 6D
  - 9 Title 49 Code of Federal Regulations
  - A International Civil Aviation
  - D Hazardous Materials ID DOT
  - E Endorsement
  - F Air Force Regulation 71-4
  - I International Maritime Organization (IMO) Code issued by Lloyds
  - R Bureau of Explosives 600-A
  - U United Nations

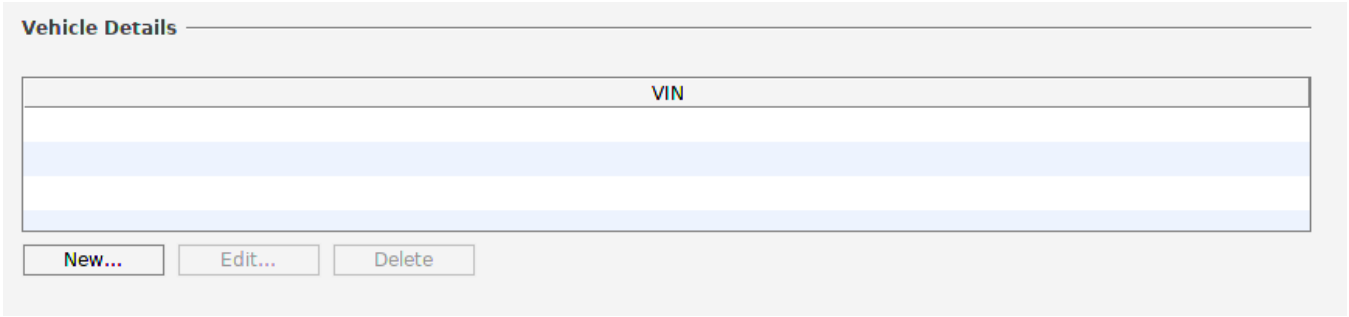
- **Contact** - The name and / or phone number of the person to contact in case of emergency
- **IMDG Class** - A code representing the hazardous class or division designated for the material in the International Maritime Dangerous Goods (IMDG) code
- **IMDG Page** - The page number in the IMDG code in which the hazardous material identification appears
- **Description** - The material name and/or special instructions, if applicable
- **Comments** - Free form description of hazardous material classification, division, or label requirements
- **Flash Point in C** - A value representing the lowest temperature at which the vapor of a hazardous combustible liquid will ignite in the air. When returned, the Flashpoint Temperature is a whole number. No decimals
- **Technical Name** - The proper shipping name of the material designated as hazardous

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

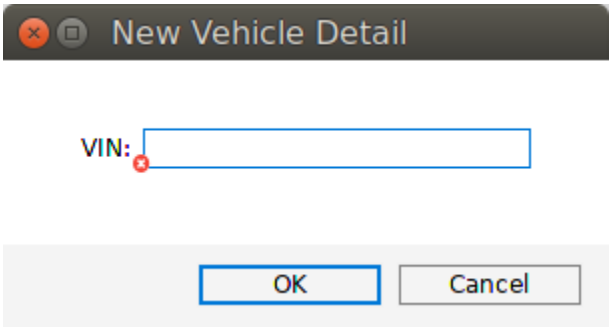


AMS Bill of Lading Vehicle Details

When vehicles are included on the bill of lading, the details of these should be recorded within the container in which the vehicle is located



Click the "New" button to add vehicle details to a container and insert the VIN number of the vehicle.



Complete the AMS

When the details for the AMS have been completed, use the menu bar option to take the next step:

- **Save** - save any details added to the AMS entry
- **Close** - save and close the AMS entry
- **Save as Template** - create a template from the AMS for repeat shipments
- **Send** - transmit the AMS entry to CBP

How-To use the Scope Purchase Order Management Systems - POMS

- Overview
- Setup
  - Creating a POMS web user
    - Enable Purchase Order Management - tab
- Creating Purchase Orders in Scope Connect
  - Overview of consignments and transport plans
  - New consignment
    - Order Lines
    - Order Lines via CSV file
- Creating Purchase Orders in Scope
  - New consignment in Scope
    - Order lines in Scope
- Forwarding Orders
  - Creating a forwarding order
    - A forwarding order from within a consignment
    - A forwarding order from the menu
    - General details of the forwarding order
    - Adding consignments to a forwarding order
    - Goods on the forwarding order
    - Routing of the forwarding order
  - Associating a shipment with the forwarding order
  - Changing the status of a consignment and a forwarding order

Overview

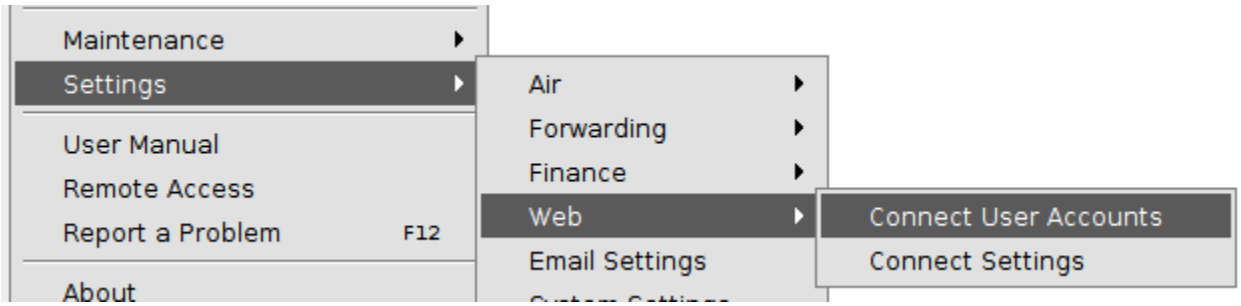
The document will explain:

- Setup the purchase order system
- Creation of web users for the purchase order system
- Entering online purchase orders in Scope Connect
- Entering purchase orders in Scope
- Processing customer purchase orders in Scope
- Adding purchase orders to forwarding orders
- Linking forwarding orders to shipments

Setup

Creating a POMS web user

The customer can enter their purchase orders online. To do this the user will need to be able to login to Scope Connect. Therefore, from the main Scope menu choose "Settings" followed by "Web" and then "Connect User Accounts"

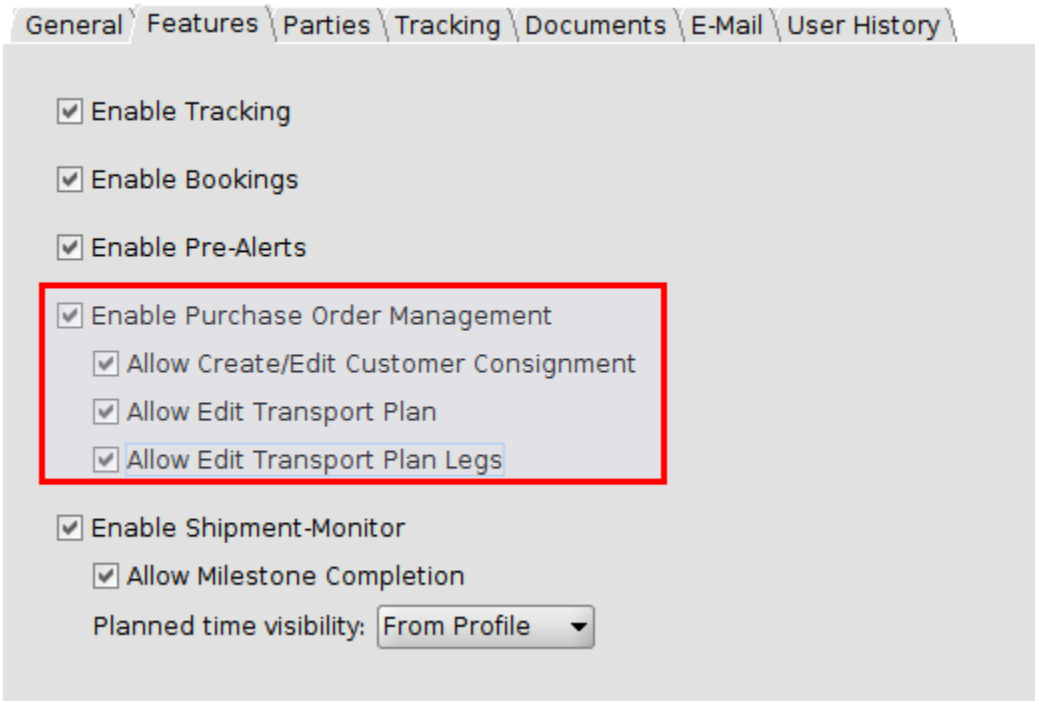


Use the General tab of the Connect User Accounts to give the new user basic login details if they do not already exist.

Enable Purchase Order Management - tab

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Click on the "Features" tab of the Scope Connect User editor.



Check the box "Enable Purchase Order Management. This will give the Scope Connect user basic access to purchase orders on-line.

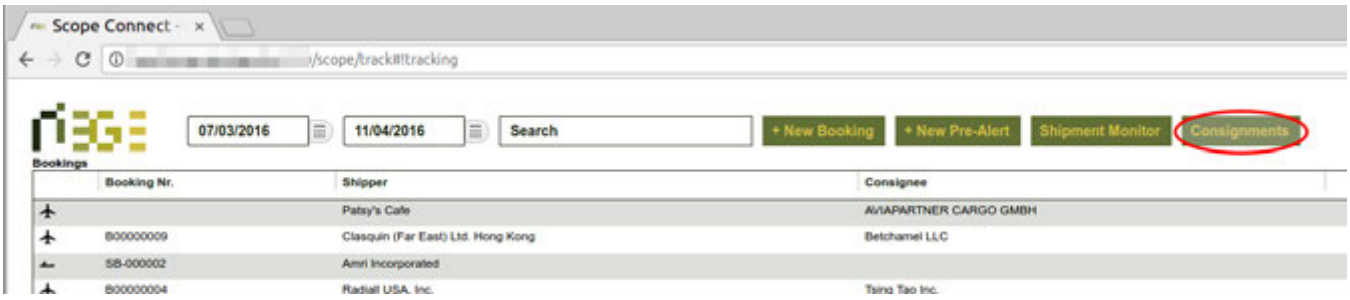
- **Allow Create / Edit Customer Consignment** - this option will allow the user to enter the main purchase order details
- **Allow Edit Transport Plan** - this option will allow the user to add transport details to the purchase order
- **Allow Edit Transport Plan Legs** - this option will allow the user to modify the transport legs used for the purchase order

Click 
when the user details are complete.

Creating Purchase Orders in Scope Connect

Now that the user has access to purchase orders, they should login to Scope Connect.

Purchase Orders are called "Consignments" and this option should be visible at the top of the Scope Connect landing page:



On clicking 

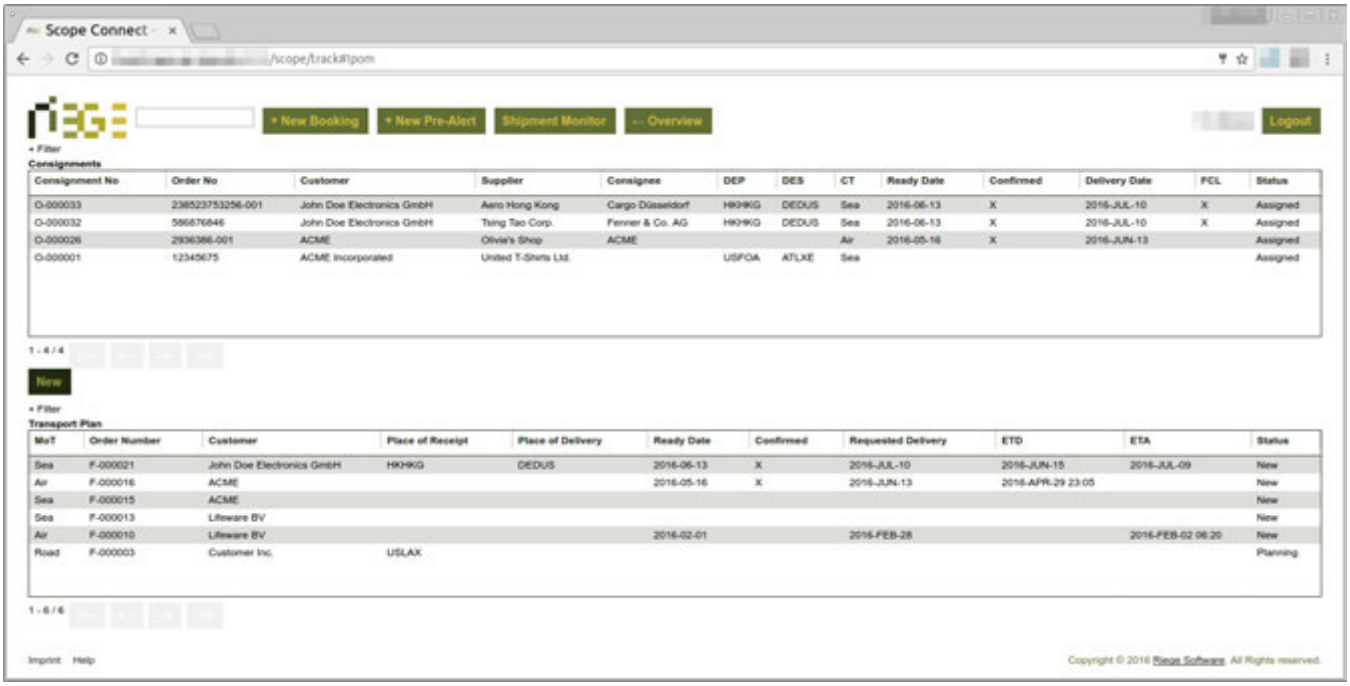
the Scope Connect will display an overview of consignments and transport plans

Overview of consignments and transport plans

The overview shows

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- **All consignments** - the user can see their consignments with their read and delivery dates, and the status of the consignments
- **All transport plans** - any transport plan that has one of the users consignments attached to it is shown in the lower window
- **Search** - this field allows the user to search for consignments using details within a consigment
- **New** - this option allows the Scope Connect user to create a new consignment



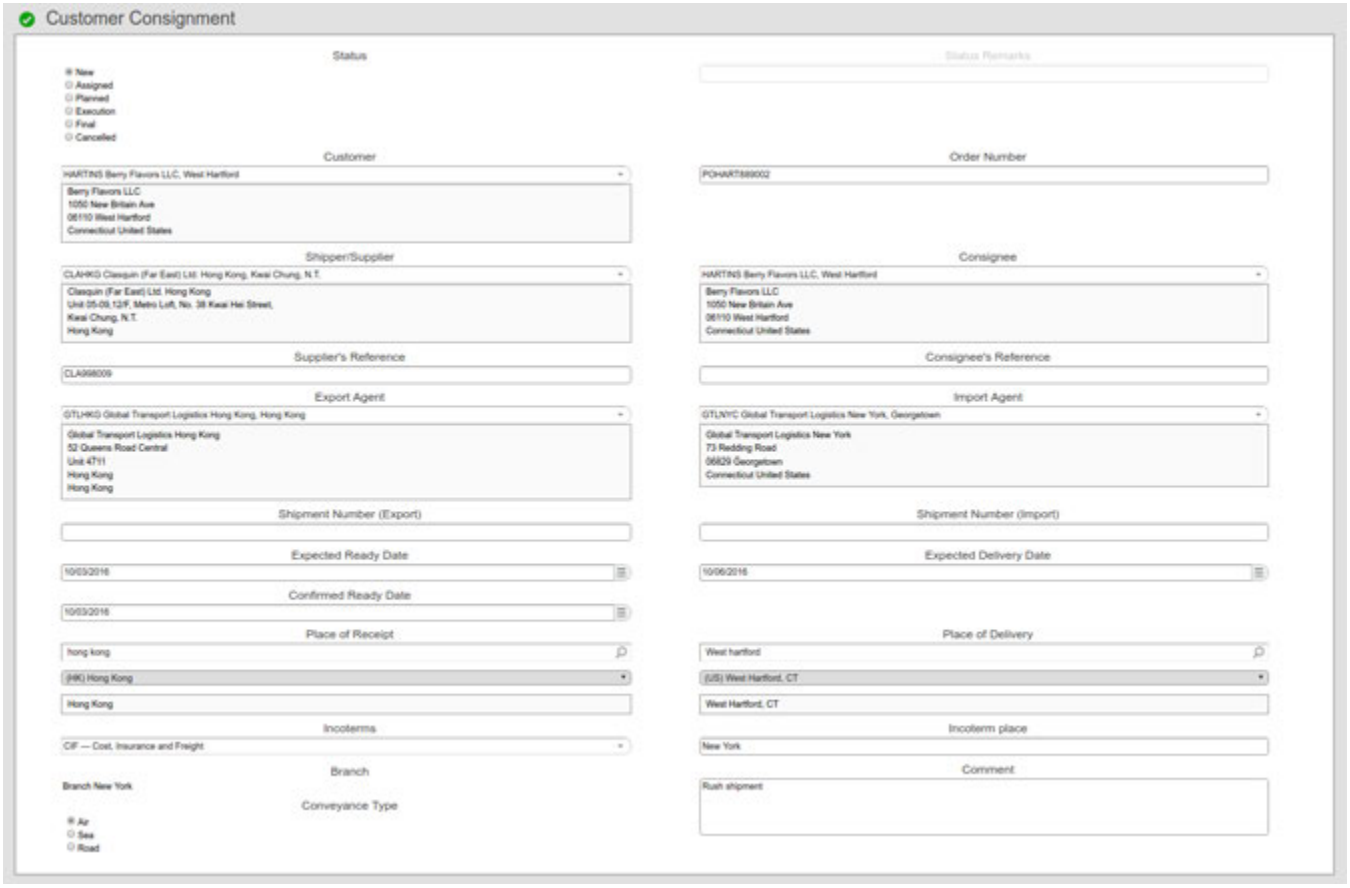
New consignment

Click  to create a new consignment

A new customer consignment will open and the following details can be entered:

- **Status** - this will always be "New" when the consignment is created.
- **Customer** - this is the forwarders customer responsible for generating the consignment. Search or choose from the drop-down list. At least 1 customer must be allocated to this users Scope Connect account.
- **Order Number** - The reference number used to identify the order
- **Shipper/Supplier** - the party who will provide the goods. This can be a one-time address or the user can choose from addresses allocated in the users Scope Connect account.
- **Supplier's Reference** - a reference used by the shipper or supplier to identify the goods
- **Consignee** - the party to whom the goods will be shipped, often this is also the customer. This can be a one-time address or the user can choose from addresses allocated in the users Scope Connect account.
- **Consignee's Reference** - a reference used by the consignee to identify the goods. This may not be the same as the order number.
- **Export Agent** - the forwarder responsible for creating a shipment for the goods.
- **Import Agent** - the forwarder who will import and process the shipment containing this consignment
- **Shipment Number (Export)**
- **Shipment Number (Import)**
- **Expected Ready Date** - the earliest date when the goods will be available. This is a mandatory field
- **Expected Delivery Date** - the date the consignee expects to receive the goods.
- **Confirmed Ready Date** - the date the goods are ready for the export agent.
- **Place of Receipt** - the place where the goods are picked up from
- **Place of Delivery** - the final location the goods will be delivered to
- **Incoterms**
- **Incoterm place**
- **Conveyance type:**
    - air
    - sea
    - road
- **Comment** - extra information about the goods

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Order Lines

Following on from entry of the above consignment details, the order lines are entered. These lines capture the goods details:

- **Amount** - the goods count
- **Type** - the packing type, use the drop down list to see packing types. Or start entering the packing type name for a list of suggestions
- **Amount (inner)** - If there is an internal packing type within the main packing type, enter the number within each external packing type
- **Type (inner)** - the type of internal packing type
- **Volume** - the total volume of this order line
- **Weight** - the total weight of this order line
- **Nature of Goods** - a description of the goods on the order line
- **Article** - the article number
- **Serial** Numbers
- **Sellers** Reference

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

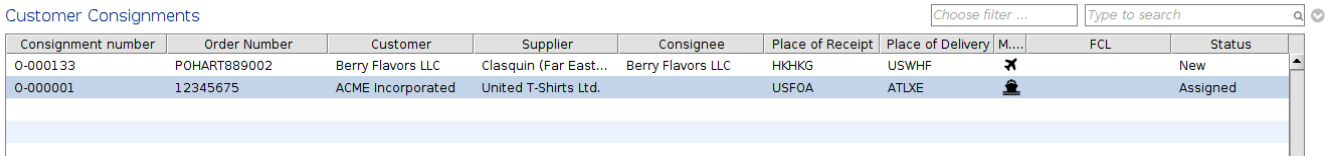
Once an order line is complete, use the Add button to save it. Use the Add button to add further order lines.

Order Lines via CSV file

If the order lines are available in a CSV file, this can be uploaded to the consignment. This greatly speeds entry where there are multiple order lines. Contact your system administrator for the structure of the CSV file containing the order line.

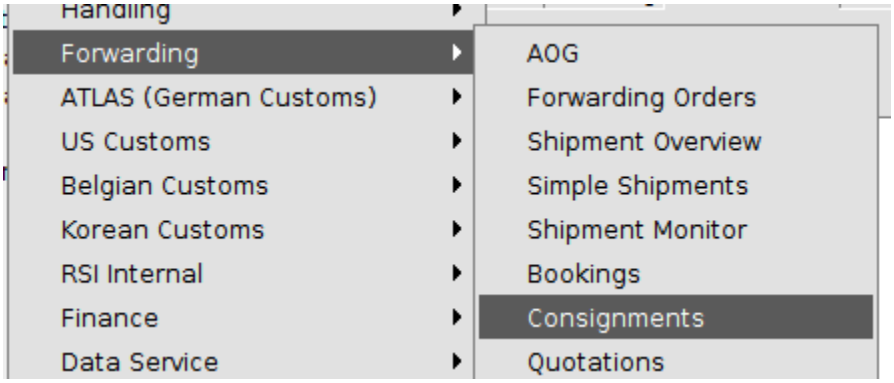
Use the Upload CSV button to upload order lines to Scope Connect

Once the consignment and order lines are complete. Press the Save to save the new consignment. This consignment will also be visible to the forwarder in Scope.



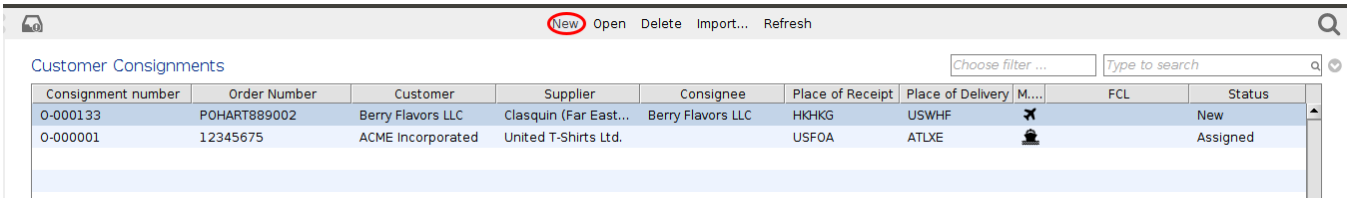
Creating Purchase Orders in Scope

Purchase orders can also be created directly in Scope, the processed is very similar to creating these in Scope Connect described above. In the Scope menu, navigate to "Forwarding" and then select "Consignments":



The overview of all consignments will open including those create in Scope Connect

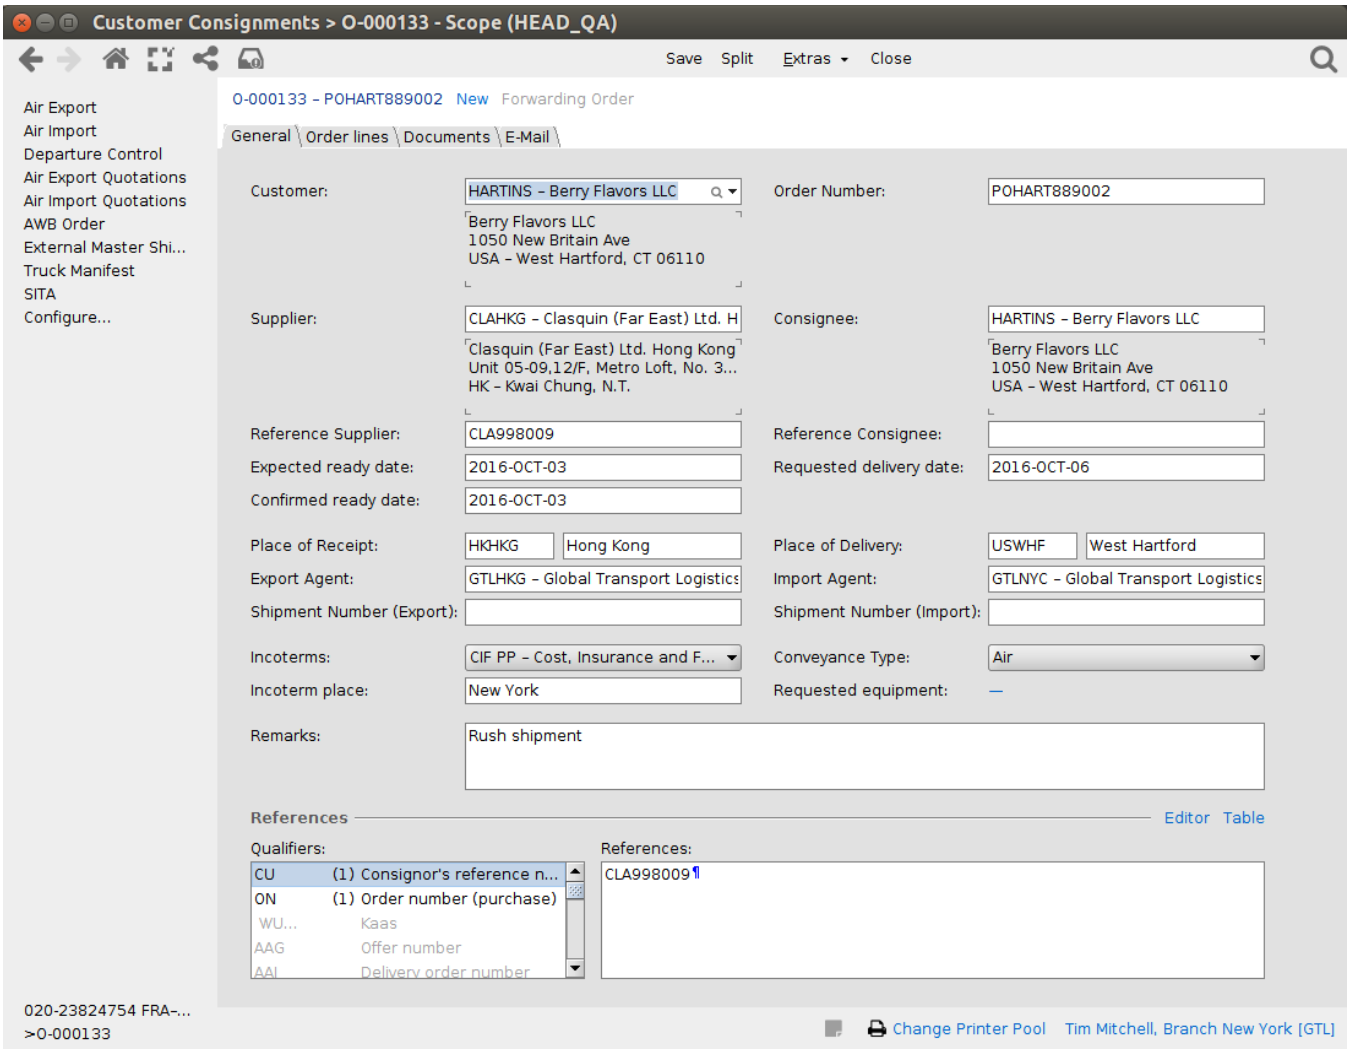
Click "New" to make a new consignment:



The consignment editor opens. The fields for completion are the same as those described above in Scope Connect:

New consignment in Scope

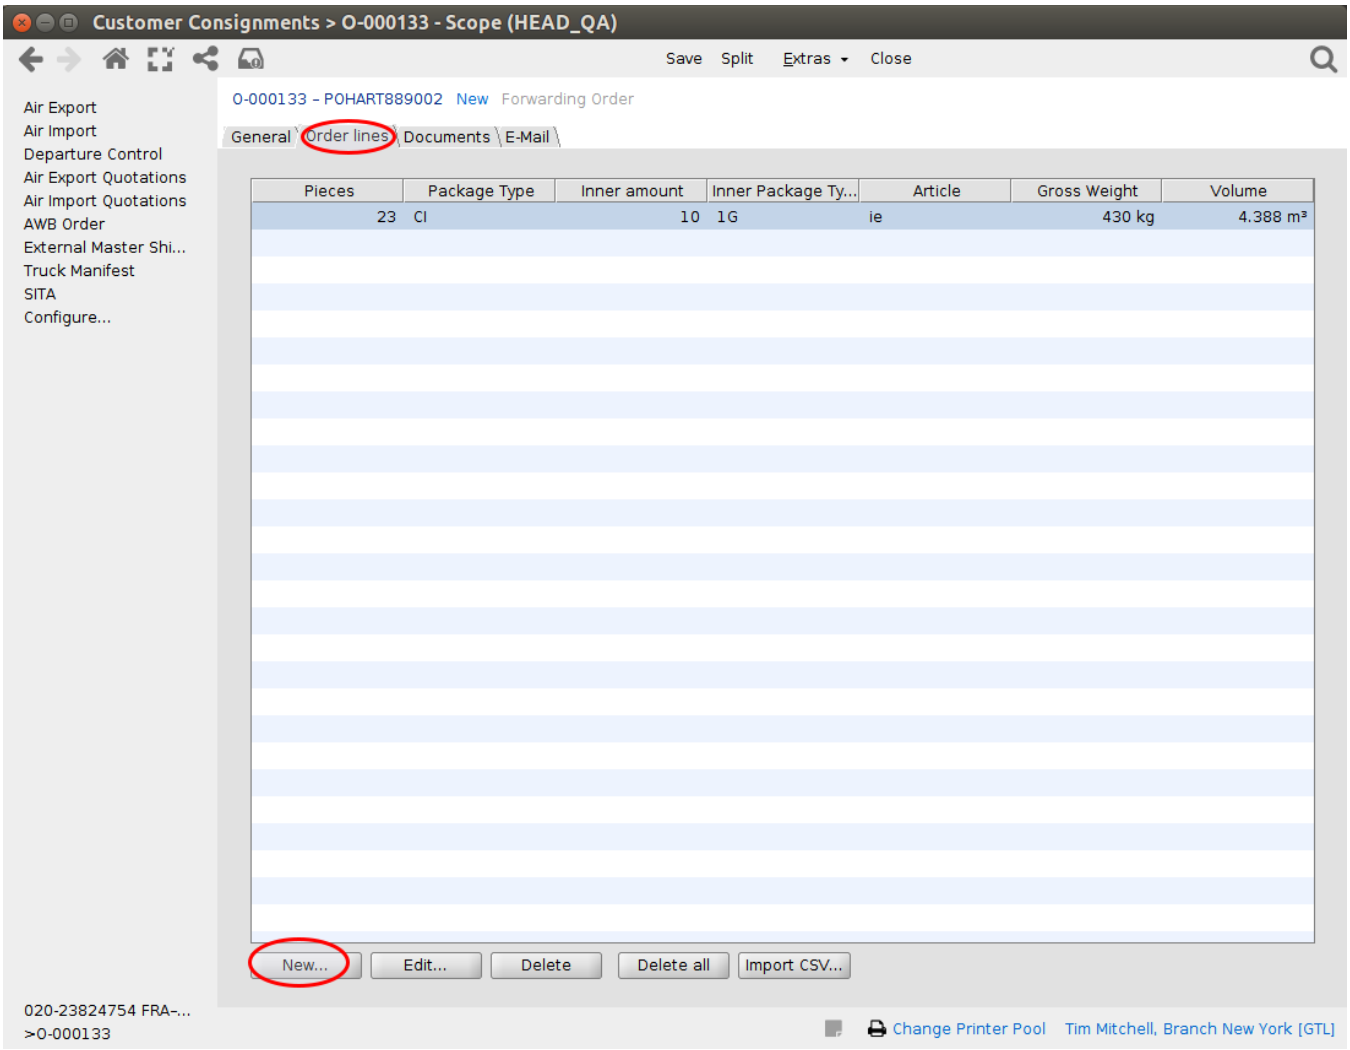
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Order lines in Scope

When the consignment details are complete, click on the "Order Lines" tab to get to the order lines screen.

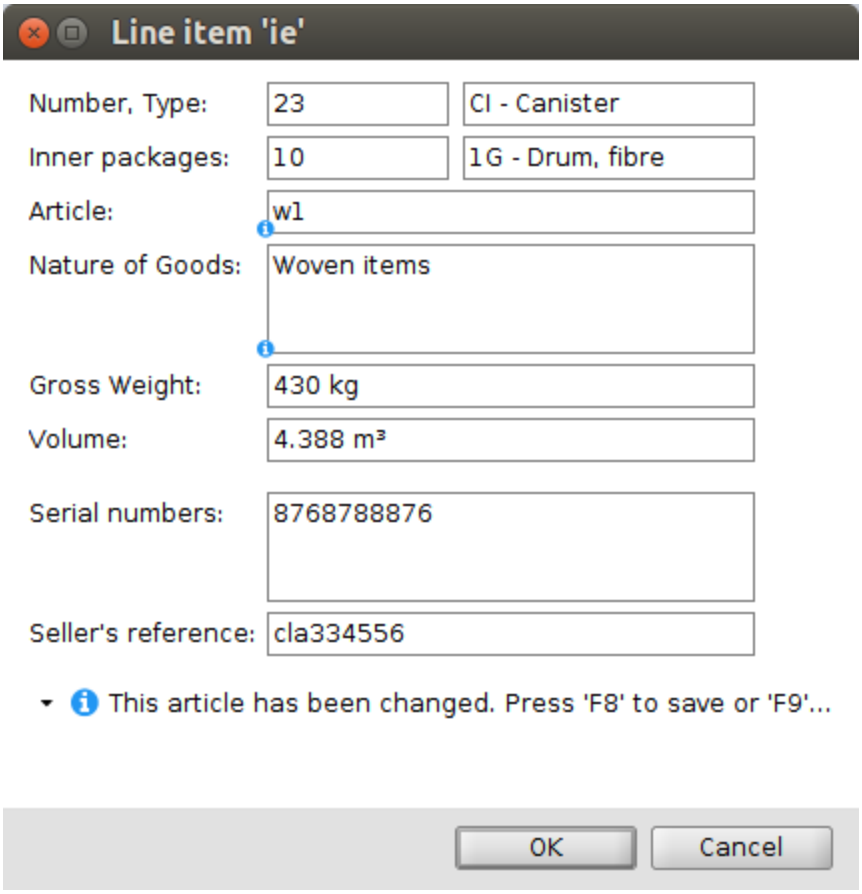
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Click the 
button to add a new line.

Complete the line item details:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Forwarding Orders

When consignments have been created, they need to be attached to a forwarding order. There can be 1 or more consignments on a forwarding order.

Forwarding orders enable the forwarder to:

- Group consignments together
- Establish dates and times when all the consignments will be ready and their required final delivery date
- Apply transport legs to the order
- Create a shipment for the order

Creating a forwarding order

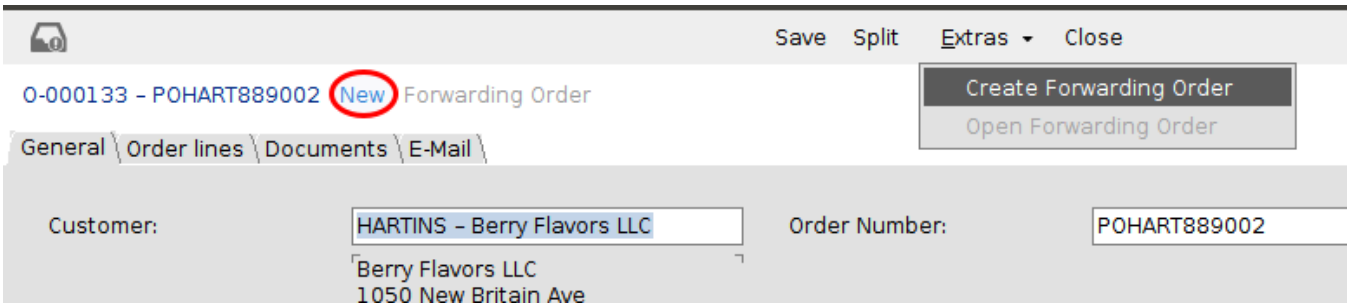
There are 2 ways to create a forwarding order:

- Within a consignment
- From the menu

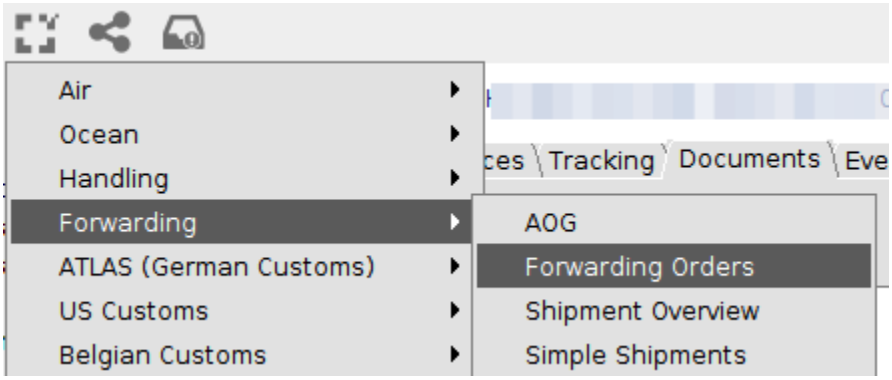
A forwarding order from within a consignment

1. Open or create a consignment.
2. The status of the consignment should be "new"
3. Click extras and select "Create Forwarding Order" from the menu.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

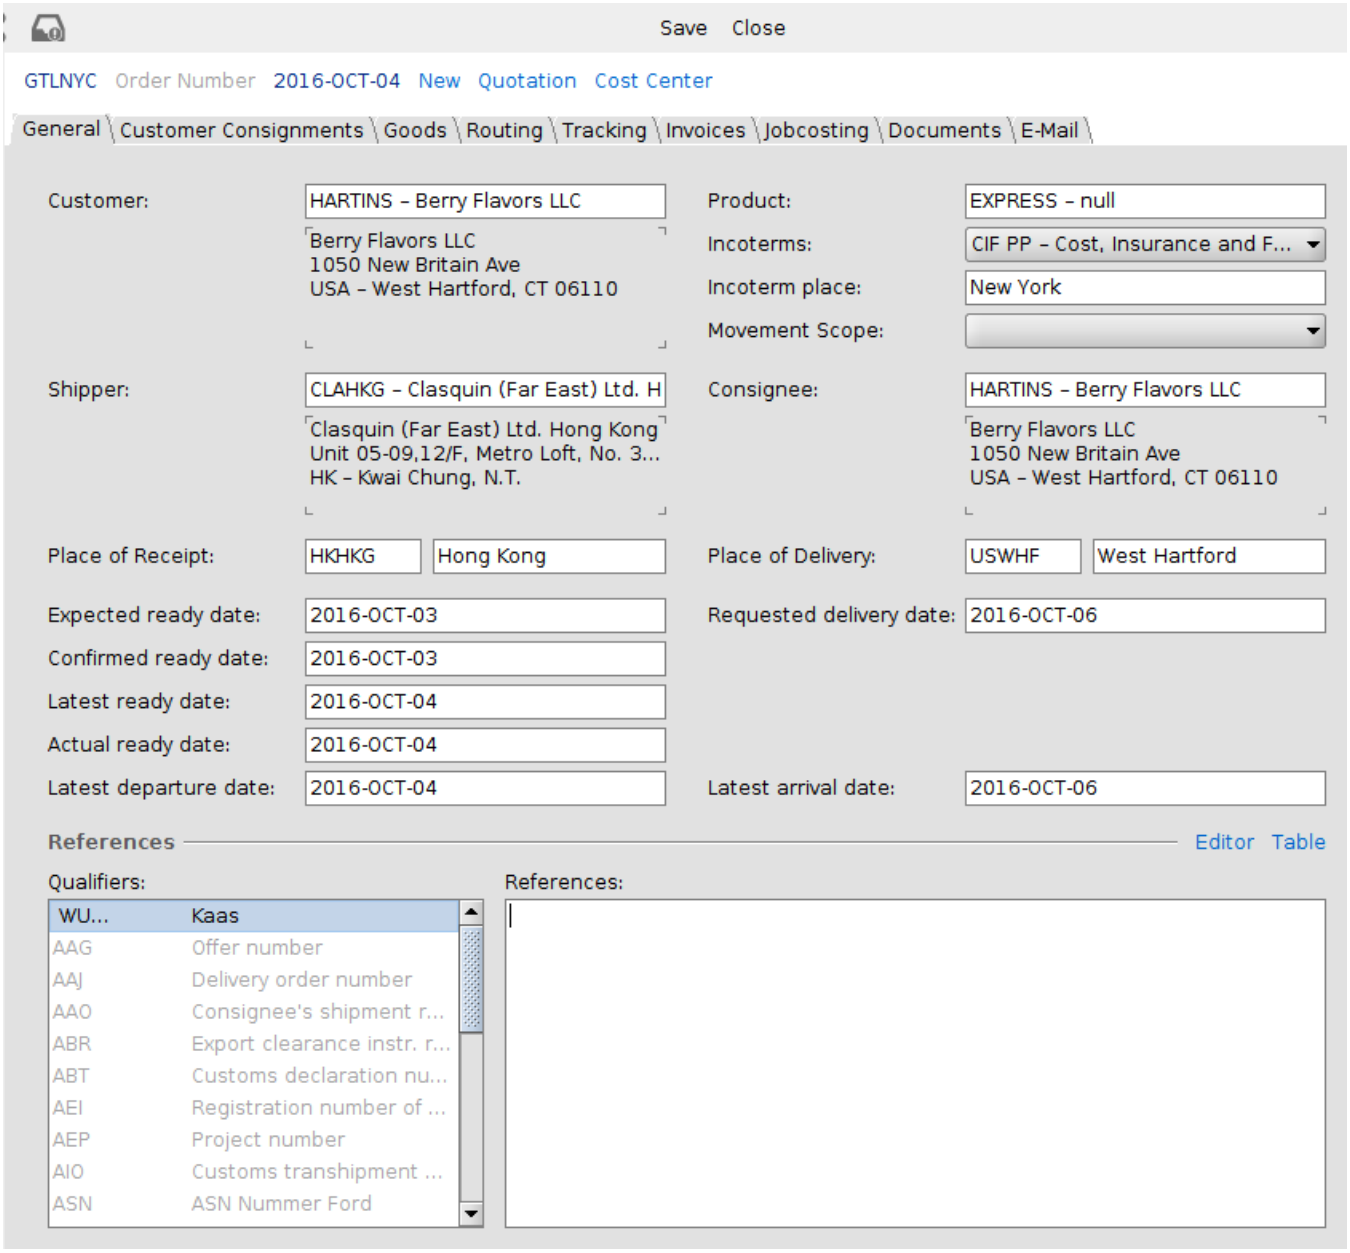


A forwarding order from the menu



General details of the forwarding order

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



When creating a forwarding order from within a consignment, most of the details from the consignment will automatically fill the general details of the forwarding order. These can be changed as required.

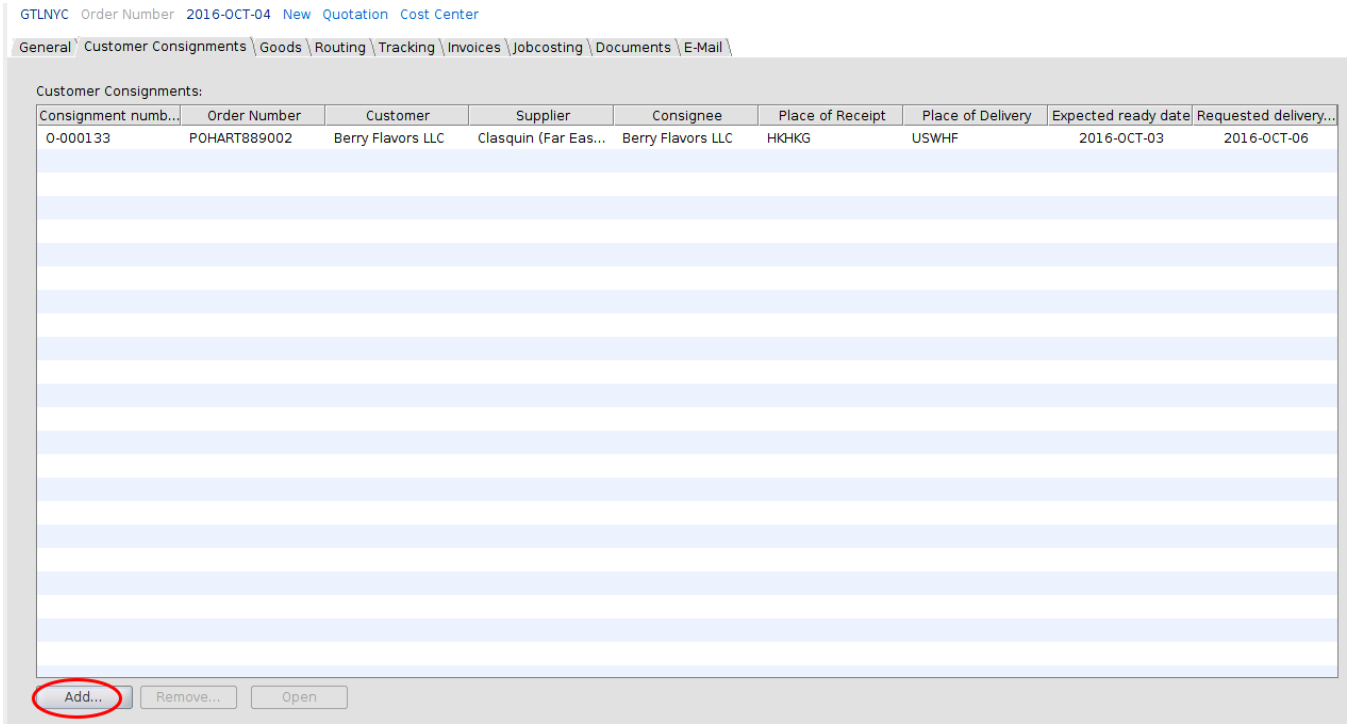
Most importantly, a set of dates can be established:

- Expected ready date
- Confirmed ready date
- Latest ready date
- Actual ready date
- Latest departure date
- Requested delivery date
- Latest arrival date

Adding consignments to a forwarding order

The "Customer Consignments" tab of the forwarding order can be used to add further consignments to the order. This tab will show an overview of consignments on the order. Use the "Add" button to add further consignments.

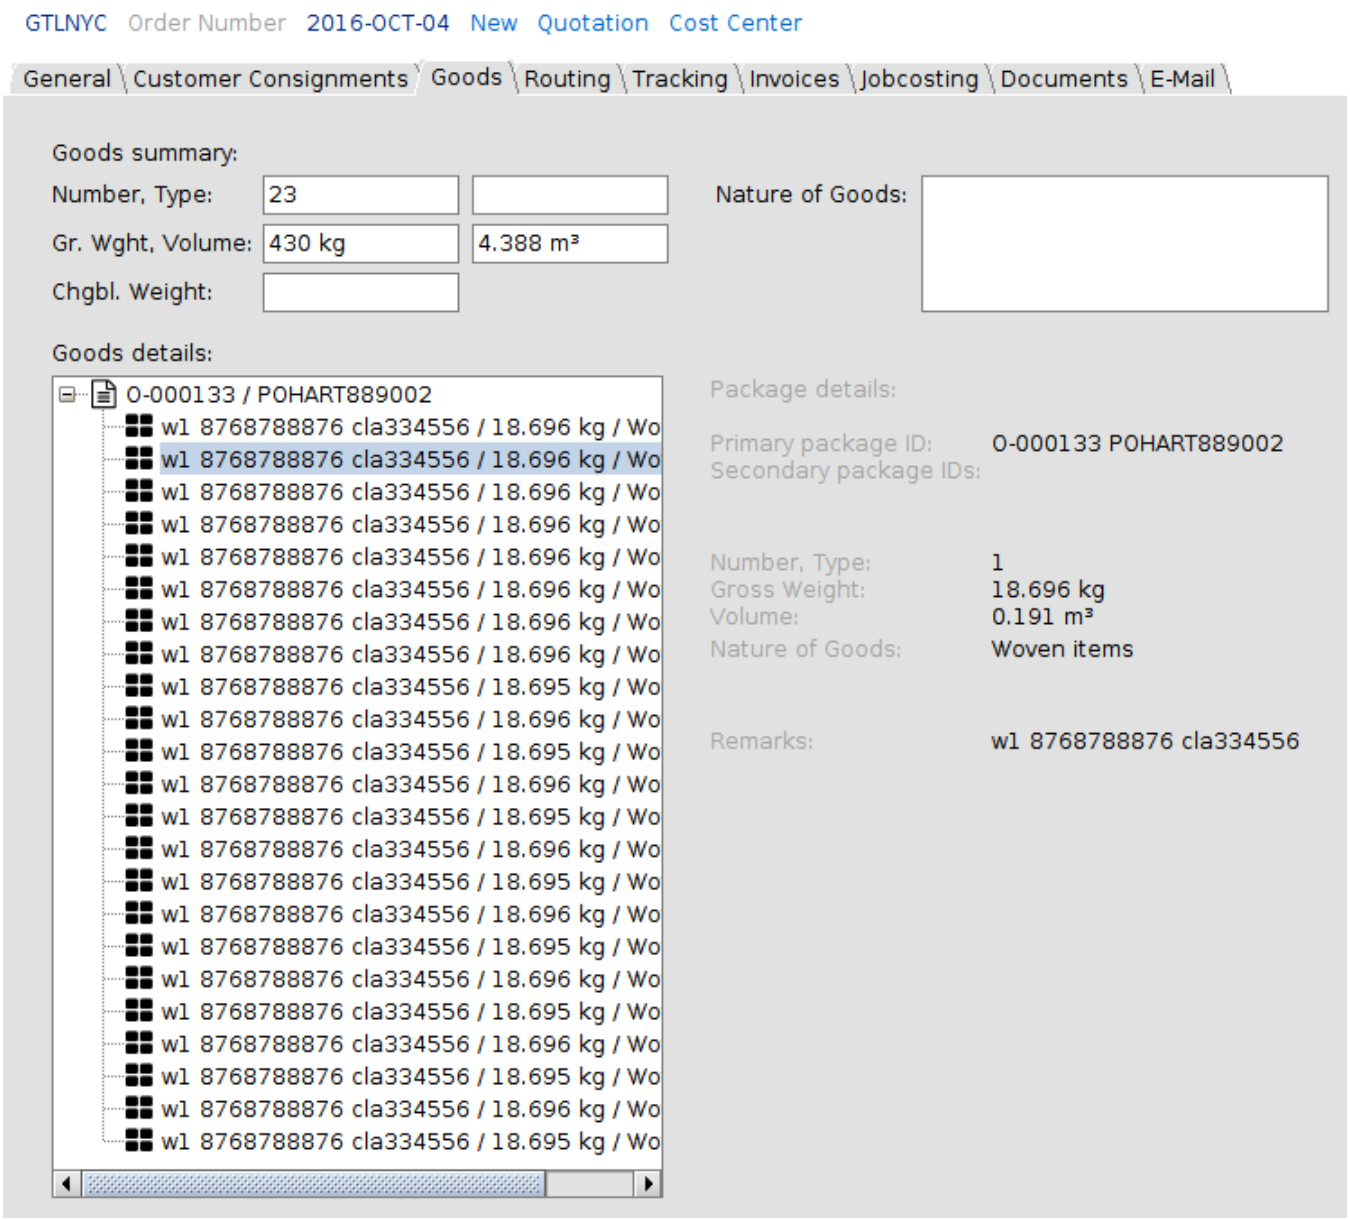
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Goods on the forwarding order

The "Goods" tab of the forwarding order will provide a view of all the goods on all the consignments that are on the forwarding order:

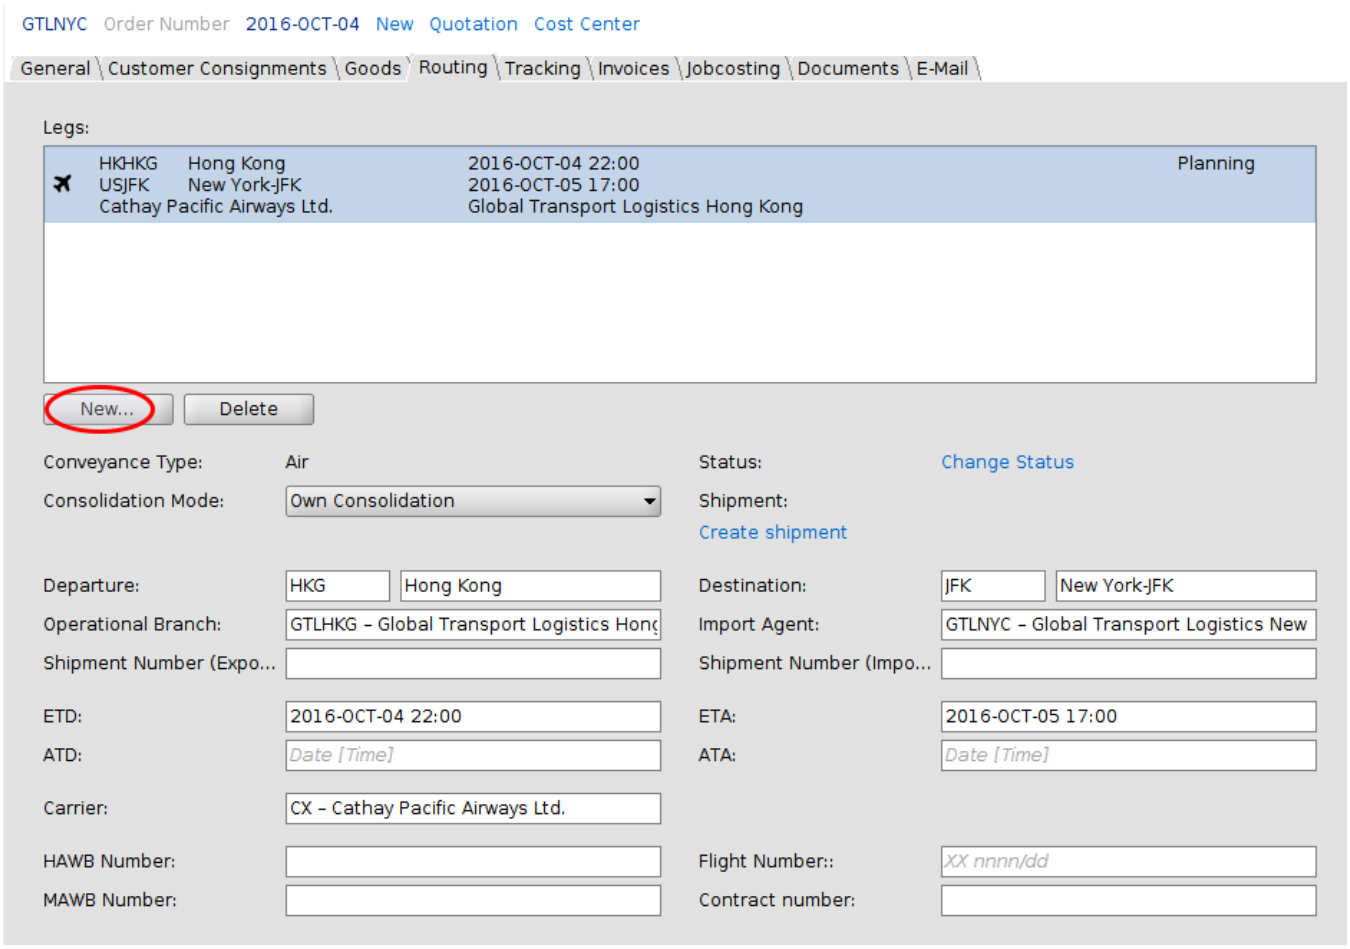
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Routing of the forwarding order

Once the transport details for the forwarding order are know, they can be entered in the "Routing" tab of the forwarding order.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

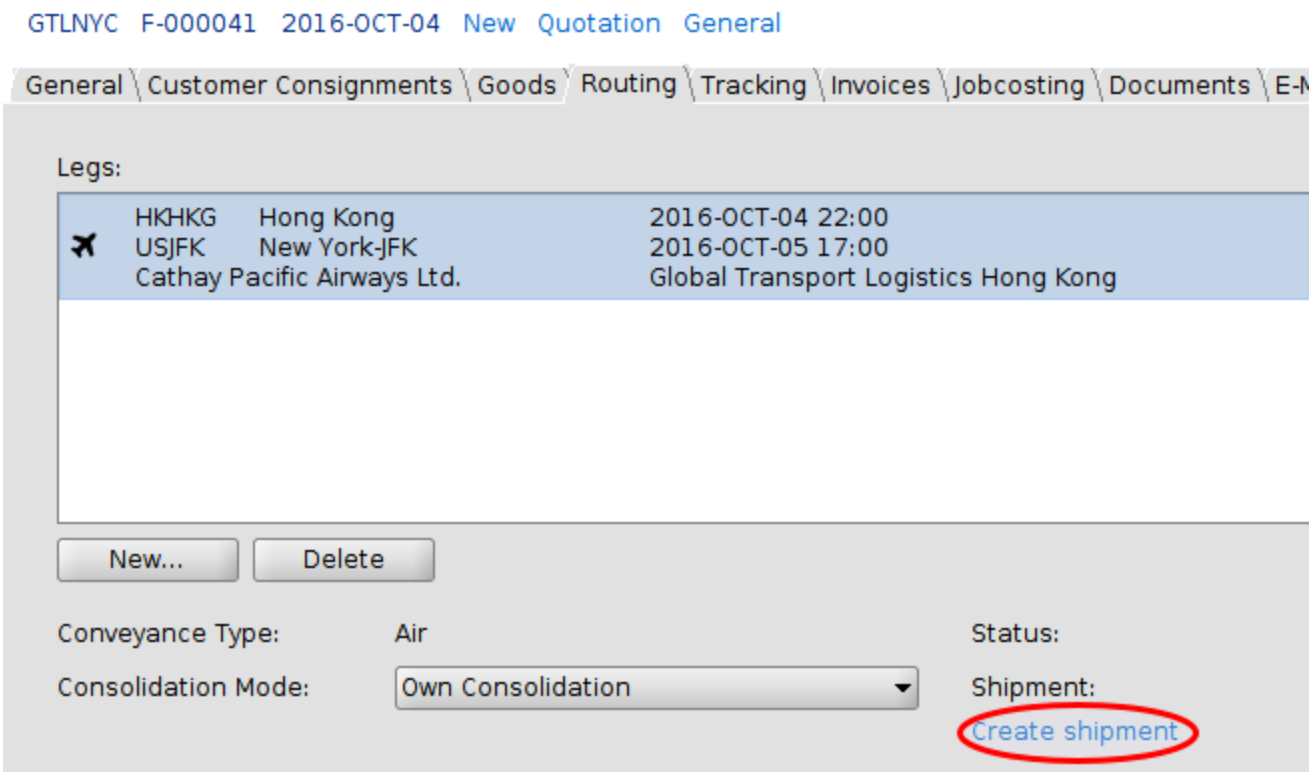


Use the "New" button to enter further transport legs if the transportation is not direct.

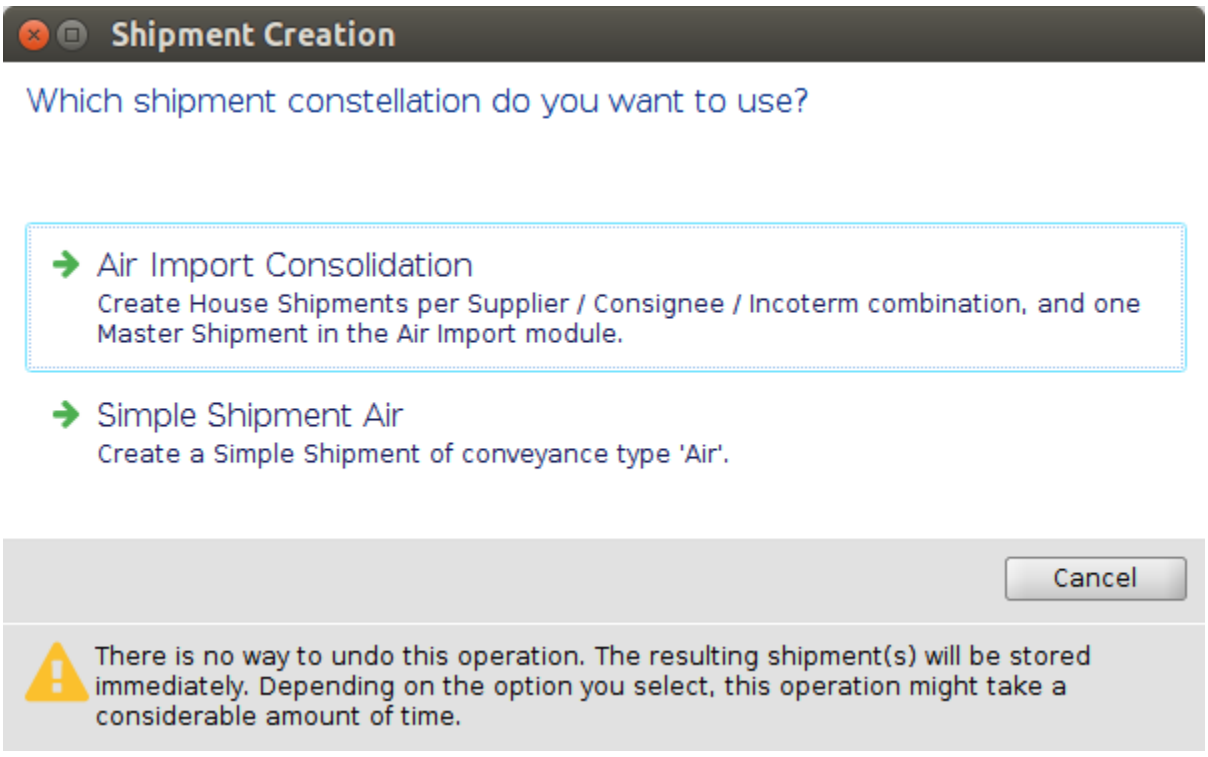
Associating a shipment with the forwarding order

The routing tab of the forwarding order provides the "Create shipment" link

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



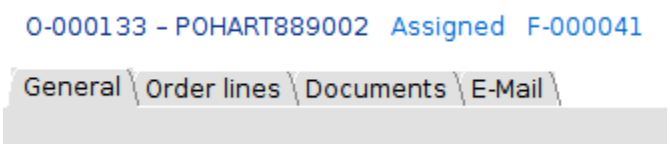
Click "Create shipment" and then choose the type of shipment to be created for the forwarding order:



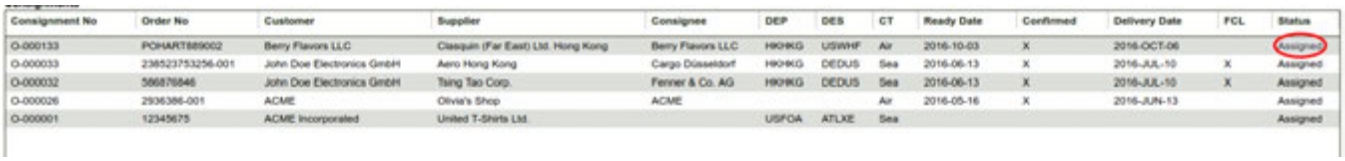
Changing the status of a consignment and a forwarding order

When a consignment is added to a forwarding order, the status changes from "New" to "Assigned"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

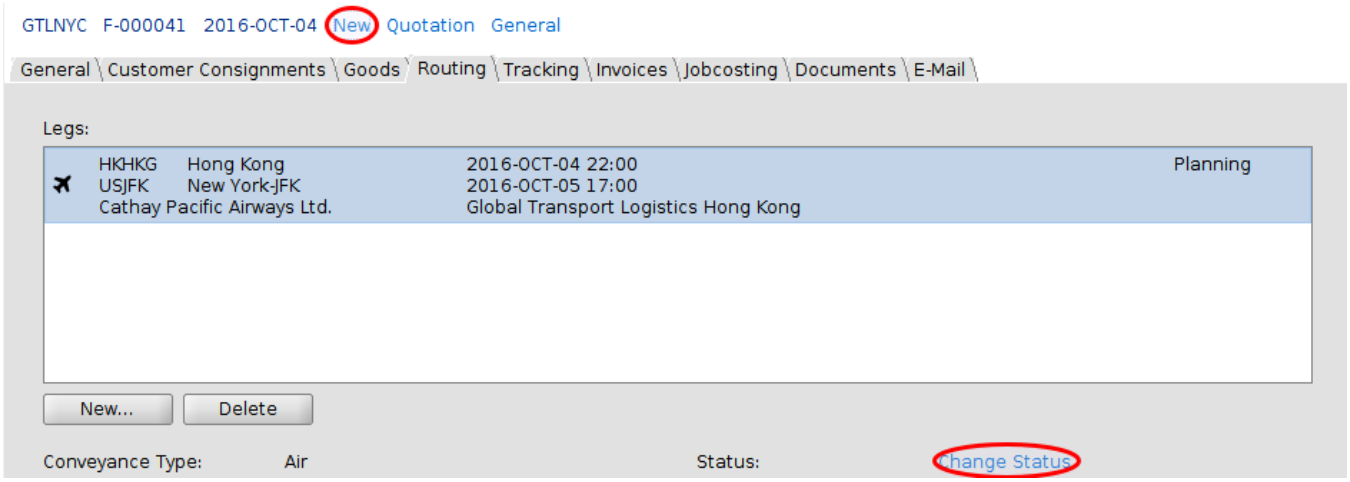


This change of status is also visible to the Scope Connect user

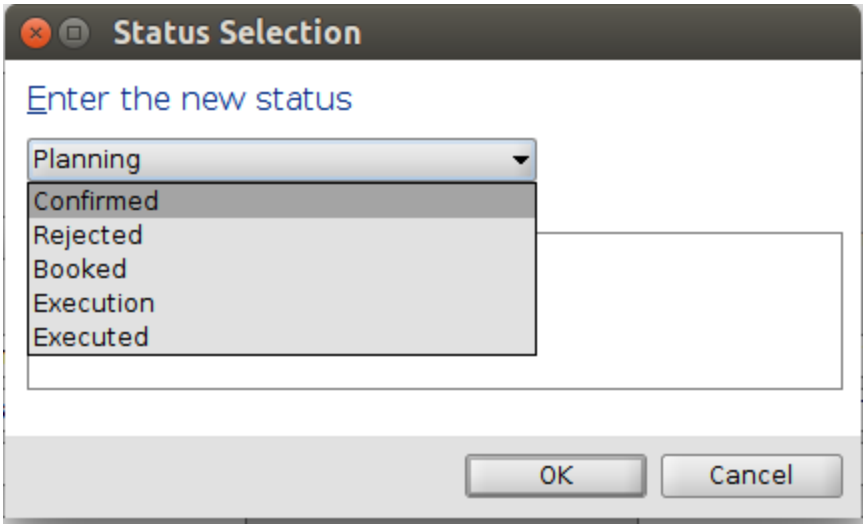


The status of the forwarding order can be changed by clicking the current status shown at the top of the order.

The status of a transport leg within a forwarding order can be changed by clicking "Change status" within the leg on the "Routing" tab of the order

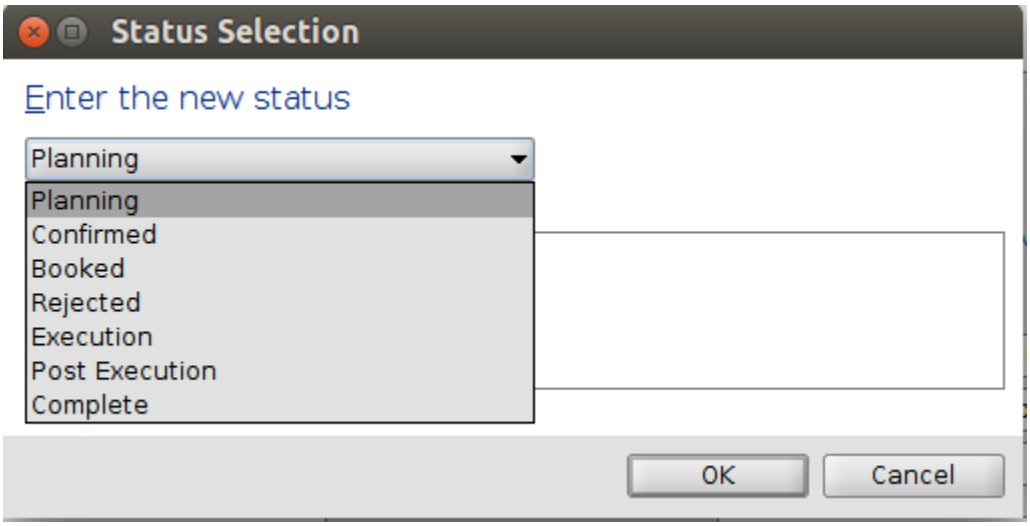


There are 6 possible status' for a transport leg:

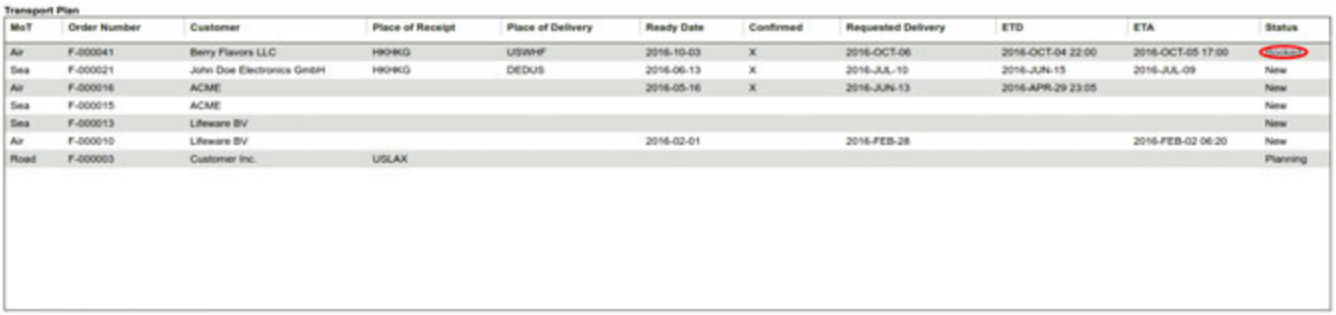


There are 7 possible status' for a forwarding order:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The current status of the forwarding order is visible to the Scope connect user in the transport plan overview:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

How-To view and manage shipments ready for Customs Clearance with Shipment Monitor

- Introduction
- Shipment Monitor Overview
- Completing a customs clearance milestone
- Accessing shipment details
- Additional Features
  - Individualized tracking plans
  - Schedules
  - Actions
  - Alarms

Introduction

The Scope Shipment Monitor is used to monitor the status of shipments. It can be used to determine if a shipment is on track to meet scheduled milestones or it can be used to determine the status of a particular milestone. This document describes:

- How to to monitor shipments that require customs clearance
- View the status of the customs clearance milestone
- Readily access and update shipments that require customs clearance
- Complete the customs clearance milestone

Shipment Monitor Overview

To launch the shipment monitor overview, from the menu select:

1. Forwarding
2. Shipment Monitor

The shipment monitor will display all shipments showing their current status. To restrict the view to just the shipments that require customs clearance place the cursor in the field "Choose filter"

- either press the space bar to see all filters
- or begin to type the name of the desired filter "Requires customs entry"

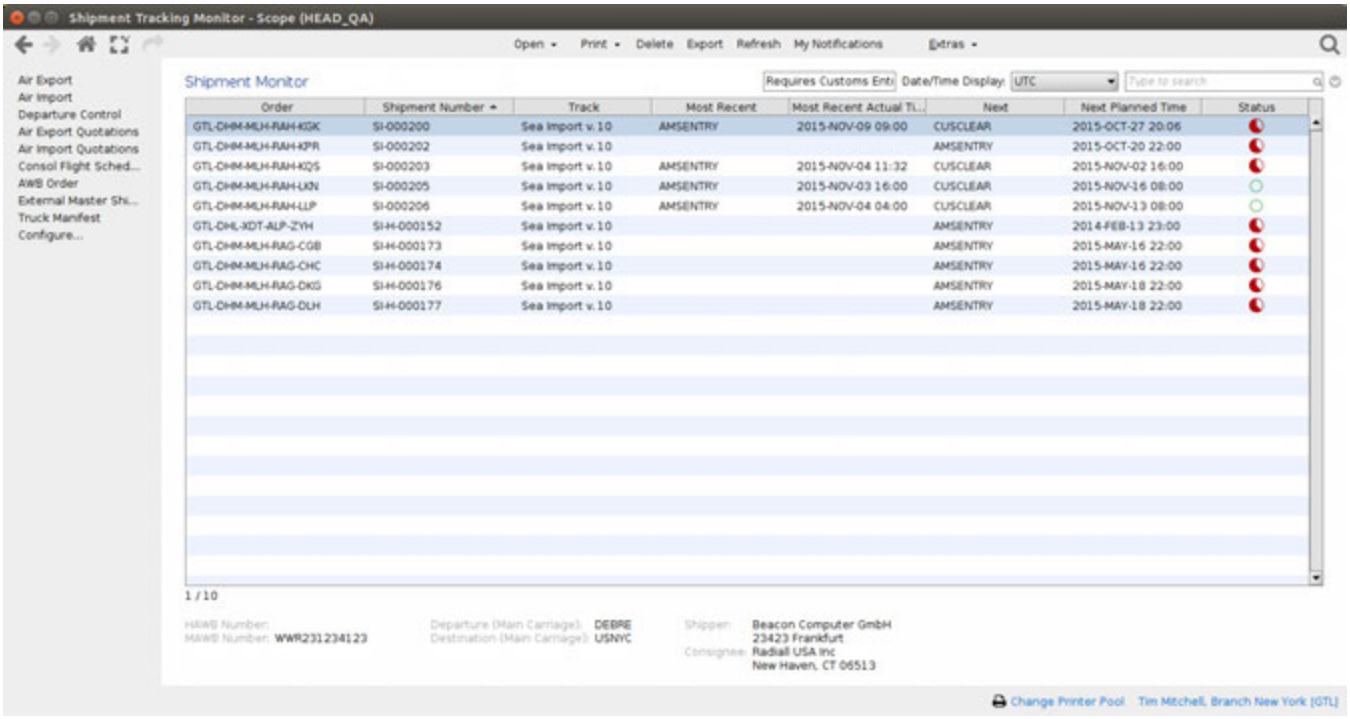
Once the "Requires customs entry" filter is loaded, the view will be restricted to those shipments that have the milestone "Customs Clearance" which uses the milestone code "CUSCLEAR". All shipments which require customs clearance will be shown.

In the example view below of shipments that require customs clearance, the overview shows:

- The most recently completed milestone ie. "AMSENTRY"
- The date of completion of this most recent milestone.
- The next due milestone ie. "CUSCLEAR"
- The date this next milestone is due

- The overall status of the shipment. The red  timer indicates the shipment is not on schedule. The green  timer indicates the shipment is on schedule.
- When the customs clearance milestone is complete, the shipment will not appear in this overview.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



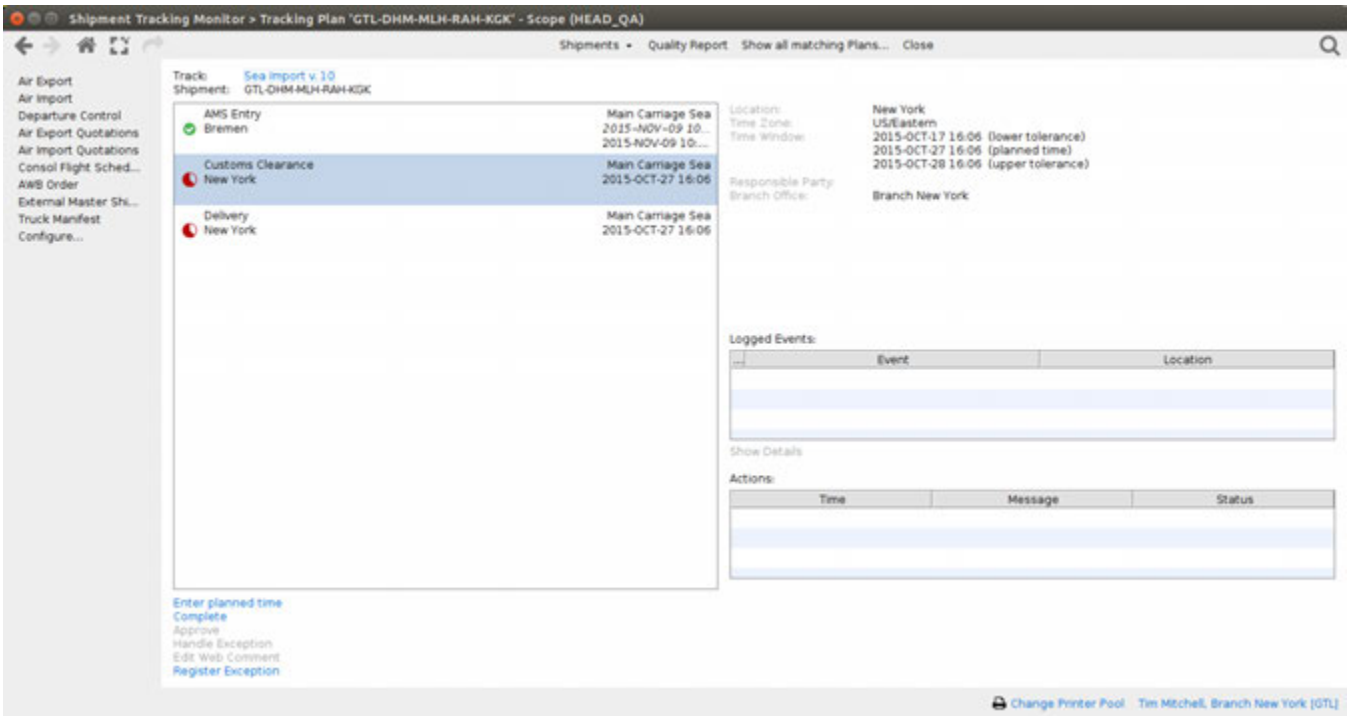
Completing a customs clearance milestone

When customs procedures are complete, update the shipment with this information

- either double click the desired shipment in the overview
- or highlight the shipment in the overview and click "Open" and "Tracking Plan" on the menu bar"

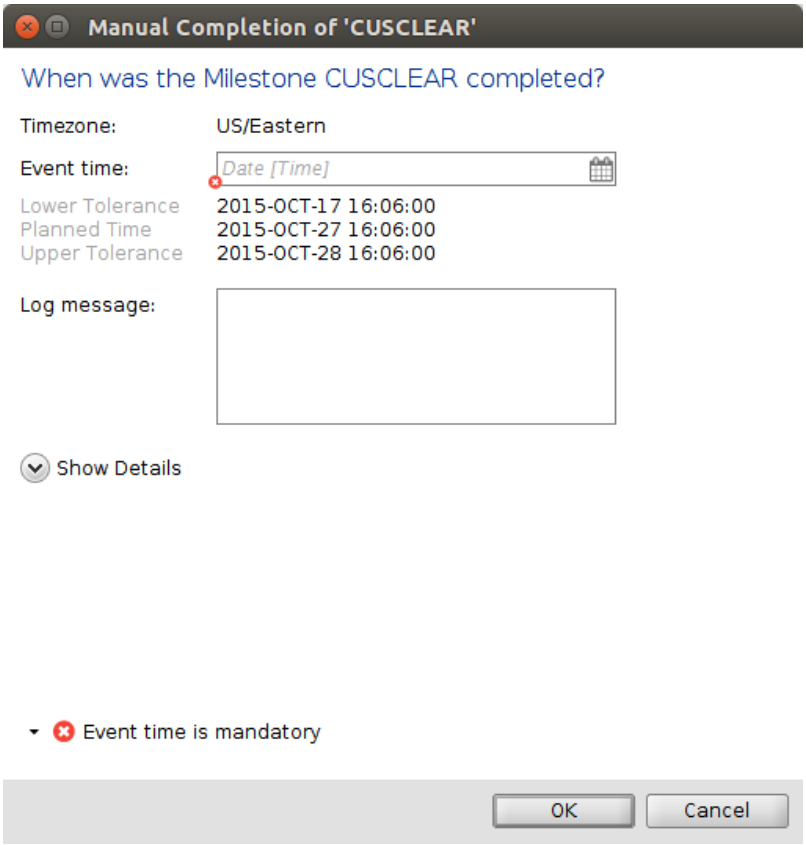
The tracking plan for the shipment will open, showing all milestones to be completed for the shipment.

Highlight the "Customs Clearance" milestone and click the blue link "Complete" below it. Icons to the left show the status of each milestone. As each milestone is highlighted, the allowed time window to complete each milestone can be seen on the right.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

When "Complete" is clicked, a manual completion window appears. Fill in the event date and time for the customs clearance and if desired enter a log message with any further info about the completion. Click "OK" to confirm.



Accessing shipment details

When a customer clearance milestone is ready to be processed, the broking staff may need items from the shipment:

- Shipment Information
- Shipment documentation such as Bills of Lading and Commercial Invoices
- Invoicing details

There are 2 ways to open the shipment itself from the shipment monitor:

- In the overview, highlight the shipment and then from the menu bar select "Open" and "Shipment".
- Open the tracking monitor for the shipment and from the menu bar select "Shipments". Open the desired shipment.

The 2 methods above will open shipments with instant access to all details. Once customs procedures are complete, broking staff can use this same method to update shipments with required information, for example they can attach the custom clearance documents and update proforma invoices with customs clearance charges. Once complete the customs clearance milestone can be completed.

Additional Features

When creating a tracking plan that includes customs clearance, individualized tracking plans, schedules, actions and alarms can be created to further enhance the functionality of this feature

Individualized tracking plans

For example, 90% of sea import shipments should be completed within 5 days of the vessel departing the last foreign port for EU traffic. A tracking plan can be created that Scope will automatically apply to all such shipments.

By contrast, customer "A" may demand customs procedures completed within 3 days of the vessel departing the last foreign port. A separate tracking plan can be created just for this customer that will automatically be applied by Scope to the customer's shipments.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Schedules

A tracking plan may contain multiple milestones, in the example above the plan has "AMS Entry", "Customs Clearance" and "Delivery". Any number of further milestones may be created for a tracking plan, and for each milestone the schedule can be used to define when this milestone must be completed to be considered on time.

Actions

For each milestone, completion can trigger certain actions automatically, for example on completion of the "Customs Clearance" milestone, an email can be automatically sent to the importer advising them of the clearance.

Alarms

For each milestone, if the the planned time is growing critical or exceeded, an alarm can be sent to a defined party, in the form of an email or a system alert.

NL - Customs - Client VWA declarations - MIG Version 3.1.1

Introduction

This page describes the changes in Scope VWA Declaration, MIG Version 3.1.1. which the NVWA announced this week (21-FEB-2021):

- From 1-MAR-2021 onward VWA declarations can be submitted in version 3.1.1.
- The usage of older versions is allowed until 31-MAR-2021.
- From 1-APR-2021 onward only 3.1.1. VWA declarations are allowed.

Description

The introduction of MIG version 3.1.1 results in the following changes in the VWA declarations.

Master data

Partners / Douane Partner Role

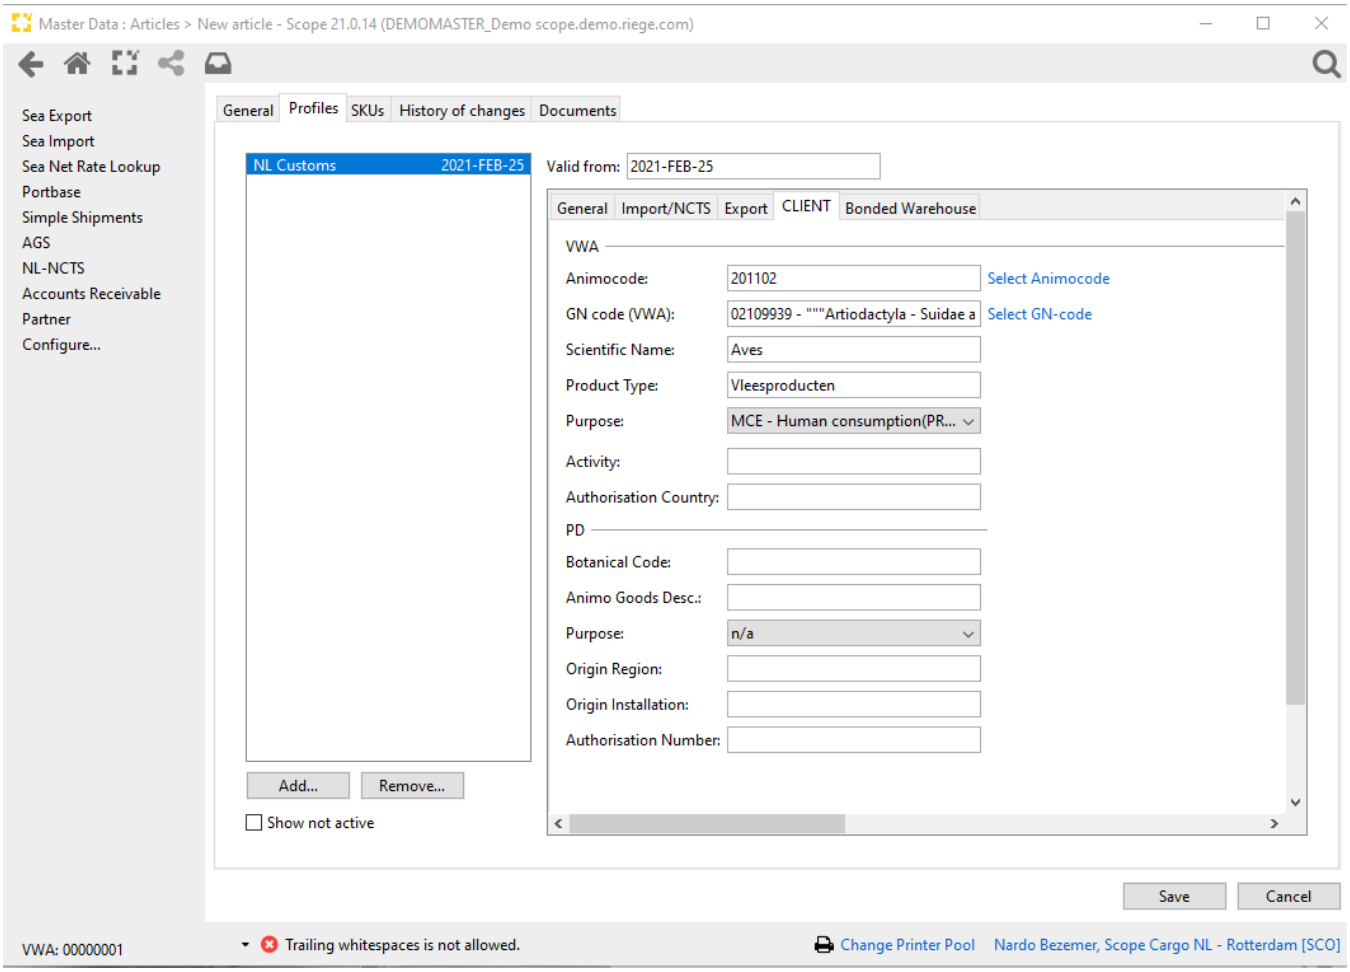
In the Partner the following fields have been added to provide defaulting in the declarations:

Fields	Description	information
Authorisation ID	Under certain Roles, an authorisation ID is to be provided	Code can be found via the webservice https://webapplicaties.agro.nl/vgc2/organisatie
Identification Type	The identification can be done by means of the following types: Traces ID : ID assigned by the EU traces organisation Chamber of Commerce: Number of the Chamber of Commerce location ID; might differ from the COC number in the registration ID.	New in the VWA 3.1.1. is that a Partner can be identified by a choice of registration IDs: Traces, Chamber of Commerce or EORI number. When the EORI number is provided in the regular field on the TAB Registration IDs of the Partner, this will be used.
Activity	A new coding system in which the type of activity performed by the partner can be stored.	This information is required for Transporters and Delivery Addresses.

Article Masterdata

There are new values required in the items to be declared in a VWA declaration. These items can be pre-registered in the article master data. The new details are entered on the tab "CLIENT"

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



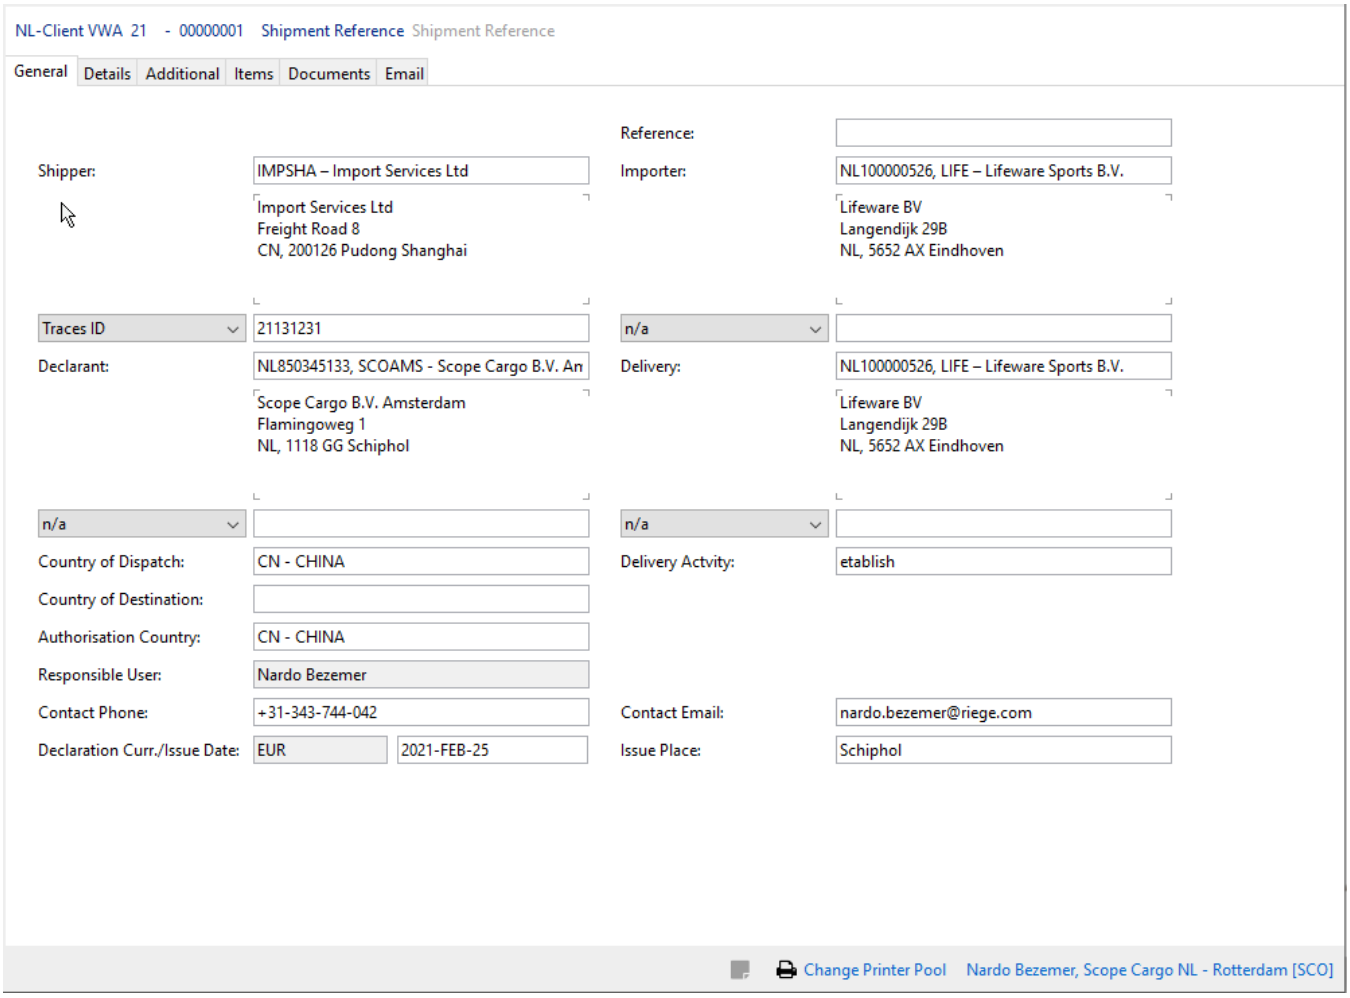
Field	Description	Webservices
Animo Code	Animo codes as per webservice codes The new webservice has been integrated. Via the action link the webservice is started and upon selection the required animo code will be populated.	https://webapplicaties.agro.nl/vgc2/animocode
GN Code (VWA)	As per webservice codes The new webservice has been integrated. Via the action link the webservice is started and upon selection of the required GN code the following fields will be populated: ▪ GN Code VWA ▪ Scientific Name ▪ Producttype	https://webapplicaties.agro.nl/vgc2/imsoc-gn-code
Scientific Name	The scientific name of the Product / Animal, previously declared via Species ID. We advise to use the webservices to select the correct name.	https://webapplicaties.agro.nl/vgc2/imsoc-gn-code
Product Type	Description of the product, new field full textual description must be used We advise to use the webservices to select the correct description.	https://webapplicaties.agro.nl/vgc2/imsoc-gn-code
Purpose	The Purpose of this article	
Activity	The activity for this product. Coding is not yet clear.	
Authorisation Country	Country which ensures the correctness of details for this article	

Declaration

In the CPD200 outgoing message entry, the following changes can be found:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

General



Identification numbers

For each address, 2 fields have been added: Identification Type and Identification Number.
In these fields an identification type and corresponding ID can be entered if no EORI number is available.
The alternative types are:
Traces ID: Identification issued by the Traces (EU) organisation
Chamber of Commerce No: Location ID as issued by the Chamber of Commerce.

Consignee

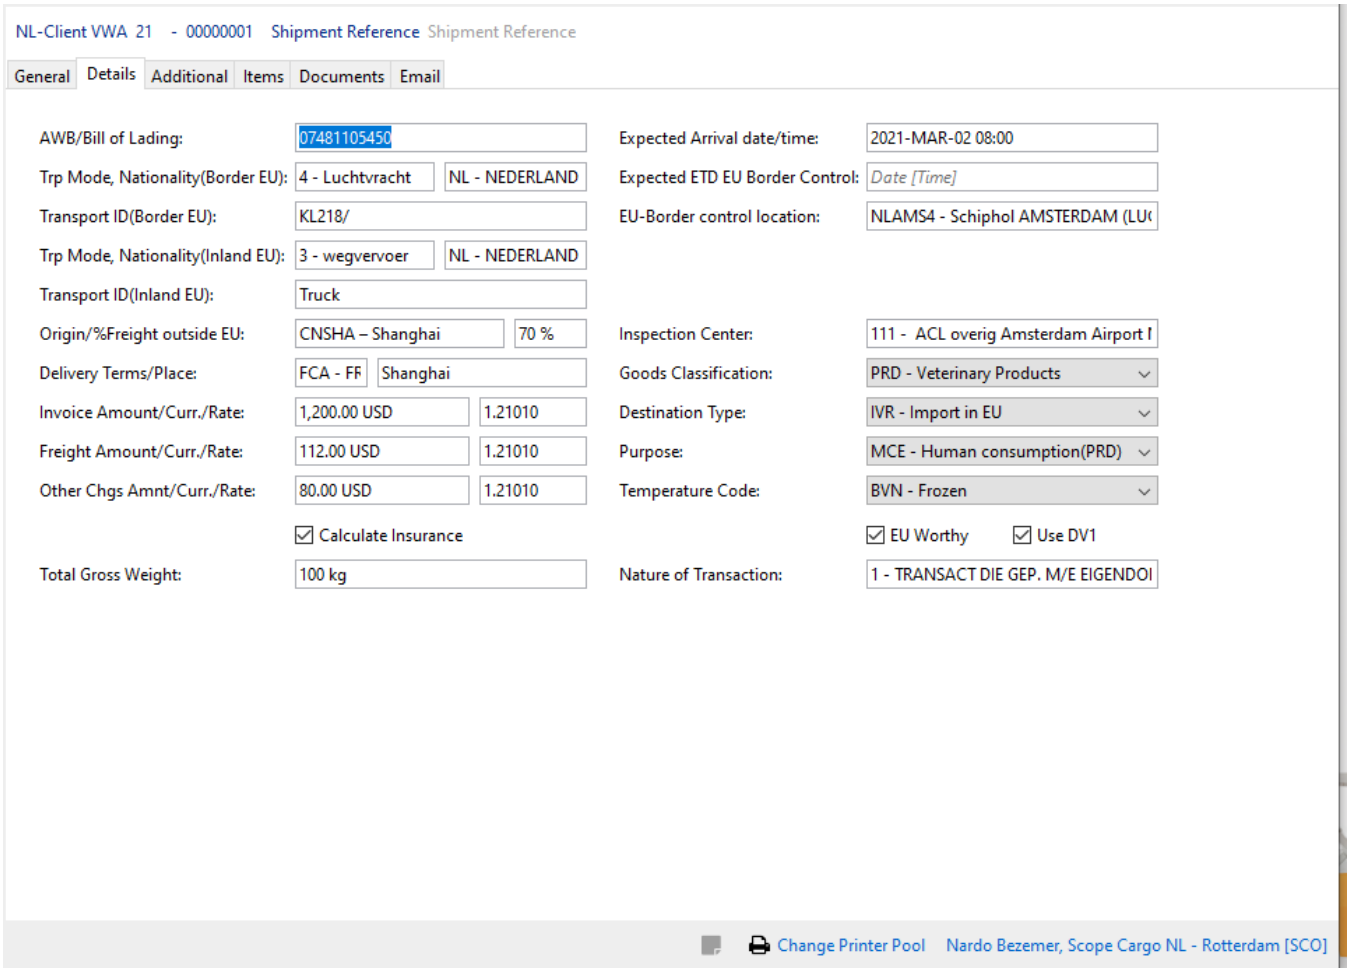
The consignee field has been removed from the declaration as it was a duplicated address from the importer.

Delivery Activity

On the delivery address an additional field has been added in in which the activity of the delivery address can be set.
The activity code can be found via https://webapplicaties.agro.nl/vgc2/organisatie

Details

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Transport details

The fields for transport modes have been extended to the following fields:

Mode of transport, nationality and identification at Border (EU)
Mode of transport, nationality and identification at Inland EU

AGS Fields

To improve the defaulting in an AGS declaration created as a follow-up procedure on the VWA declaration, the following fields are available:

- Origin/%freight outside EU
- Delivery Terms / Place
- Invoice Amount / Curr / Exchange rates
- Freight Amount / Curr / Exchange rates
- Other charges Amount / Curr / Exchange rates
- Calculate Insurance
- Use DV1
- Nature of Transaction

Expected Departure time

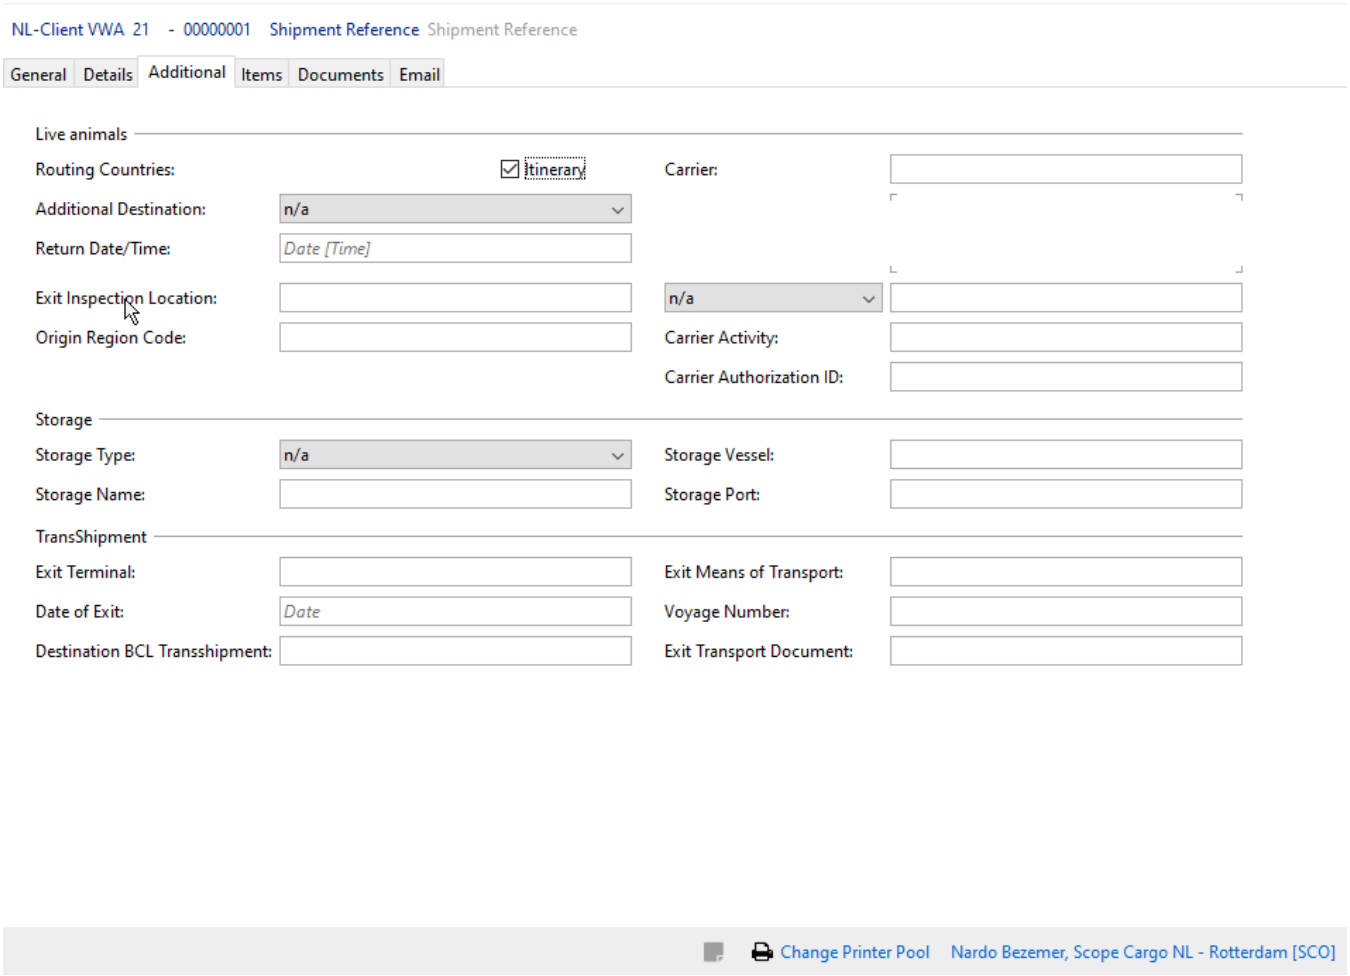
For those declarations of which the purpose or destination indicated that the declared items will not remain in the EU a new field has been introduced in which the expected ETD (departure EU) is to be entered.

BIP location

The label for BIP location has been renamed to "EU Border Control Location".

Additional

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Removed Fields

The following fields have been removed from the declaration :

- Transport after Border
- Exit Inspection location
- Carrier Registration ID

Carrier

Identification

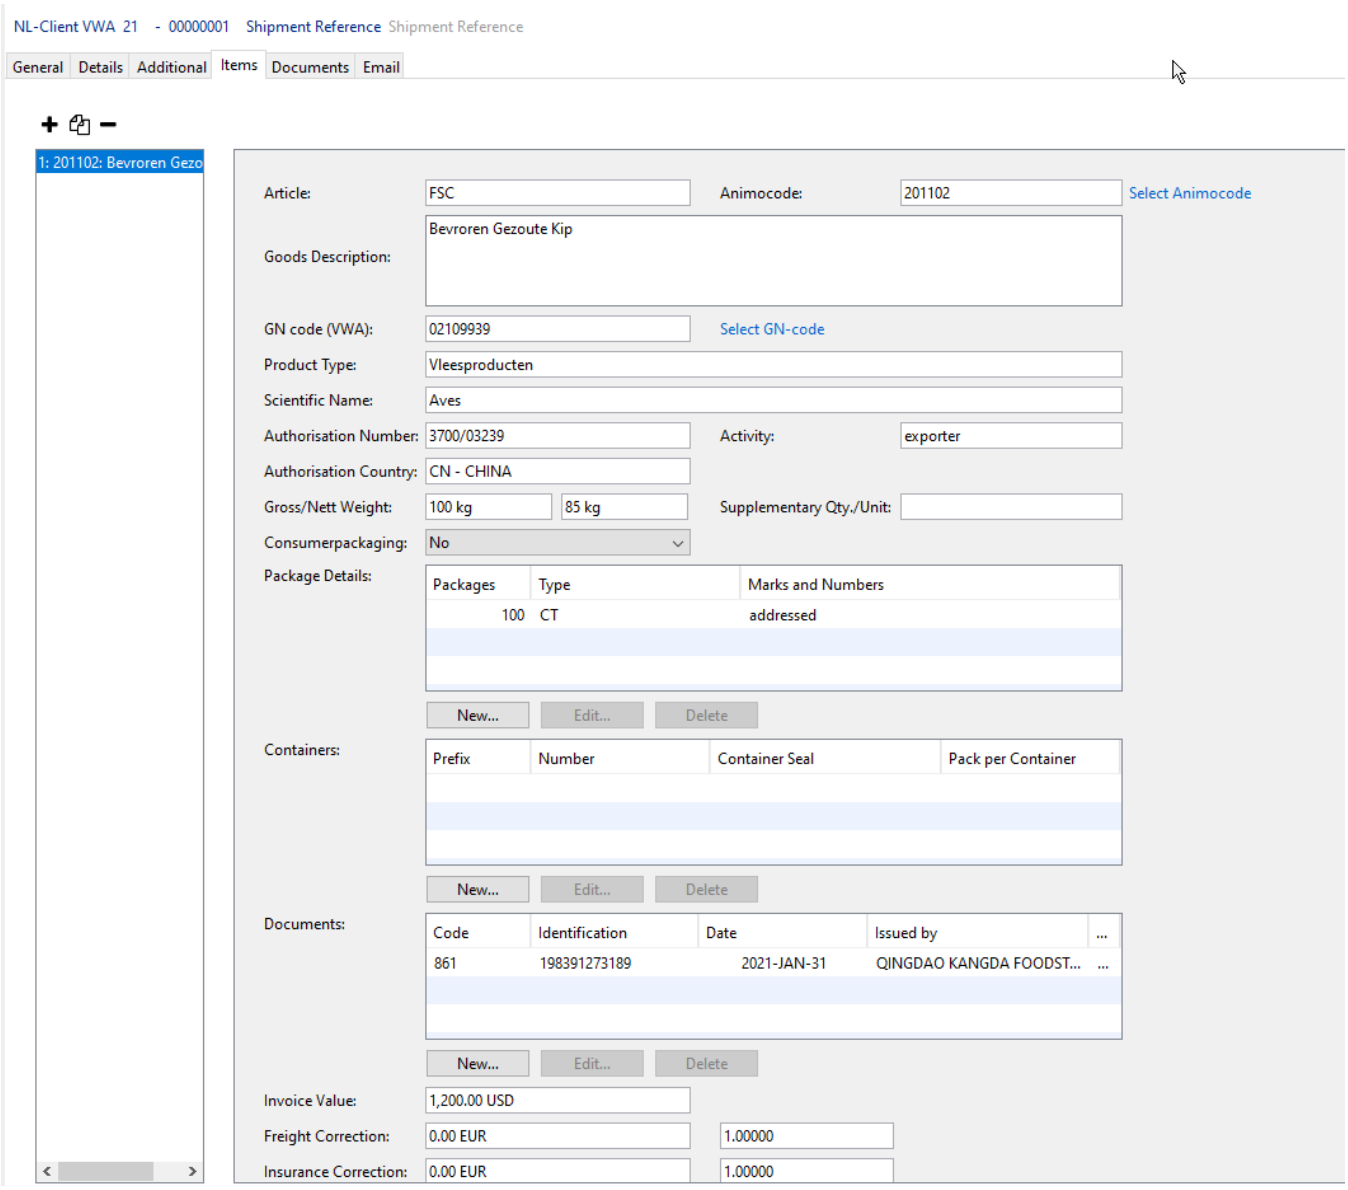
Also for the Carrier 2 fields have been added: Identification Type and Identification number.
In these fields an identification type and a corresponding ID can be entered if no EORI number is available.
The alternative types are:
Traces ID: Identification issued by the Traces (EU) organisation
Chamber of Commerce No: Location Id as issued by the Chamber of Commerce.

Activity

For the carriers it is required to indicate the activity.
The activity code can be found via https://webapplicaties.agro.nl/vgc2/organisatie.

Items

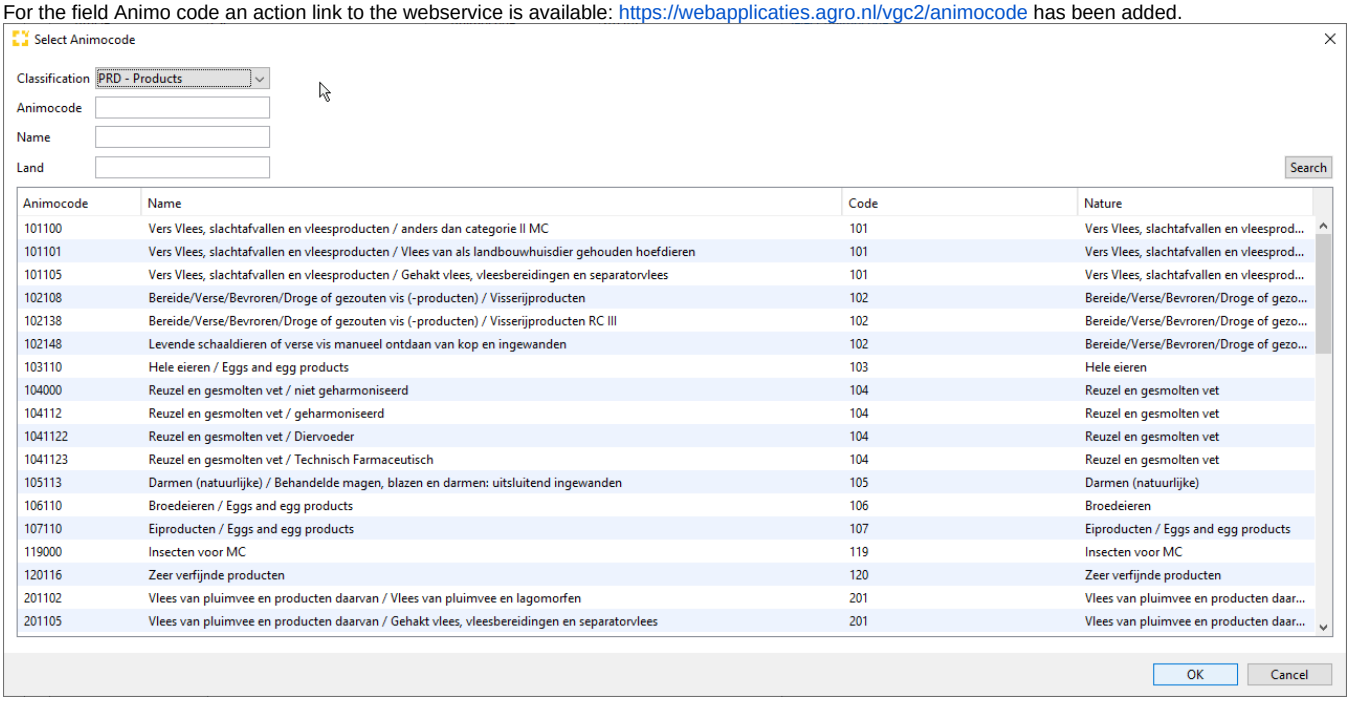
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Animo Code

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

For the field Animo code an action link to the webservice is available: https://webapplicaties.agro.nl/vgc2/animocode has been added.

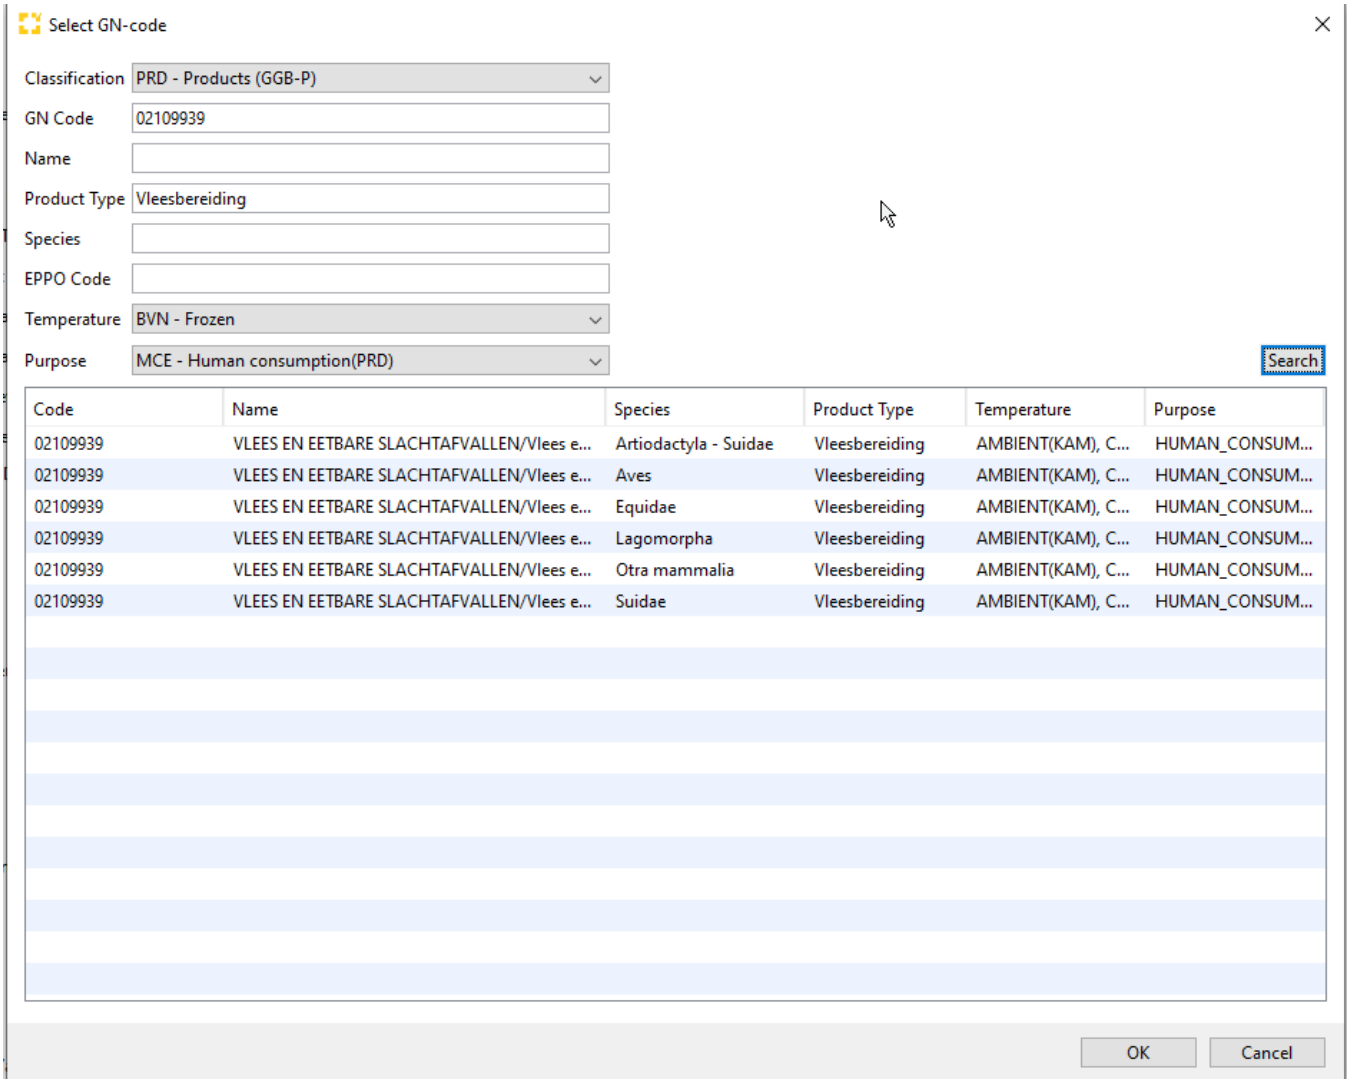


Searching and selecting of the desired code as been made possible.

GN code (VWA)

For the GN code (VWA) an action link to the webservice is available: https://webapplicaties.agro.nl/vgc2/imsoc-gn-code.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



The Webservice Dialog allows searching with the criteria. After the selection of the required GN Code, the following details will be copied to the item details:

- GN Code (VWA)
- Product type
- Species (scientific name)

Product Type

A new field is product type. The value for this field can be found via the webservice https://webapplicaties.agro.nl/vgc2/imsoc-gn-code column "Type".

Note : The value in the declaration must be for 100% equal to a value in the webservice, therefore we strongly advise to use the webservice and select the correct GN code for correct defaulting.

Scientific Name

A new field is scientific name. The value for this field can be found via the webservice https://webapplicaties.agro.nl/vgc2/imsoc-gn-code column "Species".

Note : The value in the declaration must be for 100% equal to a value in the webservice, therefore we strongly advise to use the webservice and select the correct GN code for correct defaulting.

Authorisation Number

A new field authorisation number for the manufacturer / breeder of the item is available. The number can be found via the webservice https://webapplicaties.agro.nl/vgc2/organisatie column "Erkeningnummer".

Activity

A new field activity for the manufacturer / breeder of the item.
The number can be found via the webservice https://webapplicaties.agro.nl/vgc2/organisatie column "Activiteit".

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Authorisation Country

Country under which supervision the item is manufactured / bred.

Consumer Packaging

Indicator if the product arriving is already packaged for direct retail or if repacking or further treatment is still required.

New Packaging Fields

To the packaging details three additional fields have been added.
Please note that a new restriction has been added that each item may only contain 1 packaging line.

Batch-number: to register the production batch of this item

Individual ID: if the animal / product is recognizable by means of 1 unique ID

Passport Number: If the animal is accompanied by an official passport, the number of this document

New Document Details

A new field in the document entry is meant for the country that issued the document being registered.

⚠ Important note : VWA document codes are only 3 digits long, do not use 4 digits document codes,
this will leave your declaration after sending in a "no response" state.

⚠ Important note : The new Country code field is mandatory but Scope does not yet validate on this.
Ensure that a country code is entered, missing the country code will leave your declaration after sending in a "no response" state.

AGS Fields

Per item level there are fields that only serve for proper defaulting for a follow-up AGS declaration

- Invoice Value
- Freight Correction
- Insurance Correction
- Customs Value

These fields will be calculated using the same method as in AGS.

Removed Fields

- Traces Family
- Traces Type

Container Details

Please note that the container number applicable in the declaration may only be registered on the first item.

Example:
A declaration with 3 containers and 3 products whereby the products are not mixed is the be transmitted as:

item 1) Packaging : 100 CTNS product A
Container : Container 1 : 100 packages
Container : Container 2 : 200 packages
Container : Container 3 : 300 packages

item 2) Packaging : 200 CTNS product A

item 3) Packaging : 300 CTNS product A

Response Messages

The response messages have been updated to use the new structure for error notification and container inspection selection.

Webservices

The NVWA has released new webservices by means of which relevant data not included in the code lists can be searched for.

Topic	Search for	result column	Webservice

Aplicación de comisiones de venta a los embarques

Introducción

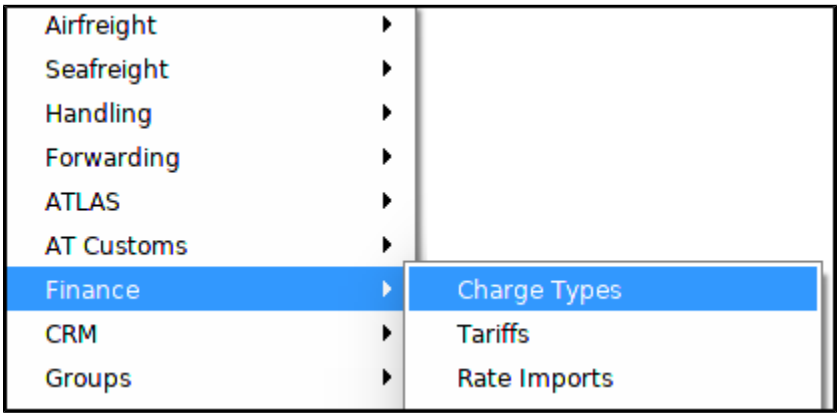
Este manual describirá cómo configurar la comisión basada en el porcentaje en su sistema Scope para su personal de ventas. Estas comisiones basadas en porcentajes pueden aplicarse cuando se desee por embarque.

Identificando los Conceptos de comisión

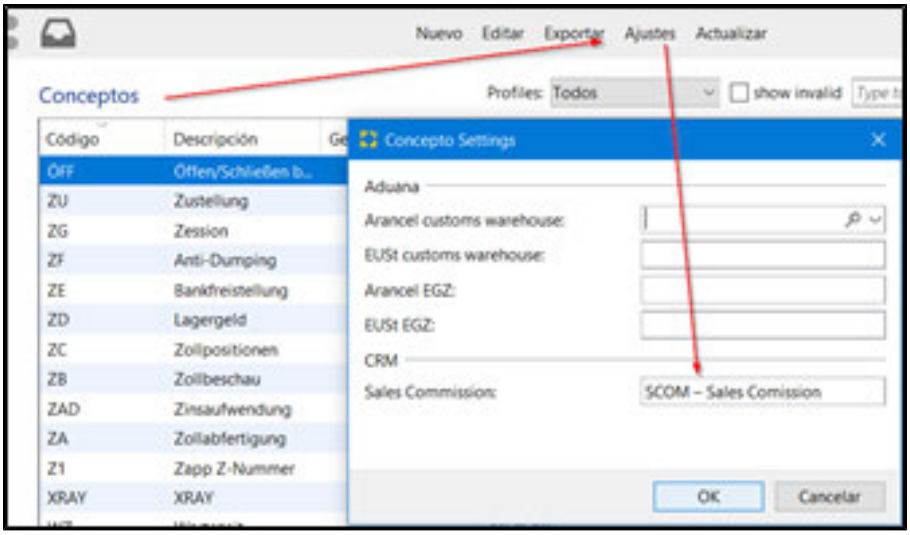
Para aplicar la comisión de ventas a los embarques, Scope deberá saber qué concepto debe usar para la comisión de ventas.

- Para configurar el tipo de cargo para comisiones:

En el menú Scope, seleccione "Datos maestros" > “Finanzas” > “Conceptos”.



En la vista general de “Conceptos”, haga clic en configuración. En la Configuración de tipo de cargo, vaya al campo "Sales Commissions" y encuentre el tipo de cargo que le gustaría usar para los cálculos de comisiones:



Configurar quién puede ver o editar comisiones de ventas

Permiso para ver comisiones de ventas.

Para que un usuario pueda ver las comisiones de ventas que se han aplicado a un envío, el usuario debe tener el permiso "Ver comisión de ventas" agregado a su perfil de usuario.

Edición de comisiones de ventas.

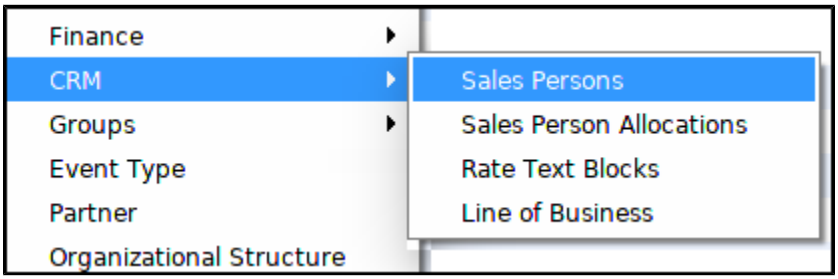
Para aplicar un porcentaje de comisión de ventas a un vendedor, el usuario debe tener el permiso "Editar comisión de ventas" agregado a su perfil de usuario.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

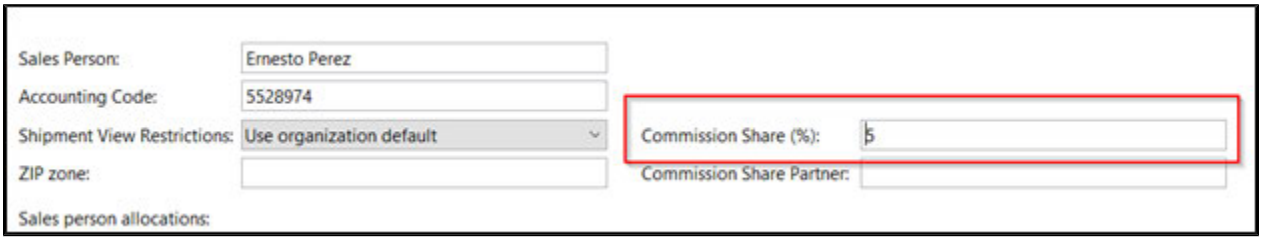
Nota: Nuestro equipo de soporte puede apoyarle definiendo los permisos de usuario, contáctenos vía correo electrónico en: support@riege.com

Aplicar un porcentaje de comisión de ventas a un vendedor

En el menú de Scope, seleccione "Datos maestros" > “CRM” > “Sales Persons”

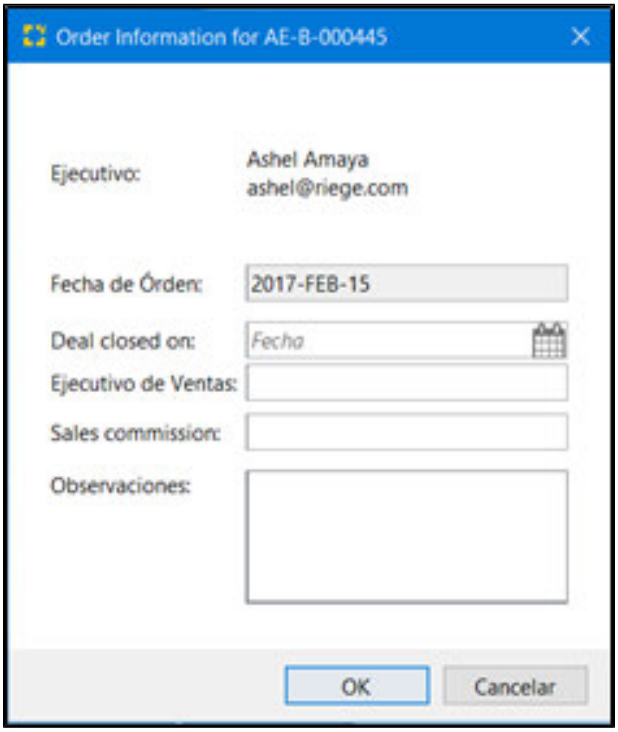


Encuentre la persona de ventas que necesita que se le aplique un porcentaje de comisión de ventas, edite la persona de ventas y en el campo "Comisiones Share (%)", ingrese el porcentaje que la persona de ventas ganará por embarque:



Ver y asignar comisiones de ventas

Si un usuario tiene permiso para ver las comisiones de ventas en los envíos, esto se puede hacer directamente dentro de un envío presionando “Ctrl + I en el envío.



Podemos asignar a quien se le calcularan las comisiones del embarque en esta ventana, en el campo “**Ejecutivo de Ventas**”, mismos que se registraron previamente en Datos Maestros > CRM > Sales Persons.

La comisión será visible en el campo “**Sales commission**”, en este campo podemos definir la comisión manualmente, una cantidad fija, por ejemplo: 5,000 MXN. Aquí también se mostrará la cantidad calculada por Scope a aquellos ejecutivos de ventas que tengan un porcentaje asignado en su perfil.

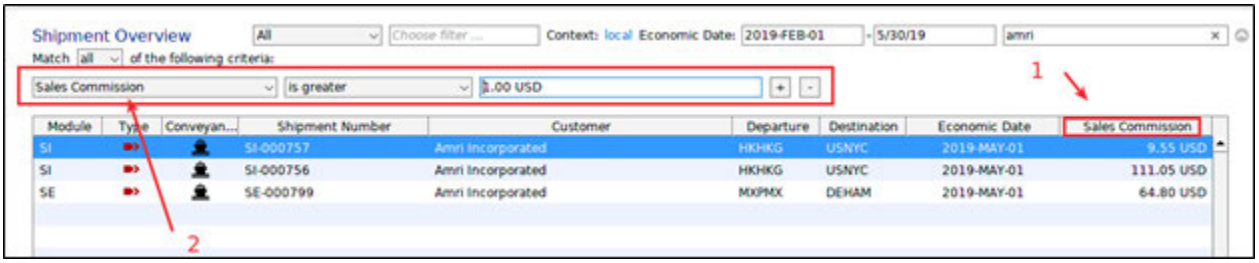
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Para obtener una descripción general de las comisiones de ventas, vaya a:
“Forwarding” > “Shipment Overview”.

Comisiones de ventas en Shipment Overview

Agregue la columna "Sales Commission" a la vista general haciendo click con el botón derecho en las columnas y luego seleccione "Sales Commission" de la lista de columnas disponibles.

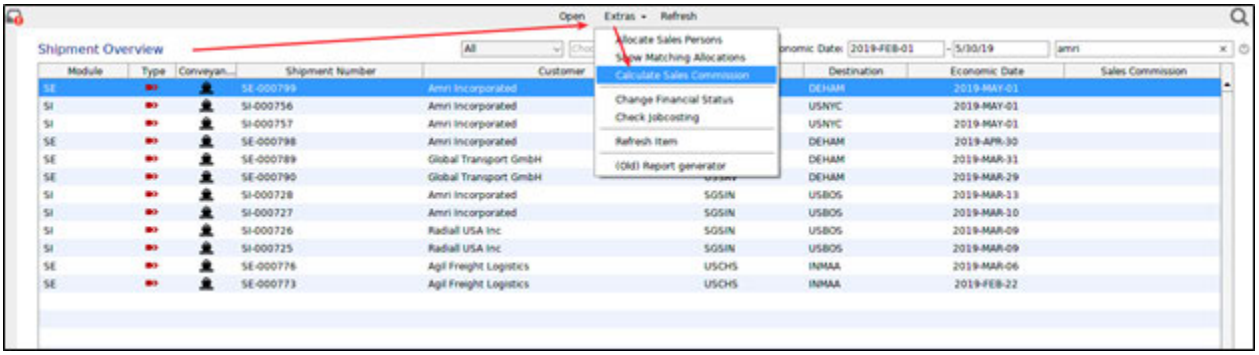
Utilice el filtro "Sales Commission" para filtrar los envíos con comisión de ventas.



Cálculo del porcentaje de comisión para los embarques.

La comisión de ventas no se calcula automáticamente para los envíos, esta acción debe realizarse desde el módulo “Shipment Overview”.

1. Vaya a “Forwarding” > “Shipment Overview”.
2. Desde el menú "Extras" en la barra de acción, elija "Calculate Sales Commission".
3. Click en el botón “Actualizar” para ver el cálculo reflejado.



Scope calculara la comisión de ventas en base al porcentaje que previamente definimos en el perfil del ejecutivo de ventas. Para que esta acción procese el porcentaje, es necesario que un agente de ventas este asignado al embarque (función CTRL + I).

Si ya existe una cifra de comisión de ventas en un embarque y la comisión de ventas se calcula de nuevo, la comisión se volverá a calcular y si es necesario, esta se actualizará.

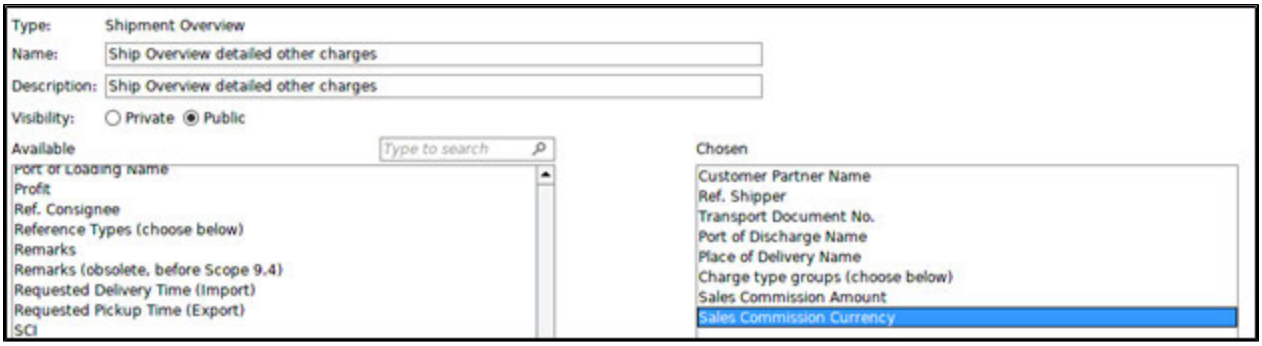
Reporte de comisiones de ventas

Para incluir la comisión de ventas en un informe:

1. Acceda a la opción "Layouts" en el submenú "Datos maestros" de Scope.
2. En los "Layouts", elija un diseño existente que sea del tipo "Shipment Overview" o cree un nuevo informe de este tipo.
3. Abra este diseño y agregue los campos:

- Sales Commission Amount
- Sales Commission Currency

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Reglas generales para el cálculo de comisiones de ventas

1. La comisión de ventas no puede ser negativa.
2. La comisión de ventas solo se calcula si el embarque tiene un representante de ventas asignado.
3. La comisión de ventas solo se calcula si la sucursal actual es el agente de exportación (para envíos de exportación), el agente de importación (para envíos de importación) o el proveedor del envío. Si la sucursal actual es solo la puerta de enlace para un envío de exportación / importación, el envío se omitirá del cálculo.
4. La comisión se calcula en función de la ganancia en moneda local del agente de exportación / importación o proveedor del envío (según el tipo de envío). Es independiente de las cifras financieras de una sucursal que actúa como puerta de enlace posiblemente diferente, ya que esa sucursal puede tener una moneda local diferente.
5. El cálculo se realiza independientemente de si una comisión de ventas ya se ha calculado o establecido manualmente en un embarque.

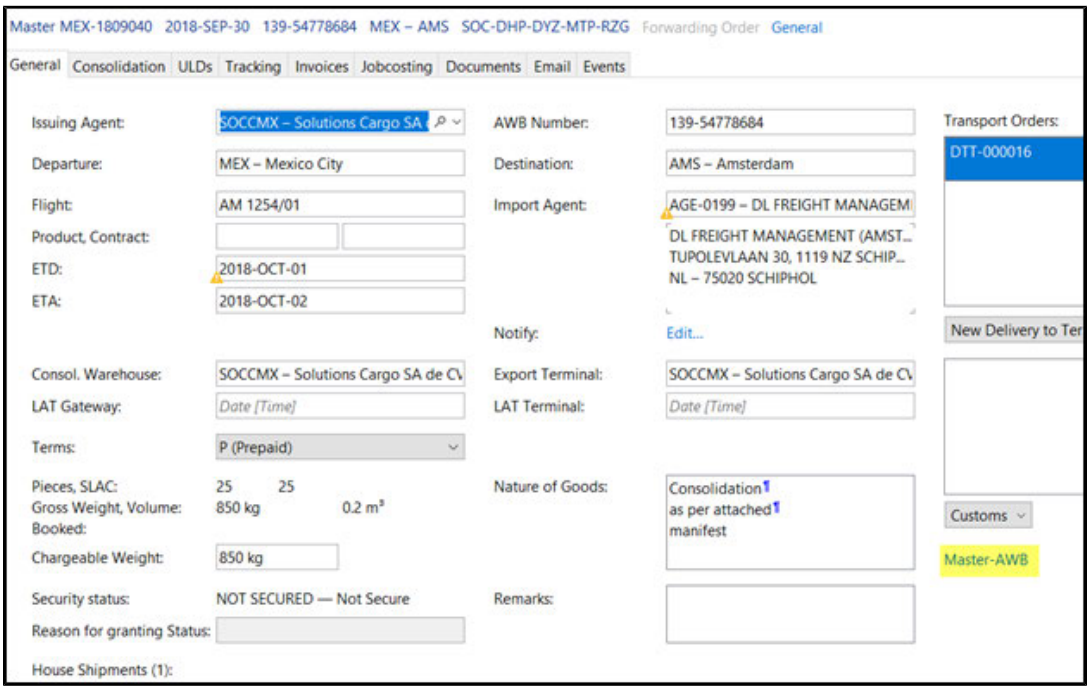
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Cambio del Shipper en un AWB

Introducción

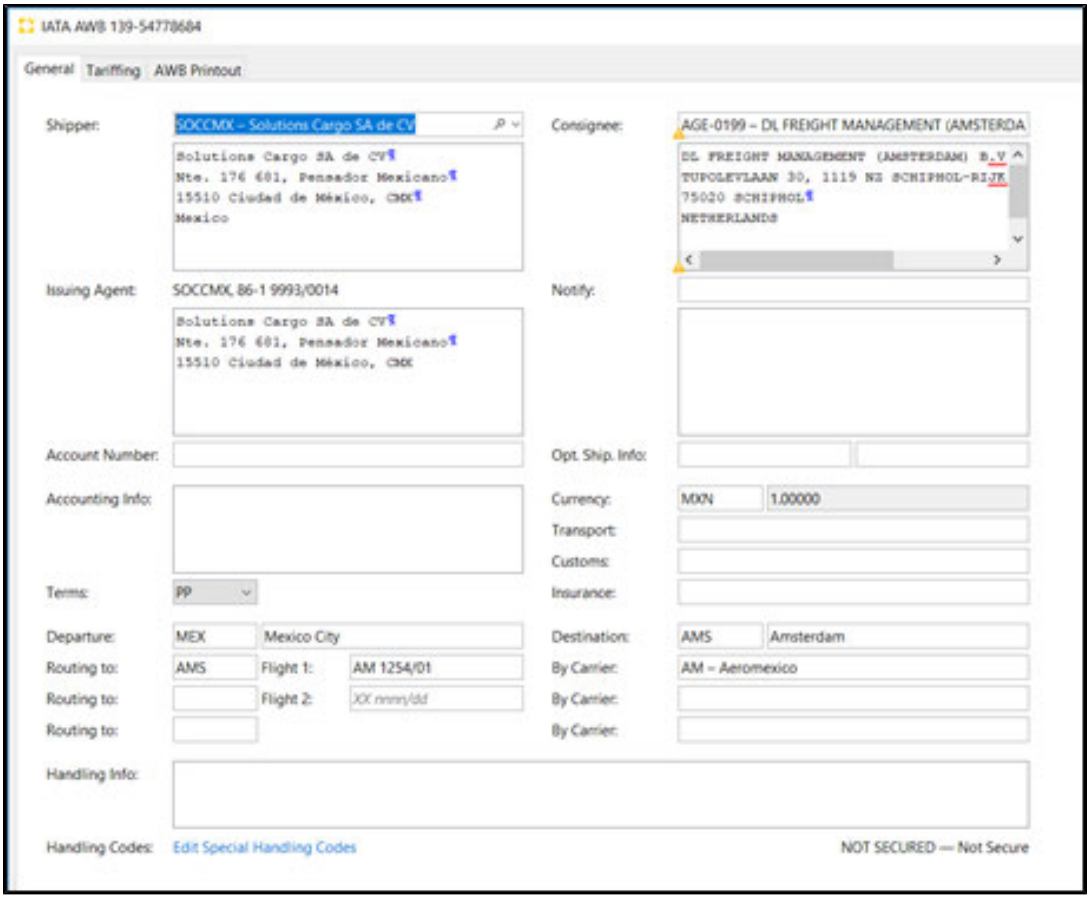
El objetivo del presente documento es mostrar cómo cambiar el Shipper en un AWB.

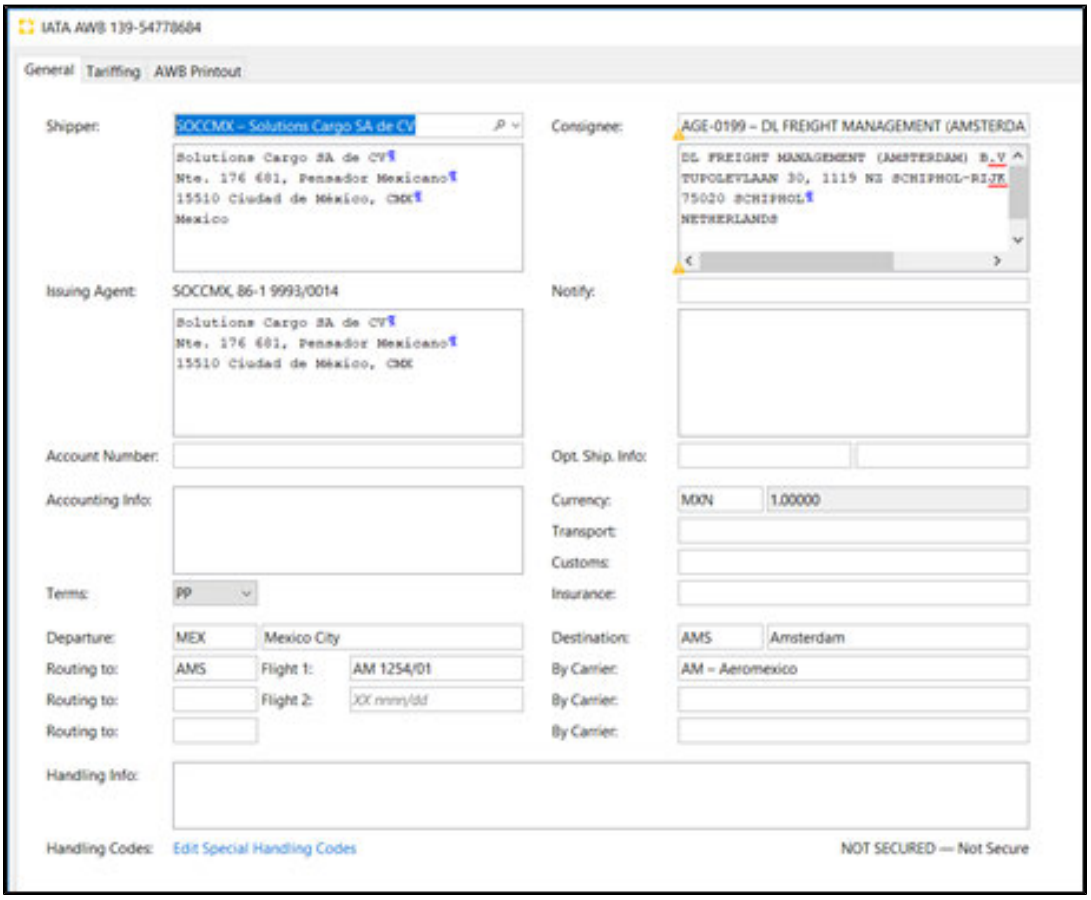
1.Dentro del embarque Master entre a la impresión de la guía en Master-AWB:



2. Al ingresar observe los datos para el AWB, en donde podrá cambiar el shipper:

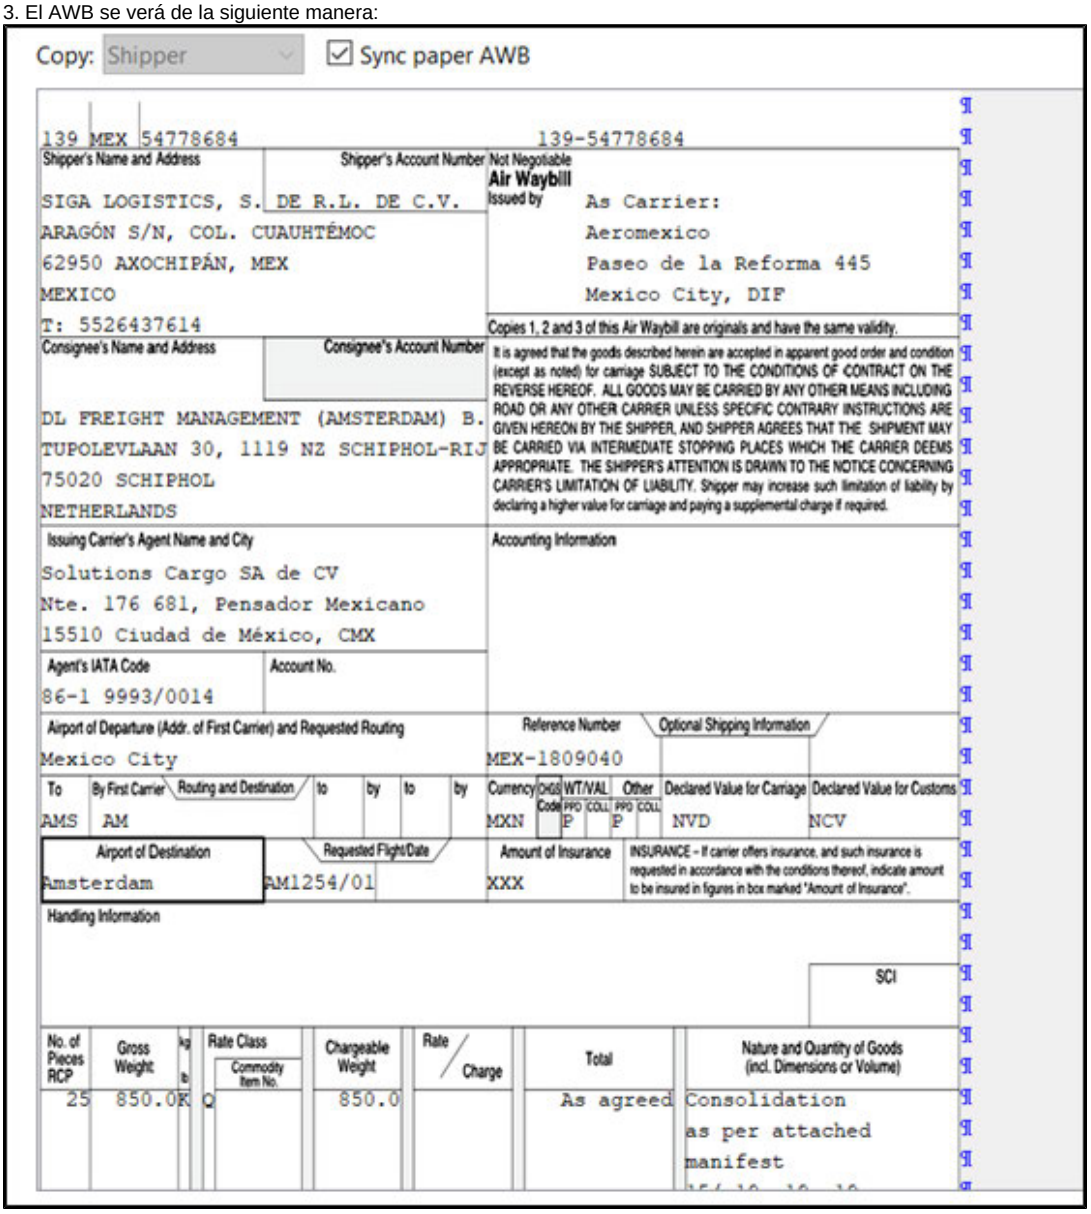
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.





Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

3. El AWB se verá de la siguiente manera:



Copy: Shipper ☑ Sync paper AWB

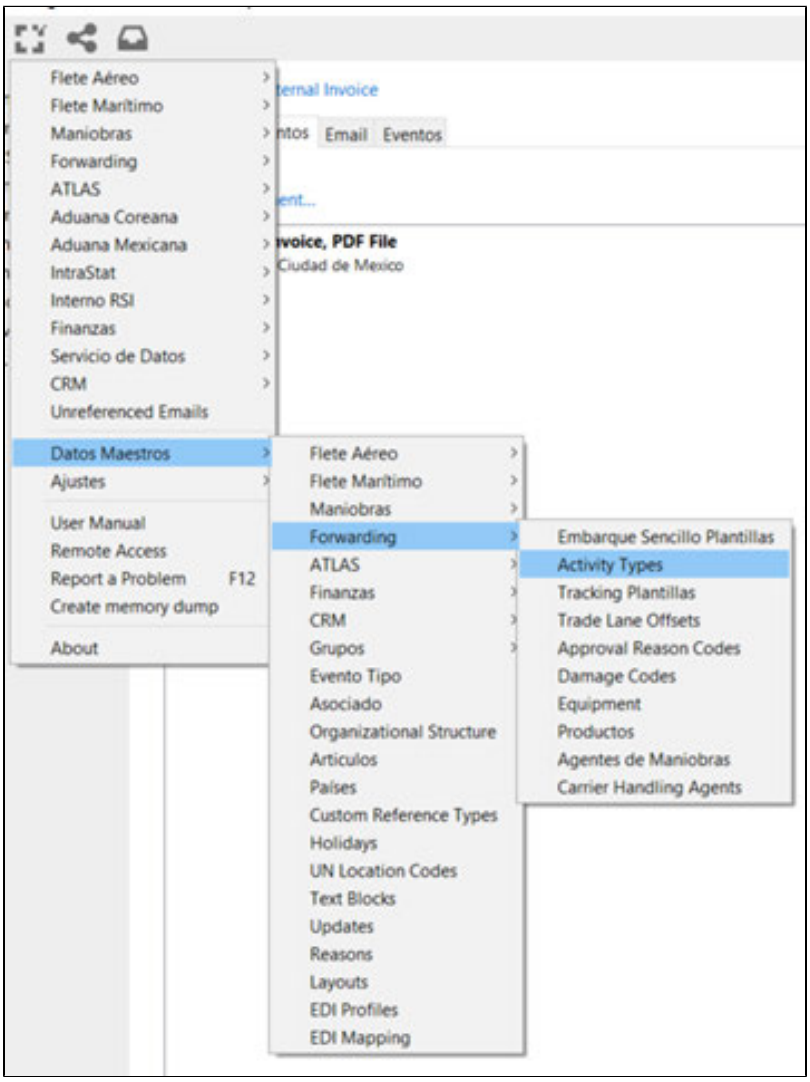
Configuración de Activity Types

Introducción

El objetivo del presente documento es mostrar cómo configurar **Activity Types**

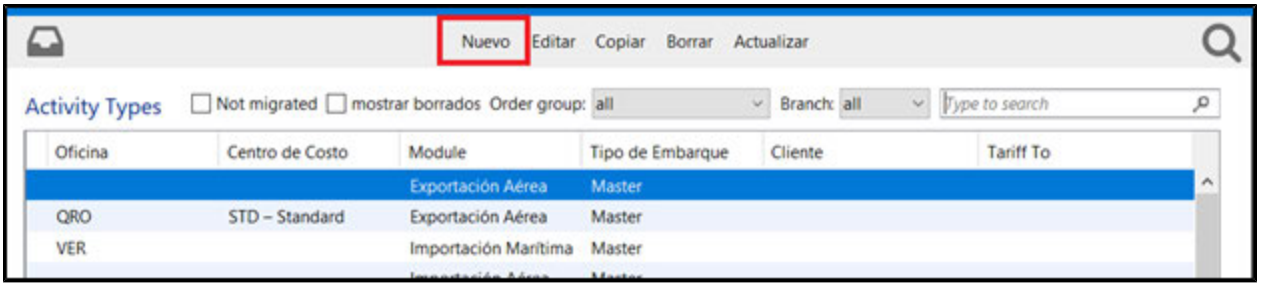
El propósito del módulo de mantenimiento de los **Activity Types** (tipos de actividad) es permitir el cálculo automático de ingresos y costos en los envíos. Estos ingresos y costos aparecerán automáticamente cuando se creen las facturas para el envío y como cargos de AWB cuando se imprima el AWB. Este proceso ayuda a garantizar que todos los ingresos y costos se tengan en cuenta y aparezcan en los registros de costos de los envíos de los trabajos, lo que lleva a cifras de beneficios precisas. Para lograr esta automatización, existe un tipo de pedido para cada paso en la vida de un envío de carga desde el envío hasta la entrega final. Los cargos por ingresos y costos se pueden aplicar a cada uno de estos tipos de orden tan pronto como se ejecuta la orden, como la generación de una nota de retiro, los ingresos y los costos asociados con esa orden se agregarán automáticamente al registro de envío.

1.Ir a Datos Maestros > Forwarding > **Activity Types**

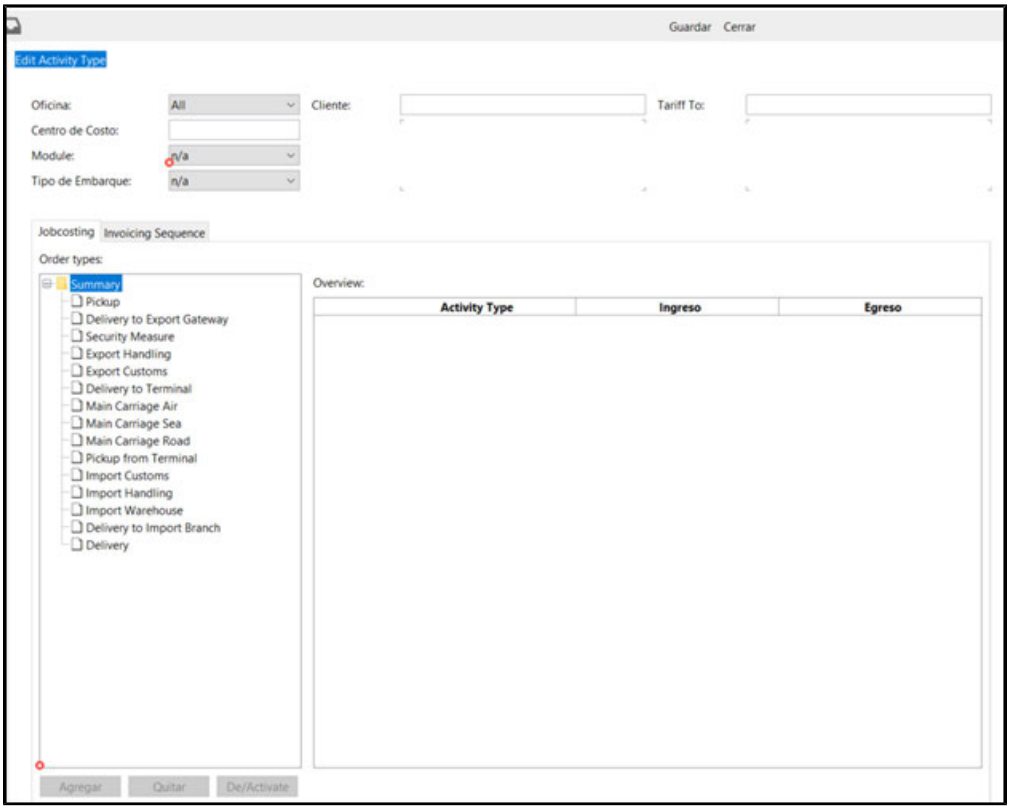


2. Al ingresar se observa el listado de todos los Activity Types, que se encuentran en el sistema, cabe aclarar que puede tener activity types muy genéricas o muy específicas. Se da click en **Nuevo**:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

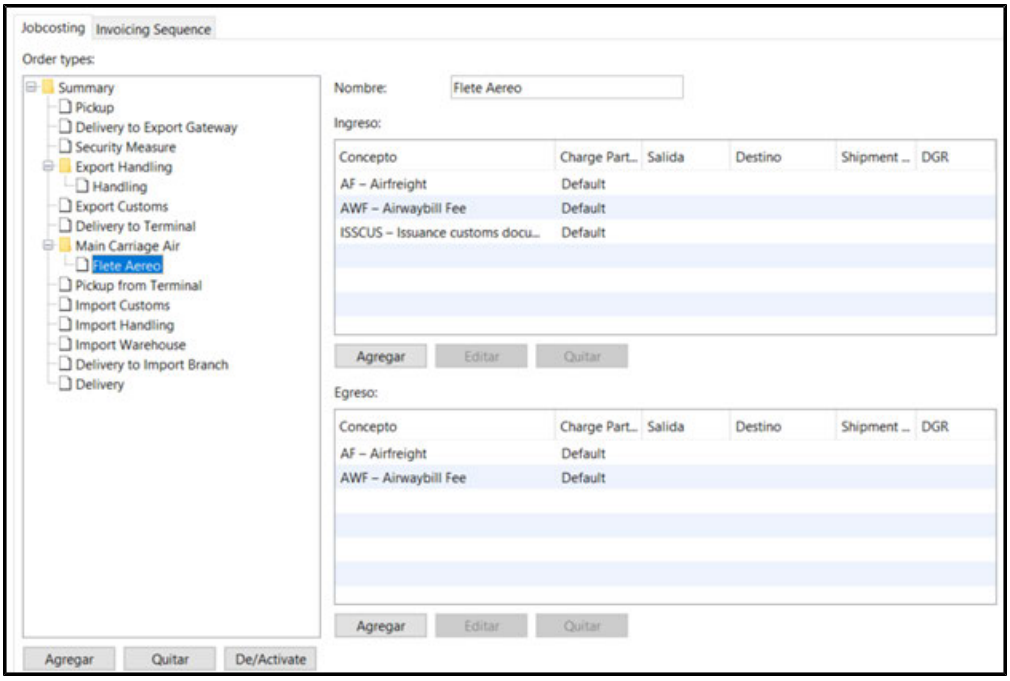


3. Al ingresar se nos presenta una pantalla para generar el Activity Type:



En este Ejemplo se va a crear un Activity Type para las exportaciones Aéreas de tipo House y en General, del lado izquierdo se observan los diferentes componentes de un embarque Aéreo de Exportación, seleccionamos Main Carriage Air y dé click en Agregar, nos solicita un nombre para este apartado, así como los conceptos de ingreso y egreso que complementan esta etapa.

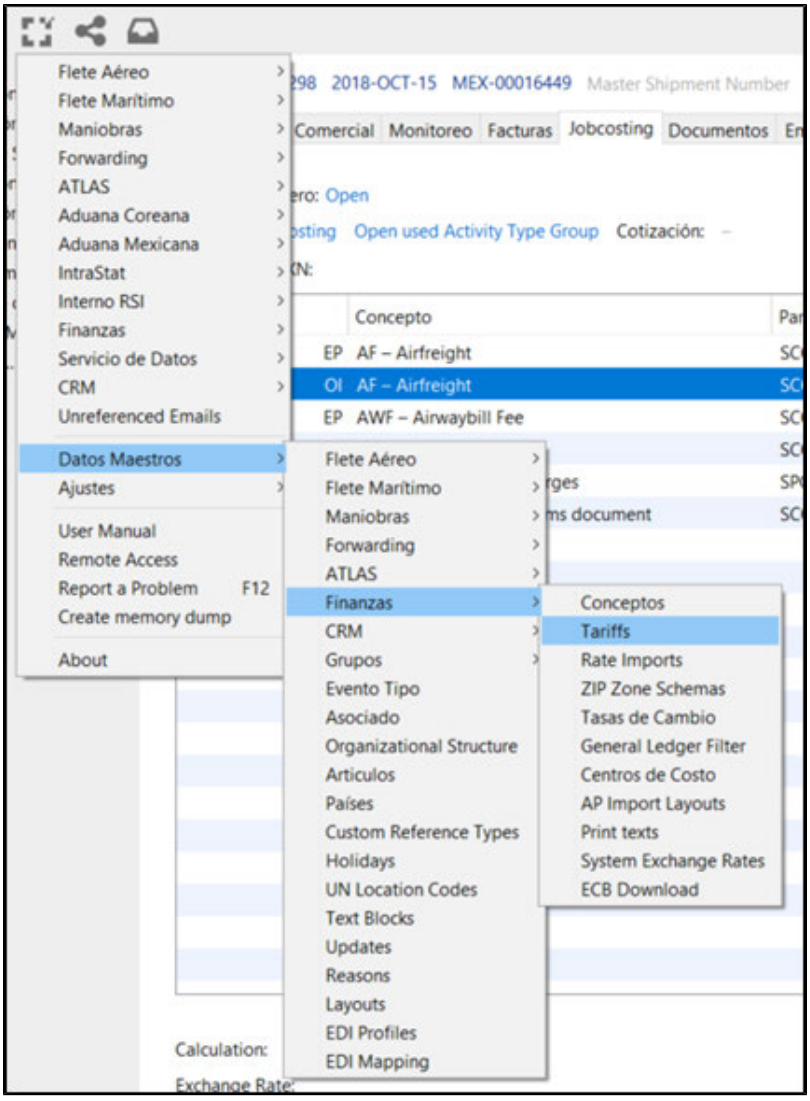
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



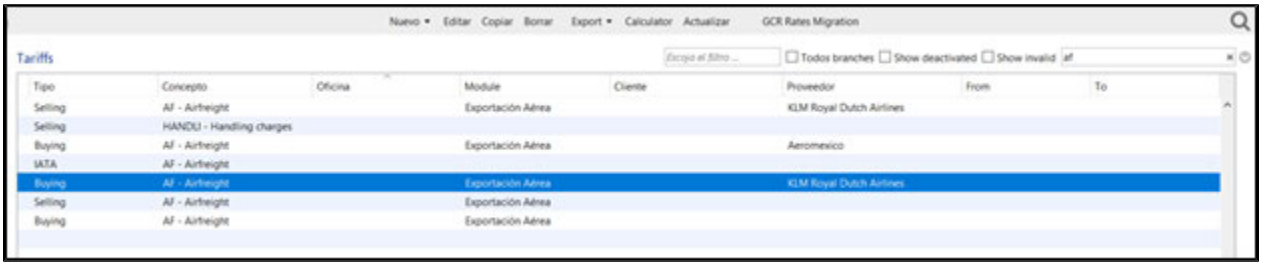
4. Un vez que ingrese todos los conceptos dé click en guardar y esta listo para sea usado en cotizaciones y embarques.

5. Para que dentro del Job Costing aparezcan las cantidades, se requiere configurar las tarifas para los conceptos, tomará el ejemplo del Flete Aéreo. Primeramente, debe entrar al módulo de tarifas en Datos Maestros – Finanzas – Tariffs

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

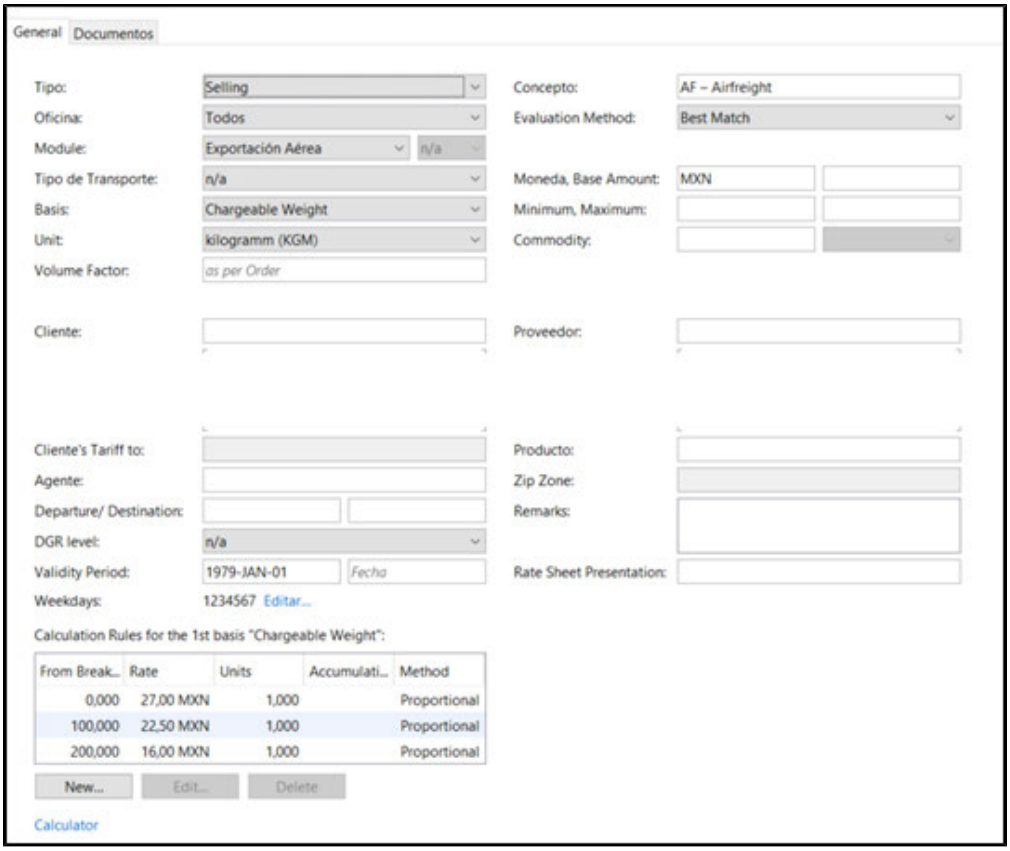


6. Al ingresar observe que hay varias Tarifas, las cuales se pueden dividir en 5 tipos, las principales son las tarifas de compra y venta, ya que estas son las usadas para cotizaciones y Job Costing.



7. Al dar de alta una tarifa, se tienen varias opciones para que sea aplicada dentro del sistema

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Esta es una configuración básica pero con un calculo dependiendo del Peso Cargable, basado en los kilogramos de la carga, de 0 a 100kg hay una tarifa de 27.00, de 100 a 200 kg, la tarifa es de 22.50, y mas de 200kg la tarifa es 16.00. Incluso se puede determinar que sea por destinos, origin, clientes o proveedores, etc.

Tipos de orden y sus categorías

Dependiendo del “Order Group” puede que tenga diferentes tipos de ordenes:

Tipo de Orden	Descripción	Disparador
Pickup	Pickup del Shipper	Creación de una orden de recolección para Exportación Aérea o Exportación Marítima.
Delivery to Export Gateway	Entrega de las mercancías de exportación desde una oficina satélite al gateway.	Creación de una orden de transporte de entrega a Gateway de una Exportación Aérea o un embarque de exportación marítima Master
Security Measure	Revisión de seguridad	Creación de un envío de exportación aérea y creación de un Pedido de Selección (Screening Order)
Export Handling	Manejo de exportación	Creación de un envío de exportación aérea o marítima.
Export Customs	Despacho de aduana de exportación	Creación de una declaración de exportación para un envío de exportación aérea o exportación marítima
Delivery to Terminal	Entrega de carga a la terminal de exportación	*Aún no ha sido implementado*
Main Carriage Air	Detalles principales del vuelo	Finalización de detalles de vuelo directo, back-to-back o detalles de envió directos para envíos de exportación aérea.
Main Carriage Sea	Detalles principales del viaje	Finalización de los detalles de transporte para los envíos de exportación marítima
	Transporte principal de envió terrestre simple	Creación de un simple shipment (terrestre)

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Main Carriage Road		
Pick up from Terminal	Recolección de la terminal de llegada	Creación de exportación aérea o envío de exportación marítima si estos envíos son envíos tipo prepagos (PP)
Import Customs	Despacho aduanero de importación	Creación de un registro de importación para un envío de Importación Aérea o Marítima. Además, si un envío aéreo es de Incoterm DDP, utilice esta actividad.
Import Handling	Procedimientos de importación	La creación de un envío de importación aérea o marítima, además, los envíos de exportación aéreos utilizarán esta actividad, ya que son "Prepaid" (PP).
Import Warehouse	Almacenamiento de importación	Creación de un embarque de importación aérea o importación marítima. Los envíos de exportación área también utilizarán este tipo de actividad si son "Prepago" (PP).
Delivery to Import Branch	Entrega de bienes a la sucursal de importación	Creación de una orden de transporte "Delivery to Branch" dentro de un embarque de importación, o dentro de exportaciones aéreas si el envío es "Prepago (PP)" y el agente de importación y la puerta de enlace son diferentes
Delivery	Entrega al consignatario	Creación de una orden de envío aéreo o marítimo para un embarque. Además, si un envío aéreo es de Incoterm DDP, utilice esta actividad.

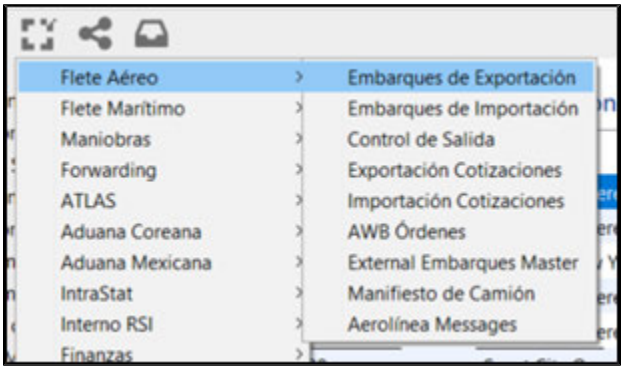
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Consolidación de Embarques

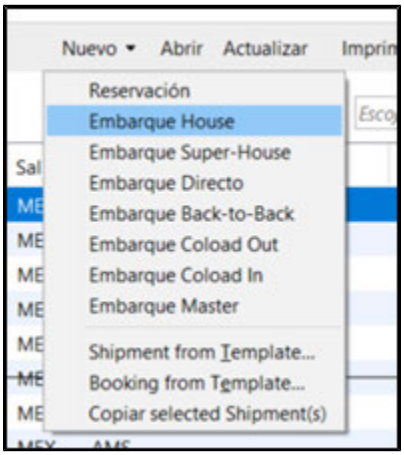
Introducción

El objetivo del presente documento es mostrar cómo consolidar los embarques.

1.Navegue al módulo Flete Aéreo > Embarques de Exportación:

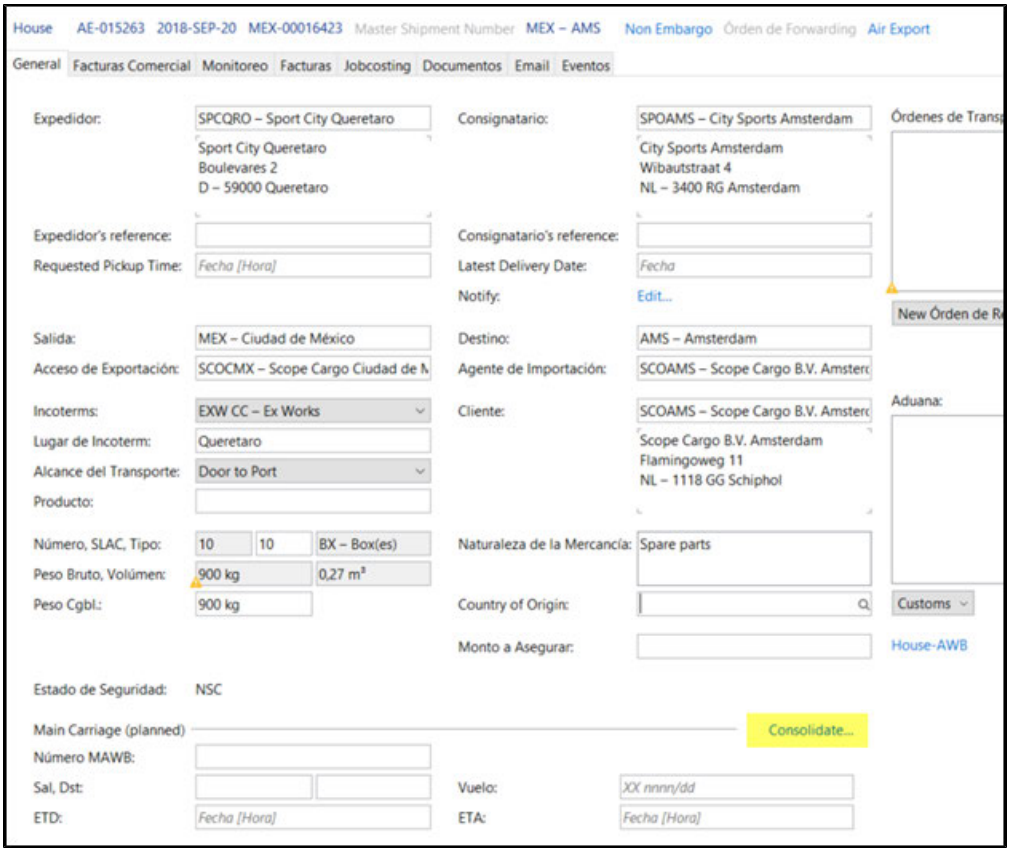


2. Dé click en Nuevo y seleccionar Embarque House:

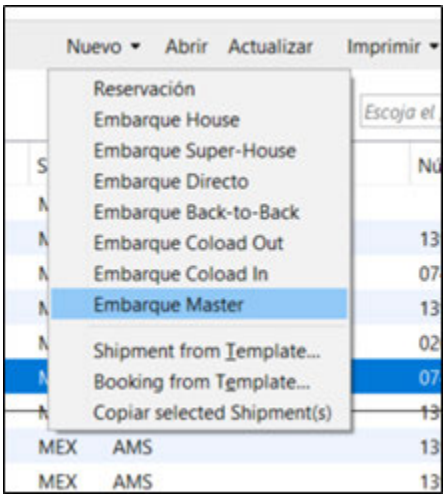


3. Genere el nuevo embarque House, como se puede apreciar hay una opción, en la sección de *Main Carriage* que dice ***Consolidate***, este sirve para consolidar el embarque cuando exista un embarque master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

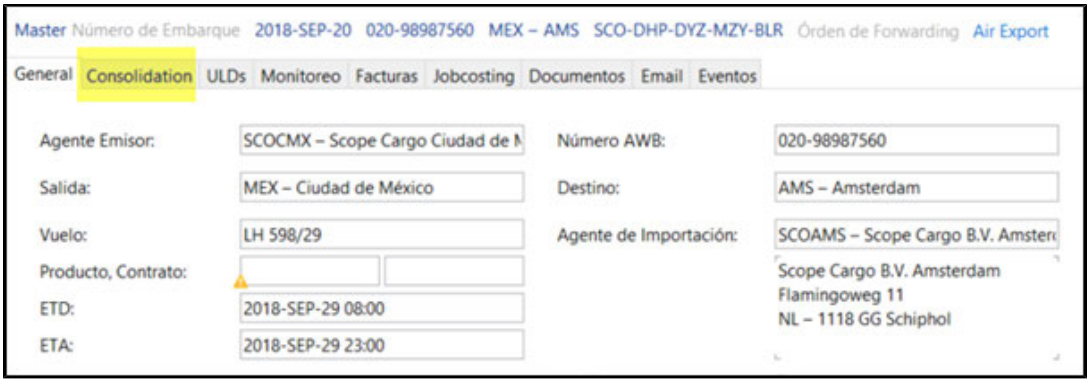


4. Después de guardar el embarque House cierre el embarque y diríjase a generar el embarque master:

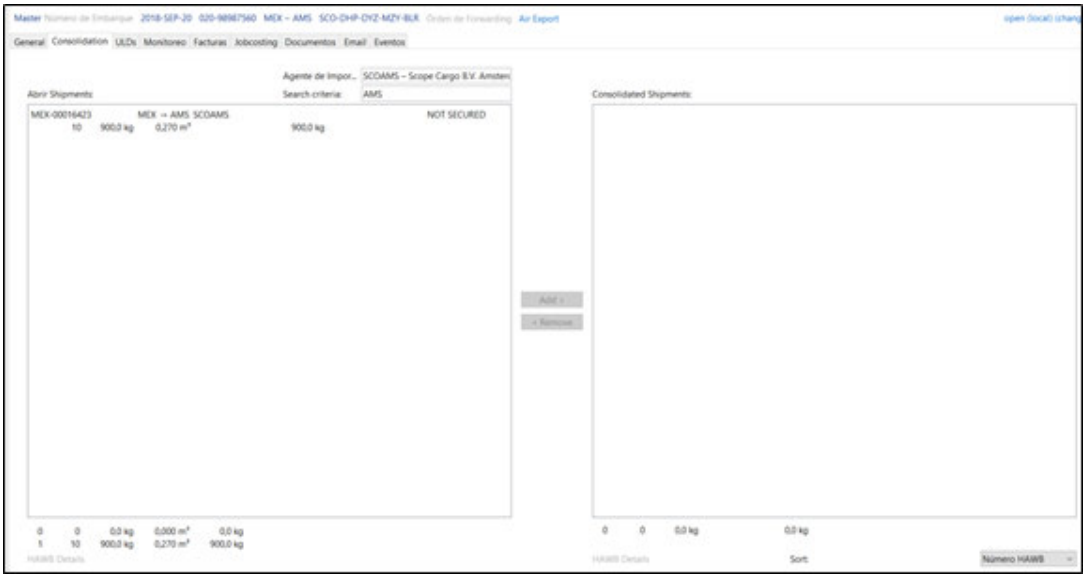


5. Al ingresar se comienza a registrar la información para el embarque master, también dentro del embarque master esta la pestaña de ***Consolidation.***

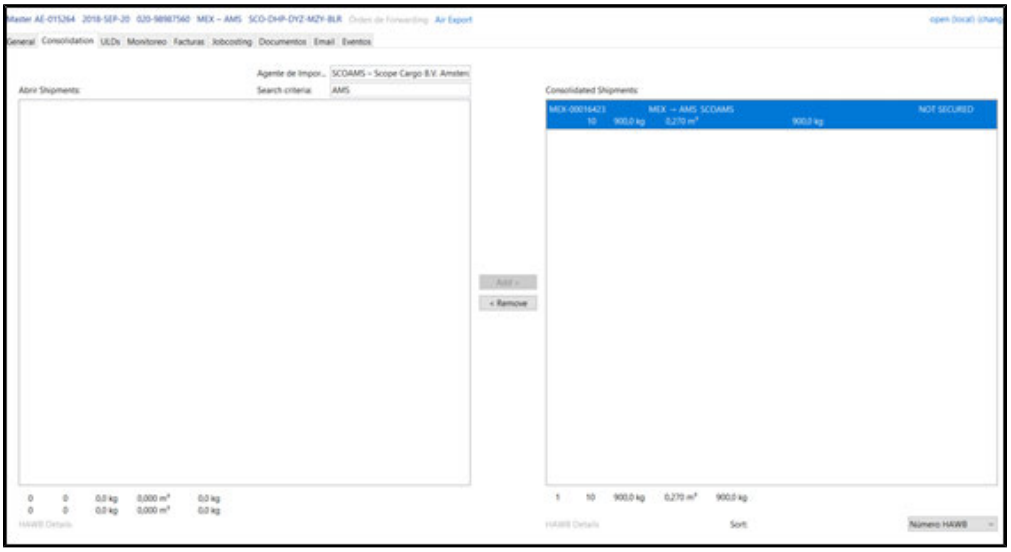
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



6. Al ingresar en esta pestaña, Scope automáticamente muestra todos los embarques House que tienen el mismo Origen y Destino:

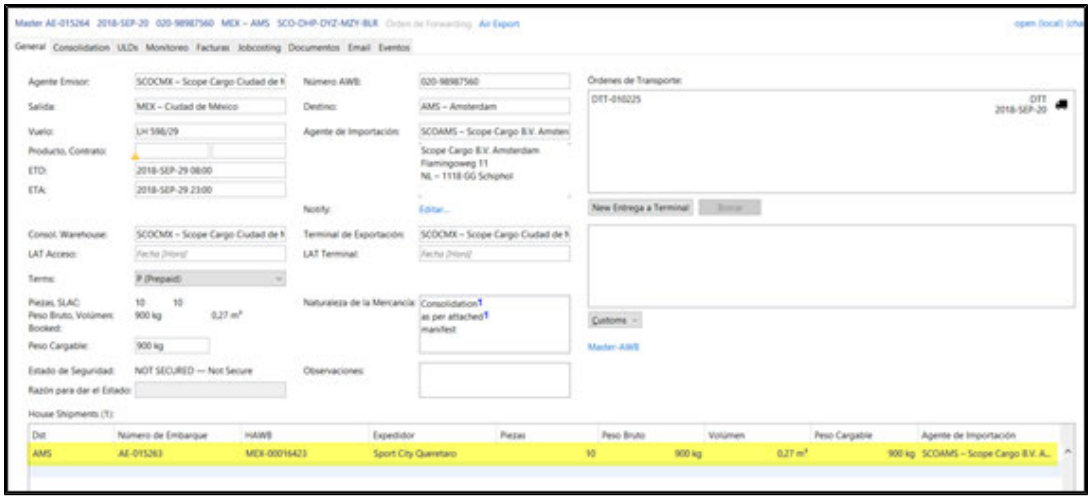


7. Solo es cuestión de seleccionar el(los) embarques que se quiera consolidar al master, y se dé click en guardar:

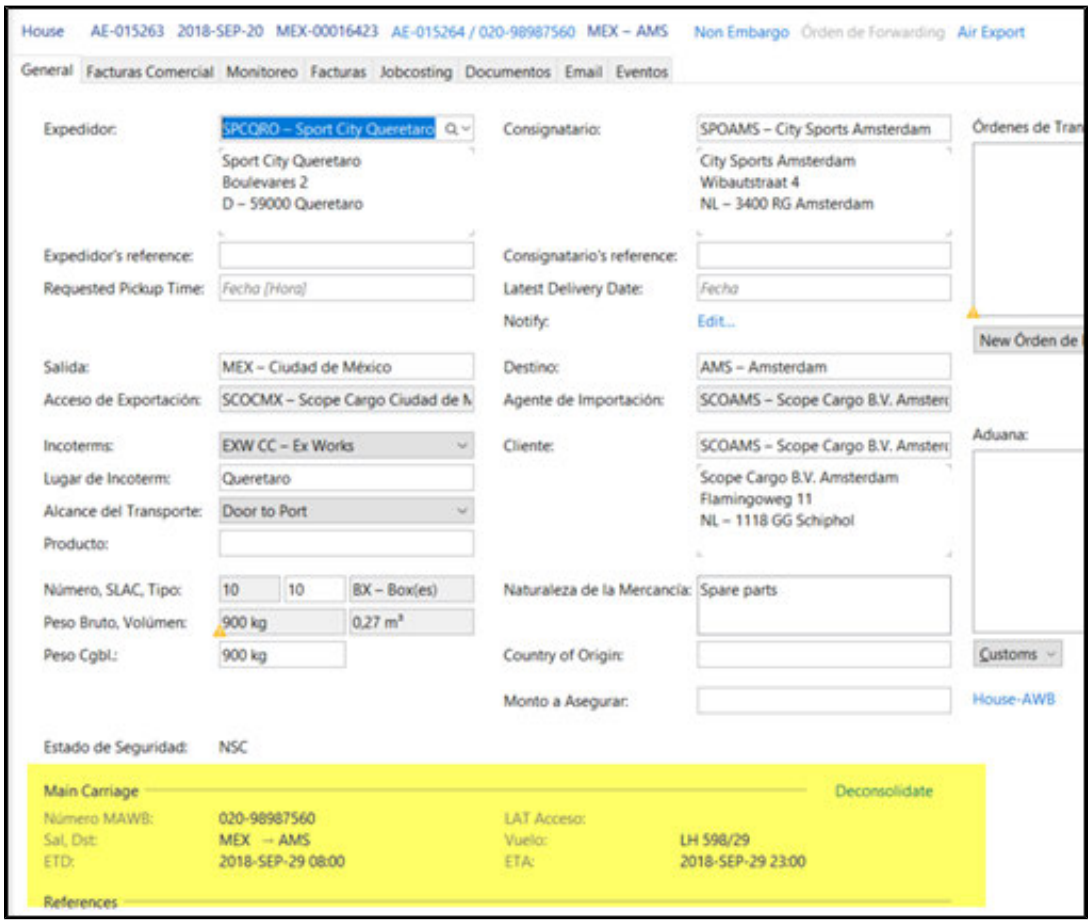


8. Al revisar la pestaña de general se puede apreciar los embarques House consolidados al Master.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



9. También, puede revisar el embarque House a que Embarque Master está consolidado.



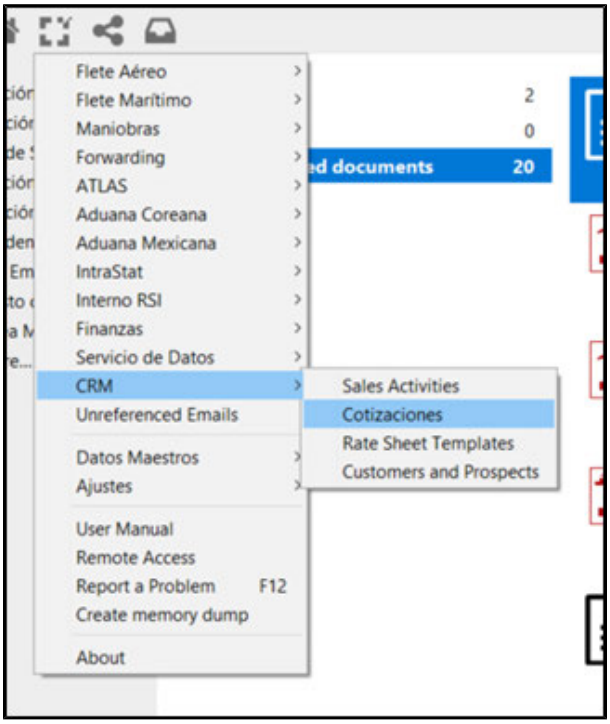
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Convertir un Prospecto a Cliente

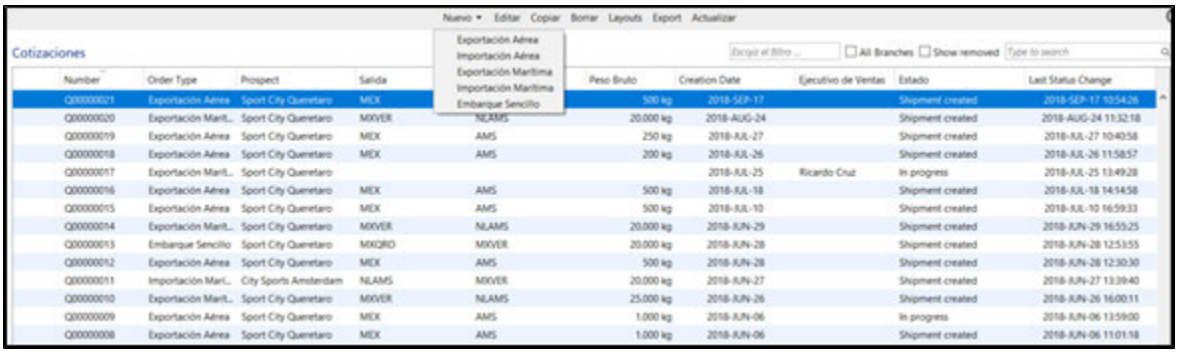
Introducción

El objetivo del presente documento es mostrar cómo generar o convertir un prospecto a cliente.

1.Ingrese al módulo: CRM > **Cotizaciones**

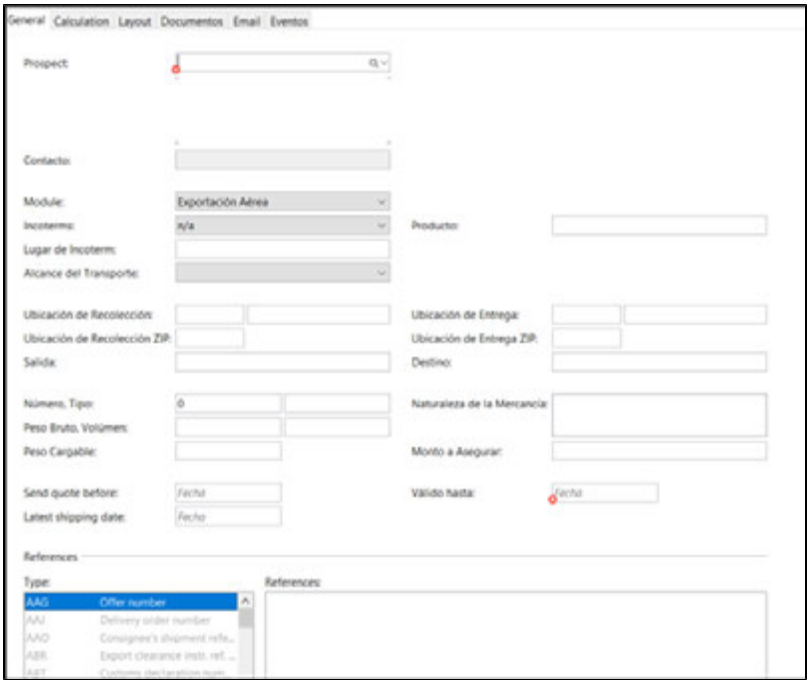


2.Después de ingresar a la vista general de cotizaciones seleccione **“Nuevo”** y apareceran las opciones para los diferentes tipos de embarques:

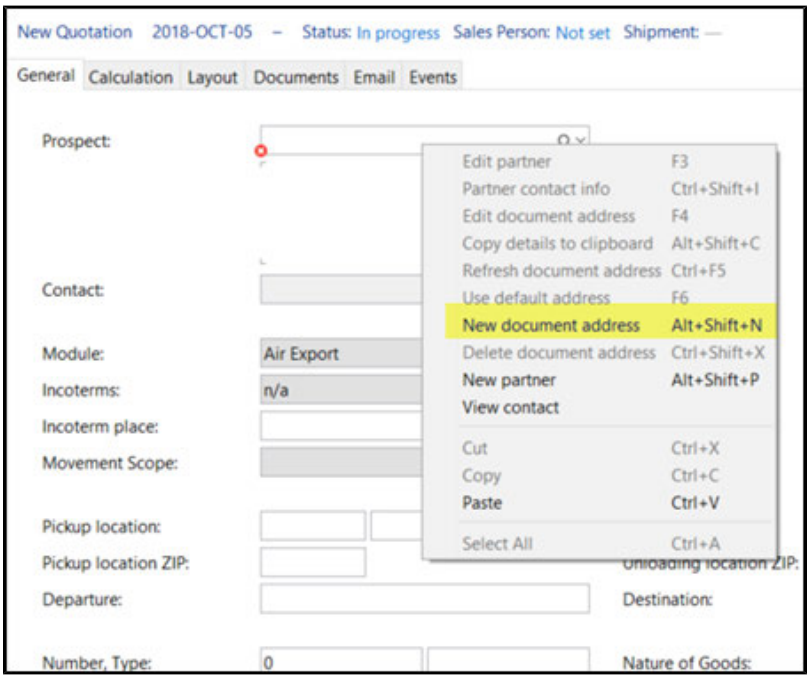


3. Elija el tipo de cotización y se muestra la pantalla para definir los datos generales para la cotización:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

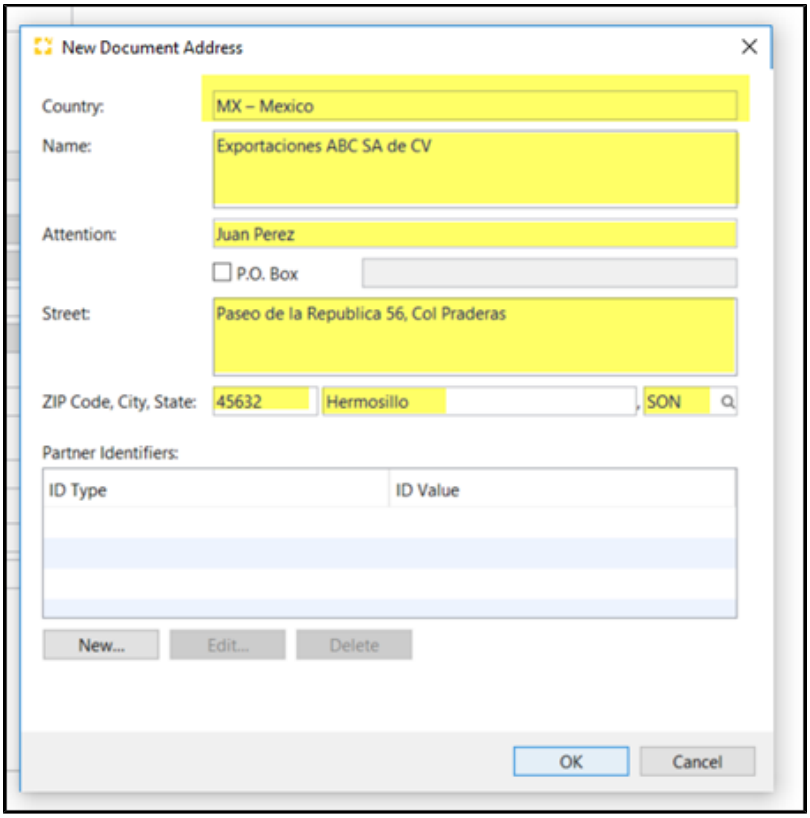


4. Si es un nuevo prospecto, haga click derecho sobre la ventana del campo ***Prospect*** y seleccionamos la opción "**New Document Address**":

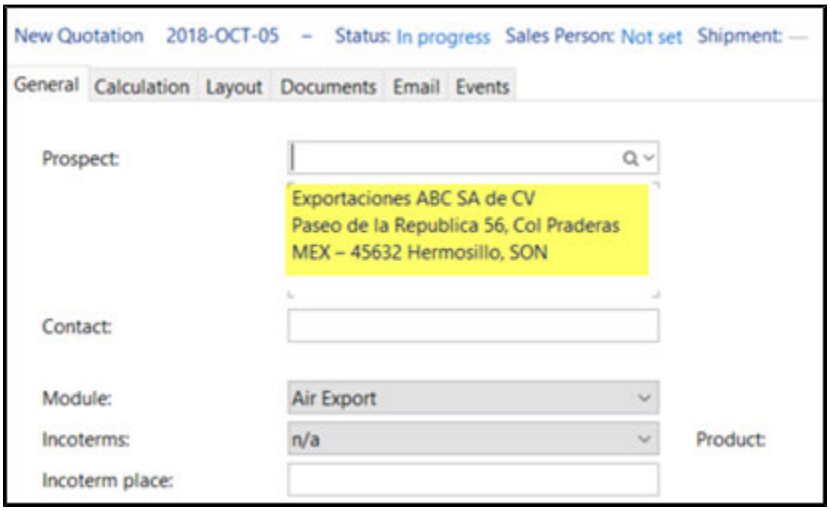


Llene la pantalla con los datos requeridos del prospecto:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

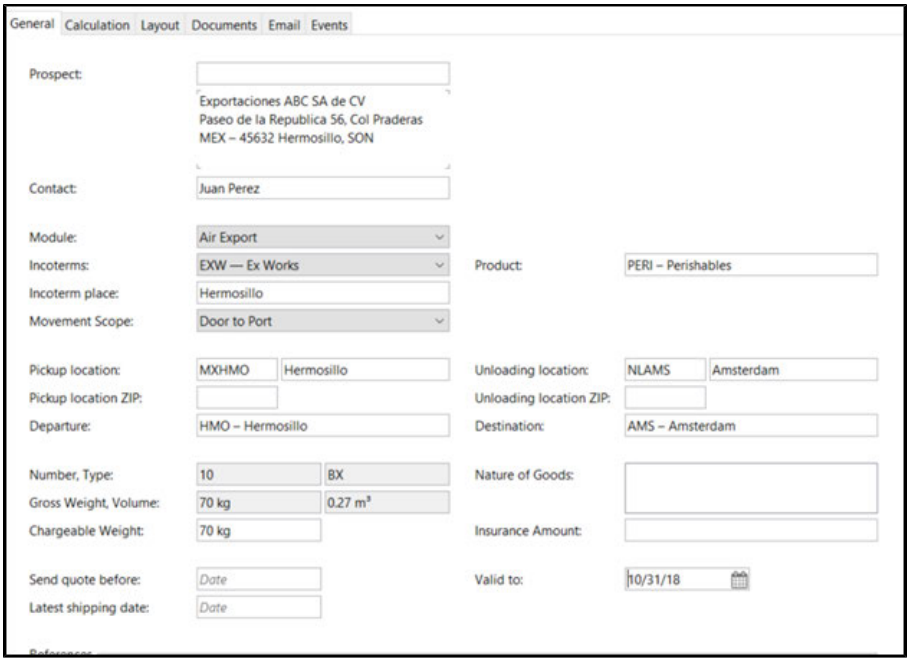


5. Después de agregar los datos del prospecto, aparecerá en la forma de la cotización

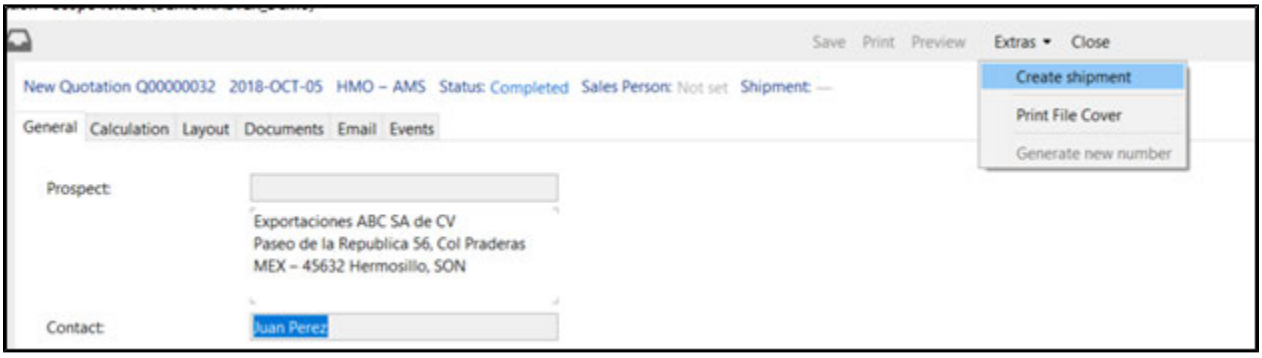


6. Continúe con el llenado de la cotización:

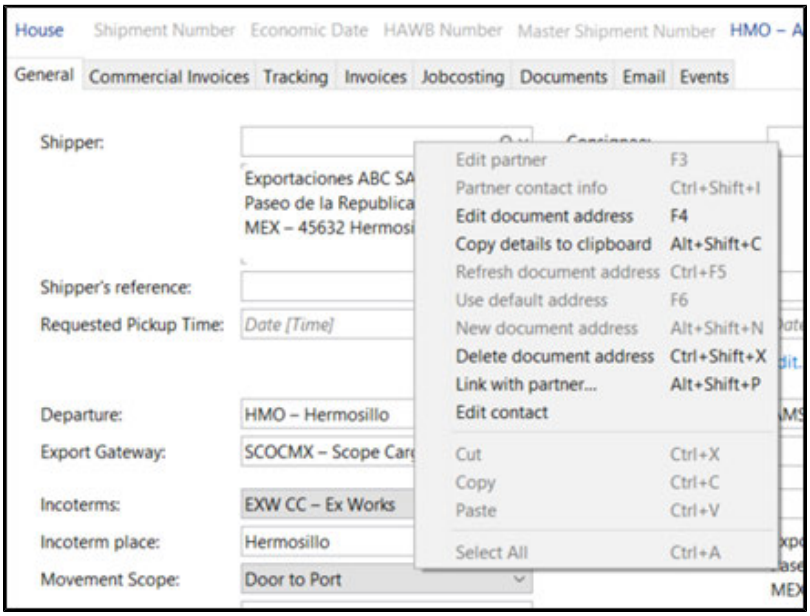
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



7. Una vez que el prospecto acepta la cotización, convierta la cotización en embarque:



8. Dentro del embarque, dé click derecho sobre el campo de *Shipper* (Embarcador) y seleccione la opción de **Link with partner**, de esta forma se abrirá el modulo de Asociados para dar de alta al prospecto como cliente.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Creación de "Tracking Templates"

Introduction

tracking templates son usados para:

- Define a que milestone se aplicara y a que embarque
- Especifica la ventana de tiempo permitida del milestone para ser gestionada
- Gestiona como debe de ser cubierto ese milestone
- Aplica las acciones y alertas relacionadas con cada milestone
- Determina que milestones son visibles en Scope Connect para el cliente, shipper, consignatario, agente

Cuando se aplica una plantilla de seguimiento (tracking template) a un embarque, los resultados se ven en la pestaña "Seguimiento o Tracking" del embarque.

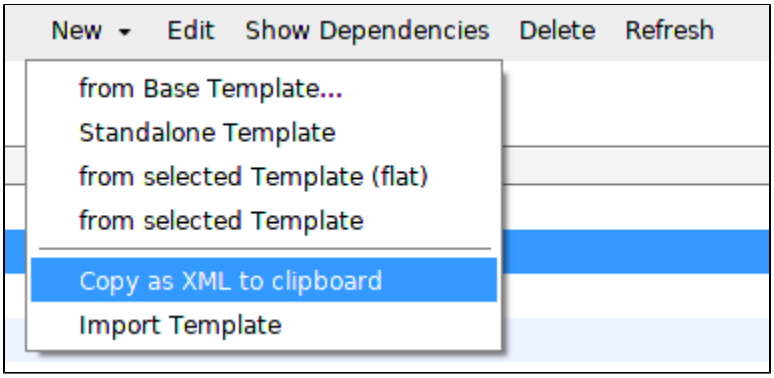
Descripción general de las plantillas de seguimiento "tracking templates"

La vista general muestra todas las plantillas de seguimiento que ya se han creado. Cuando se resalta un plan de seguimiento en la descripción general, la ventana "Aplicabilidad" en la parte inferior de la pantalla mostrará los atributos utilizados para aplicar la plantilla al embarque correcto.

Crear una nueva plantilla de seguimiento

Existen varias formas de crear una nueva plantilla de seguimiento, pero los 2 métodos más fáciles son:

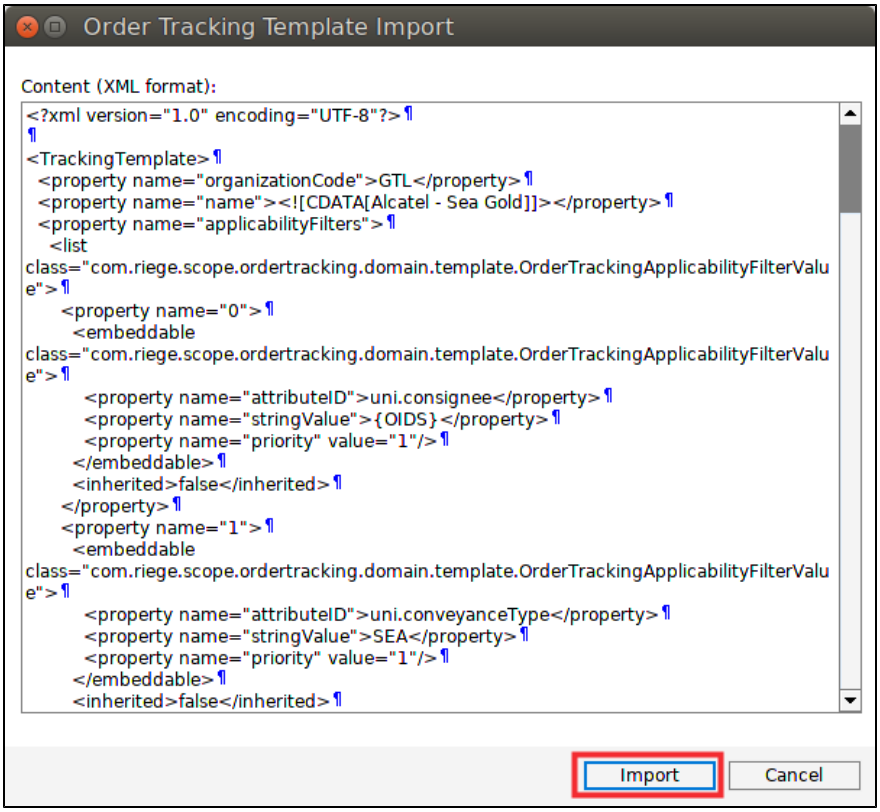
- **Standalone Temple** - esta opción creará la plantilla de seguimiento desde cero.
- **Copy as XML to clipboard** - esta opción te permitirá copiar y pegar en su portapapeles, de alguna otra ya existente para después importarla como una nueva plantilla.



Crear una nueva plantilla de seguimiento copiando desde una ya existente

1. En el menú "Nuevo", elija "Copiar como XML al portapapeles"
2. Ahora, en el menú "Nuevo", elija "Importar plantilla"
3. Aparecerá una ventana en blanco "Importar plantilla de seguimiento"
4. Coloque el cursor en el área de contenido en blanco y haga clic derecho. Elija "pegar" y la plantilla copiada aparecerá como datos XML
5. Click "Importar"
6. Aparecerá la plantilla copiada. Renombre y continúe con los cambios, haga click en "guardar" para mantenerla.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



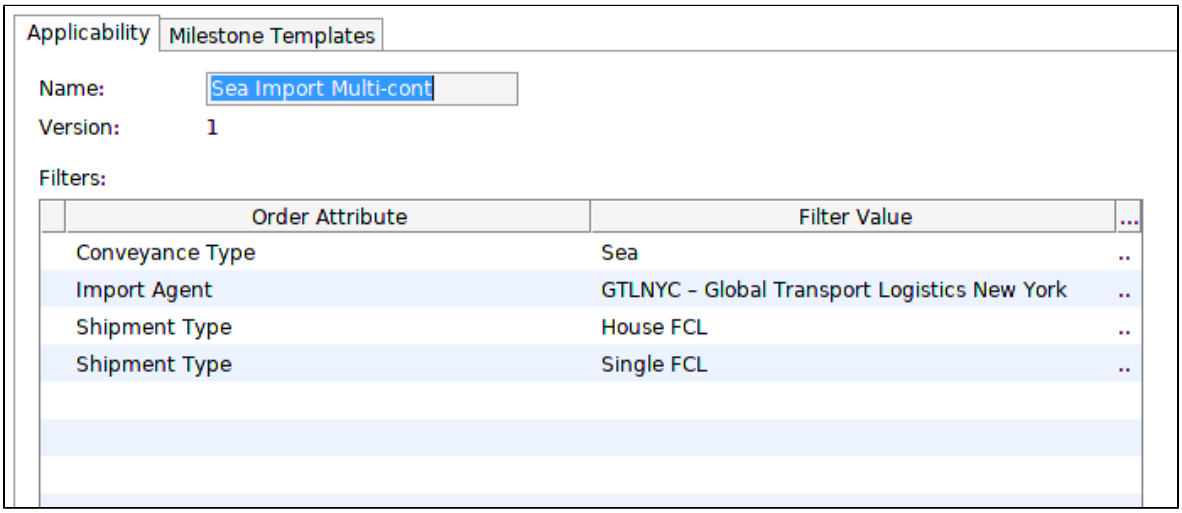
Definir cuando aplicar una plantilla de seguimiento "tracking template"

Una plantilla de seguimiento puede ser muy general o muy específica, o ambas opciones. La pestaña "Aplicabilidad" de una plantilla se utiliza para definir cuándo la plantilla debe aplicarse a un embarque.

Plantilla de seguimiento generalmente aplicada

En el siguiente ejemplo, esta plantilla de seguimiento se aplicará a cualquier embarque donde:

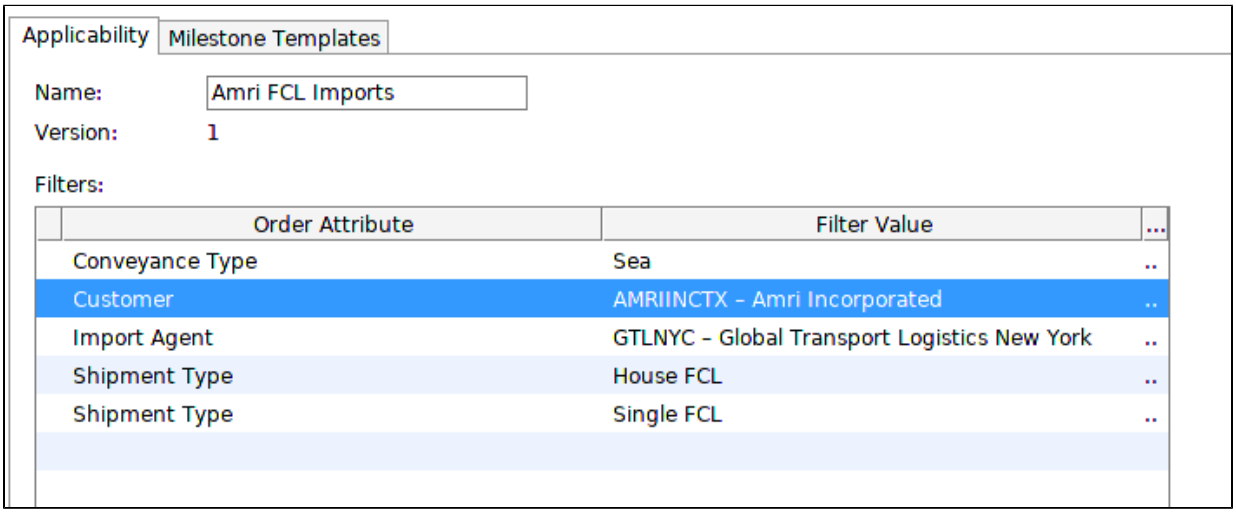
1. El medio de transporte sea "Marítimo"
2. El agente de importación es Global Transport Logistics en Nueva York
3. El tipo de embarque sea un FCL interno o un FCL único (tenga en cuenta que un solo envío FCL puede tener más de 1 contenedor)



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

La plantilla anterior solo se aplicará cuando no se pueda encontrar una plantilla más específica

Plantilla de seguimiento específica



La aplicabilidad de la plantilla de seguimiento anterior es muy similar a la plantilla de seguimiento general anterior, excepto que el cliente se especifica como "Amri Incorporated". Esto significa que esta plantilla se aplicará a los embarques FCL de importación marítima cuando:

1. El medio de transporte sea "Marítimo"
2. El agente de importación es Global Transport Logistics en Nueva York
3. El tipo de embarque sea un FCL interno o un FCL único (tenga en cuenta que un solo envío FCL puede tener más de 1 contenedor)
4. El cliente en el embarque sea is "Amri Incorporated"

Crear Milestones para una nueva plantilla

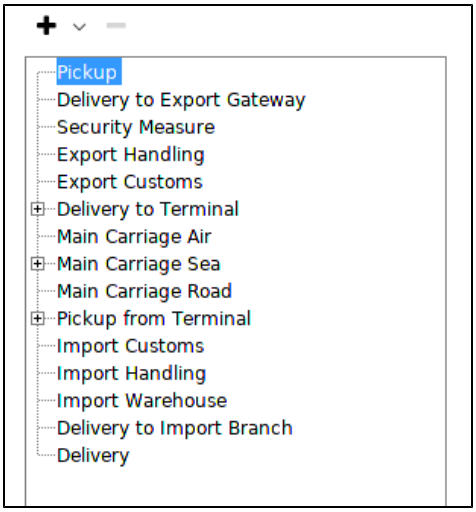
Cada embarque tiene un ciclo de vida desde la recolección hasta la entrega. Este ciclo de vida se compone de una serie de pasos y puede definir los milestones dentro de cada paso. El primer tramo es la recolección, y para este recurso podemos definir los siguientes milestones:

1. Emitir la instrucción de recolección
2. Recibir la confirmación de recolección
3. Confirmación de entrega en la terminal de exportación

Dependiendo del tipo de embarque al que se aplica la plantilla de seguimiento, se pueden definir estos milestones para la etapa de recolección o solo algunos de estos o ninguno.

A continuación se muestra el conjunto de pasos que están disponibles para cada embarque. Se pueden crear Milestones para cada paso según sea el caso.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

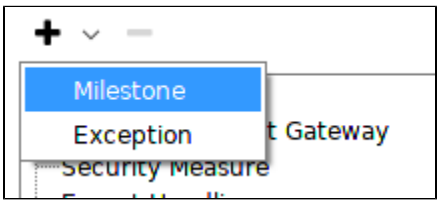


Agregar un milestone a la etapa de recolección

En este ejemplo se creará un milestone "Confirmación de recolección"

- Posicionarse sobre "Pickup" y da click en el símbolo de "+".

- Del sub-menu seleccione "Milestone"



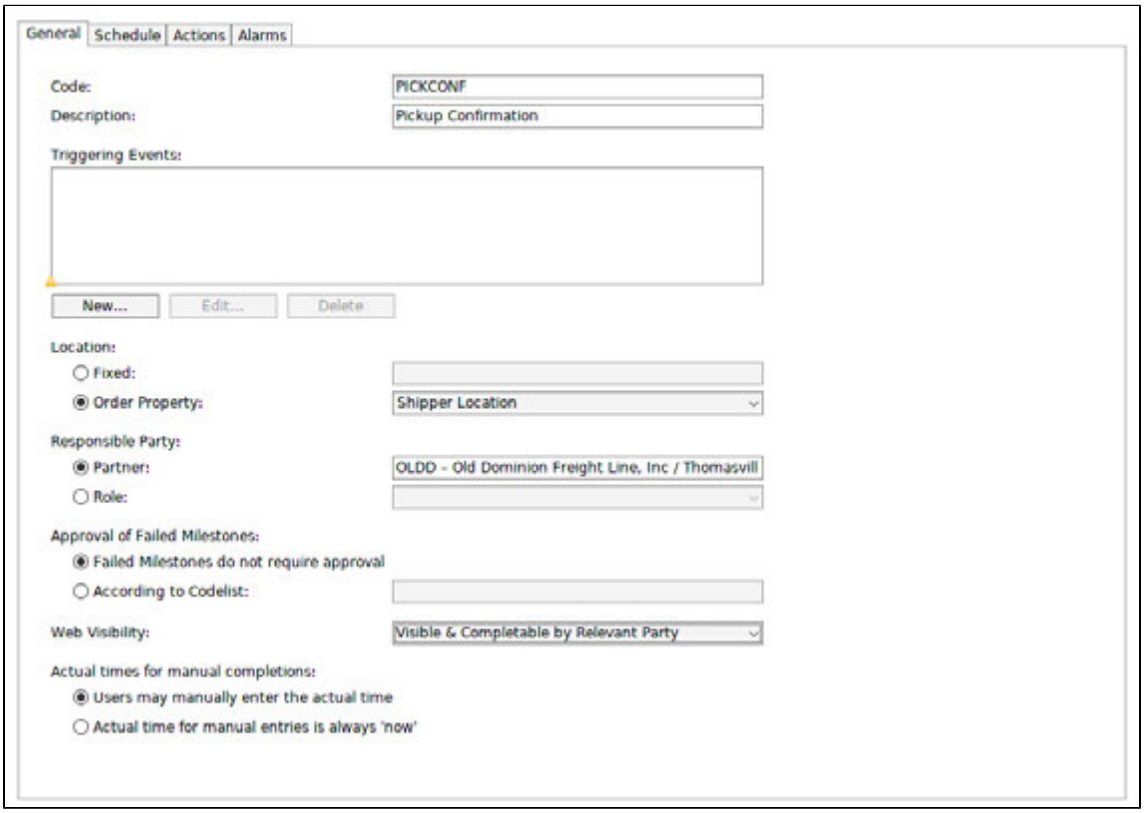
Completando los elementos generarles del milestone

La primera pestaña de un nuevo milestone es la pestaña general y aquí es donde definimos los conceptos básicos de esta.

- **Code** - Este es el código corto para el milestone. El ejemplo es "PICKCONF"
- **Description** - Es la descripción completa del milestone es decir, "Confirmación de recolección" o "Pickup Confirmation"
- **Triggering events** - Un milestone puede estar completo automaticamente, por ejemplo, si el operador del camión pudiera electrónicamente transmitirnos su evento de recolección. Entonces podríamos usar esto para terminar automáticamente el evento. Y si el operador del camión no puede hacer esto entonces manualmente tendrá que ser terminado el evento para que el campo que quede se pueda dejar en blanco.
- **Location** - Necesitamos especificar dónde tendrá lugar el milestone para aplicarle la zona horaria correcta. En este caso, la recolección se realizará en la ubicación del remitente.
- **Responsible party** - Aquí definimos quién debe completar este milestone. En este caso se espera que el operador del camión nos notifique a través de Scope Connect y completando el milestone por nosotros.
- **Approval of failed milestone** - La mayoría de las veces cuando un milestone no esta completo en tiempo, es suficiente alertar al usuario, pero en algunos milestones se requerirá un control muy detallado y para usuarios avanzados se puede crear una lista de códigos para controlar las fallas.
- **Web Visibility** - Muchas veces necesitamos hacer visible el milestone en Scope Connect. Este campo permite a los usuarios elegir el tipo de visibilidad que su milestone tiene en Scope Connect:
    - Invisible

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

  - Visible
  - Visible y completo
  - Visible y completo por el responsable
- **Actual times for manual completions** - El tiempo actual debe de ser utilizado o el usuario debe de escoger un tiempo para completar esta tarea.

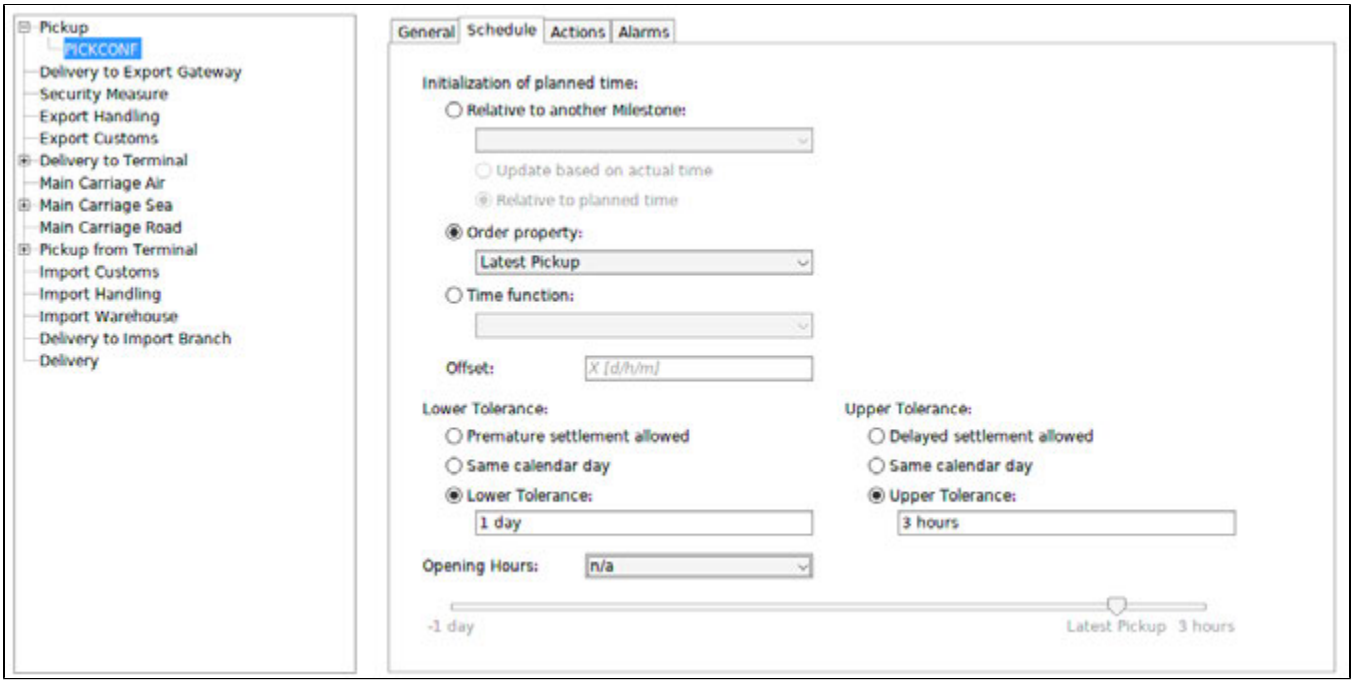


Completando los Milestones programados

La segunda pestaña del milestone en la programación y aquí definimos cuando se espera que ese milestone pueda completarse. Desde lo mas cercano hasta lo más tardío que este evento pueda ocurrir.

- **Initialization of planned time** - Hay tres formas de establecer cuándo se debe completar un milestone
- Relativo a otro milestone: este método analiza un milestone ya existente y calcula en función de la fecha de finalización de este
- propiedad de pedido: aquí se utiliza una fecha que pertenece al embarque. En este ejemplo, la "Fecha de recolección más reciente" registrada por el usuario en el embarque se utilizará para fijar la fecha y hora de finalización esperadas.
- Función de tiempo: este es el tiempo de creación del embarque.
- **Offset** - Se puede utilizar para impulsar la fecha y hora de finalización y hora y fecha de algún embarque. Por ejemplo la finalización de la recolección puede estar relacionada con el ETD de la embarcación y por lo tanto, la compensación podría usarse para especificar que la finalización de la recolección ocurra horas antes del ETD de la embarcación.
- **Lower Tolerance** - Aquí podemos definir qué tan temprano puede ocurrir la finalización. En este ejemplo, la finalización de la recolección es relativa a la última fecha de recolección registrada en el embarque. "día 1" en el ejemplo significa que lo más pronto que esperamos que ocurra la recolección es 24 horas antes de la última fecha y hora de recolección.
- **Upper Tolerance** - Aquí definimos qué tan tarde puede ocurrir la finalización. El siguiente ejemplo permite 3 horas después de la última fecha y hora de recogida registrada en el envío.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

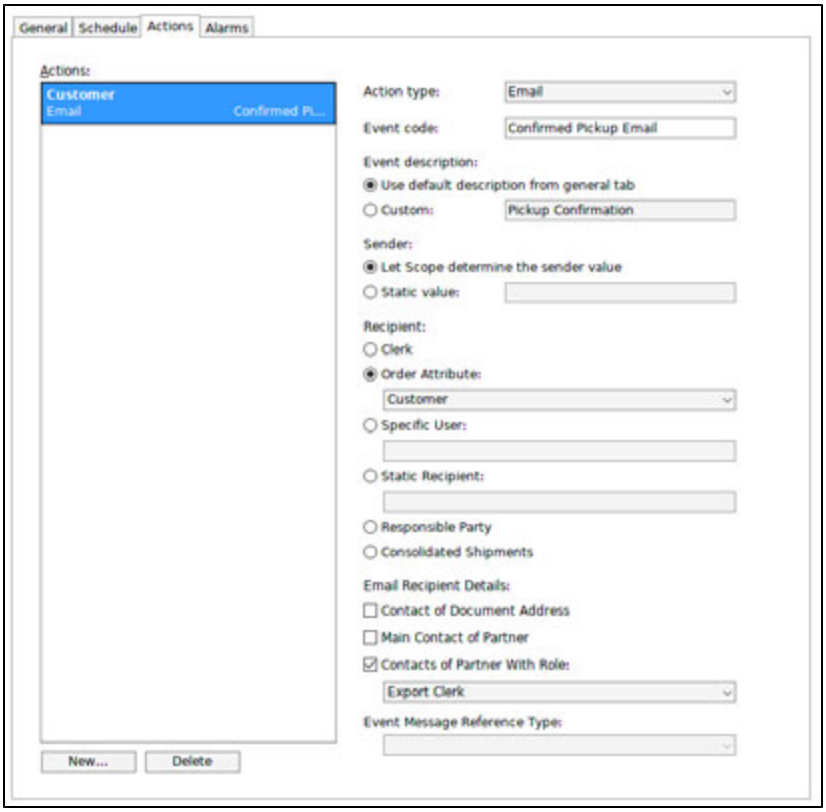


Crear acciones asociadas con la finalización de un milestone

Cuando se completa un hito, hay acciones que se pueden ejecutar automáticamente. La pestaña "Acciones" de un milestone se usa para crear estas y se pueden crear múltiples acciones para un solo milestone.

- **Action type** - los tipos de acciones más comunes son:
  - Enviar un correo electrónico notificando a alguien que el milestone se ha completado
  - Notificar al usuario que se ha completado un milestone
- **Event Code** - este campo se puede usar para dar a esta acción su propio código de evento
- **Event Description** -aquí podemos definir si la descripción del milestone es suficiente, o mediante el uso de la descripción personalizada se puede utilizar información más específica sobre el evento.
- **Sender** -aquí podemos definir de quién debería aparecer la alerta.
- **Recipient** - según el tipo de acción, se pueden utilizar varios métodos para especificar quién es el destinatario de la acción. En el siguiente ejemplo, la acción enviará un correo electrónico. Para garantizar que el destinatario correcto reciba el correo electrónico, podemos elegir:
  - Clerk - esto enviaría el correo electrónico al usuario que posee actualmente el envío.
  - Order attribute - aquí podemos elegir de la lista de partes asociadas con el envío. En el ejemplo, nuestro correo electrónico irá al cliente al que pertenece el embarque.
  - Specific user - use este campo si el correo electrónico debe ir a un usuario específico en Scope o un socio de Scope.
  - Static Recipient - este campo se utiliza si el destinatario es una dirección de correo electrónico específica que no cambia.
  - Responsible party - esto enviaría un correo electrónico a la parte responsable de completar el milestone.
- **Email recipient details** -esta sección nos permite ser aún más específicos sobre quién debe recibir el correo electrónico notificándoles la acción. En el ejemplo, el cliente al que pertenece el envío recibe el correo electrónico, pero estamos especificando que el contacto del cliente con el rol "Export Clerk" debe recibir el correo electrónico.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



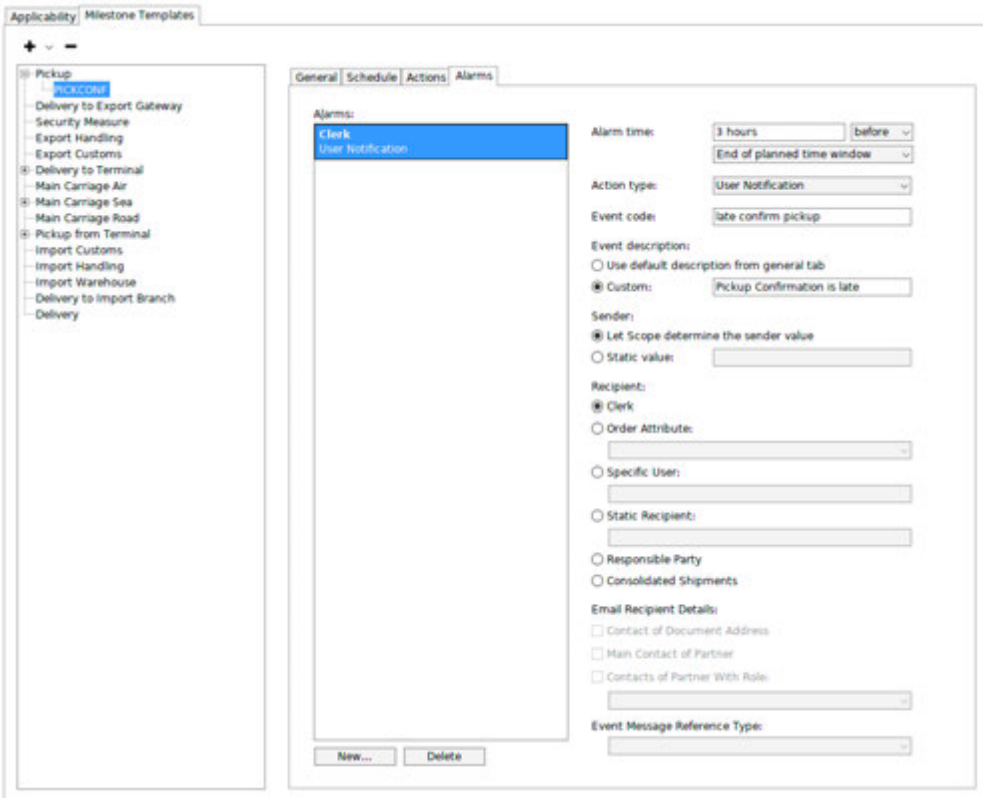
Crear alarmas en el milestone

Del mismo modo que se pueden crear acciones cuando un milestone se completa con éxito, se pueden crear alarmas para milestones cuando la falla de la finalización oportuna parece inminente. Se pueden crear múltiples alarmas diferentes para un solo milestone.

A continuación, utilizando la pestaña "Alarmas", se ha creado una con nombre "Confirmación de recogida" o " Pick up Confirmation".

- **Alarm time** - aquí hemos especificado que esta alarma debe activarse 3 horas antes del final de la ventana de tiempo permitida. Esto debería permitir tiempo para contactar al operador y asegurarse de que se dirige a su recolección.
- **Action type** - aquí especificamos qué debe hacer la alarma. Hemos elegido enviar al usuario de Scope una notificación.
- **Event Code** - un código específico para esta alarma. Esto establecerá de forma predeterminada el código del milestone y esto puede conservarse si se prefiere.
- **Event description** - una descripción completa del evento ayudará al destinatario a comprender de inmediato el problema.
- **Sender** - la parte que debería aparecer para enviar la alarma.
- **Recipient** - al igual que con las acciones, existen numerosas opciones para garantizar que la parte correcta reciba la alerta. En este caso, el usuario responsable del envío recibirá la alerta.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Cuando se completan las 4 pestañas del milestone, se puede comenzar a definir el próximo.

Haga clic en "Guardar" cuando todos los milestones cuando estén completos para un plan de seguimiento.

Milestone desde Ocean Insights

Ocean Insights te proporciona los siguientes milestones:

- Container empty to shipper CEP
- Container pickup at shipper CPS
- Container arrival at first POL(Gate in) CGI
- Container loaded at first POL CLL
- Vessel departure from first POL VDL
- Vessel arrival at T/S port 1 VAT1
- Container discharge at T/S port1 CDT1
- Container loaded at T/S port 1 CLT1
- Vessel departure from T/S 1 VDT1
- Vessel arrival at T/S port 2 VAT2
- Container discharge at T/S port 2 CDT2
- Container loaded at T/S port 2 CLT2
- Vessel departure from T/S 2 VDT2
- Vessel arrival at T/S port 3 VAT3
- Container discharge at T/S port 3 CDT3
- Container loaded at T/S port 3 CLT3
- Vessel departure from T/S port 3 VDT3
- Vessel arrival at final POD VAD
- Container discharge at final POD CDD
- Container departure from final POD (Gate out) CGO
- Container delivery to consignee CDC
- Container empty return to depot CER

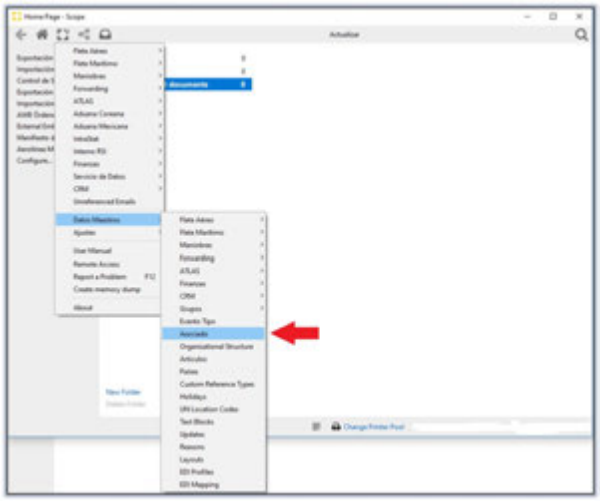
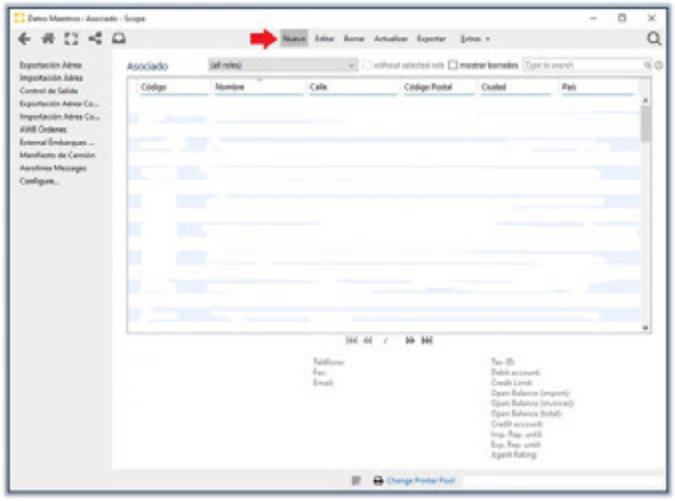
Creación de Asociados (Partners)

El objetivo del presente documento es mostrar cómo dar de alta a un Asociado (Partner).

1. Menú Principal > Datos Maestros > **Asociado**



2. Dé un click sobre la opción **Nuevo**

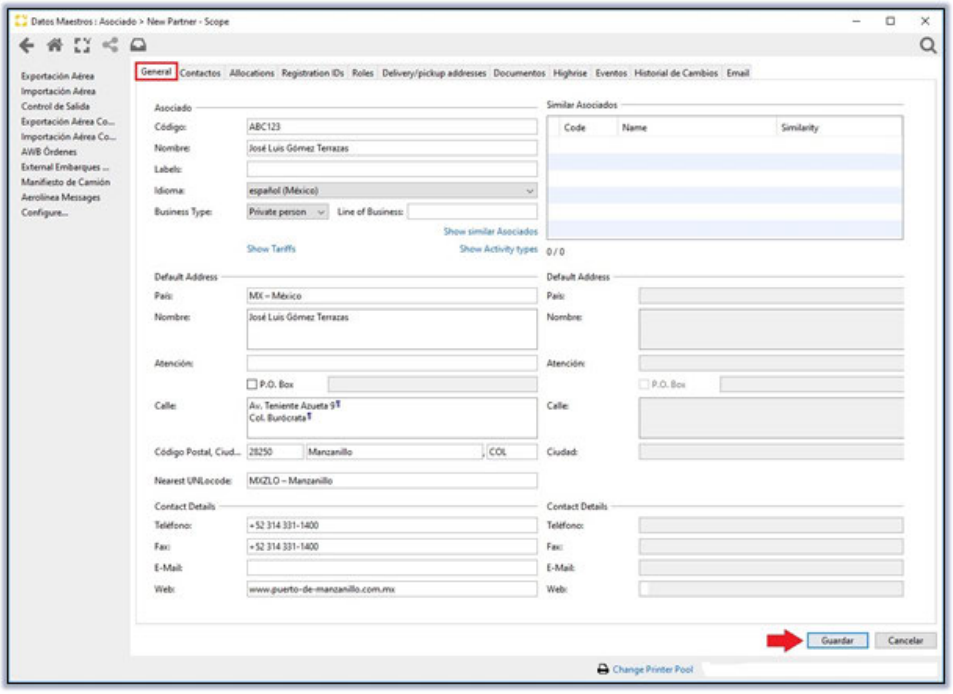


3. En esta forma habrá que concentrarse, primeramente, en las 3 pestañas señaladas:

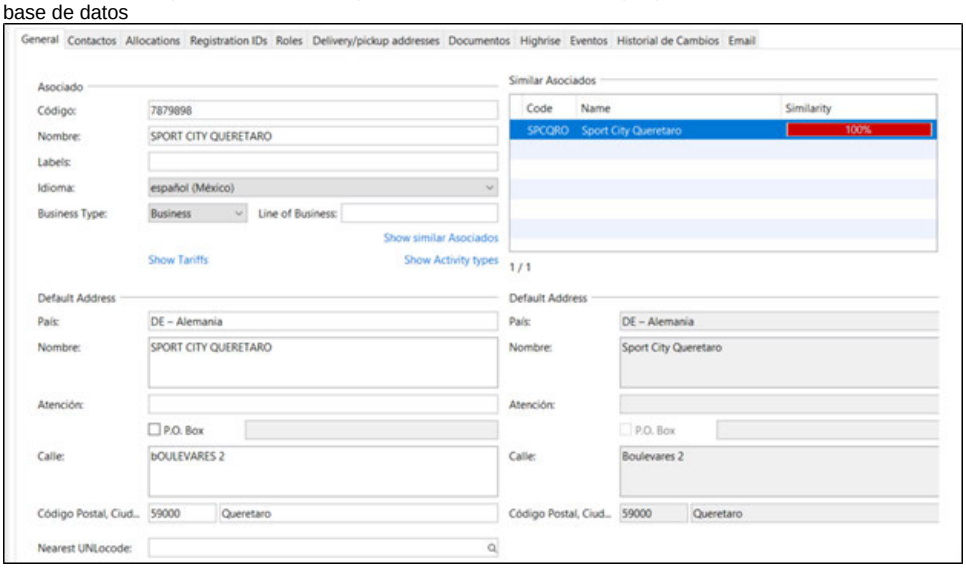
   General | **Registration IDs** | **Roles**
   Que permitirán identificar a un **Asociado**.

4. En la pestaña de **General**, ingrese los valores de los datos requeridos y en lo posible, también los valores opcionales, los cuales podrán tener un uso muy conveniente en los módulos de Scope

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

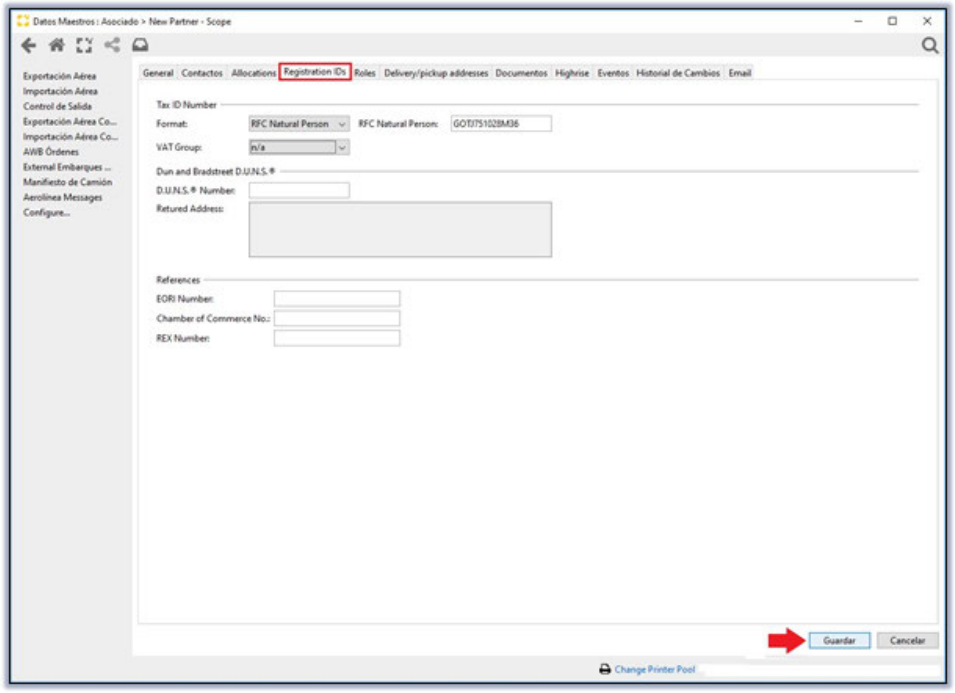


Del lado derecho aparece una sección que dice **Similar Asociados**, que permite revisar si existe un asociado con los mismos datos dentro de la base de datos

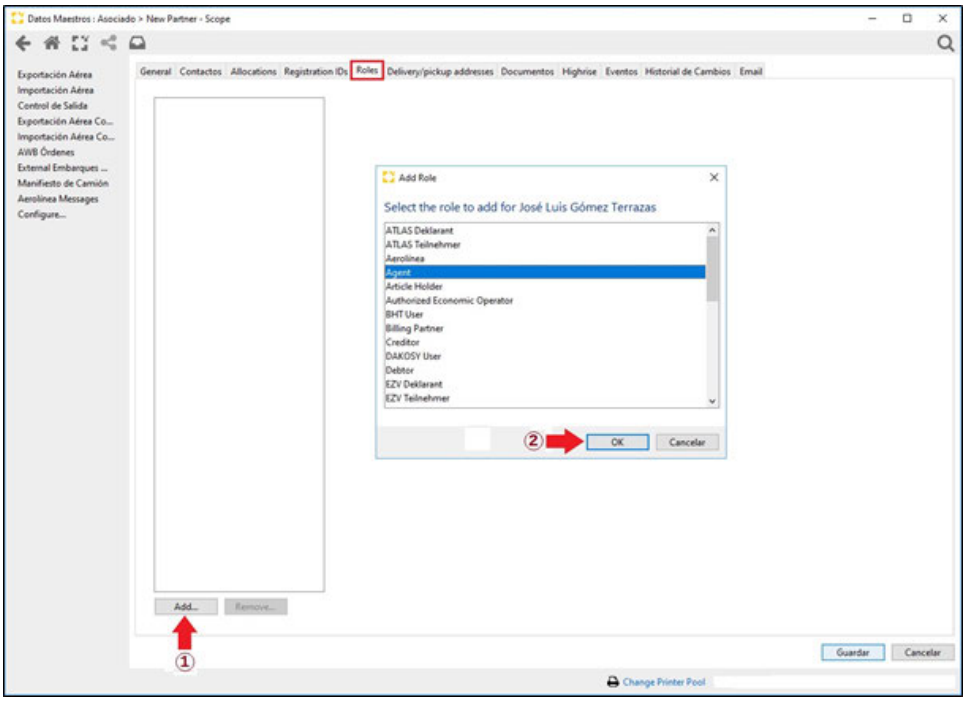


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

5. En la pestaña de **Registration IDs** ingrese el RFC correspondiente a una persona física o moral.

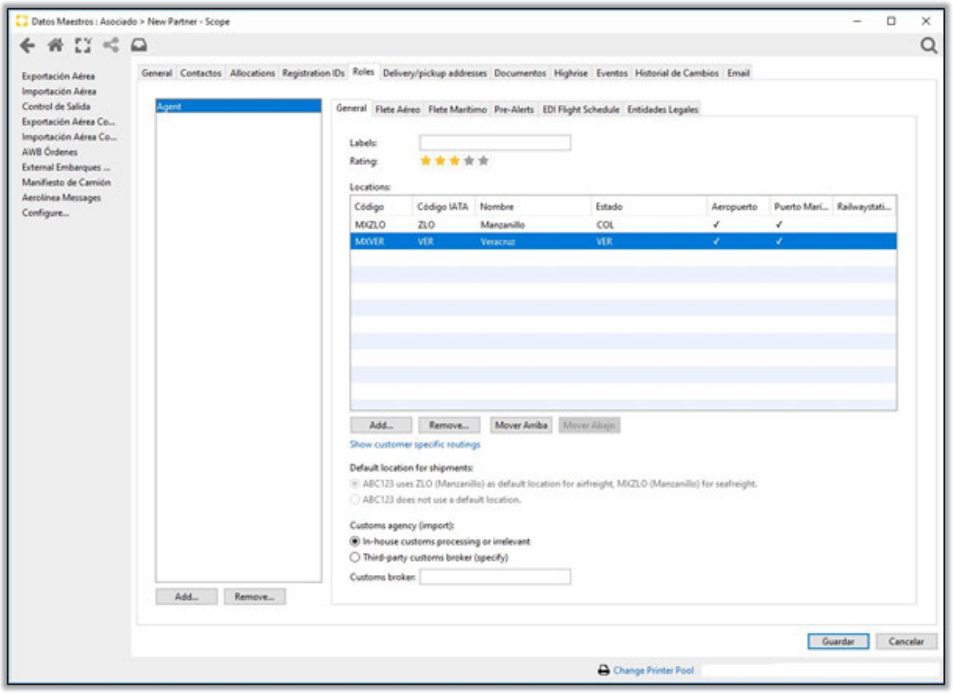


En la pestaña de **Roles**;
Proceda a dar un click en el botón **Add…**
Aparecerá una ventana con los roles que pueden asignarse a un **Asociado**.
Una vez elegido el rol, oprima el botón de **OK**

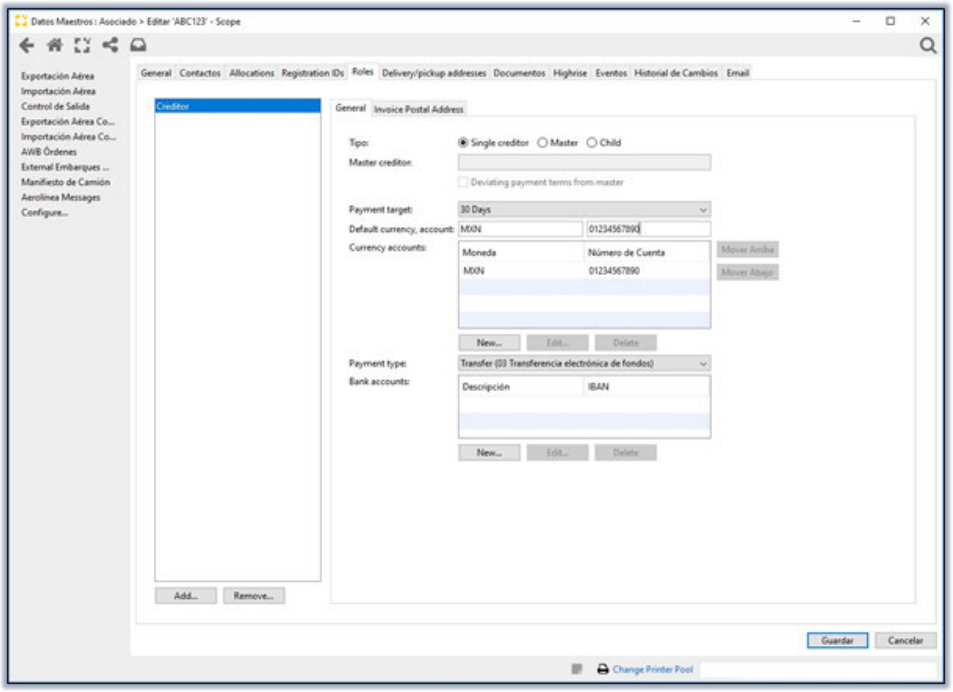


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

6. Una vez asignado el rol de **Agente** al **Asociado** podrán agregarse los lugares en donde el **Agente** realiza sus actividades aduanales.

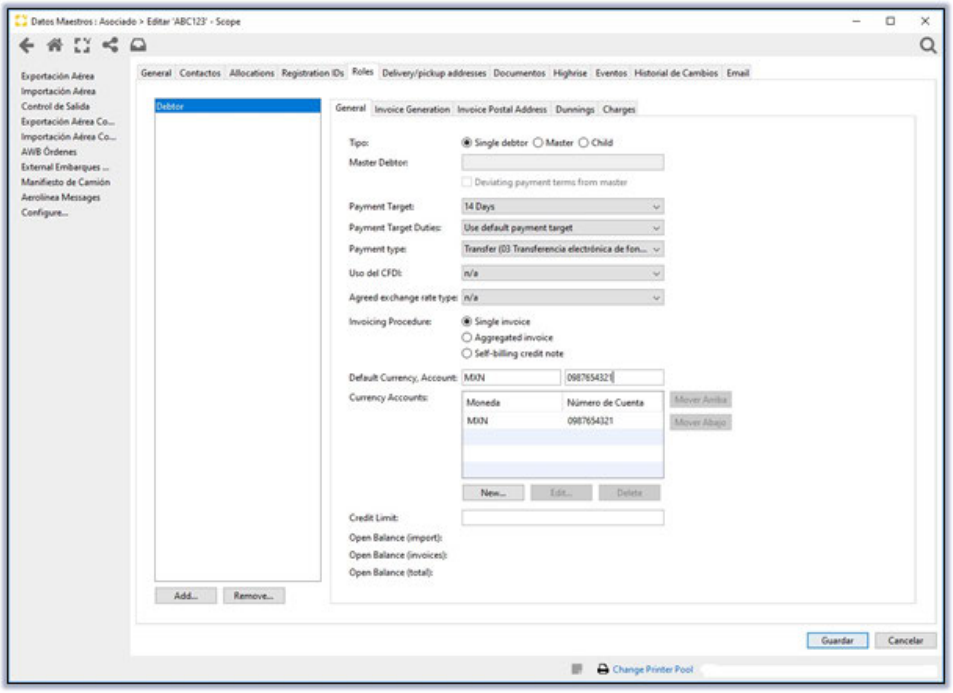


7. Asimismo, puede proceder a dar un click en el botón **Add…** para asignarle al **Asociado** un rol de **Acreedor.**



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

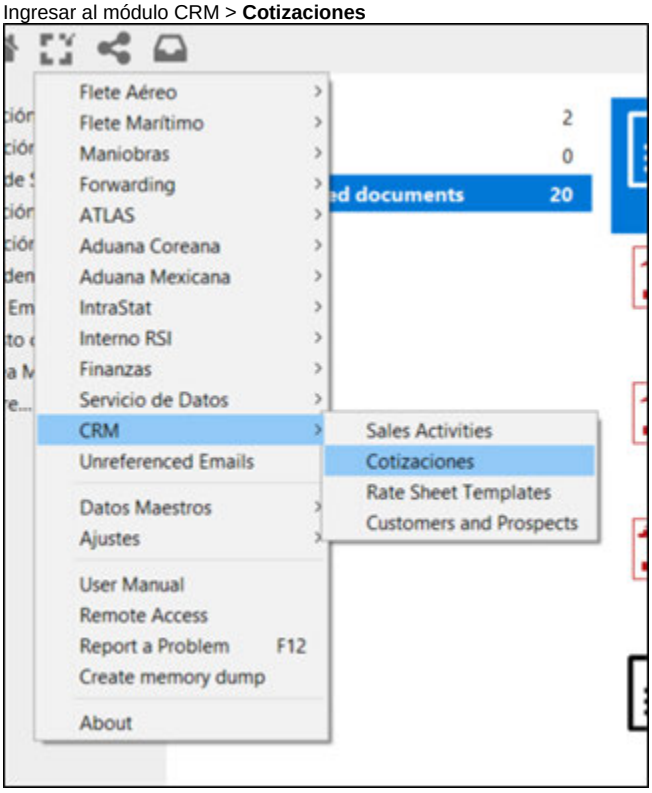
8. Finalmente, un rol más, el de **Deudor** el cual resulta muy importante para efectos de llevar el control de las Facturas por Cobrar.



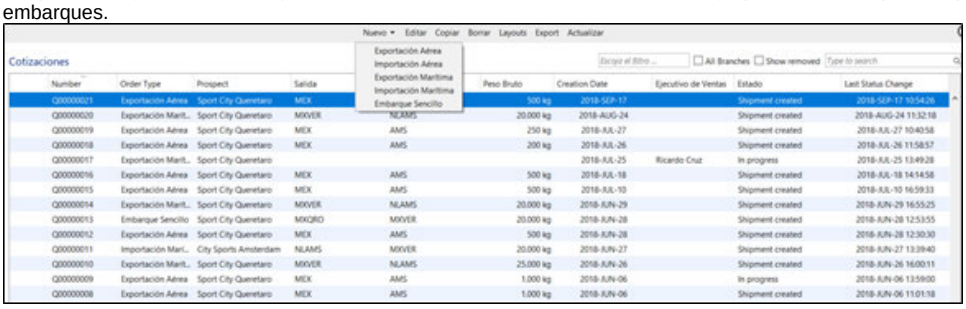
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Creación de Cotizaciones

1. Ingresar al módulo CRM > **Cotizaciones**



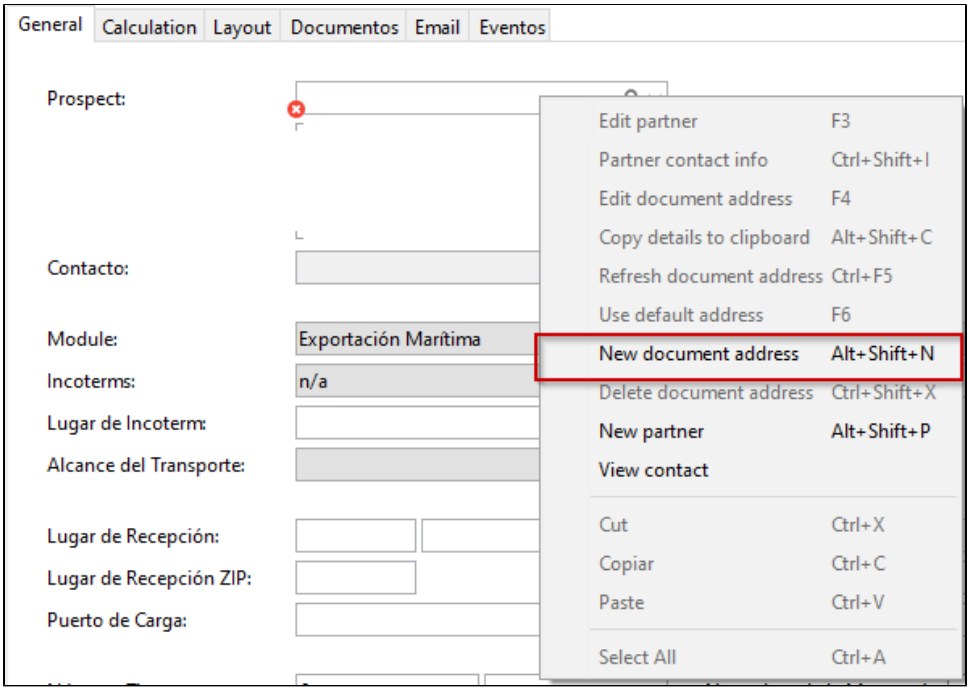
2. Después de ingresar a la vista general de cotizaciones seleccionamos **"Nuevo"** y aparecerán las opciones para los diferentes tipos de embarques.



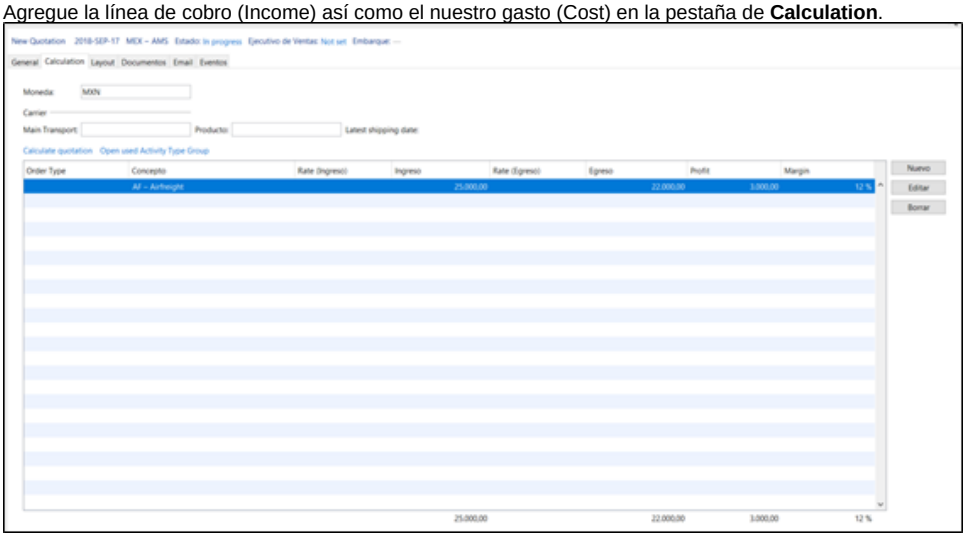
3. Al seleccionar nuestro tipo de cotización, entramos a la vista general de la misma, los campos necesarios para guardarla son el prospecto y validez de la misma.
   Es importante proporcionar la mayor cantidad de información posible, ya que todos los datos se pueden transferir a un embarque.

   Nota: Los prospectos son aquellos que están dados de alta en 'Asociados', en caso de que aún no este en el sistema, podemos hacer **click derecho en el campo** y seleccionar la opción **"New document address"** para cargar un perfil provisional:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

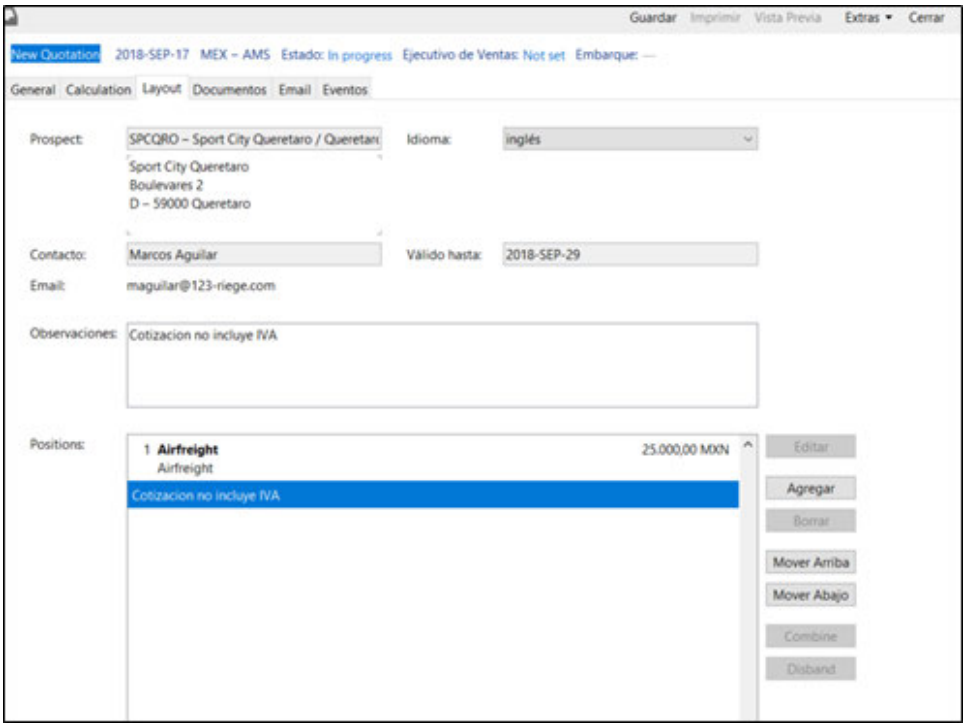


4. Agregue la línea de cobro (Income) así como el nuestro gasto (Cost) en la pestaña de **Calculation**.

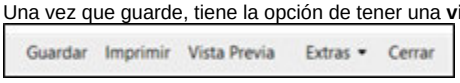


5. Una vez teniendo los diferentes ingresos y costos, pasamos a la pestaña de **Layout** para visualizar y editar como se vería la cotización. Una vez que tenemos todos los datos, guarde los cambios con la acción de **Guardar**.

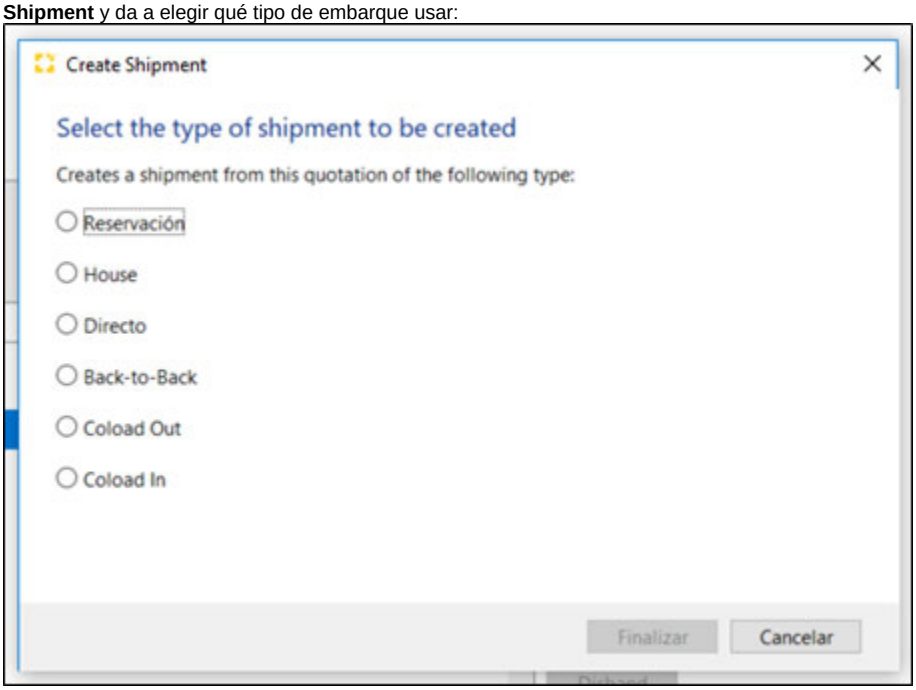
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



6. Una vez que guarde, tiene la opción de tener una **vista previa** o de **imprimir** la cotización para enviar al cliente/prospecto:



7. Una vez que la cotización fue aceptaba por el cliente, Scope permite convertir la cotización en un embarque usando la opción Extras > **Create Shipment** y da a elegir qué tipo de embarque usar:



8. Después de seleccionar el tipo, Scope automáticamente lleva al editor del tipo de embarque seleccionado e incluye la información que trae la cotización para realizar el embarque.

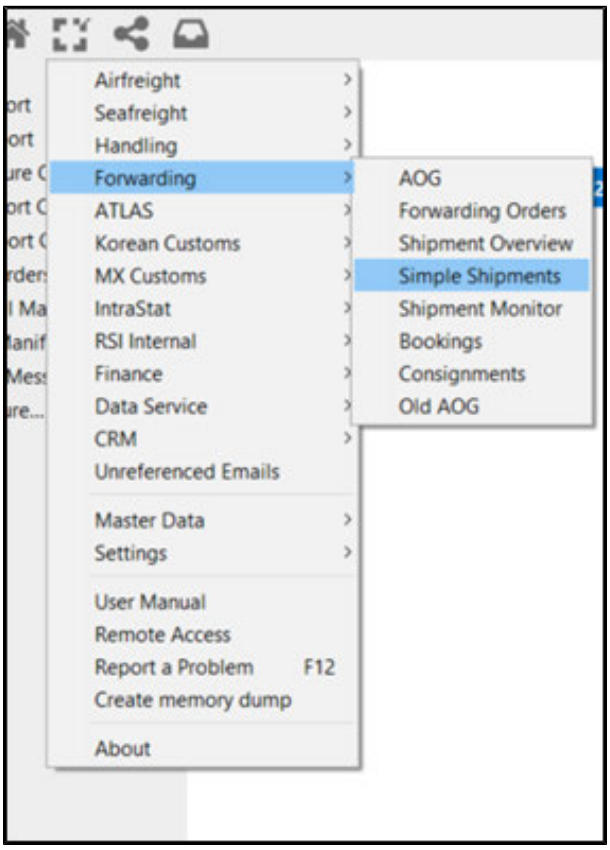
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Creación de Embarques Terrestres

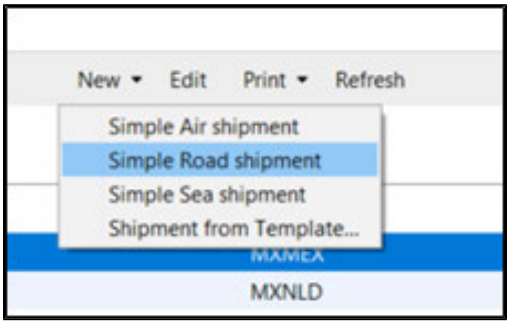
Introducción

El objetivo del presente documento es mostrar cómo crear embarques terrestres

1. Ingrese al módulo de Forwarding > Simple Shipments

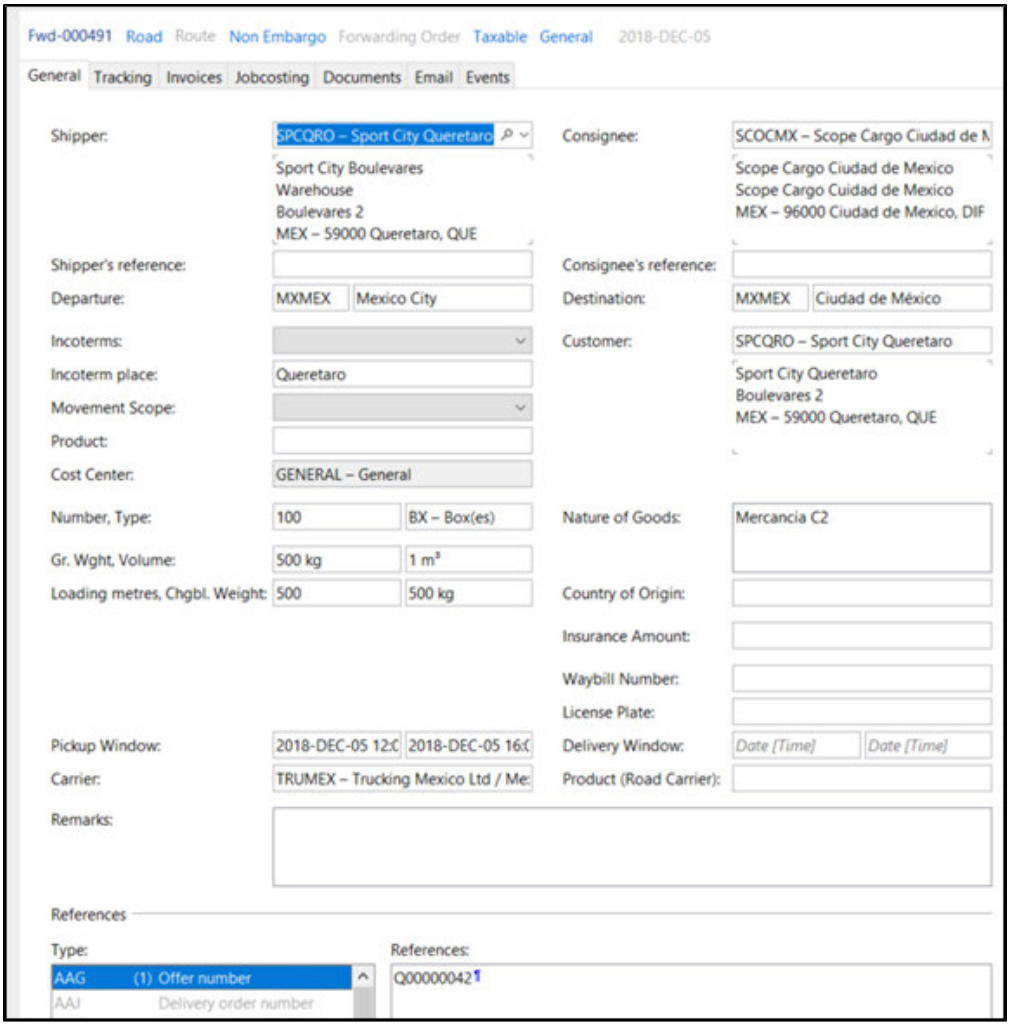


2. Seleccione New > **Simple Road Shipment**



3. Al ingresar se solicita los datos del embarque. Capture los campos solicitados:

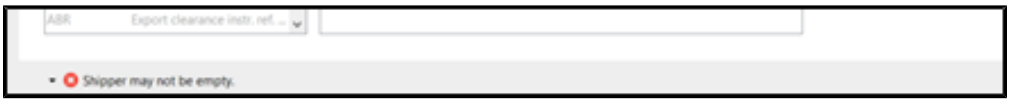
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



4. Al terminar haga click el Botón de "**Save"** para que se guarde el embarque.

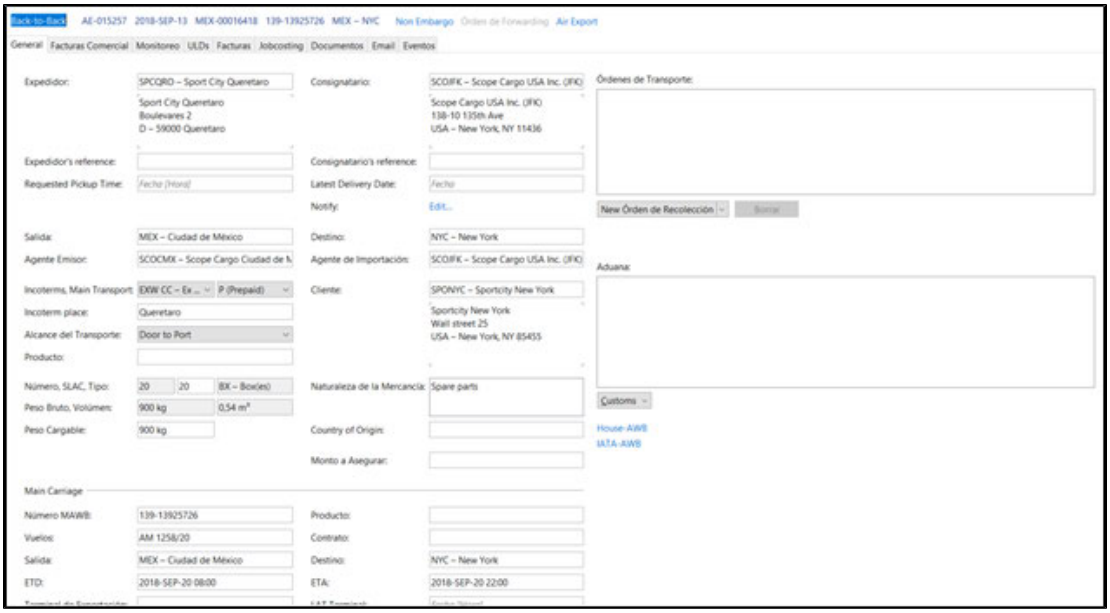
5. Después se prosigue con el Job Costing y posteriormente la Facturación.

6. En la parte inferior de la pantalla Scope muestra mensajes que indican si falta algún dato o es incorrecto:

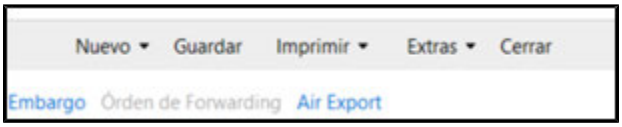


7. Los campos de Expedidor, Consignatario y Cliente se llenan con datos que se encuentran en el Catálogo de Asociados, también hay otros campos que ya tienen un listado predeterminado para usarse.

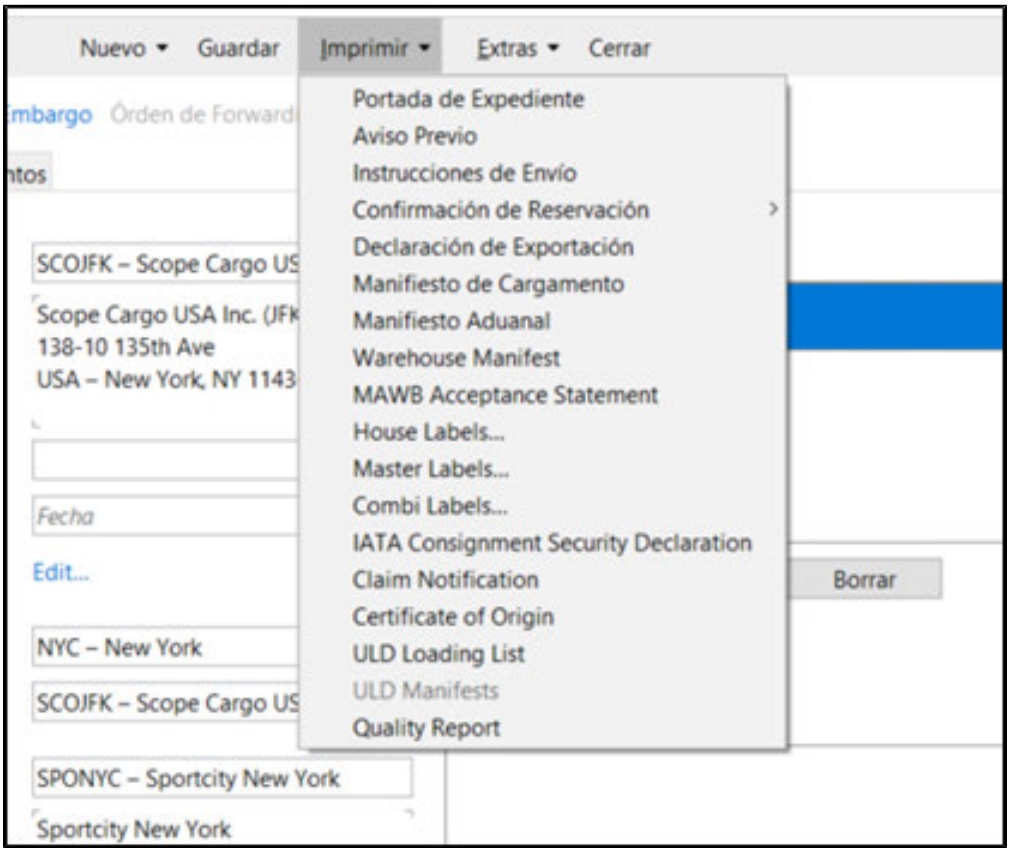
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



8. Después de llenar la información queda guardar el embarque. De click en "**Guardar"** que se encuentra en la parte superior.



9. Dentro del embarque, tiene las opciones para imprimir diferentes documentos.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Crear una cuenta de Scope Connect a Externos

Introducción

Este documento explica cómo se puede crear una cuenta de inicio de sesión en Scope para cualquier usuario que necesite iniciar sesión en Scope Connect.

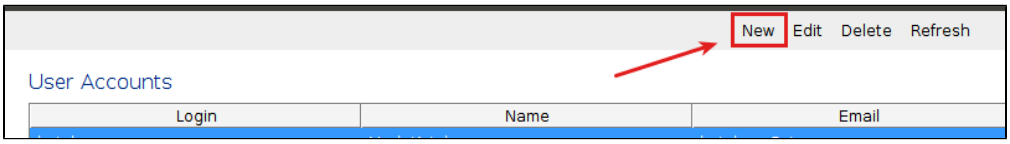
Navegando a la cuenta de usuario en Scope Connect

Settings > Tracking > User Accounts*
Ajustes > Monitoreo > User Accounts

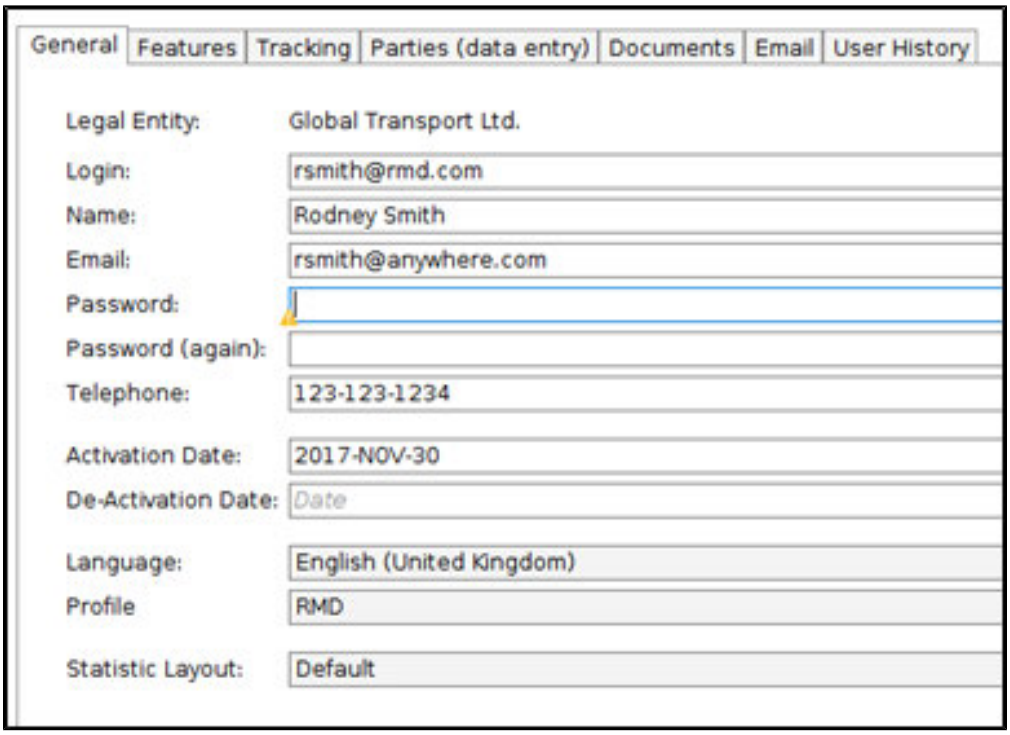
En caso de no poder entrar a este apartado, puede que su cuenta de Scope requiera permisos adicionales. Comuníquese con nuestro equipo de soporte en support@riege.com para que agreguen el permiso de cuenta necesario.

Creando un nuevo usuario

Cuando se abra la vista general de los usuarios de seguimiento, seleccione "Nuevo":



Ingresando los detalles básicos del usuario nuevo



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Campo	Descripción
Login*	Nombre de la cuenta
Name / Nombre*	Nombre del usuario
Email*	Correo electrónico
Password*	Contraseña, ingrésela dos veces
Telephone	Teléfono
Activation Date	Fecha cuando inicia el acceso de la cuenta
De-Activation Date	Fecha cuando termina el acceso de la cuenta, se recomienda dejarla en blanco para que no expire la cuenta
Language	Lenguaje predeterminado
Profile	Perfil, estos se definen en Ajustes > Monitoreo > Settings
Statistic Layout	Los diseños de estadísticas personalizados se pueden crear y aplicar a un usuario de Scope Connect.

*Campo requerido para la creación de la cuenta

Asignar características de Scope Connect al nuevo usuario

Use la pestaña "**Features**" para seleccionar qué funciones de Scope Connect tendrá el nuevo usuario cuando inicie sesión en Scope Connect:

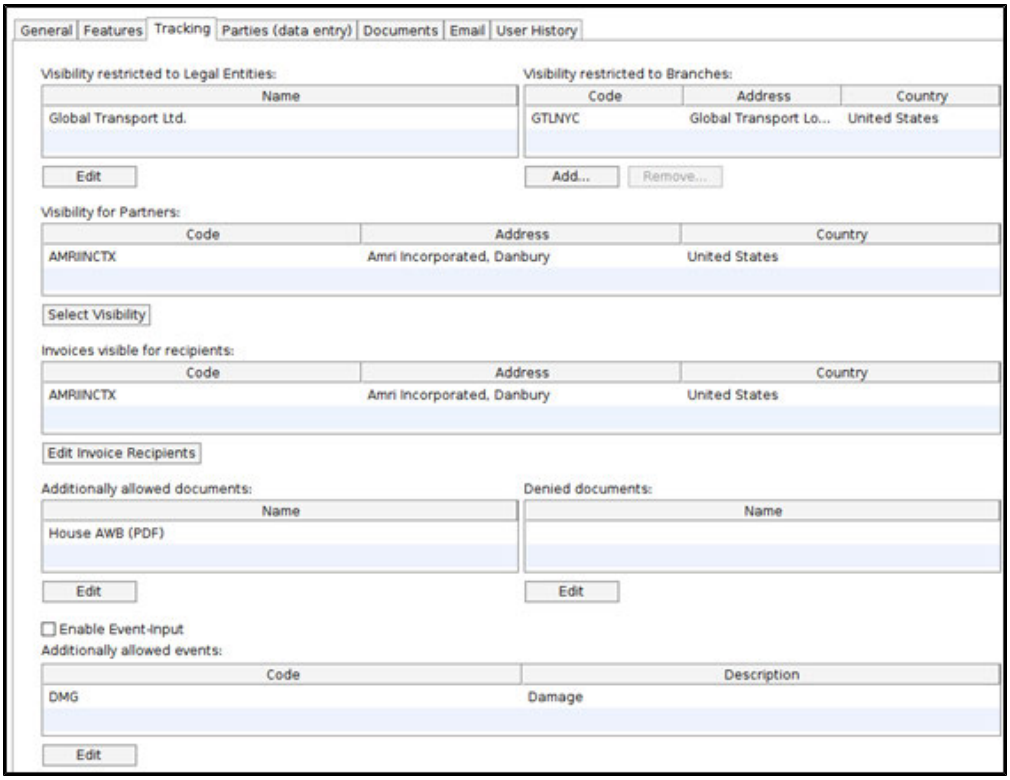
Opción	Función
Enable Tracking	Esto permitirá al usuario ver sus envíos, milestones y documentos.
Enable Booking	Esto permitirá al usuario crear reservas de exportación por mar y aire. Los usuarios de Scope los verán en Scope y pueden convertirlos en envíos de Scope.
Enable Pre-Alerts	Esto permitirá a los agentes de exportación crear envíos en Scope Connect. Estos serán vistos por los usuarios de importación de Scope y pueden convertirlos en envíos de importación aéreos y marítimos.
Enable Purchase Order Mangement	Esto permitirá que el usuario de Scope Connect vea la información de la orden de compra (POMS) en Scope Connect.
Allow Create/Edit Customer Consignment	El usuario puede crear consignaciones POMS.
Allow Edit Transport Plan	El usuario puede editar cualquier plan de transporte POMS.
Allow Edit Transport Plan Legs	El usuario puede editar cualquier plan de transporte de POMS.
Enable Shipment Monitor	El usuario de Scope Connect podrá ver el monitoreo de envíos que indica si los envíos están dentro de los puntos de tiempo planificados.
Allow Milestone Completion	El usuario de Scope Connect podrá ingresar tiempos de finalización para algunos milestones.
Planned Time visibility	La configuración aquí determinará si el usuario puede ver las fechas planificadas para los milestones.
Enable Handling	El usuario de Cope Connect tiene acceso a las funciones del módulo Scope Handling.

Determinar lo que el usuario de Scope Connect puede ver y hacer en el tracking

Utilice la pestaña de "Tracking" para;

- Definir qué embarques puede ver el usuario de Scope Connect.
- Si pueden ver o no las facturas de Scope.
- Que documentos de envío que pueden ver.
- Eventos adicionales que pueden ver y eventos que pueden ingresar al sistema.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



En el ejemplo anterior, este usuario está configurado de la siguiente manera:

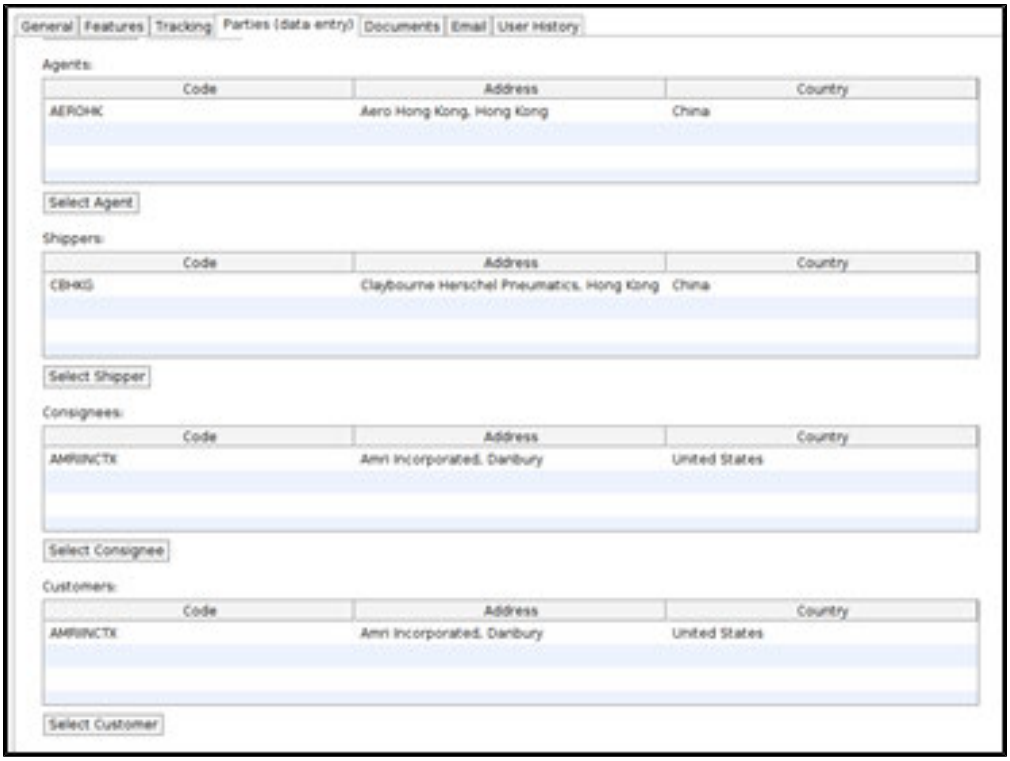
- **Legal Entity** - Solo pueden ver los envíos dentro de la entidad legal de "Global Transport Ltd." Probablemente encontrará que solo tiene una entidad legal, por lo que será fácil de seleccionar.
- **Branch** - El usuario solo puede ver los envíos dentro de la rama de Scope "GTLNYC" y esta es una rama de la entidad legal "Global Transport Ltd.".
- **Visibility for Partners** - El usuario solo puede ver los envíos cuando uno de los socios del envío es "Amri Incorporated".
- **Invoices visible for recipients** - Este usuario puede ver las facturas creadas en el ámbito cuyo destinatario es "Amri Incorporated".
- **Additionally Allowed Documents** - Además de permitir regularmente documentos, este usuario también puede ver "House AWBs"
- **Denied documents** - Ninguno de los documentos visibles regularmente se le niega a este usuario.
- **Enable event input** - Este usuario no puede actualizar ningún evento.
- **Additonally allowed events** - Este usuario puede ingresar al evento "DMG".

Selección de las partes a las que el usuario de Scope Connect tiene acceso cuando crea reservas o prealertas

Si un cliente o un agente de exportación puede realizar reservas o pre-alertas, es útil si pueden buscar partes de Scope en Scope Connect. La pestaña "**P arties (data entry)"** del usuario de Scope Connect, se utiliza para asignar las partes de Scope deseadas al usuario:

- **Agents** - busque y seleccione los agentes de alcance que el usuario puede aplicar a las reservas y pre-alertas en Scope Connect.
- **Shippers** - Busque y seleccione las partes de Scope que el usuario puede aplicar como remitente a las reservas y pre-alertas en Scope Connect.
- **Consignees** - busque y seleccione las partes de Scope que el usuario puede aplicar como consignatario a las reservas y pre-alertas en Scope Connect
- **Customers - Shippers** - busque y seleccione las partes de Scope que el usuario puede aplicar como cliente a las reservas y pre-alertas en Scope Connect3

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Documents

Use la pestaña de “**Documentos**” para almacenar cualquier documento que sera importante para este usuario de Scope Connect.

Email

La pestaña de “**Email**” puede ser usada para comunicarse con el usuario de Scope Connect. Aquí se generará automáticamente un correo electrónico con los detalles del usuario de su inicio de sesión en Scope Connect y un enlace para cambiar su contraseña.

User History

La pestaña del historial de usuarios mostrará todos los inicios de sesión de Scope Connect de este usuario.

Guardar y salir

Una vez que todos los datos son correctos, haga clic en "Guardar" para guardar y salir. Asegúrese de que se haya enviado el correo electrónico con los detalles de inicio de sesión del nuevo usuario.

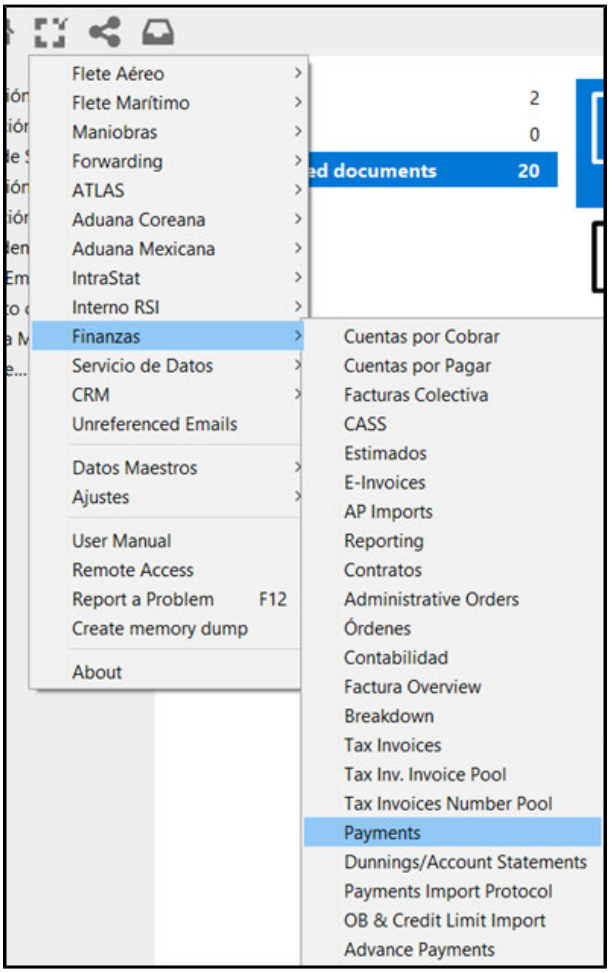
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Estados de Cuenta

Introducción

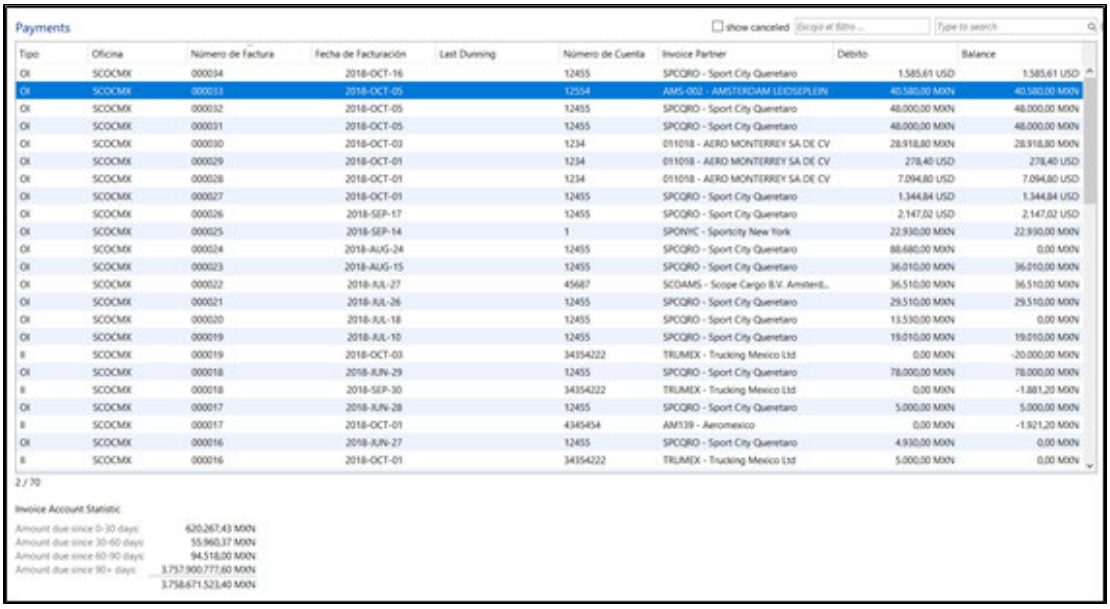
El objetivo del presente documento es mostrar cómo generar estados de cuenta

1. Ingrese al módulo: Finanzas > **Payment**



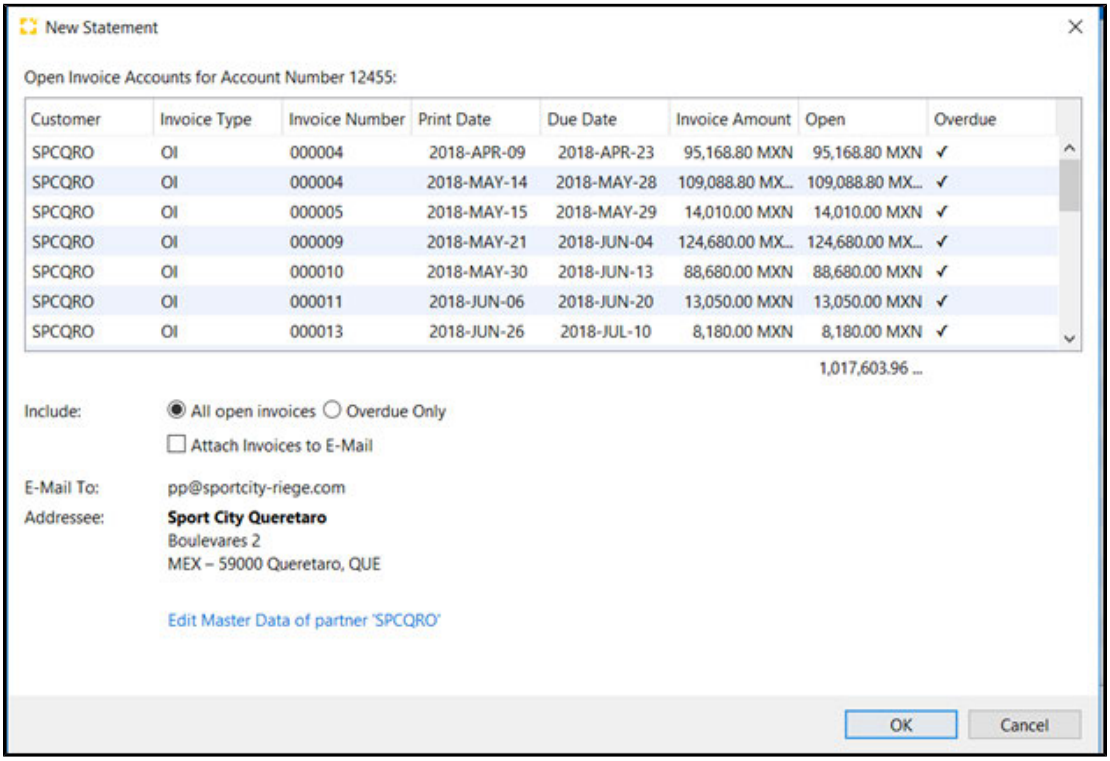
2. Al ingresar, observara todas las facturas que se han ingresado en el sistema, tanto las emitidas a los clientes como la de los proveedores.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



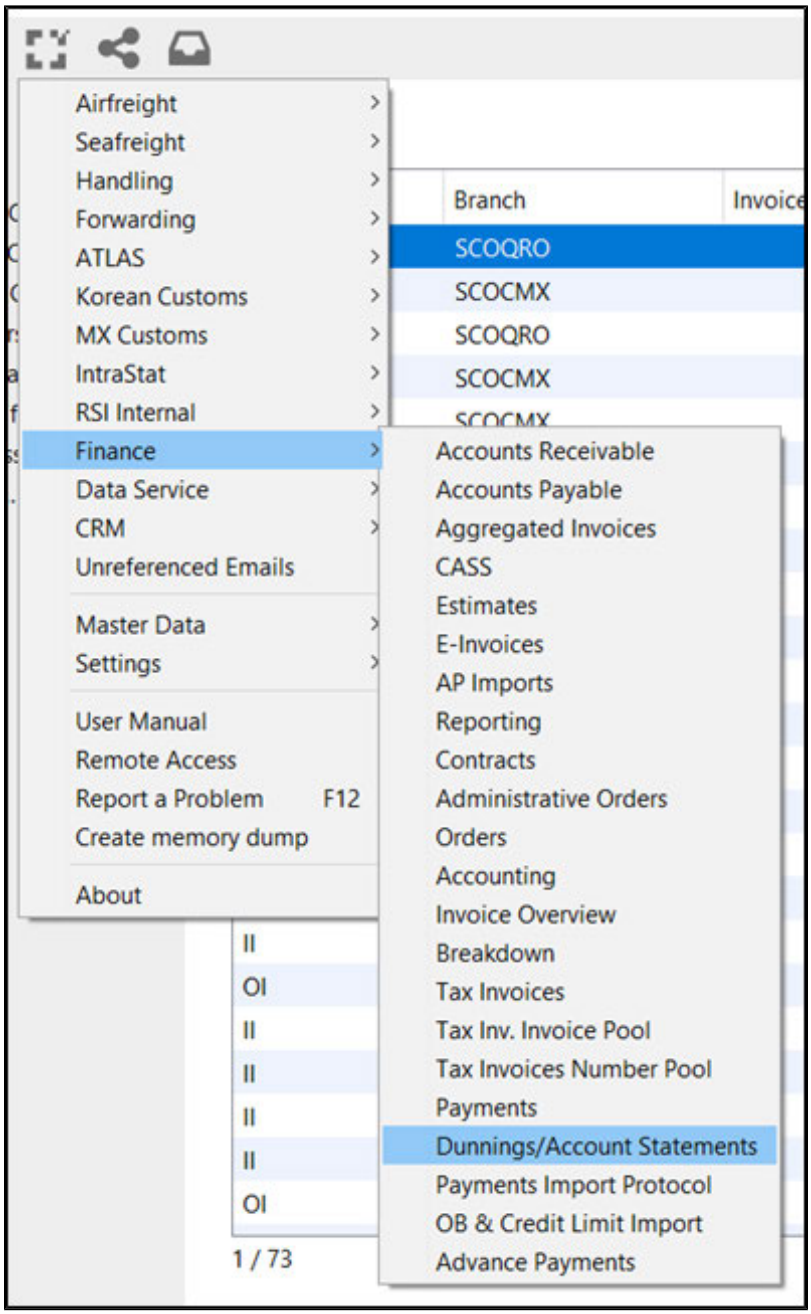
3. Seleccione la factura el cliente del cual quiere obtener el estado de cuenta y seleccione:
New > **Statement**

Al dar click en **Payment**, se presenta una ventana indicando las facturas en estado *Open* (sin Pagar) además puede seleccionar generar/enviar el total de las facturas o solo las vencidas, además de seleccionar, si quiere enviar el estado de cuenta incluyendo las facturas.

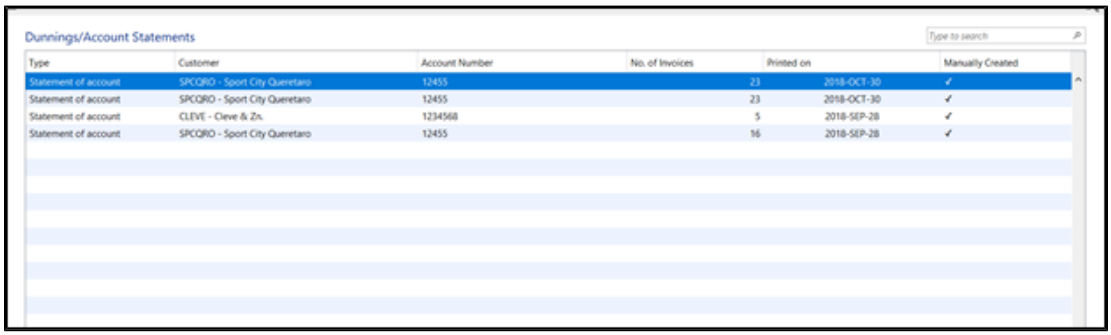


4. Al terminar, diríjase a Finanzas > **Dunnings/Account Statements.**

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



5. Ahí aparecen los estados de cuenta que se han generado.



6. Abra el último estado de cuenta y podrá ver las facturas pendientes:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

7. En la pestaña de documentos observe el PDF generado:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Facturas Colectivas

Introducción:

El objetivo del presente documento es mostrar cómo crear Facturas Colectivas en Scope.

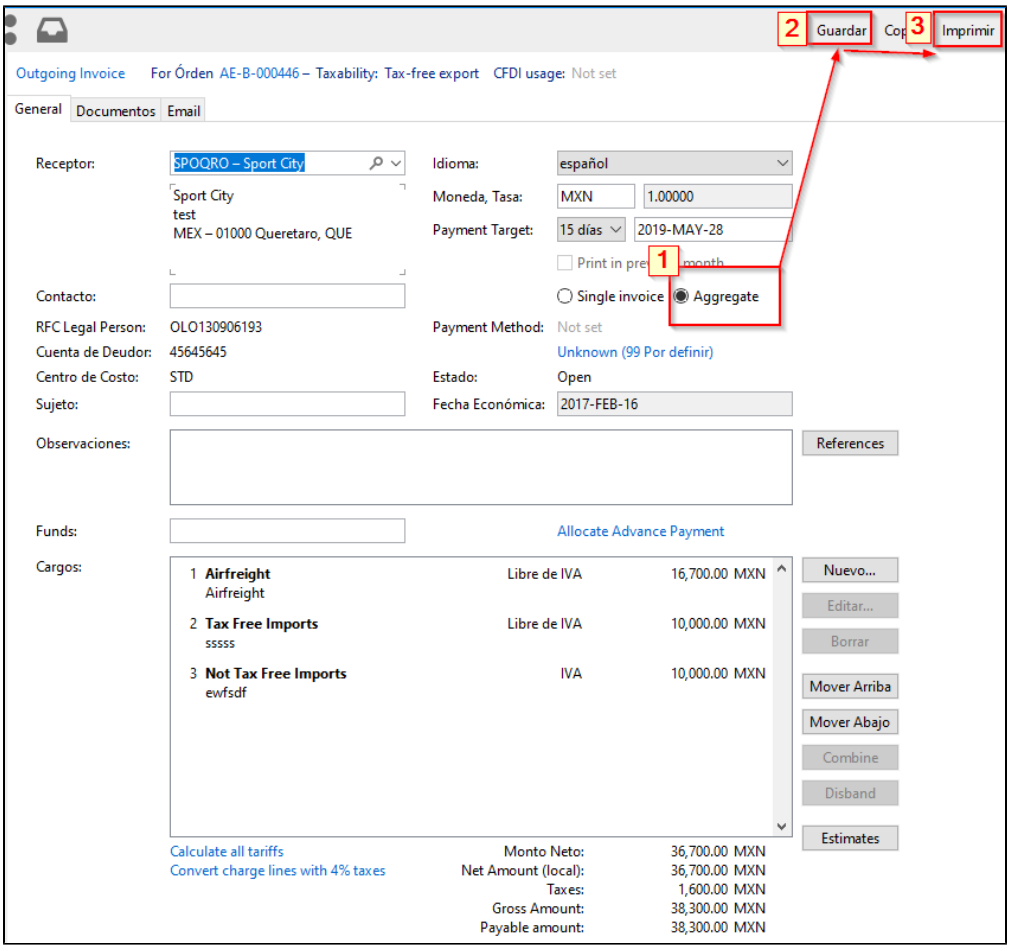
Contenido:

1. Pasos para preparar una factura colectiva
2. Navegar al módulo de Facturas Colectivas
3. Imprimir Factura Colectiva

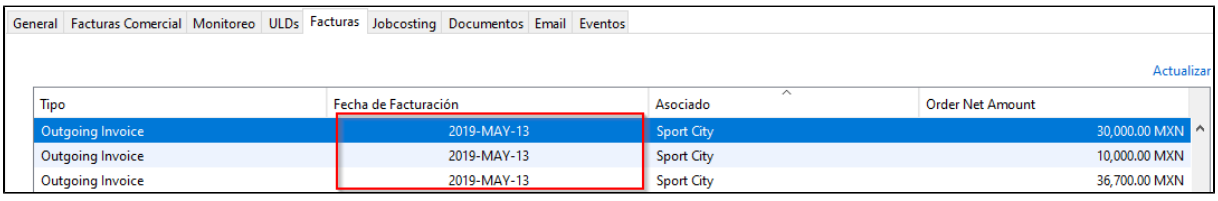
1.Pasos para preparar una factura colectiva:

1. Al momento de crear un “Outgoing Invoice”, es necesario activar la opción “Agregate”.
2. Guardar
3. **Imprimir**

***Al ser de tipo Agregate, Scope pospondrá la generación de CFDI, al Imprimir la factura le estamos diciendo a Scope que hemos finalizado la factura y esta lista para ser procesada como colectiva.*



Repetiremos el mismo proceso para todas las demás facturas que deseemos agregar, para esta guía, hemos usado 3 facturas salientes marcadas como “Aggregate”, aquellas que no cuenten con Fecha de Facturación – no han sido Impresas como se describe en el ultimo paso.

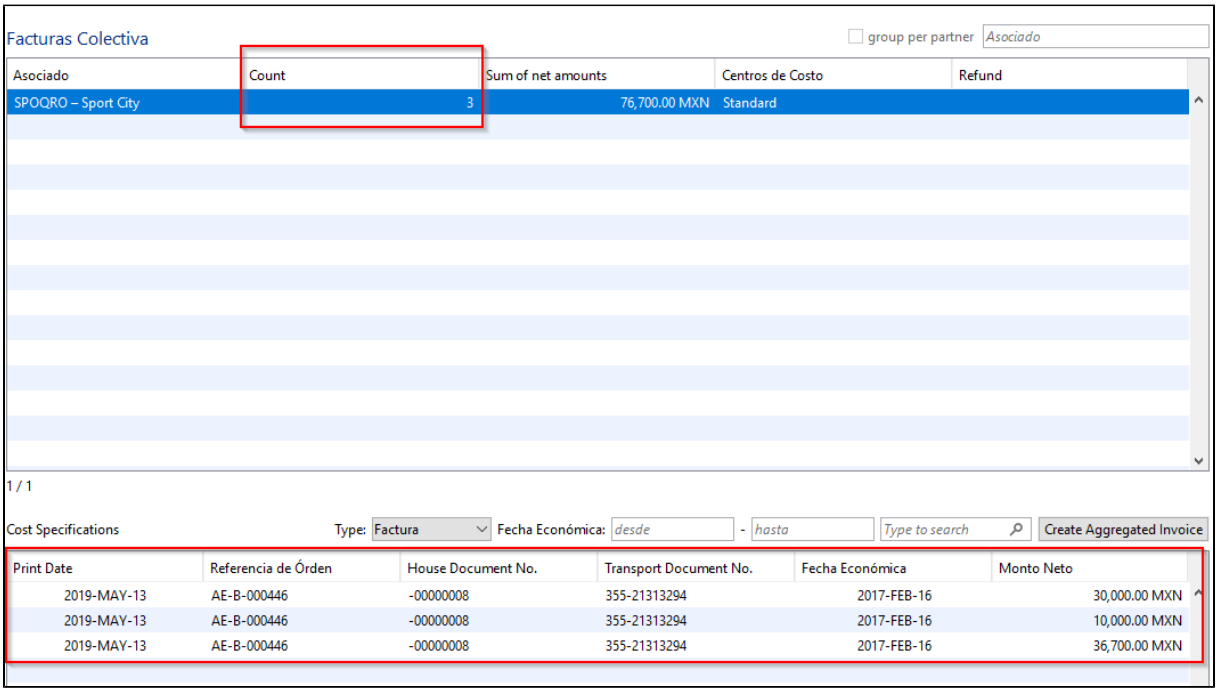


Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

2. Navegar al módulo de Facturas Colectivas:

Al tener nuestras facturas listas, navegamos en el siguiente modulo: Menú Principal > Finanzas > **Facturas Colectiva**

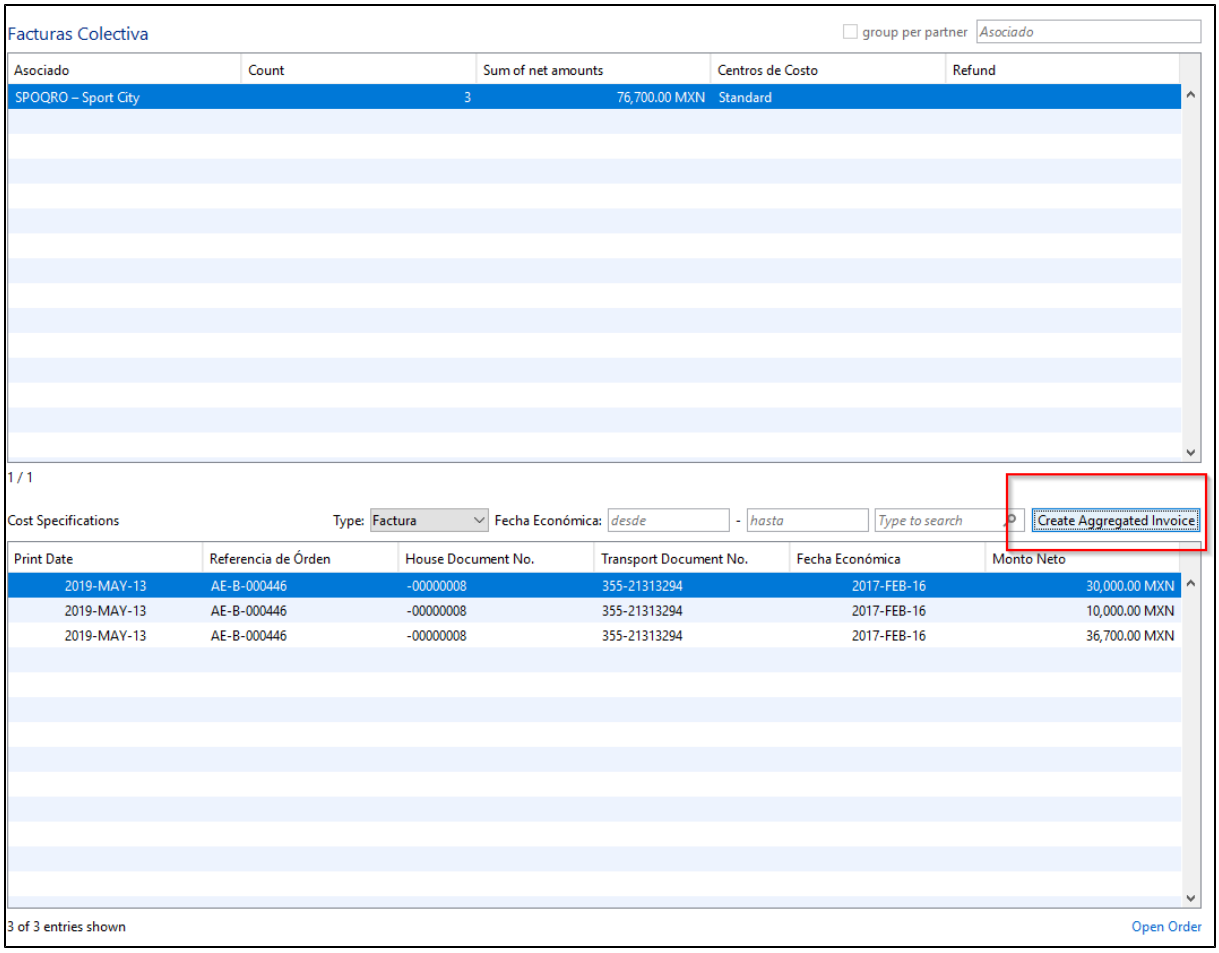
Aquí podemos ver cuantas facturas están listas para ser procesadas, en este caso, para el Asociado Sport City existen 3 facturas:



3. Crear la Factura Colectiva:

1. Seleccionamos la opción "**Create Aggregated Invoice**":

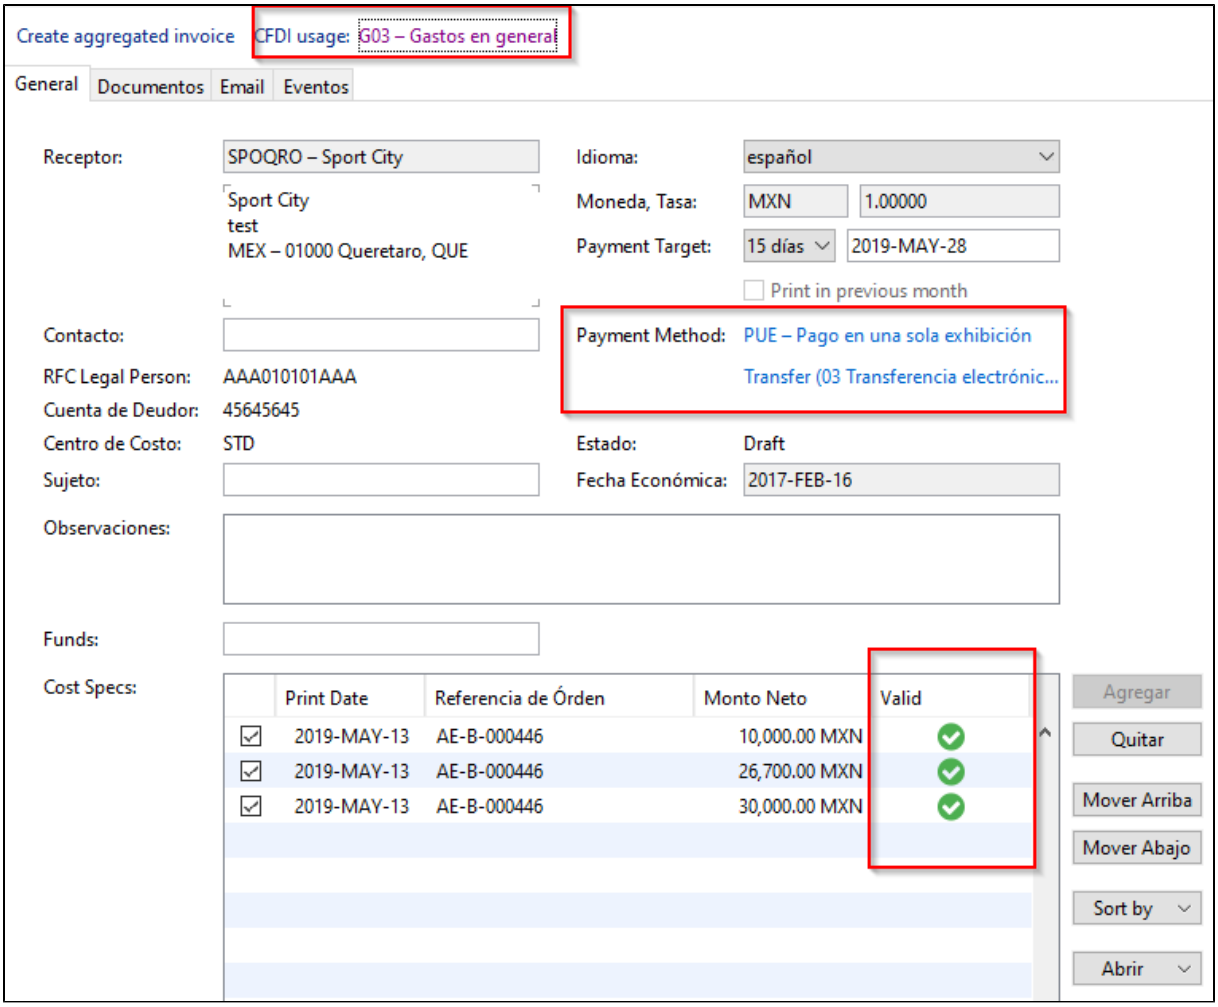
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



2. Scope nos lleva a una ultima pantalla donde podemos verificar que toda la información sea correcta y también verificara que las facturas usadas sean válidas. Estos son los campos principales que debe verificar antes de finalizar la factura:

- Uso de CFDI
- Método de pago, debe ser PUE.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



3. Imprimir Factura Colectiva:

1. Si toda la información es correcta; procedemos en hacer click en “Imprimir”:

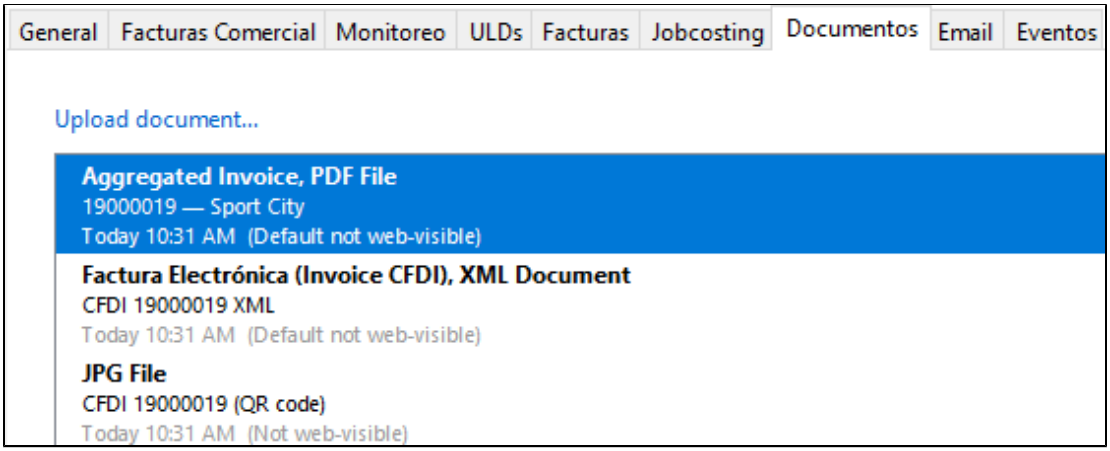
Existen dos opciones de impresión:

- Standard: Se imprime una factura colectiva con información básica de cada factura.
- Detailed: Se desglosa más a fondo cada factura incluida.

Scope también nos ofrece la opción de generar un reporte de Excel, este puede ser modificado en el módulo “Layout” de reportes.

El resultado (PDF y CFDI) podemos encontrarlo en la pestaña de “Documentos”, de vuelta en nuestro embarque:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Facturas - Sustitución de los CFDI previos

Nota de crédito de los documentos relacionados (Credit note of related documents).

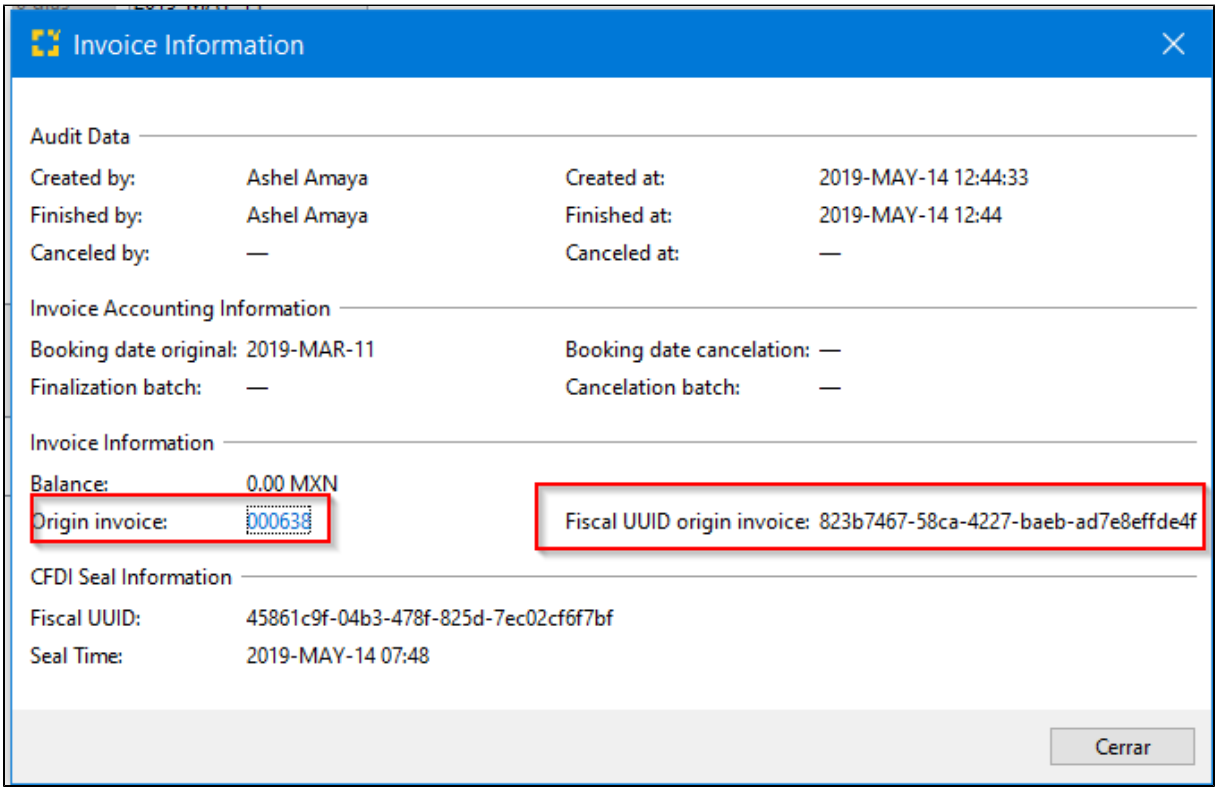
Caso de uso: Crear un descuento, reembolso o bono para una factura saliente que ya fue sellada.

1. Abra la factura finalizada, para la cual la corrección por nota de crédito debería ser creada, esto se hace en la opción "***Create Correction Create Credit Note***". ***Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.*** *Una vez que la factura haya sido cancelada en Scope, no es posible crear una nueva factura relacionada.*
2. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    - Tipo: Nota de Crédito
    - Uso CFDI: G02 Devoluciones, descuentos o bonificaciones (Por ser nota de crédito).
    - Relación de CFDI: Tipo 01 Nota de crédito de los documentos relacionados.
    - (En la impresión de PDF aparece el UUID relacionado del paso 1).

Sustitución de los CFDI previos.

Caso de uso: Corregir una factura saliente, la cual ya fue sellada sin cancelación.

1. Abra la factura finalizada, para la cual la corrección por nota de crédito debería ser creada, esto se hace en la opción "***Create Correction Create Credit Note***". ***Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.*** *Una vez que la factura haya sido cancelada en Scope, no es posible crear una nueva factura relacionada.*
2. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    - Tipo: Nota de Crédito
    - Uso CFDI: G02 Devoluciones, descuentos o bonificaciones (Por ser nota de crédito).
    - Relación de CFDI: Tipo 01 Nota de crédito de los documentos relacionados.
    - (En la impresión de PDF aparece el CFDI UUID relacionado del paso 1.
3. Cambie el tipo de relación de CFDI a **04 Sustitución de los CFDI previos.** Al cambiar la relación, el tipo de relación cambiara automáticamente al de la factura original en el paso 1 (esta es una nota de crédito también y no necesita tener el tipo de uso G02).
4. Finalice (Imprima) la nota de crédito.
5. Regrese a la factura del paso 1 y haga click en: ***Create Correction Create Substitution Invoice***. ***Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.***
6. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    a. Tipo: Nota de Crédito
    b. Uso CFDI: Mismo tipo que la factura del paso 1.
    c. Relación de CFDI: Tipo 04 Sustitución de los CFDI previos.
    d. (En la impresión de PDF aparece el UUID relacionado del paso 1), este también aparece al presionar las teclas **CTRL + I** en el teclado:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Finanzas - Editor de Addenda

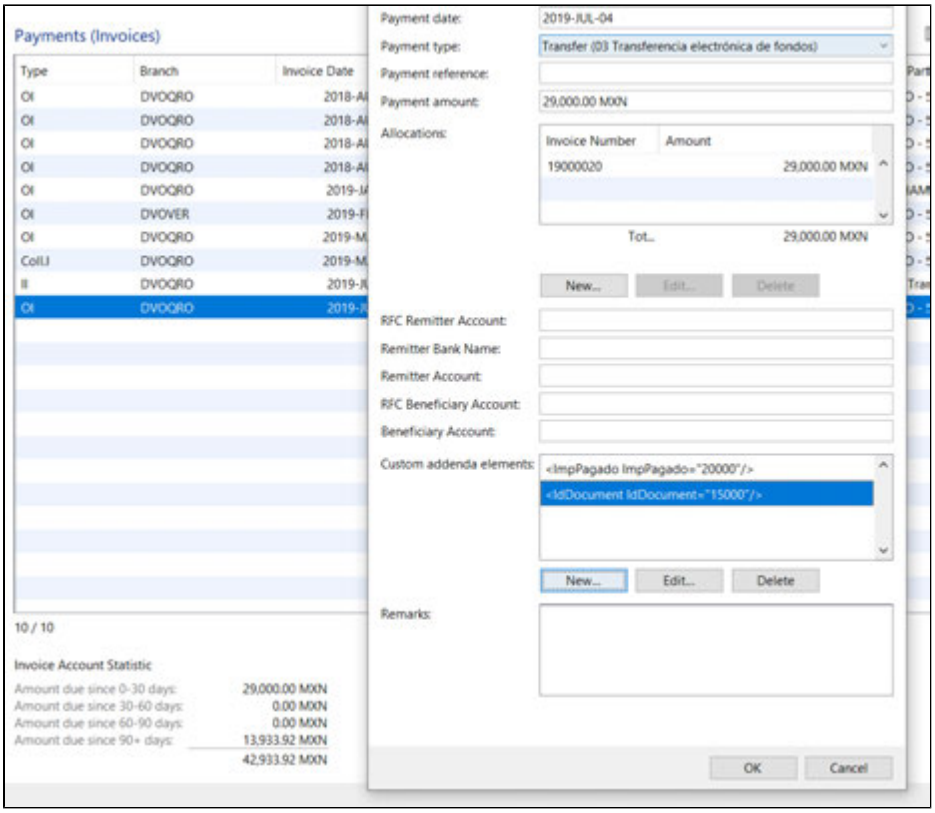
Introducción

¿Qué es una addenda?

Una addenda son datos adicionales que se pueden agregar a la Factura Electrónica dentro del XML y únicamente son requeridos por el cliente a facturar, como datos comerciales por la venta de productos y/o servicios, a diferencia de lo que es un complemento.

El elemento <Addenda> de un archivo XML de CFDI puede contener información específica de la cliente relacionada con la factura o los pagos en el archivo XML. El problema con este elemento es que no tiene una estructura de datos conocida o fija, puede contener cualquier elemento XML válido.

Debido a varias solicitudes de nuestros clientes para agregar información al elemento <Addenda>, hemos implementado un editor especial para el contenido del elemento <Addenda>. El cliente debe poder agregar sub-elementos con nombres y atributos de elementos arbitrarios al elemento <Addenda>. Tenga en cuenta que no admitiremos elementos XML anidados. La funcionalidad del editor está sujeta a un nuevo permiso y se ofrecerá en el cuadro de diálogo de entrada de pago debajo de los campos Comentarios.



El contenido del elemento <Addenda> para una entrada de pago debe definirse antes de sellar el pago.

Ejemplos de elementos que podrían agregarse a las <Addenda>. Un solo pago puede tener de 0 a N de esos elementos:

```
<FACTPUE Folio="OI1905721" IdDocumento="d52eac92-551f-4d88-a2fa-9af103138b98"
TotalPagado="911.04"/>
```

```
<DepGtía Shipment="SI-1118-1451" ImpPagado="20,000.00" />
```

```
 <LiqPUE Folio="OI111111" ImpPagado="100.00"/>
```

Más información:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

El cuadro de diálogo de entrada de pago en Scope para almacenar una lista de elementos XML que se agregarán al elemento <Addenda> para este pago. Cada elemento XML (como se muestra en los ejemplos anteriores), se almacena como una cadena separada en la entrada de pago. En caso de que un recibo de pago tenga varios pagos, los elementos XML de las adiciones para todas las entradas de pago se agregarán a las <Addenda> del recibo.

Como es muy probable que un usuario no pueda ingresar un elemento XML válido en un área de texto, se necesita un editor más avanzado para un solo elemento XML: un editor donde el nombre del elemento XML se puede ingresar en un campo de texto y el nombre del atributo / los pares de valores se capturan en una tabla con las columnas Nombre y Valor.

Generación de CFDI

Los elementos de addenda personalizados definidos para una entrada de pago, se agregarán a un recibo de pago además de los elementos <PagosHechos> que Scope puede generar automáticamente. La generación de elementos de adición de <PagosHechos> está codificada para facturas y pagos en Scope y no se verá afectada por esta característica. El propósito del nuevo campo en una entrada de pago es proporcionar una opción para ingresar elementos adicionales de apéndices personalizados. Las funcionalidades existentes no se verán afectadas por este cambio.

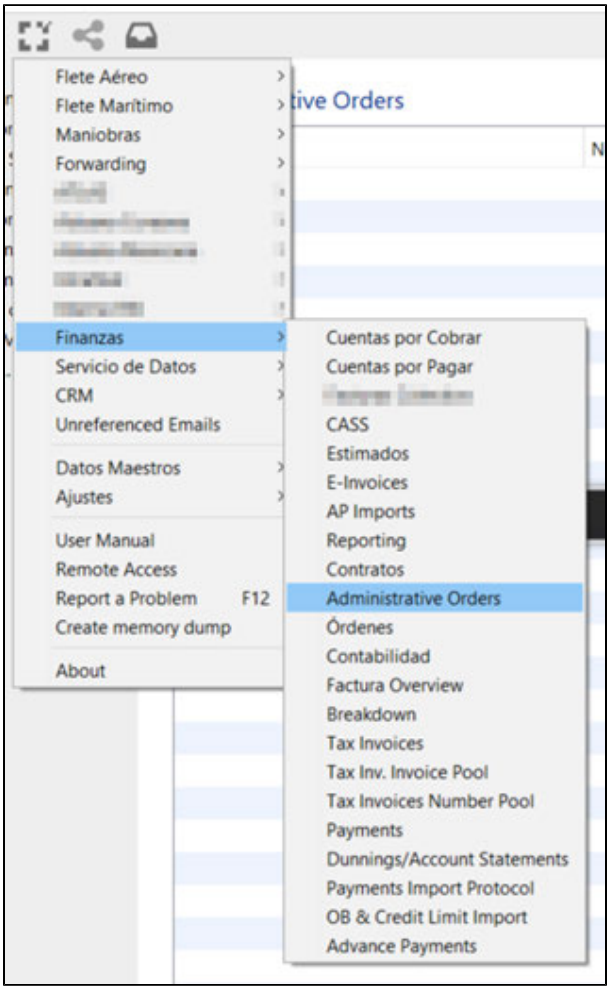
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Generación de Ordenes Administrativas

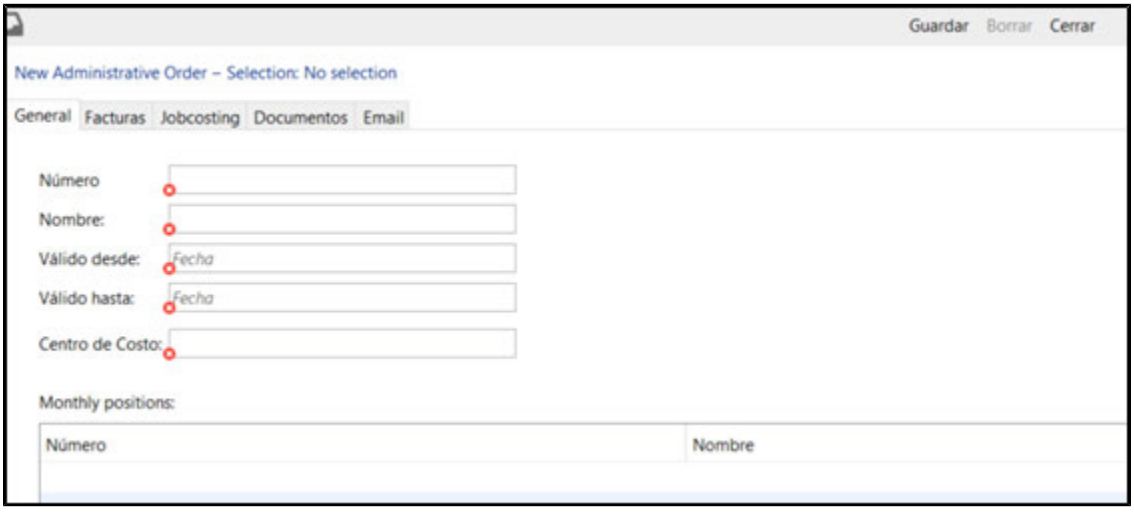
Introducción

El objetivo del presente documento es mostrar cómo crear Ordenes Administrativas en Scope.

1.Ingrese al módulo: Finanzas – ***Administrative Orders***



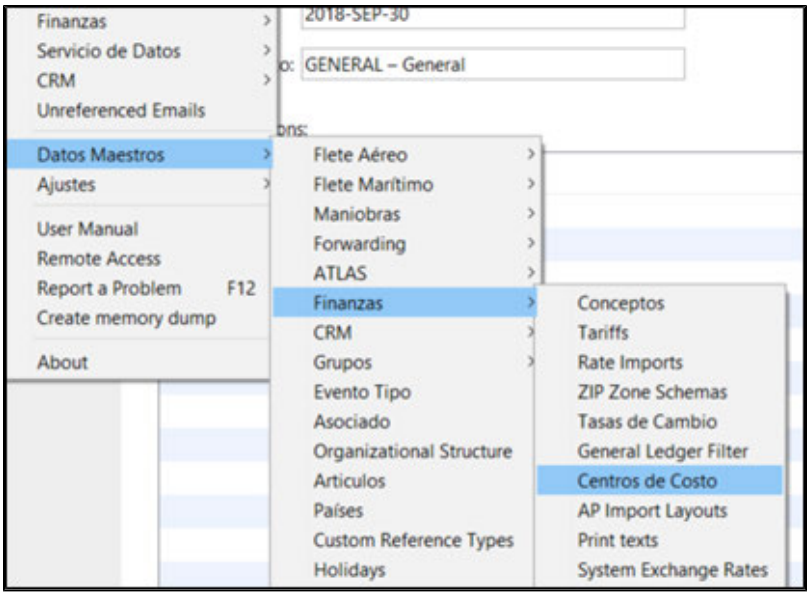
2. Dé click en “New” y comience a llenar los siguientes datos:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

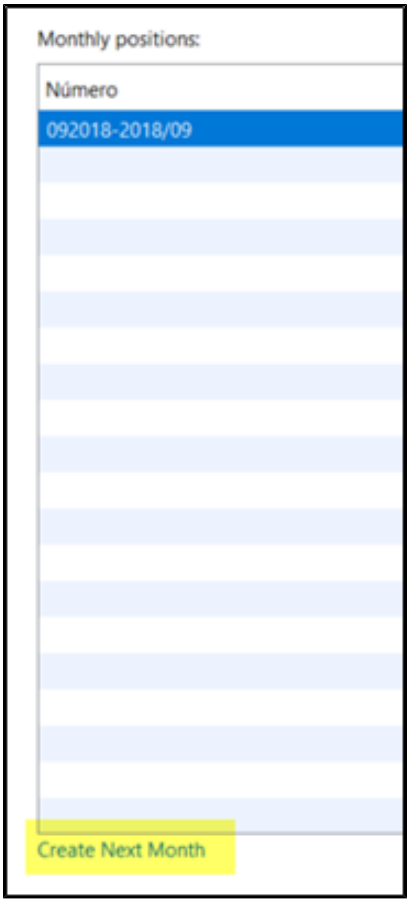
3. Se le asigna un numero a la orden, puede ser por ejemplo, mes 09 y el año 2018, quedando 092018, se le asigna un nombre y posteriormente una rango de validez para la orden, es recomendable que fije el ciclo completo por el que estará usando esta orden. También debe seleccionar un Centro de Costo.

Nota: Para efectos de reportes y estadísticas, es recomendable crear un Centro de Costos únicamente para las ordenes administrativas. Los centros de costo pueden ser creados en Datos maestros > Finanzas > Centros de Costo.

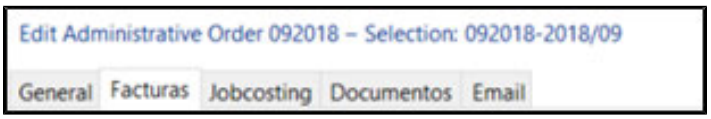


En la parte inferior de la pantalla aparece una leyenda que dice "**Create Next Month**", haga click ahí y se genera la nueva posición mensual:

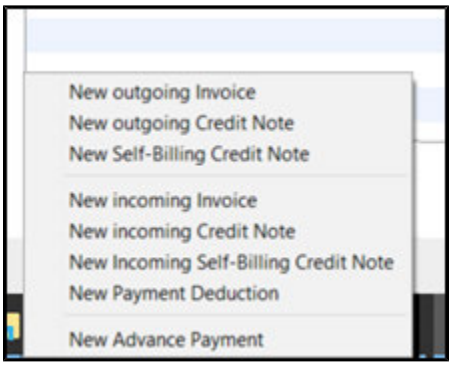
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



4. Una vez creada la orden Administrativa, pase a la pestaña de “Facturas”:



5. Haga click en **New**, y seleccione el tipo de factura que va a agregar a la orden administrativa:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Guía de Instalación Scope

Introducción

El objetivo del presente documento es mostrar cómo crear instalar la versión 11.0 de Scope.

A partir de la versión 11, Scope requiere el uso de la aplicación de software llamada “Scope Runtime”, esta aplicación está disponible para descarga gratis desde nuestro sitio web oficial. Los ejecutables están disponibles para Microsoft Windows y macOS.

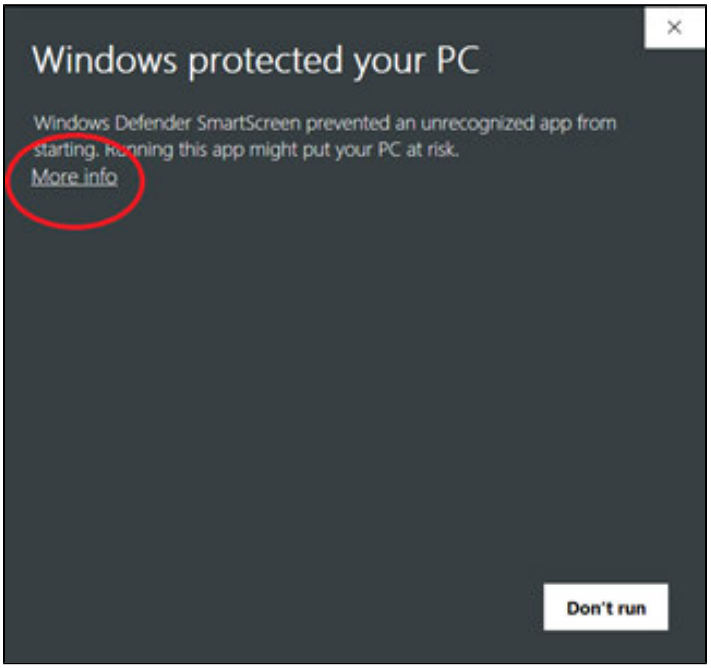
1.Instalar la nueva versión de Scope es rápido y sencillo, a continuación las instrucciones de instalación:

https://www.riege.com/mx/scope/download/

2. Seleccionaremos nuestro sistema operativo*

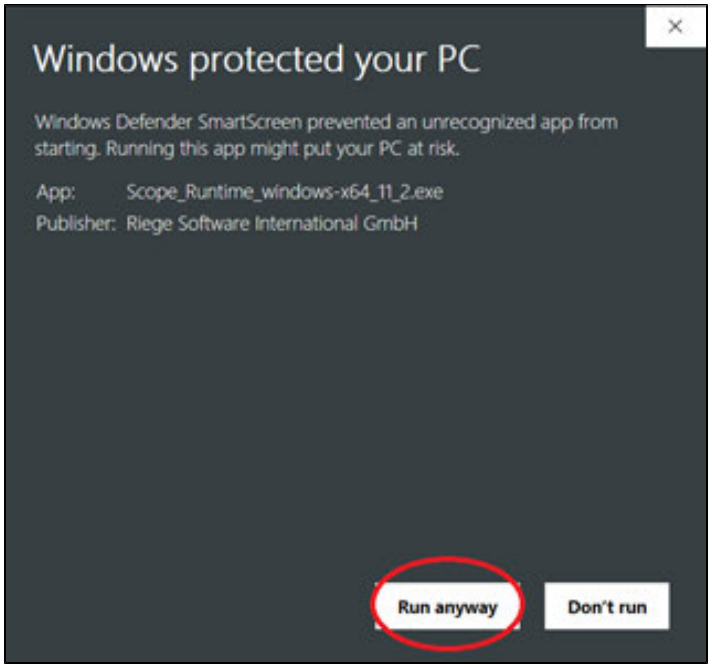
***Nota: En caso de utilizar una versión de Microsoft Windows de 32-bits, debe descargar aquí: Versión de 32-bits.**

3. Ejecutamos el archivo descargado y nos aparecerá una ventana de confirmación de la instalación:

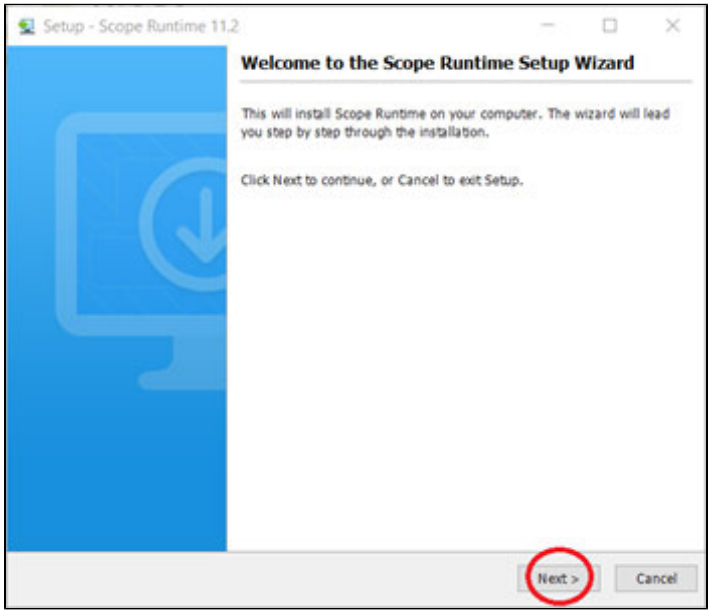


4. Hacemos clic en “**More info**” y posteriormente en “**Run Anyway**”

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

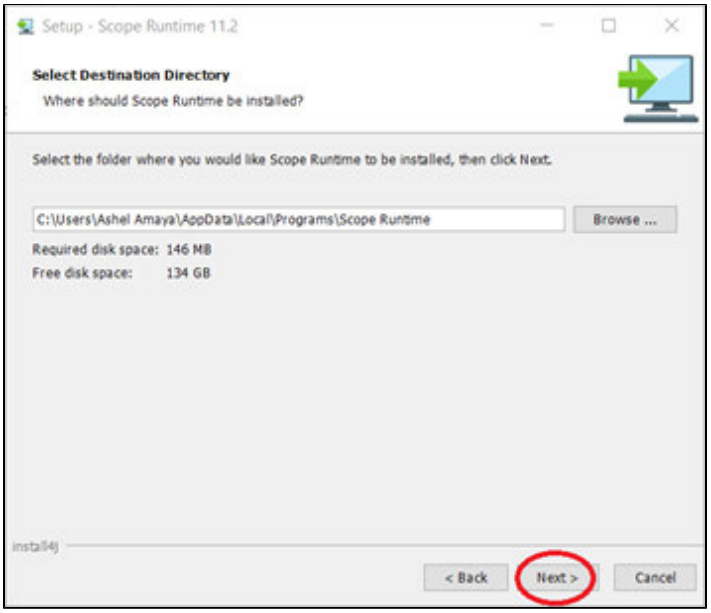


5. Iniciara la instalación del programa, hacemos clic en “**Next**”:

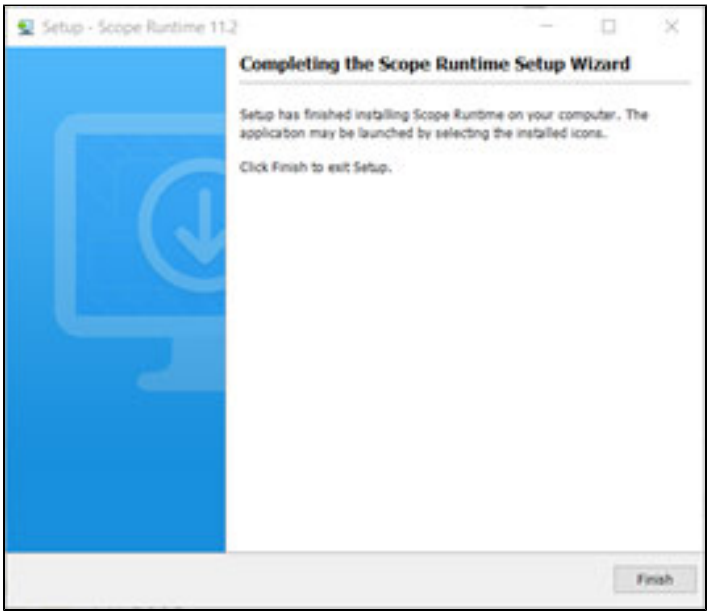


6. La siguiente ventana nos indica el directorio en donde instalaremos la aplicación, hacemos clic en “Next”:

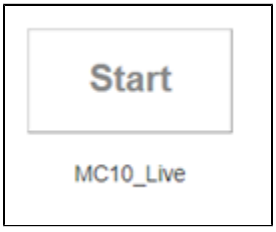
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



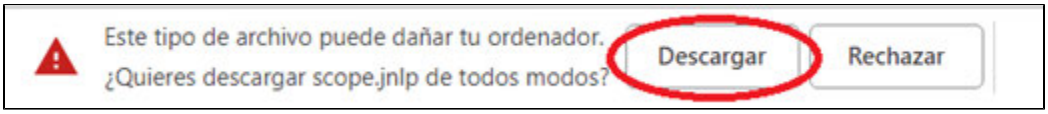
7. Ha instalado la aplicación con éxito



8. Finalmente, ingresamos a la siguiente dirección https://scope10.riege.com/scope/ y hacemos clic en “**Start**”:

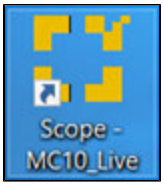


Esto descargara el archivo scope.jnlp, confirmamos que la descarga es segura y ejecutamos el archivo.



9. Este ultimo paso es necesario para actualizar nuestro acceso rápido en el escritorio:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Guía de Job Costing, creación y sustitución de facturas

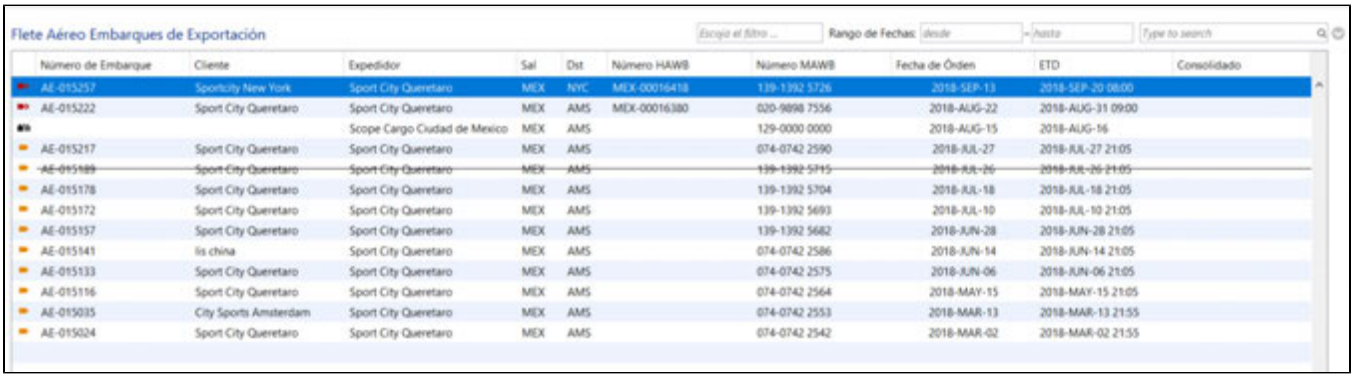
- Introducción
- Guía de Job Costing y creación de Factura
- Estados en el Job Costing
- Crear facturas con relación de CFDI (CfdiRelacionados)

Introducción

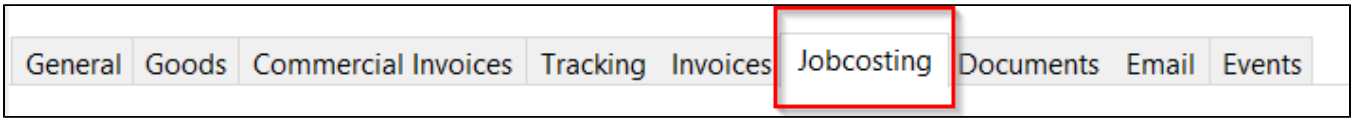
El objetivo de esta guía es mostrar cómo generar el Job Costing, creación de facturas con timbrado y facturas para sustitución de CFDI.

Guía de Job Costing y creación de Factura

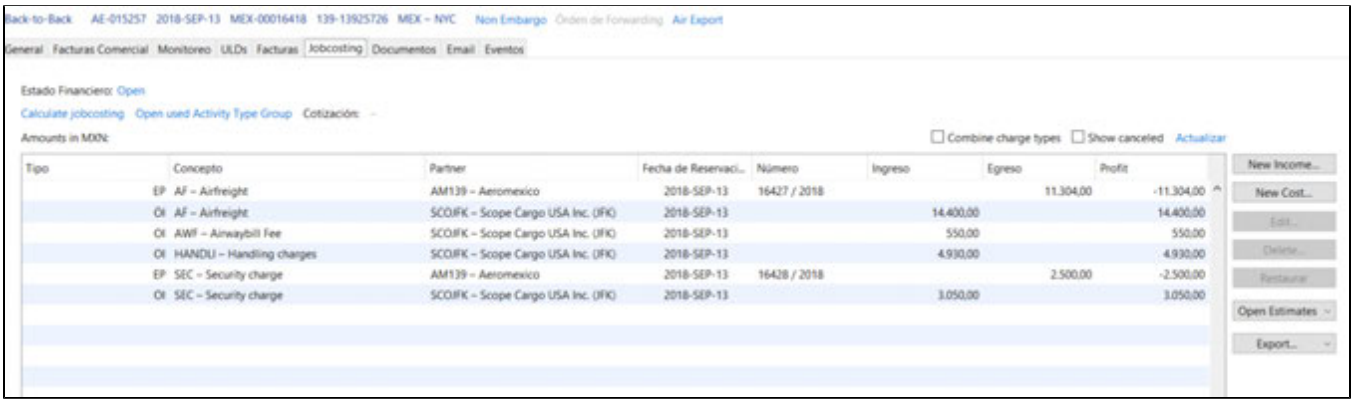
1.- Ingresar al módulo donde se encuentra el embarque al que vamos a crear el Job Costing y su Factura



2.- Al encontrar el embarque deseado ingresamos haciendo doble click en él y luego buscamos la pestaña de Job Costing:

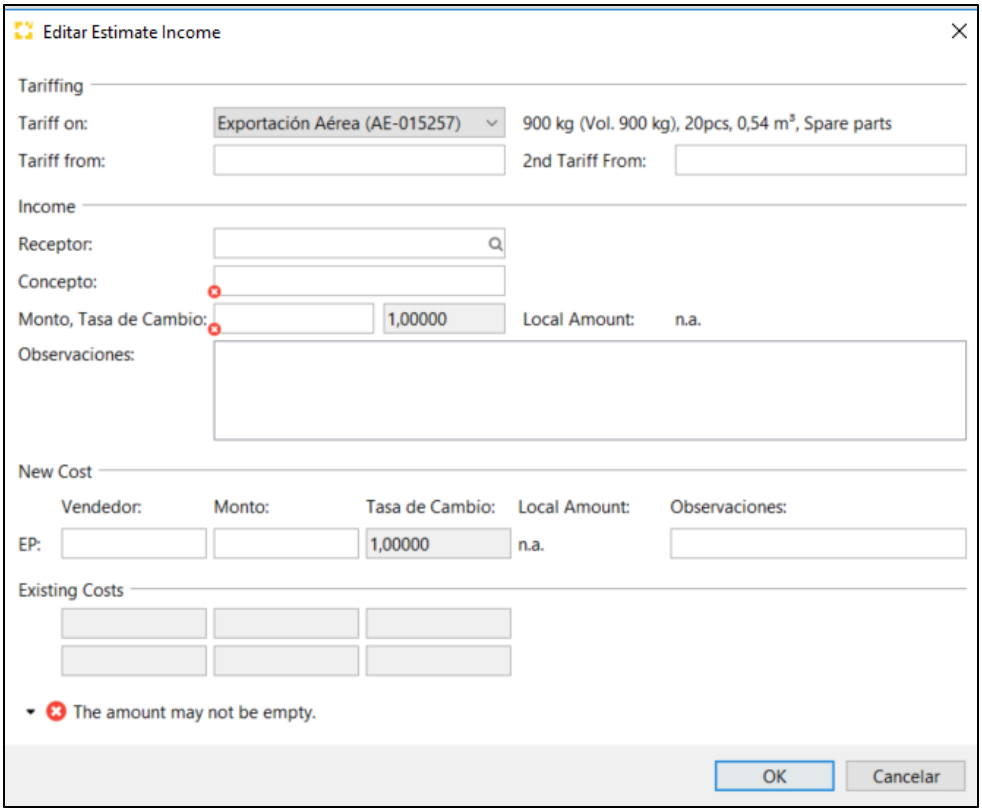


3.- En Job Costing agregamos los conceptos de ingresos y costos por el embarque. Por cada concepto que le vamos a cobrar al cliente lo agregamos con **New Income**, y por cada costo de parte los proveedores es un **New Cost**.

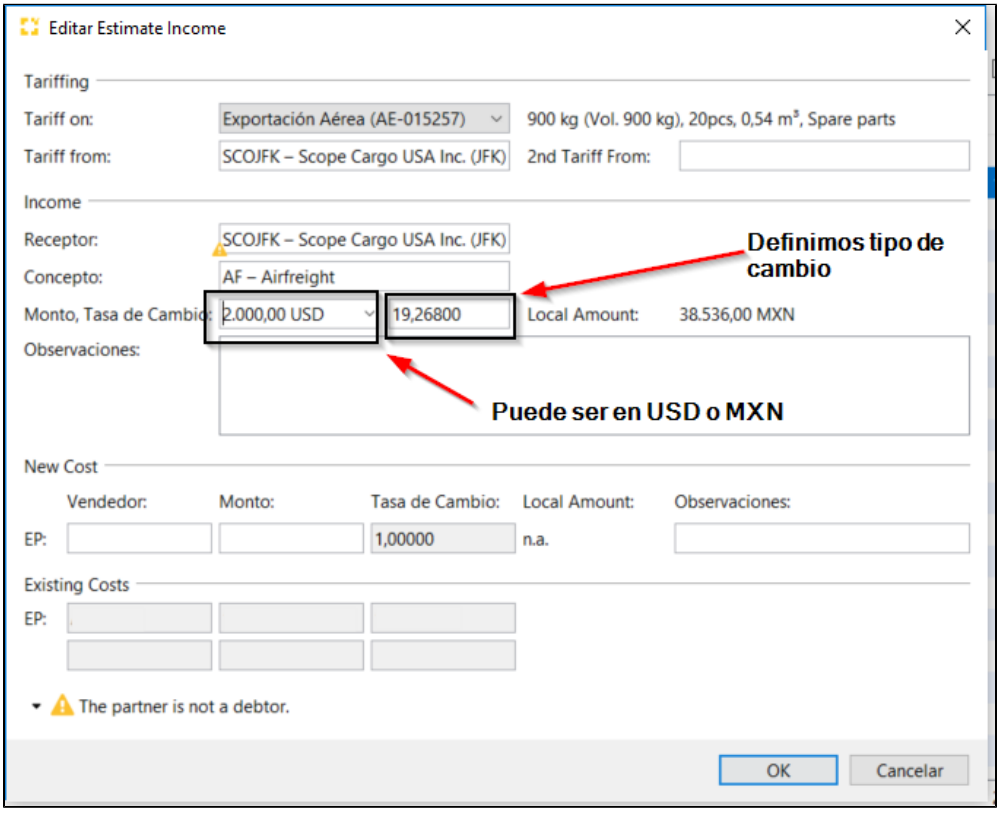


4.- Para agregar un nuevo ingreso o costo debe de llenar la siguiente información:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

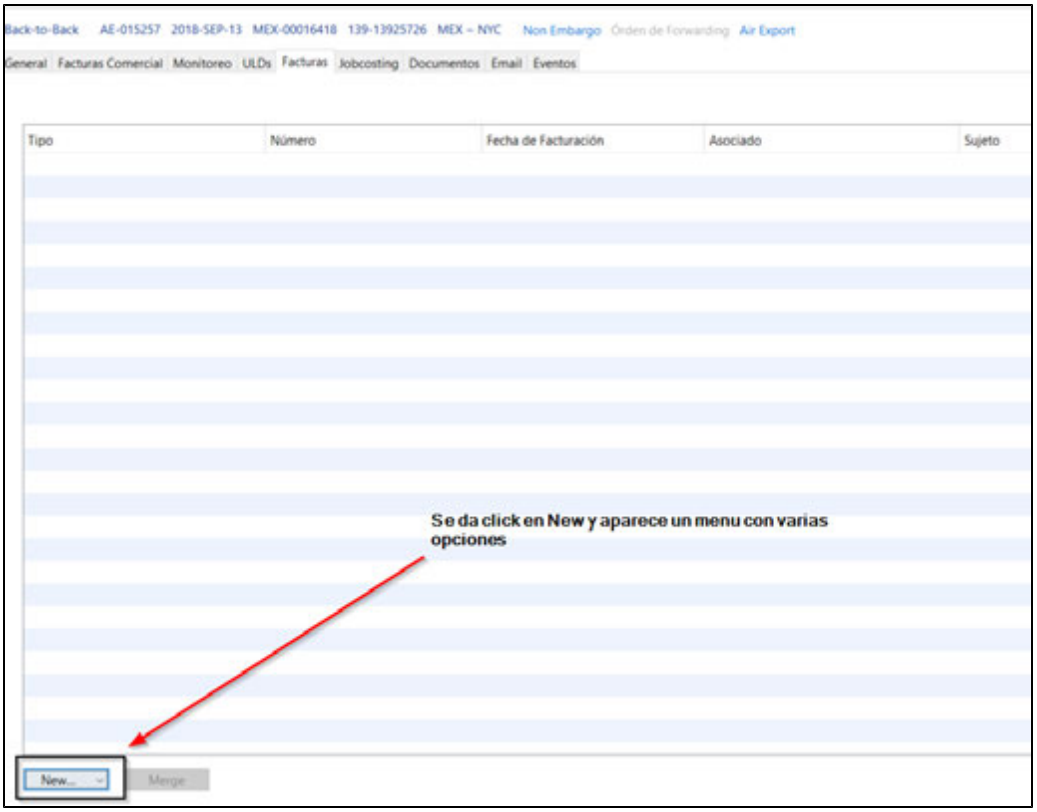


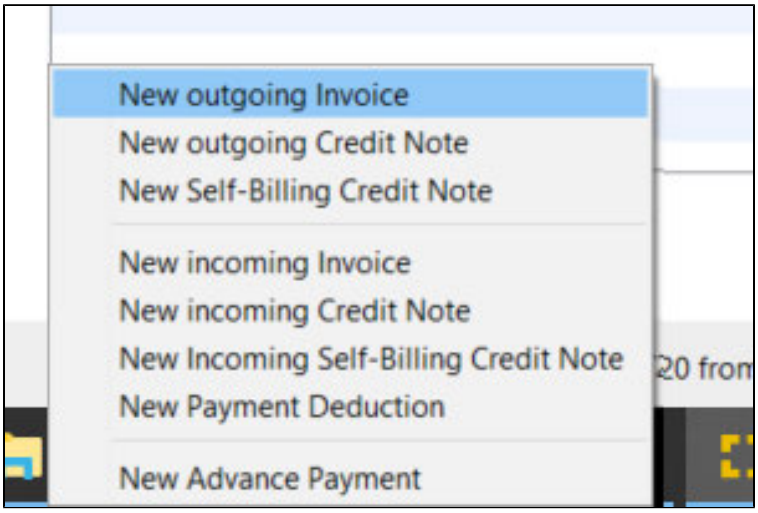
5.- Después de ingresar los datos y dar click en **OK** se agregará la línea al Job Costing.



6.- Una vez que tenemos todos los ingresos y costos, vamos a la pestaña de **Facturas** y seleccionamos **New…** > **New Outgoing Invoice**:

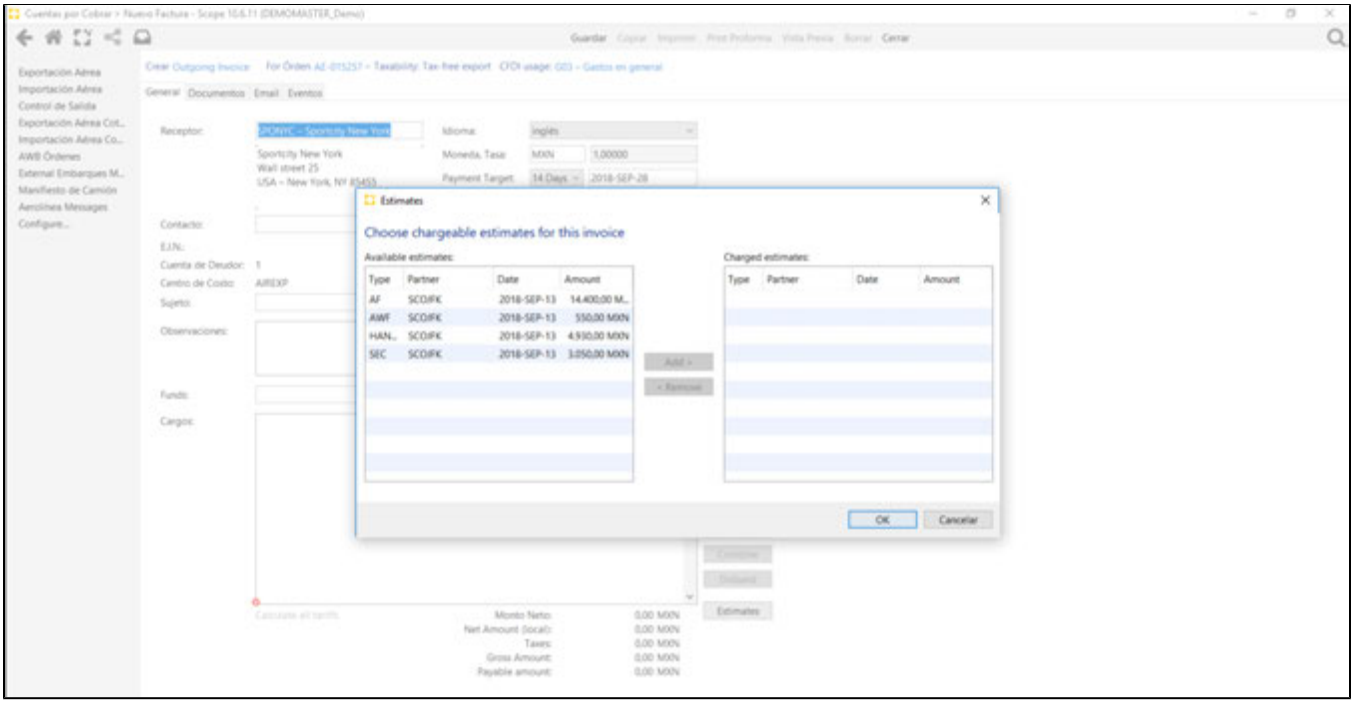
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



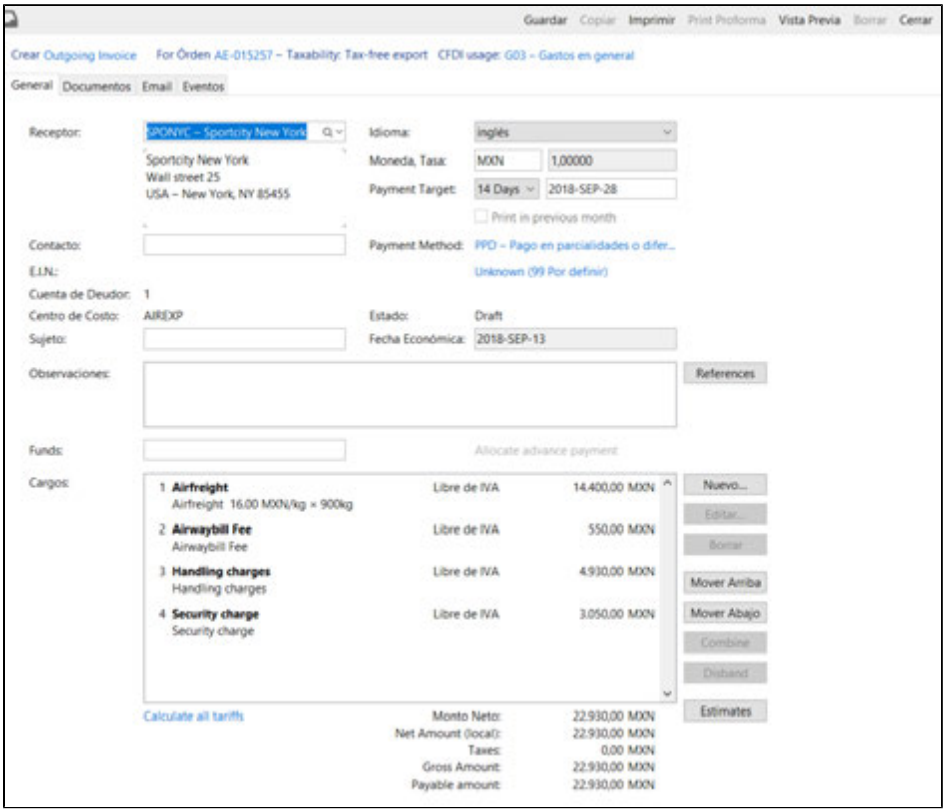


7.- Después de ingresar a **Outgoing Invoice**, automáticamente nos sugiere que cargos van a ser facturados, los seleccionamos y aparecerán en las líneas de conceptos:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

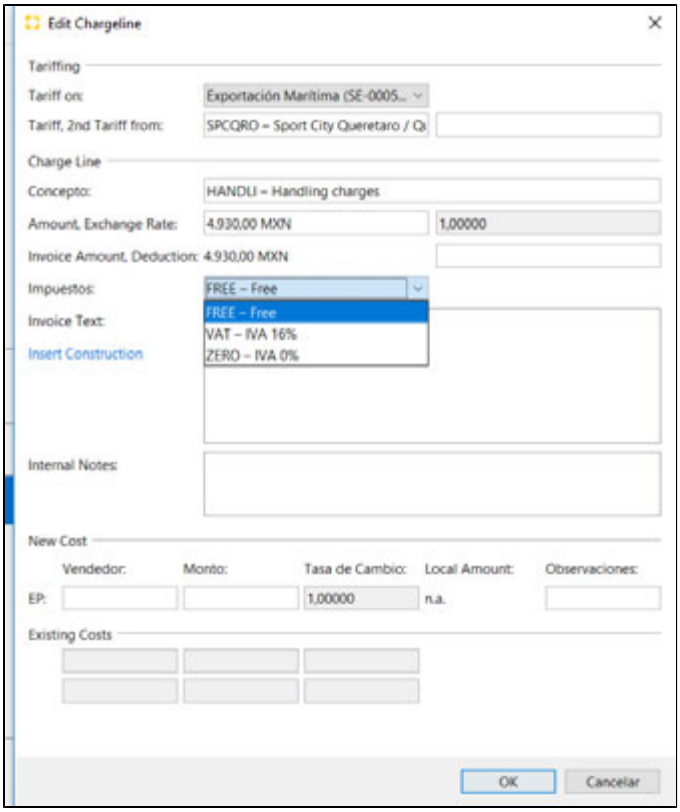


8.- Una vez que seleccionamos los conceptos podemos editar los elementos de la factura:



9.- Cada línea de cargo puede ser editada para realizar cambios, por ejemplo cambiar el tipo de impuesto o la tasa de tipo de cambio:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



10.- Una vez teniendo la información correcta, le damos **Guardar** en el menú que se encuentra en la parte superior.

11.- Una vez guardada la factura podemos imprimir **Proformas** u obtener una vista previa.

Guardar – Guarda cambios a la factura

Copiar – Opción para copiar la factura y generar una nueva.

Imprimir - Registra la factura ante el SAT y genera el PDF y XML (Timbrado)

Print Proforma – Imprime factura proforma

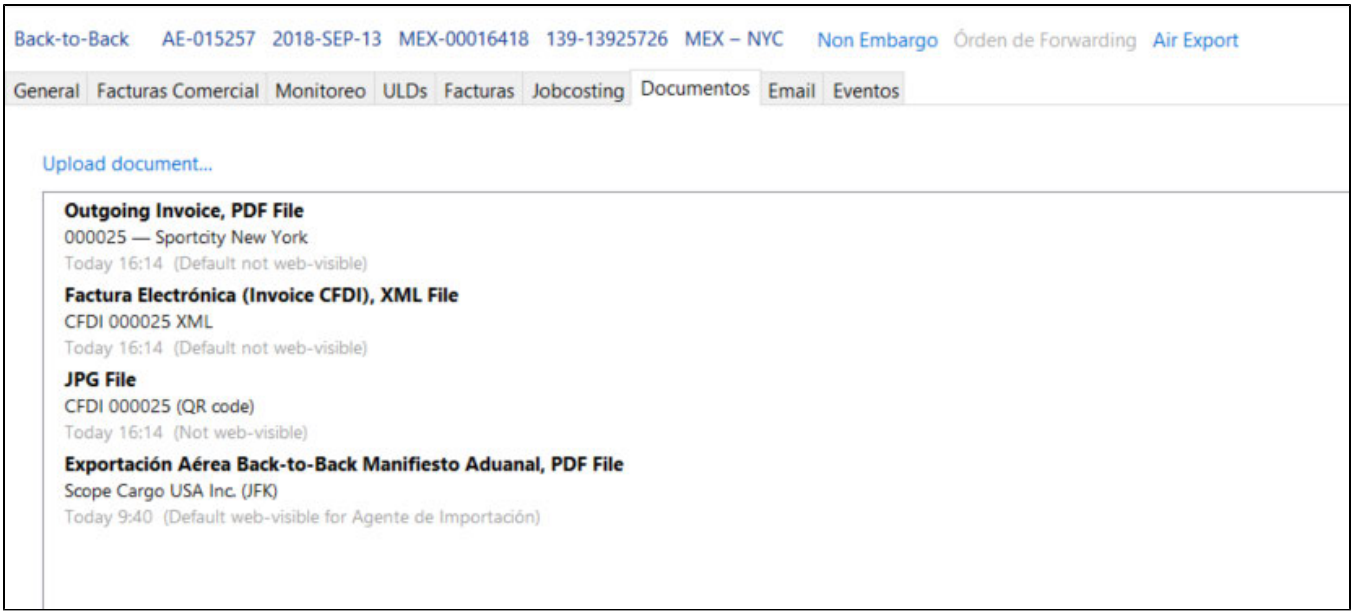
Vista Previa – Solo nos genera una vista para revisar el PDF

Borrar – Borra la factura (Si esta timbrada se deshabilita esta opción)

Cerrar – Cierra la ventana de edición.

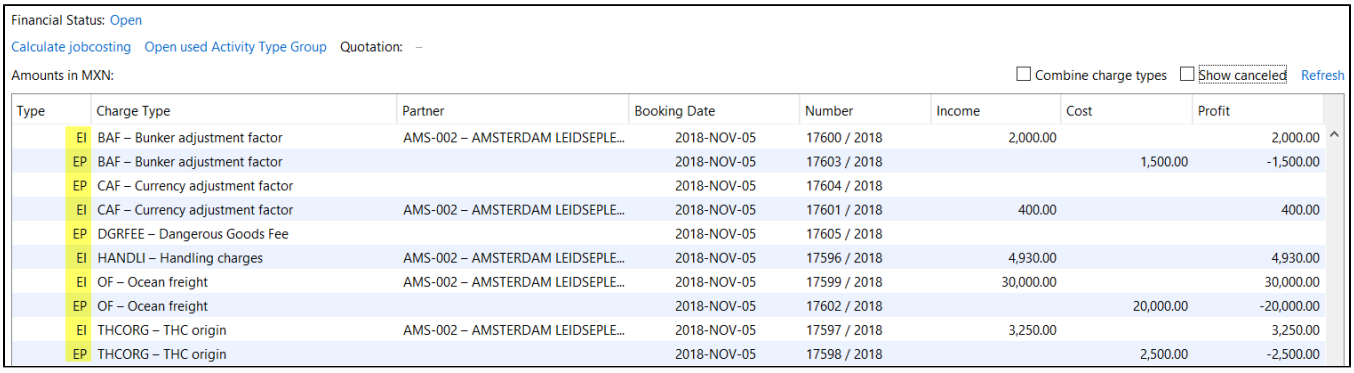
12.- Al imprimir (Timbrar), se genera el PDF y XML el cual lo puede revisar en la pestaña de documentos de la factura:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Estados en el Job Costing

El objetivo de esta sección es describir los estados de los conceptos en el Job Costing.



Type	Charge Type	Partner	Booking Date	Number	Income	Cost	Profit
EI	BAF – Bunker adjustment factor	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17600 / 2018	2,000.00		2,000.00
EP	BAF – Bunker adjustment factor		2018-NOV-05	17603 / 2018		1,500.00	-1,500.00
EP	CAF – Currency adjustment factor		2018-NOV-05	17604 / 2018			
EI	CAF – Currency adjustment factor	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17601 / 2018	400.00		400.00
EP	DGRFEE – Dangerous Goods Fee		2018-NOV-05	17605 / 2018			
EI	HANDLI – Handling charges	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17596 / 2018	4,930.00		4,930.00
EI	OF – Ocean freight	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17599 / 2018	30,000.00		30,000.00
EP	OF – Ocean freight		2018-NOV-05	17602 / 2018		20,000.00	-20,000.00
EI	THCORG – THC origin	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17597 / 2018	3,250.00		3,250.00
EP	THCORG – THC origin		2018-NOV-05	17598 / 2018		2,500.00	-2,500.00

1. Entrar a un embarque e ir a la pestaña de Job Costing, ahí podremos ver los Conceptos de Ingreso y Costos, cada uno de ellos pueden tener los siguientes estados:

I – Ingresos (Income), estos son los conceptos que se le van a facturar a los clientes.

P – Costos (Payable), estos son los conceptos de gasto o costo, de esperamos una factura por parte de un proveedor.

A estos tipos les asignamos los siguientes estados:

E – Estimados (Estimated), concepto que por el cual no ha sido registrado en una factura, tanto a un cliente o que recibamos de un proveedor.

O – Abierto (Open), conceptos que ya se encuentran dentro de una factura, pero que no ha sido generada.

T – Transferidos (Transfered), usado para los cargos consolidados, si se ingresa un costo a un embarque master, Scope va a transferir el costo a las *Ho uses* que estén consolidadas.

Sin estado – Sucede ya cuando se emitió la factura y se ingresaron las facturas de los proveedores.

Crear facturas con relación de CFDI (CfdiRelacionados)

Tipo 01: Nota de crédito de los documentos relacionados

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Caso de uso: Crear un descuento, reembolso o bono para una factura saliente que ya fue timbrada.

1. Cancelar la factura en el portal del SAT.
2. En Scope, abra la factura finalizada para la cual la corrección por nota de crédito debería ser creada, esto se hace en la opción *"**Create Correction Create Credit Note**". **Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.** Una vez que la factura haya sido cancelada en Scope, no es posible crear una nueva factura relacionada.*
3. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    a. Tipo: Nota de Crédito
    b. Uso CFDI: G02 Devoluciones, descuentos o bonificaciones (Por ser nota de crédito).
    c. Relación de CFDI: Tipo 01 Nota de crédito de los documentos relacionados.
    d. (En la impresión de PDF aparece el UUID relacionado del paso 1).

Tipo 04: Sustitución de los CFDI previos

Caso de uso: Corregir una factura saliente, la cual ya fue timbrada sin cancelación.

1. Cancelar la factura en el portal del SAT.
2. En Scope, abra la factura finalizada para la cual la corrección por nota de crédito debería ser creada, esto se hace en la opción *"**Create Correction Create Credit Note**". **Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.** Una vez que la factura haya sido cancelada en Scope, no es posible crear una nueva factura relacionada.*
3. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    a. Tipo: Nota de Crédito
    b. Uso CFDI: G02 Devoluciones, descuentos o bonificaciones (Por ser nota de crédito).
    c. Relación de CFDI: Tipo 01 Nota de crédito de los documentos relacionados.
    d. (En la impresión de PDF aparece el CFDI UUID relacionado del paso 1.
4. Cambie el tipo de relación de CFDI a **04 Sustitución de los CFDI previos.** Al cambiar la relación, el tipo de relación cambiara automáticamente al de la factura original en el paso 1 (esta es una nota de crédito también y no necesita tener el tipo de uso G02).
5. Finalice (Imprima) la nota de crédito.
6. Regrese a la factura del paso 1 y haga click en: ***Create Correction Create Substitution Invoice***. ***Esta opción solo estará disponible siempre y cuando la factura no haya sido cancelada en Scope.***
7. Como resultado, una nueva factura saliente es creada con los siguientes parámetros:
    a. Tipo: Nota de Crédito
    b. Uso CFDI: Mismo tipo que la factura del paso 1.
    c. Relación de CFDI: Tipo 04 Sustitución de los CFDI previos.
    d. (En la impresión de PDF aparece el UUID relacionado del paso 1), este también aparece al presionar las teclas **CTRL + I** en el teclado:

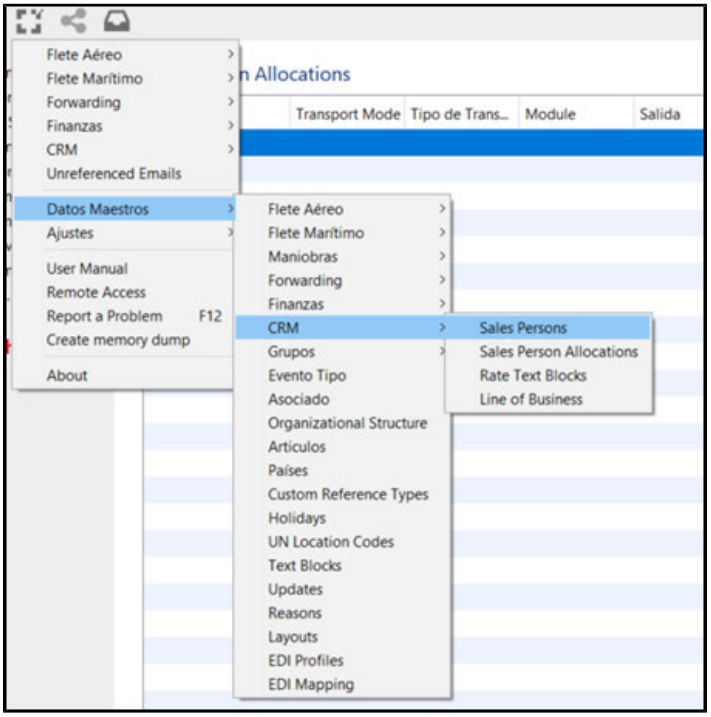
Guía Rápida para asignar Agentes de Venta

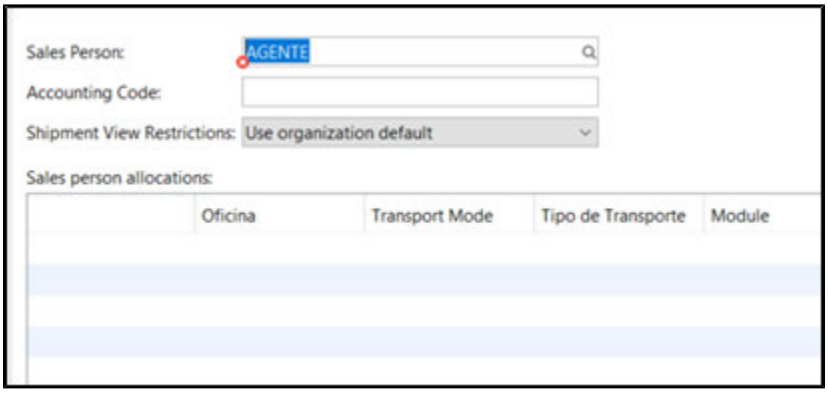
Introducción

El objetivo del presente documento es mostrar cómo crear Agentes de Venta y asignarlos.

1. Ingrese al módulo Datos Maestros > CRM > Sales Persons

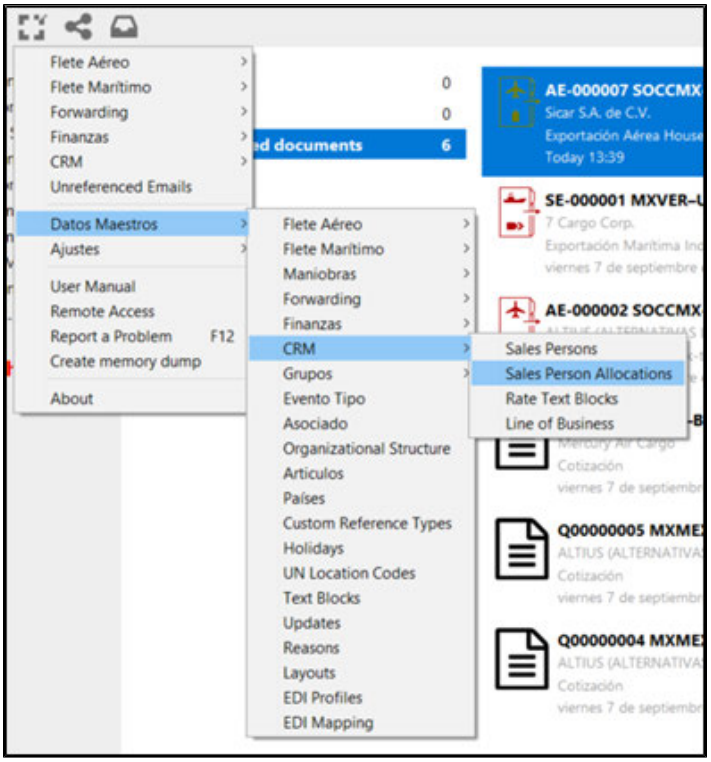


2. Ahí se de click en **New** y agregue el nombre del Agente y guarde.

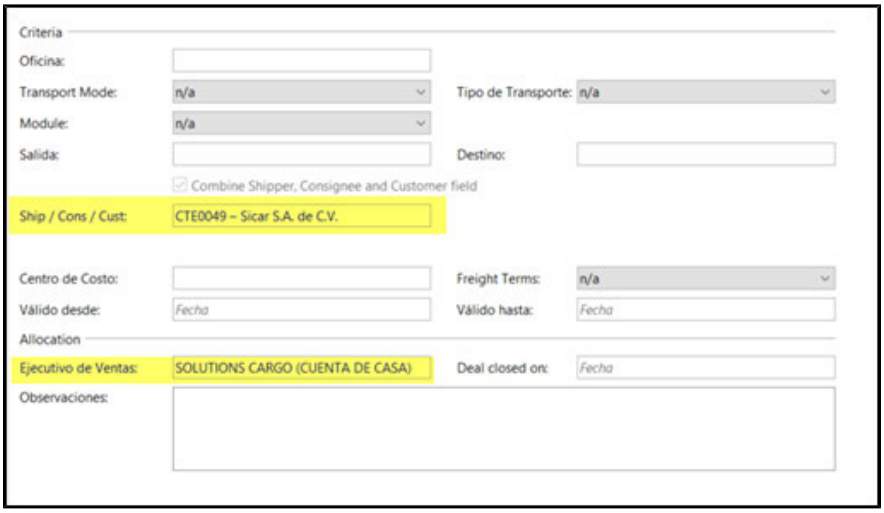


3. Después de agregar el agente se debe de asignar a un cliente, ingrese a Datos maestros > CRM > **Sales Person Allocations**

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



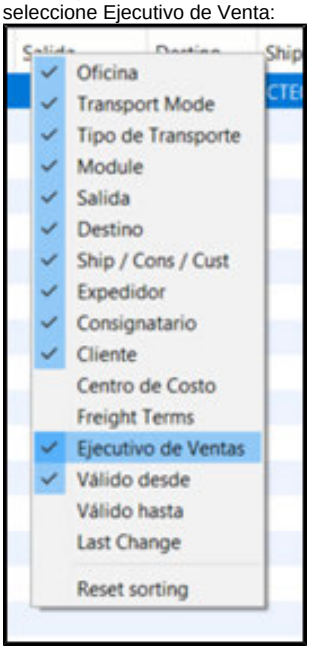
4. Después de dar click en new se presenta la pantalla para asignar al Ejecutivo de Ventas el cliente que le corresponde.



Los otros campos sirven para delimitar a los Agentes de Venta a embarques más específicos.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

5. En la pantalla de **Sales Person Allocation** agregue la columna Ejecutivo de Venta, dando un click derecho sobre el nombre de las columnas y seleccione Ejecutivo de Venta:



6. En el listado aparecerá en nombre del ejecutivo.

7. Una vez que se crea el embarque y se selecciona el cliente y si tiene asignado un Agente de Ventas lo puede ver usando el teclado presionando las teclas Ctrl + I, de esta manera aparecerá una ventana con los datos del embarque y del agente de ventas.

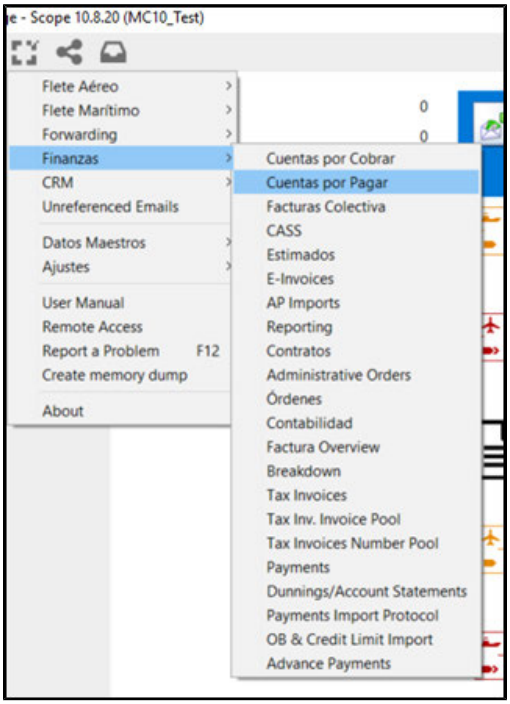
Ingreso de Facturas y Registro de Pago (Proveedores)

Introducción

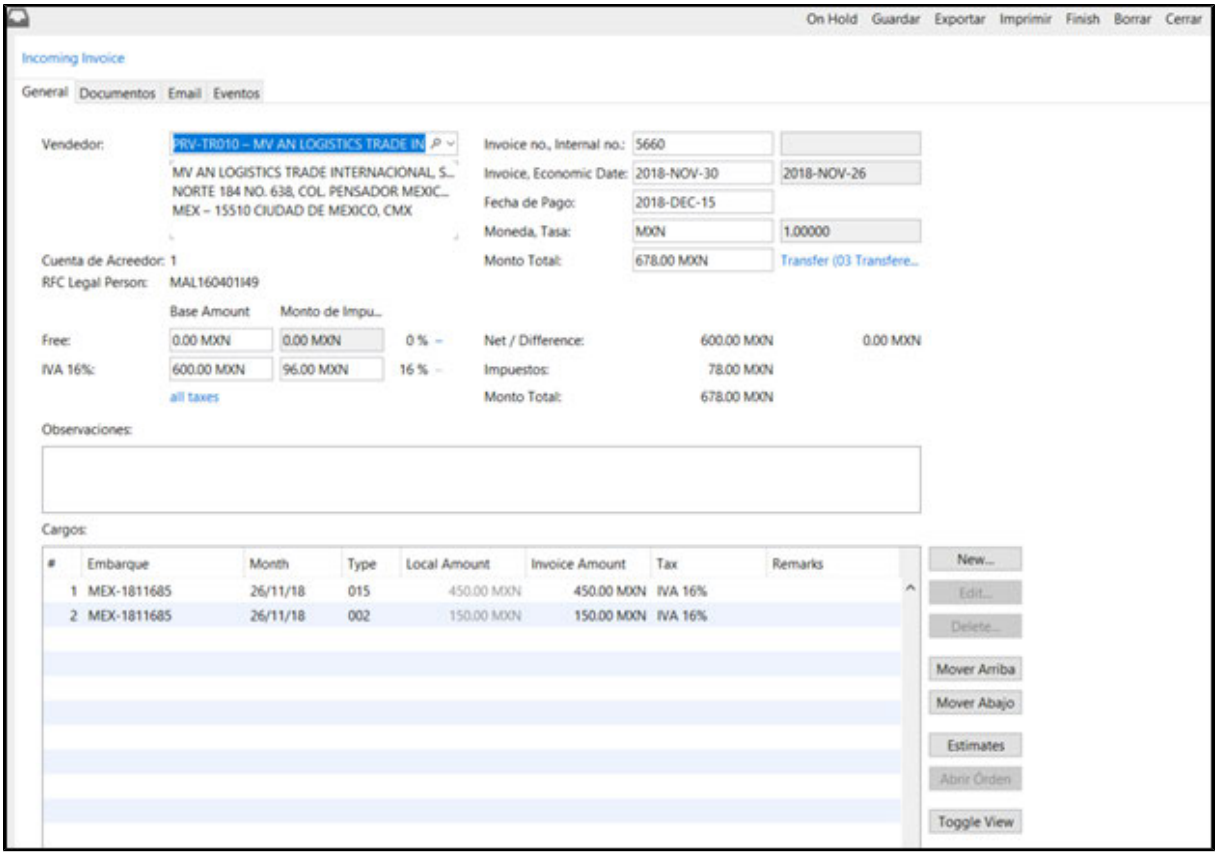
El objetivo del presente documento es mostrar cómo ingresar facturas entrantes y registrar el pago

- Cuando se va a registrar un pago a un proveedor, debe ingresar al módulo de Finanzas – Cuentas por pagar (Payables).

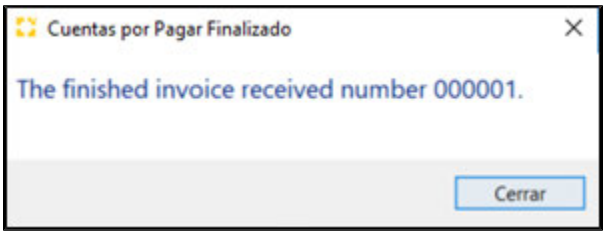


- Al ingresar, se busca la factura del proveedor y se le da doble click para entrar a esa Orden de Pago.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

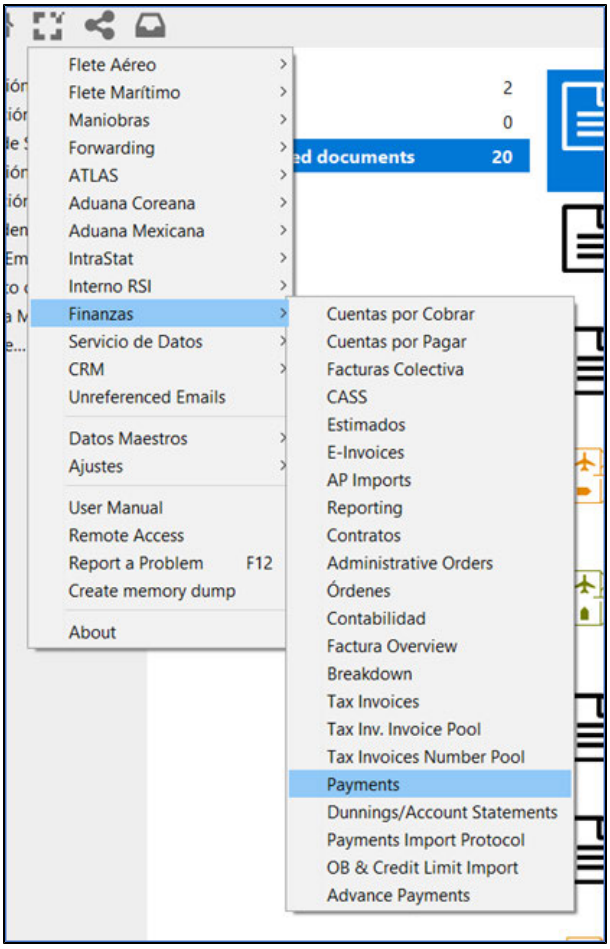


- Revise que todo este correcto y de click en el botón de Finish, para que de esta forma el registro de la deuda aparezca en el módulo de Payments, y se pueda registrar el pago correspondiente.

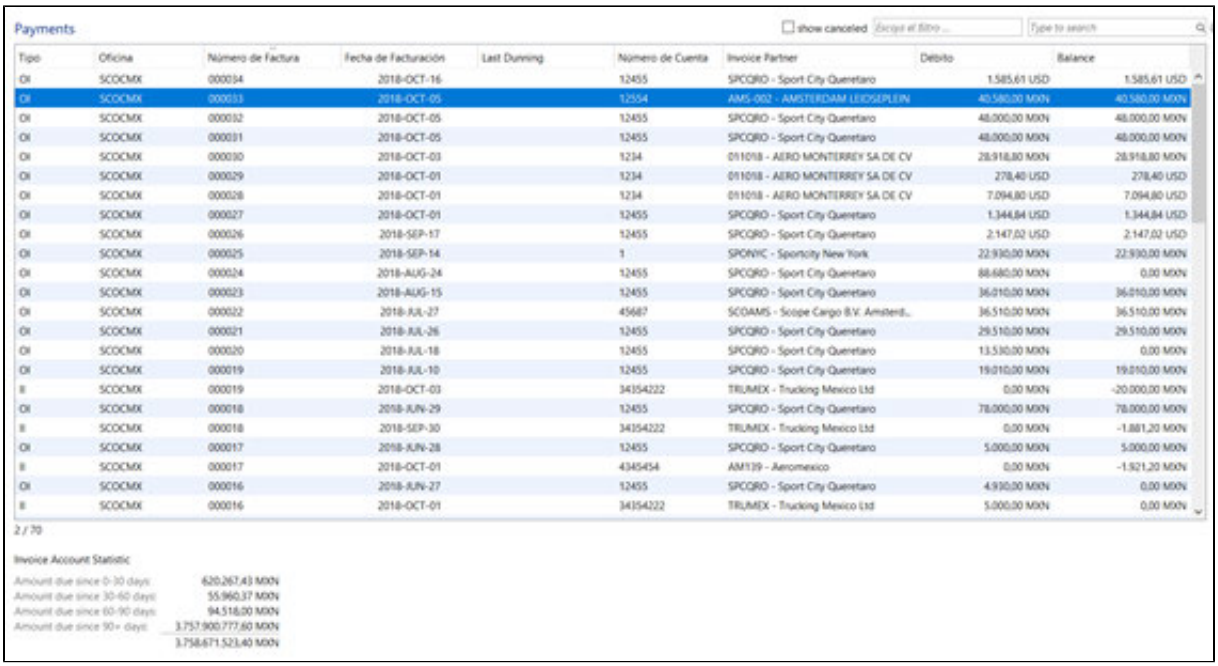


- Ingrese al módulo Finanzas – Payments

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



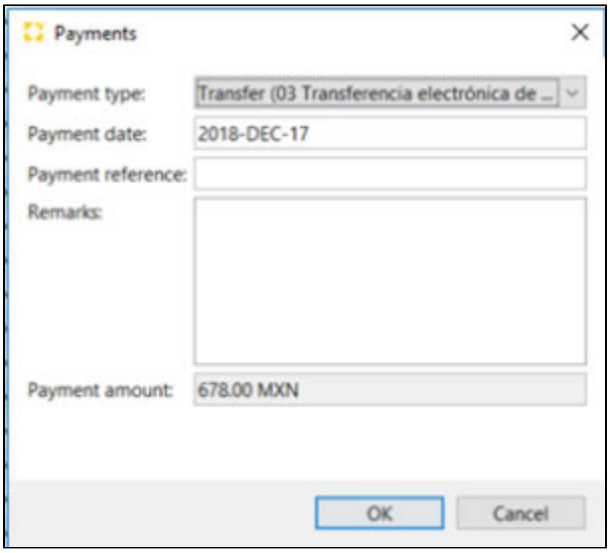
- Se mostrarán todas las facturas que se han ingresado en el sistema, tanto las emitidas a los clientes como la de los proveedores, las facturas para los clientes en el **Type**, son las que son OI, la de los proveedores son las II



- Seleccione la factura que se va a pagar, y dé click en el botón de **Payment**.

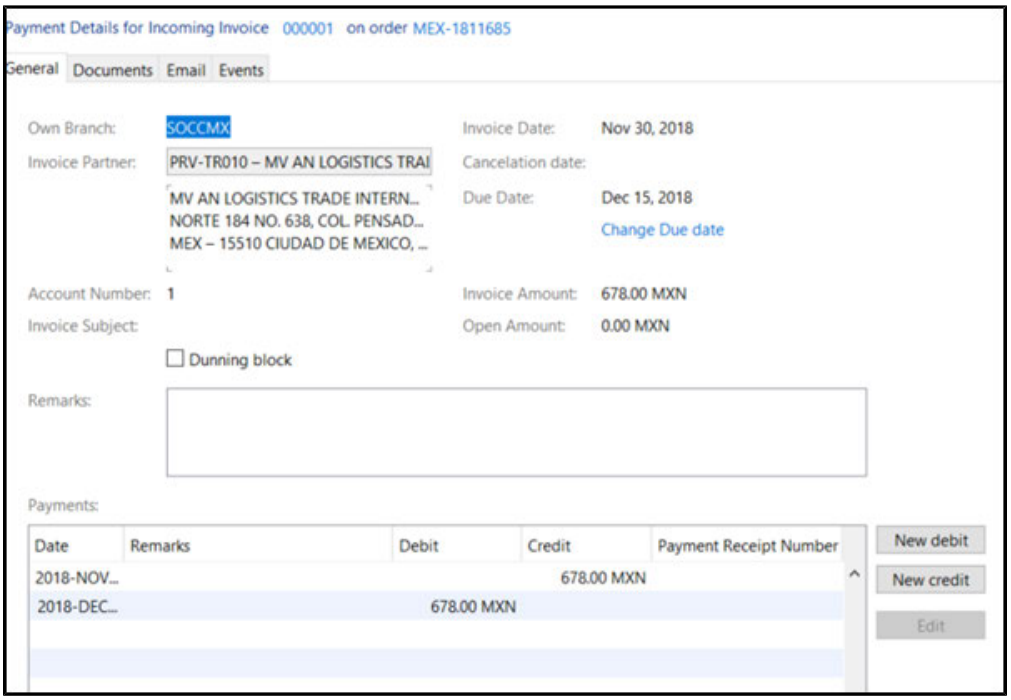
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- Al dar click en **Payment**, se presenta una ventana para agregar los datos requeridos para registrar el pago.



- Al terminar, de click en OK y observe que el balance cambia:

- Al entrar a la factura, observe que el crédito y débito cuadran:



Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Job Costing - Definiciones

Introducción

El objetivo del presente documento es describir los estados de los conceptos en el Job Costing.

- Entrar a un embarque e ir a la pestaña de Job Costing, ahí podremos ver los Conceptos de Ingreso y Costos, cada uno de ellos pueden tener los siguientes estados:

Financial Status: Open
Calculate jobcosting Open used Activity Type Group Quotation:
Amounts in MXN: Combine charge types Show canceled Refresh

Type		Charge Type	Partner	Booking Date	Number	Income	Cost	Profit
	EI	BAF – Bunker adjustment factor	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17600 / 2018	2,000.00		2,000.00
	EP	BAF – Bunker adjustment factor		2018-NOV-05	17603 / 2018		1,500.00	-1,500.00
	EP	CAF – Currency adjustment factor		2018-NOV-05	17604 / 2018			
	EI	CAF – Currency adjustment factor	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17601 / 2018	400.00		400.00
	EP	DGRFEE – Dangerous Goods Fee		2018-NOV-05	17605 / 2018			
	EI	HANDLI – Handling charges	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17596 / 2018	4,930.00		4,930.00
	EI	OF – Ocean freight	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17599 / 2018	30,000.00		30,000.00
	EP	OF – Ocean freight		2018-NOV-05	17602 / 2018		20,000.00	-20,000.00
	EI	THCORG – THC origin	AMS-002 – AMSTERDAM LEIDSEPLE...	2018-NOV-05	17597 / 2018	3,250.00		3,250.00
	EP	THCORG – THC origin		2018-NOV-05	17598 / 2018		2,500.00	-2,500.00

I – Ingresos (Income), estos son los conceptos que se le van a facturar a los clientes.

P – Costos (Payable), estos son los conceptos de gasto o costo, de esperamos una factura por parte de un proveedor.

A estos tipos les asignamos los siguientes estados:

E – Estimados (Estimated), concepto que por el cual no ha sido registrado en una factura, tanto a un cliente o que recibamos de un proveedor.

O – Abierto (Open), conceptos que ya se encuentran dentro de una factura, pero que no ha sido generada.

T – Transferidos (Transfered), usado para los cargos consolidados, si se ingresa un costo a un embarque master, Scope va a transferir el costo a las *Ho uses* que estén consolidadas.

Sin estado – Sucede ya cuando se emitió la factura y se ingresaron las facturas de los proveedores.

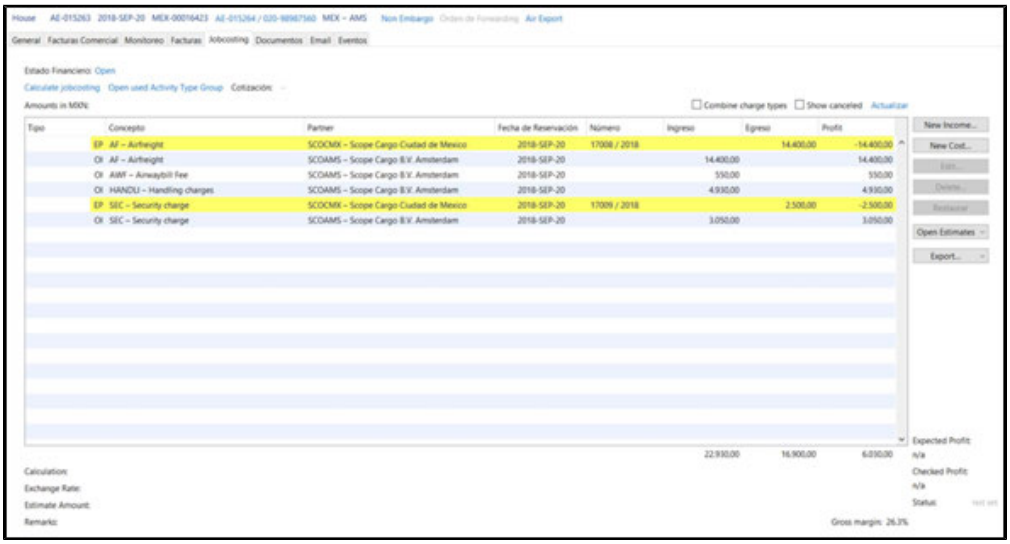
Pago a Proveedores

Introducción

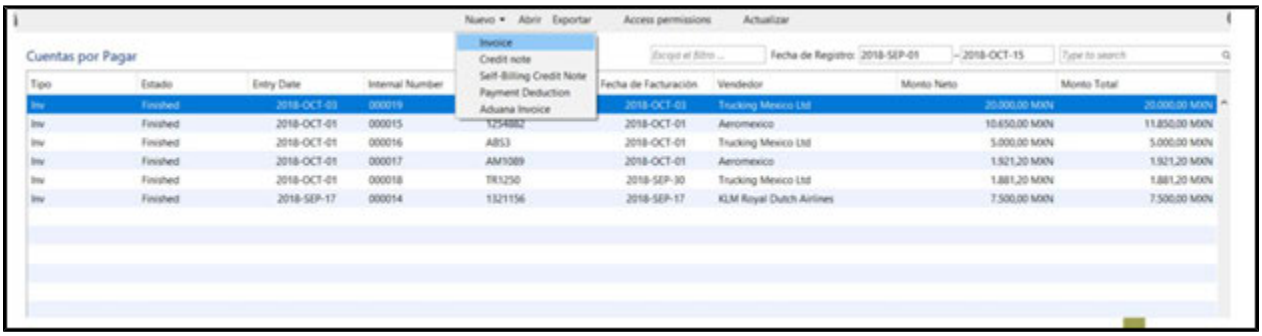
El objetivo del presente documento es mostrar cómo Emitir Orden de Pago a Proveedores.

1.Después de realizar el Job Costing de un embarque, en donde se asignaron los Ingresos (cobros al cliente) y los costos (gastos), tiene algunos Costos Estimados con algunos proveedores.
En este ejemplo, el embarque es de tipo Exportación Aérea, con número AE-015263.



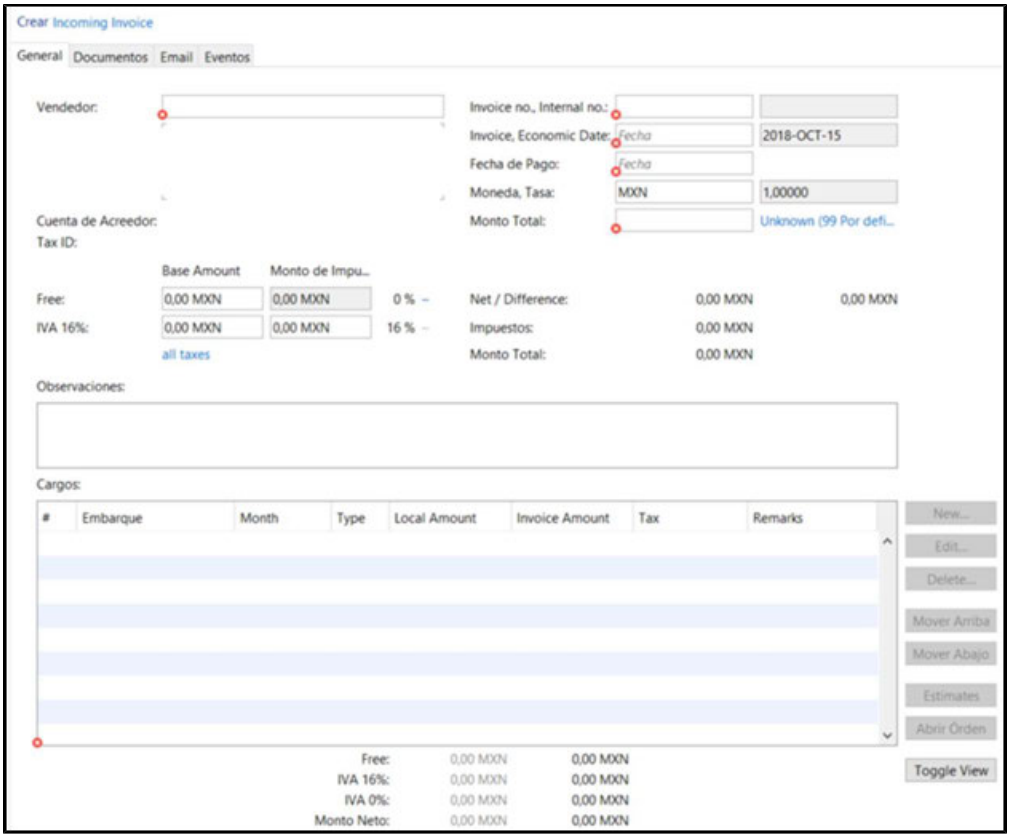
En este caso se observan dos costos de nuestros proveedores Scope Cargo Ciudad de México (Ej.14,400 y 2,500). Guarde los cambios y salga del módulo.

2. Ingrese al módulo de Finanzas – Cuentas por pagar y seleccione "nuevo- invoice"

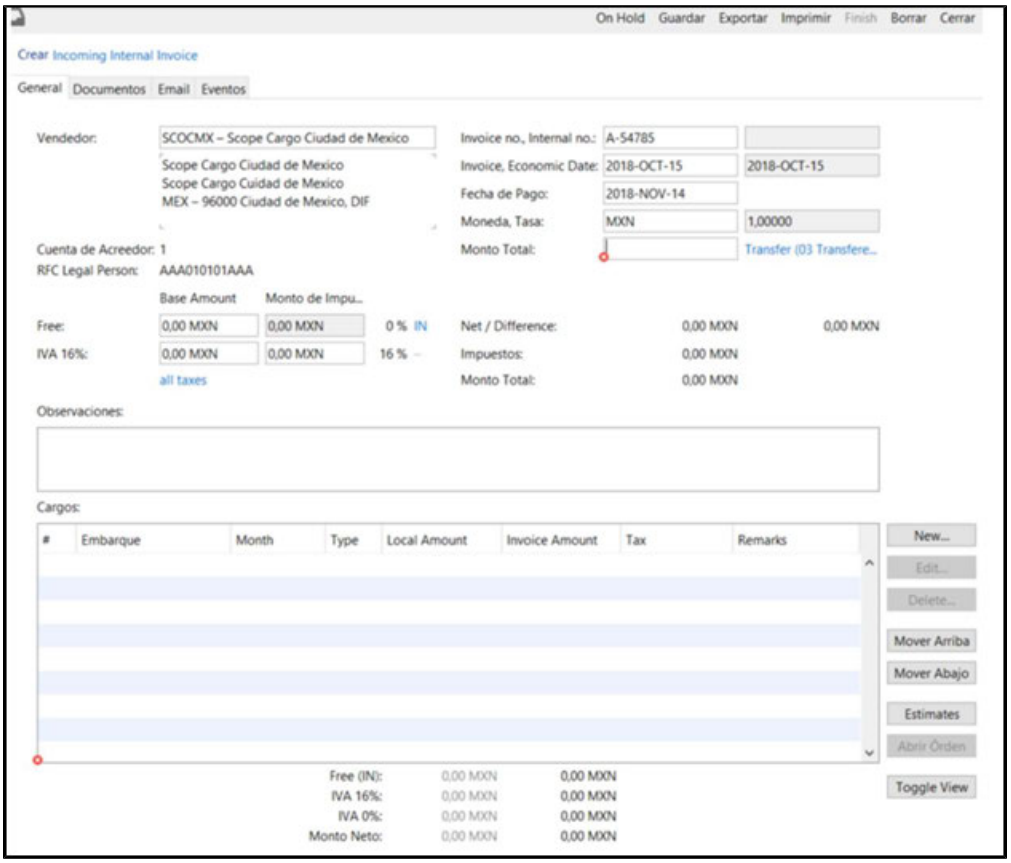


3. Al ingresar capture los datos requeridos

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

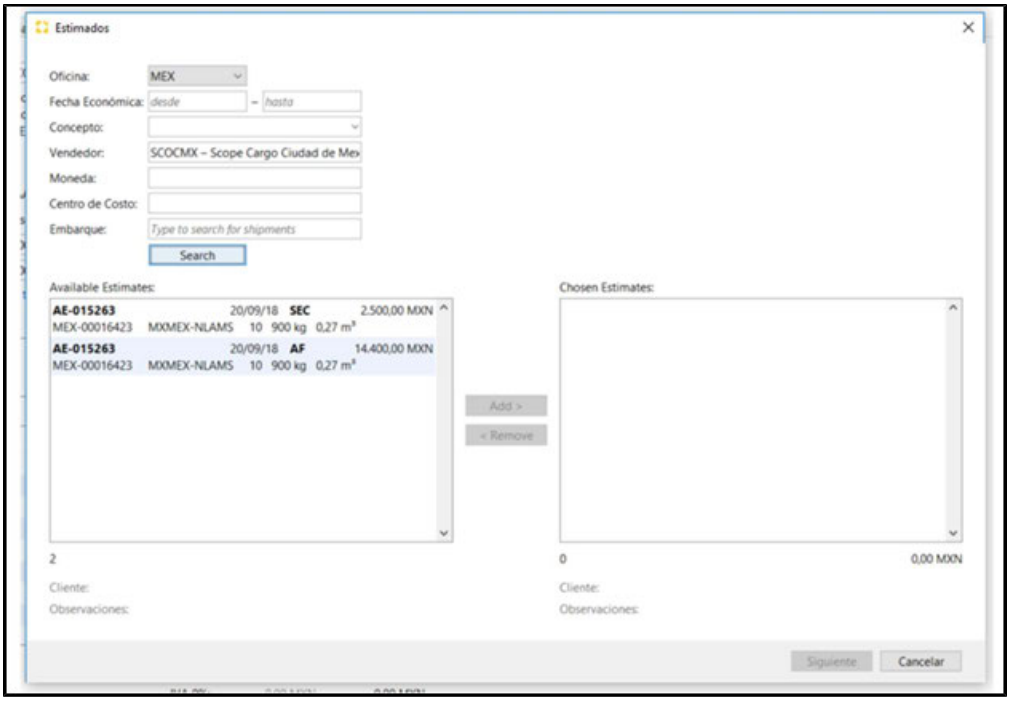


Después de ingresar los datos seleccionamos **“Guardar”** para que se habiliten las funciones de New, Edit, Mover Arriba, Mover Abajo, Estimates.

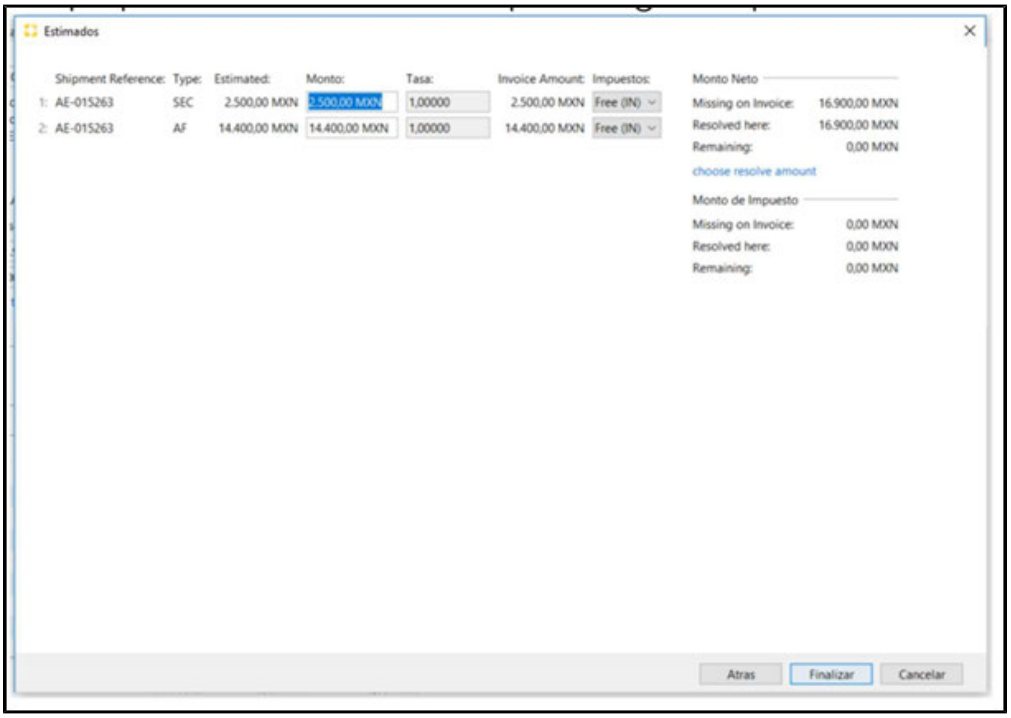


4. Observe que hay un botón llamado **“Estimates”**, el cual al presionar, presentará una ventana de Estimados, dé un click en **“Search”** y Scope buscará todos los costos para el proveedor.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

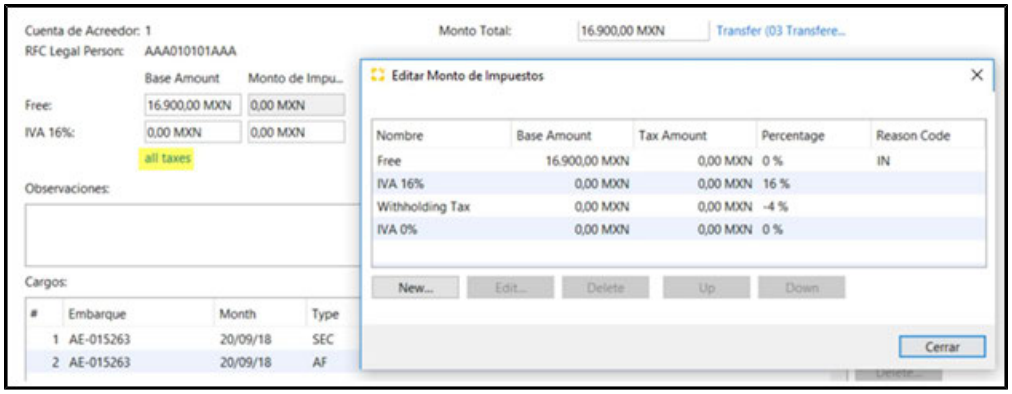


Aquí se encuentran los dos costos que fueron asignados en el Job Costing del embarque AE-015263 y selecciónelos, pase a la derecha y de click en "**Sig uiente**": Scope presentara una ventana para asignar impuestos:

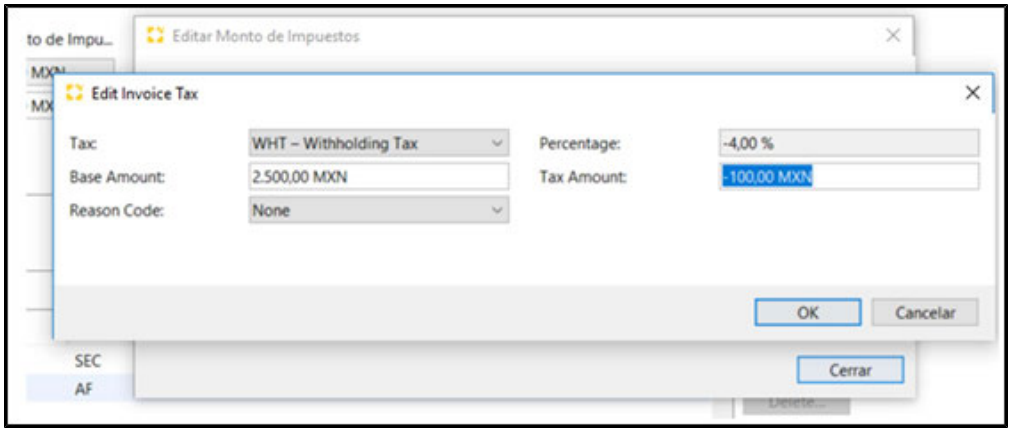


5. Después de asignar los impuestos se da click en finalizar y regresará a la pantalla de captura:

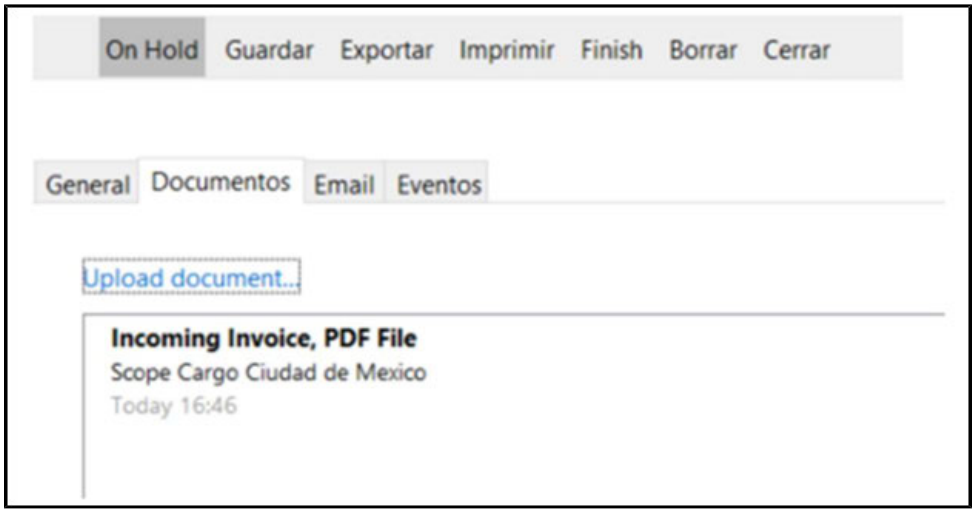
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Si es necesario capturar alguna retención, se debe dar click en el apartado que dice **all taxes**, y presentará una ventana para poder capturar otros tipos de impuestos, dé un doble click en el impuesto y capture el monto base. Scope realizara el cálculo como el siguiente ejemplo:



6. Una vez que termine de dar de alta la factura de entrada dé click en guardar y podrá Imprimir la orden de pago:



En la pestaña de “**Documentos**” puede encontrar la orden de pago generada.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Recepción de Pagos de CFDI versión 3.3

Introducción

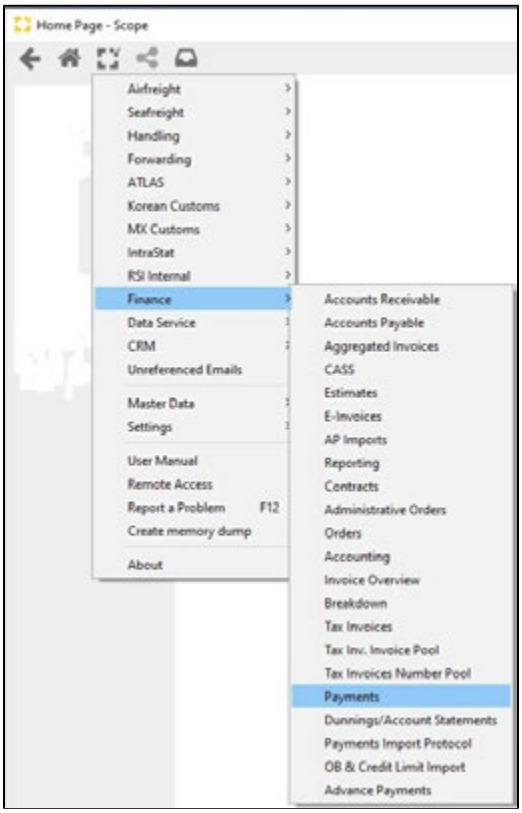
De acuerdo con los requerimientos del SAT, Riege Software ha modificado el módulo de
Finanzas > Pagos. Para cumplir con las disposiciones de las autoridades fiscales, mismas que entran en vigor el 1º. de septiembre del 2018. Los cambios se implementaron en el sistema Scope versión 10.6.10

Tabla de Contenidos

- Introducción
- Tabla de Contenidos
  - 1. Ingreso al módulo de Pagos
  - 2. Registro en Scope de un Pago – total o parcial - de UNA sola Factura por Cobrar
  - 3. Registro en Scope de un Pago – total o parcial - de Dos o Más Facturas por Cobrar
  - 4. Registro ante el SAT de un Pago – total o parcial - de una Factura

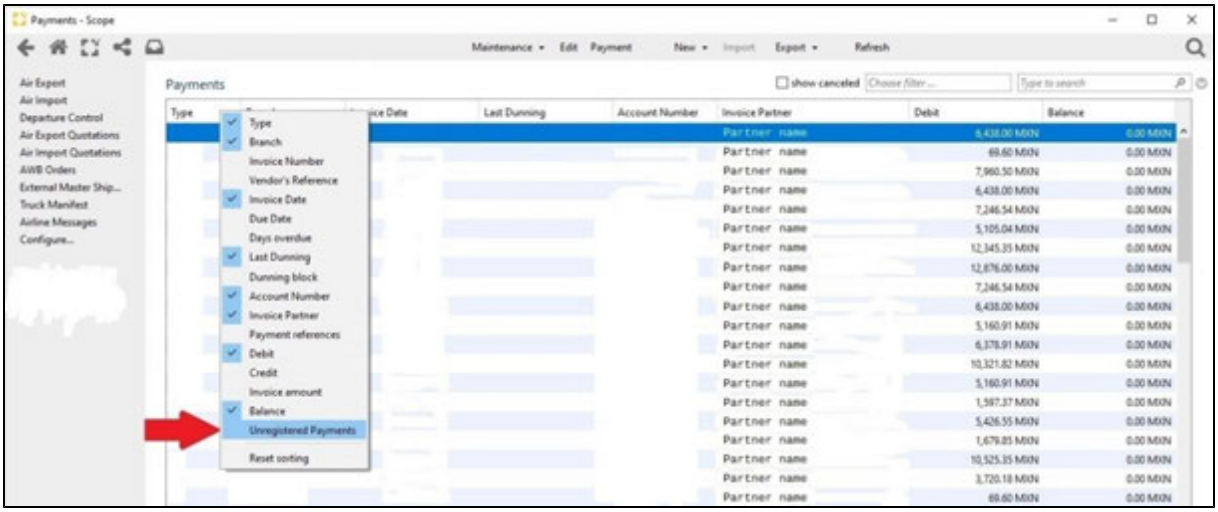
1. Ingreso al módulo de Pagos

1.1 Menú Principal > Finanzas > **Pagos**



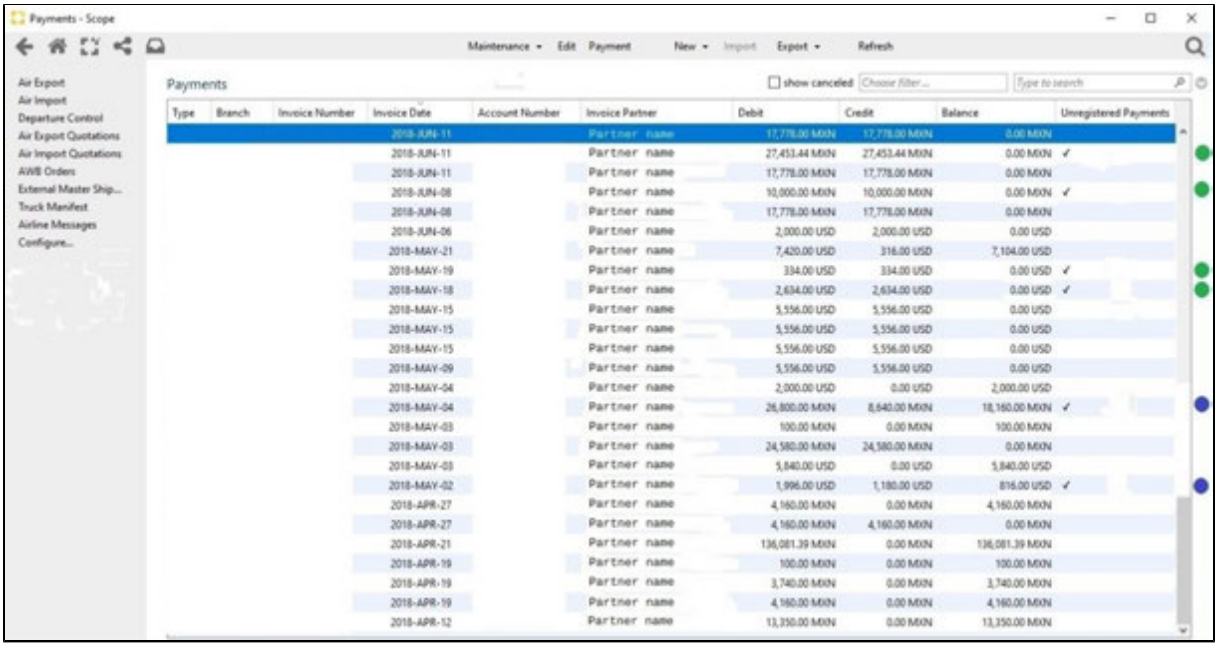
1.2 Dé click derecho sobre el encabezado de las columnas y agregue "**Unregistered Payments**", la cual servirá para identificar cuáles facturas ya han tenido pagos registrados ante el SAT.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



1.3 Existen únicamente dos casos en los que aparece el símbolo debajo de la columna de “Unregistered Payments y que ninguno de estos pagos haya sido registrado ante el SAT

- La factura que ha sido pagada en su totalidad.
- La factura que en el esquema “PPD – Pago en Parcialidades o Diferido” se le ha registrado en Scope al menos un pago.



2. Registro en Scope de un Pago – total o parcial - de UNA sola Factura por Cobrar

2.1 El usuario selecciona **UNA** sola Factura por Cobrar que no tenga un solo pago registrado en Scope.

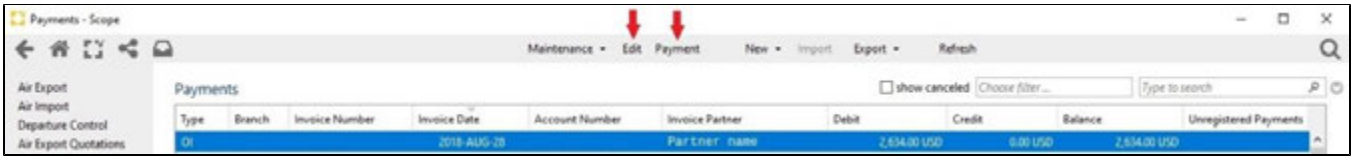
Debit	Credit	Balance
$100.00	$ 0.00	$ 100.00

Si realiza el pago del monto total de la Factura, oprima “**Payment**” en el menú superior.

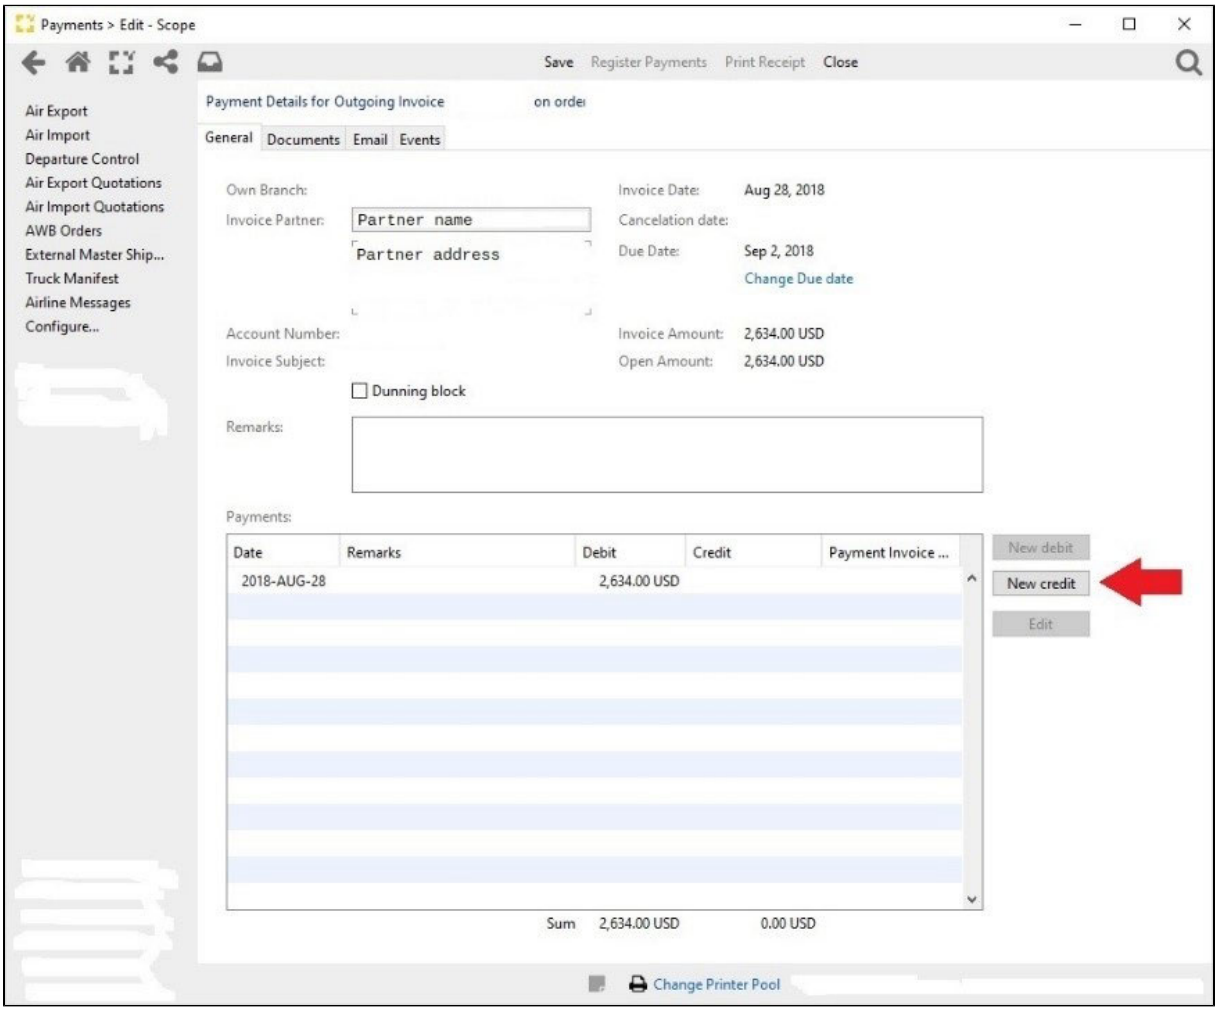
Continúe con el paso 2.3.1.

En cambio, si va a registrar en Scope un primer pago parcial, oprima “**Edit**” o dé doble-click sobre la Factura seleccionada.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



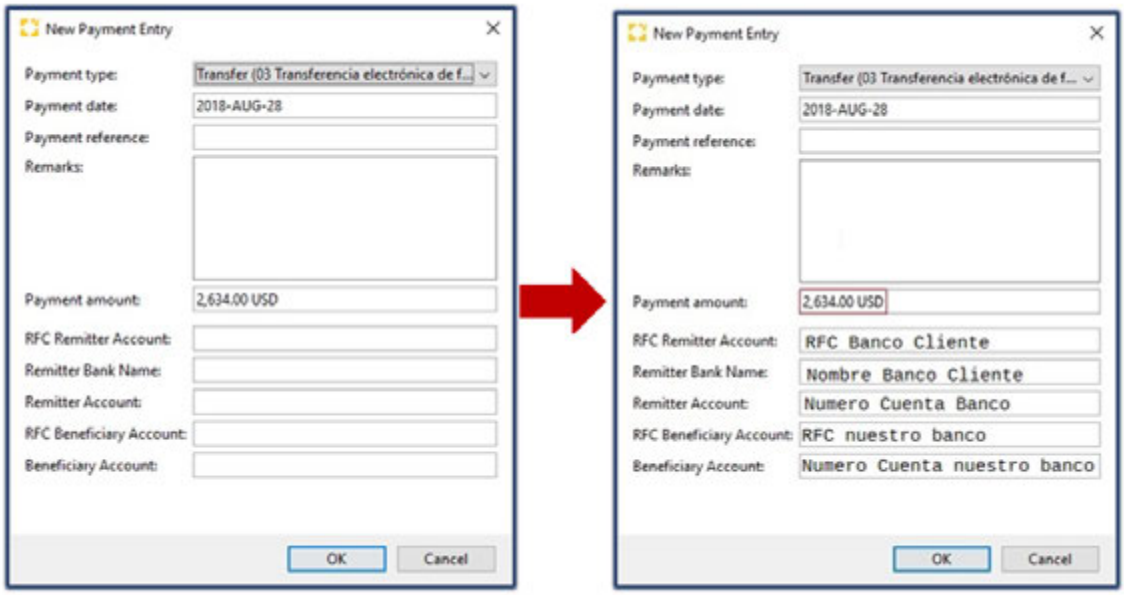
2.2 Proceda a registrar un abono dando click en el botón de "**New credit**"



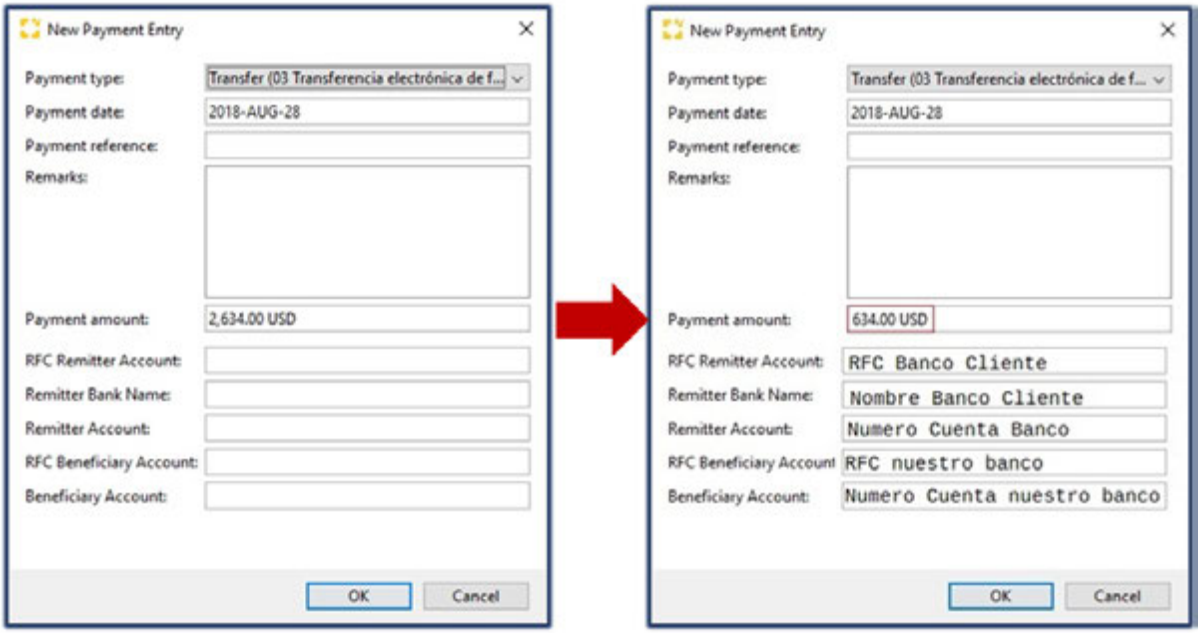
2.3 Si el usuario:

2.3.1 Oprimió **"Payment"**, entonces el monto a pagar NO es editable, ingrese los valores de los datos y oprima **OK**.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



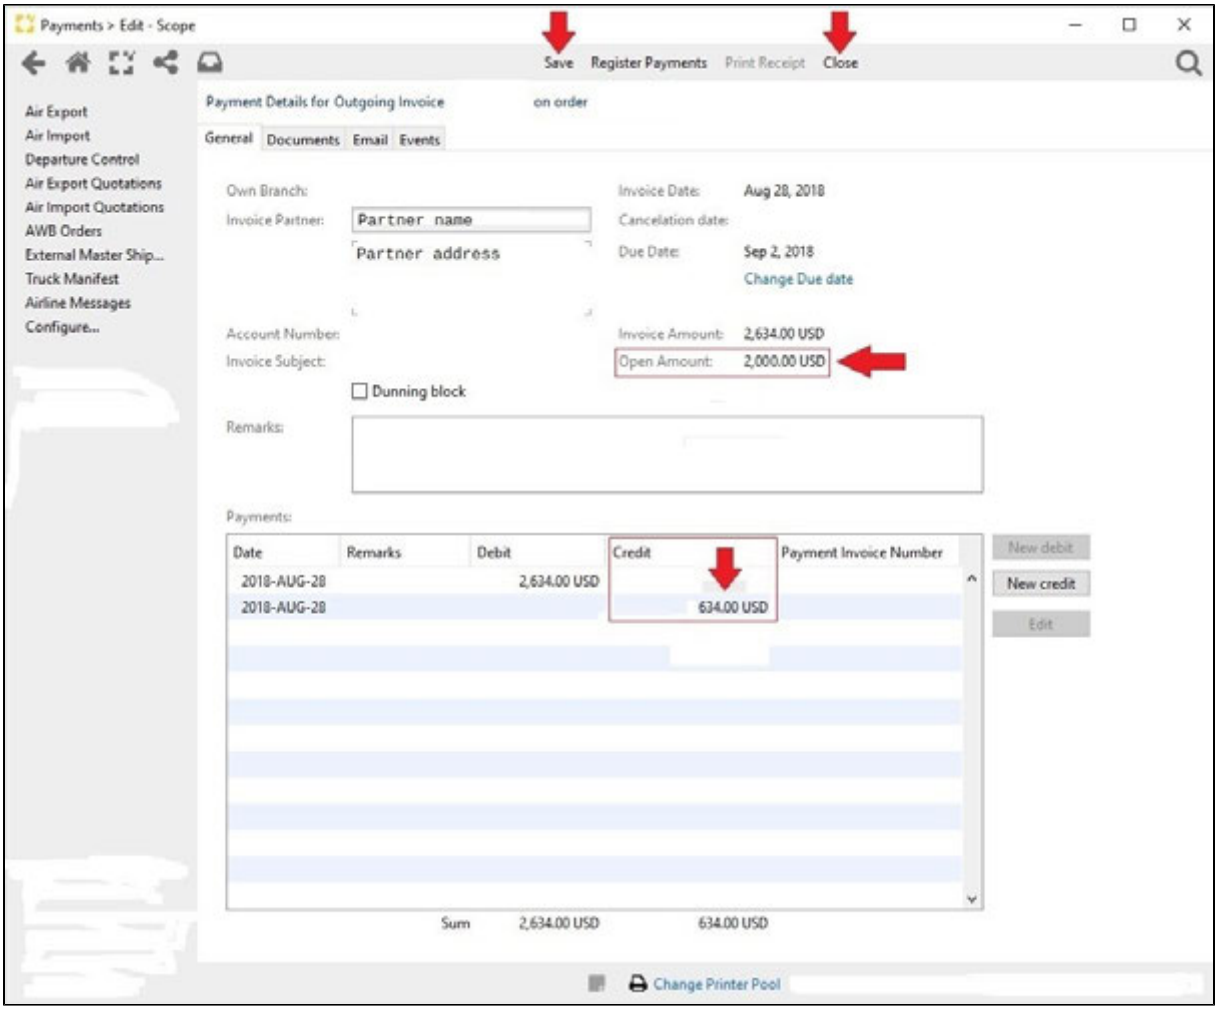
2.3.2. Realiza un pago parcial, entonces la cantidad a abonar **es editable,** ingrese los valores de los datos y oprima **OK**.



2.4. Aparece monto acreditado $ 634.00 USD con saldo deudor – Open Amount – por $2,000.00 USD.

Asegúrese de guardar esta operación dando click en **“Save”** del menú superior. Luego proceda a dar un click en “**Close”**.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



2.5. Aparecerá nuevamente el listado de Pagos.

Ya sea que el usuario haya realizado:

- el pago total del monto de la factura
- un pago parcial

Observe que ahora aparecerá el símbolo ✓ debajo de la columna "**Unregistered Payments**".

3. Registro en Scope de un Pago – total o parcial - de Dos o Más Facturas por Cobrar

3.1. El usuario selecciona más de una factura por cobrar

- del mismo cliente
- con el mismo Tipo de Moneda

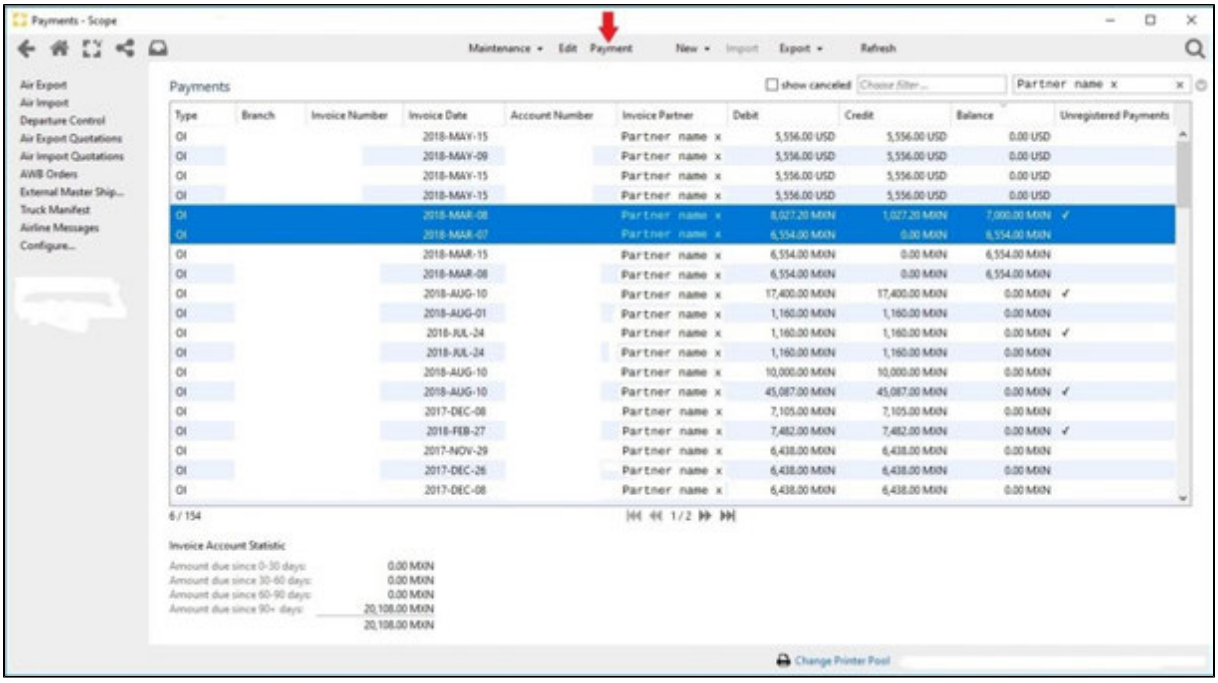
Las facturas seleccionadas pueden tener: un saldo deudor igual o menor al monto total de la factura.

El pago se aplicará para que el saldo deudor de las Facturas seleccionadas sea igual a cero.

3.2. Para este ejemplo, son seleccionadas (2) Facturas por Cobrar.

3.2.1. Oprima la opción de **"Payment"**

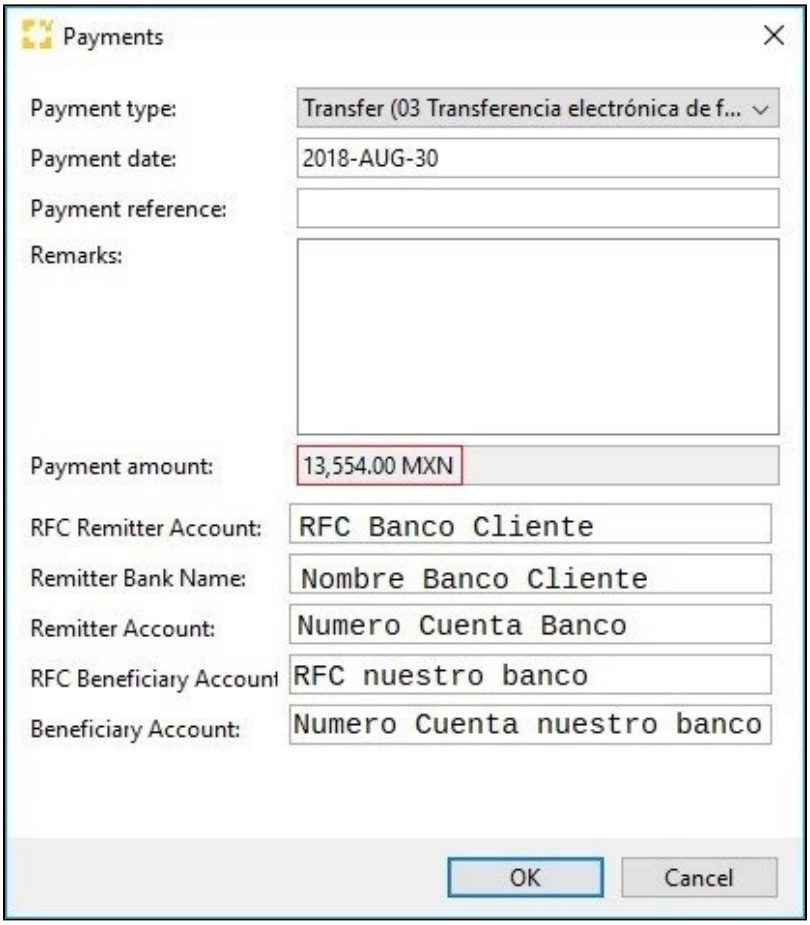
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



3.3. Observe que el monto total a pagares la suma de los saldos pendientes por pagar de ambas Facturas.

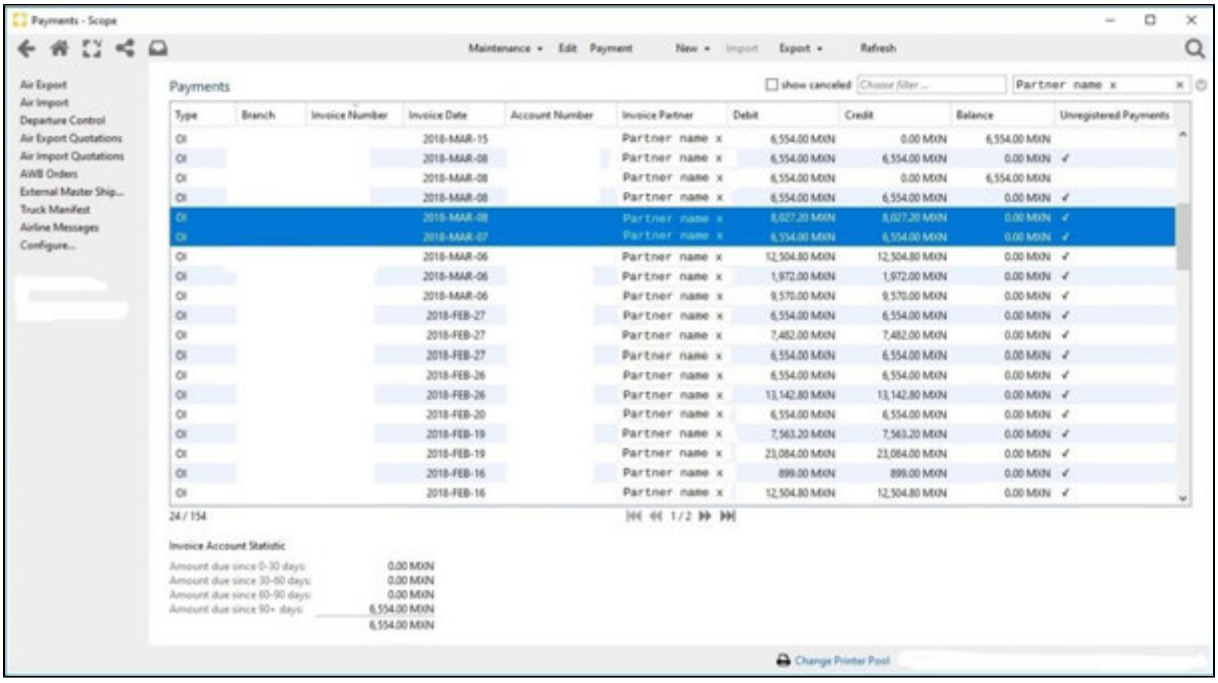
3.3.1. Ingrese los valores de los datos.

3.3.2. Oprima el botón "**OK**".



3.4. En el listado de Pagos, ambas Facturas tienen un saldo deudor de cero.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



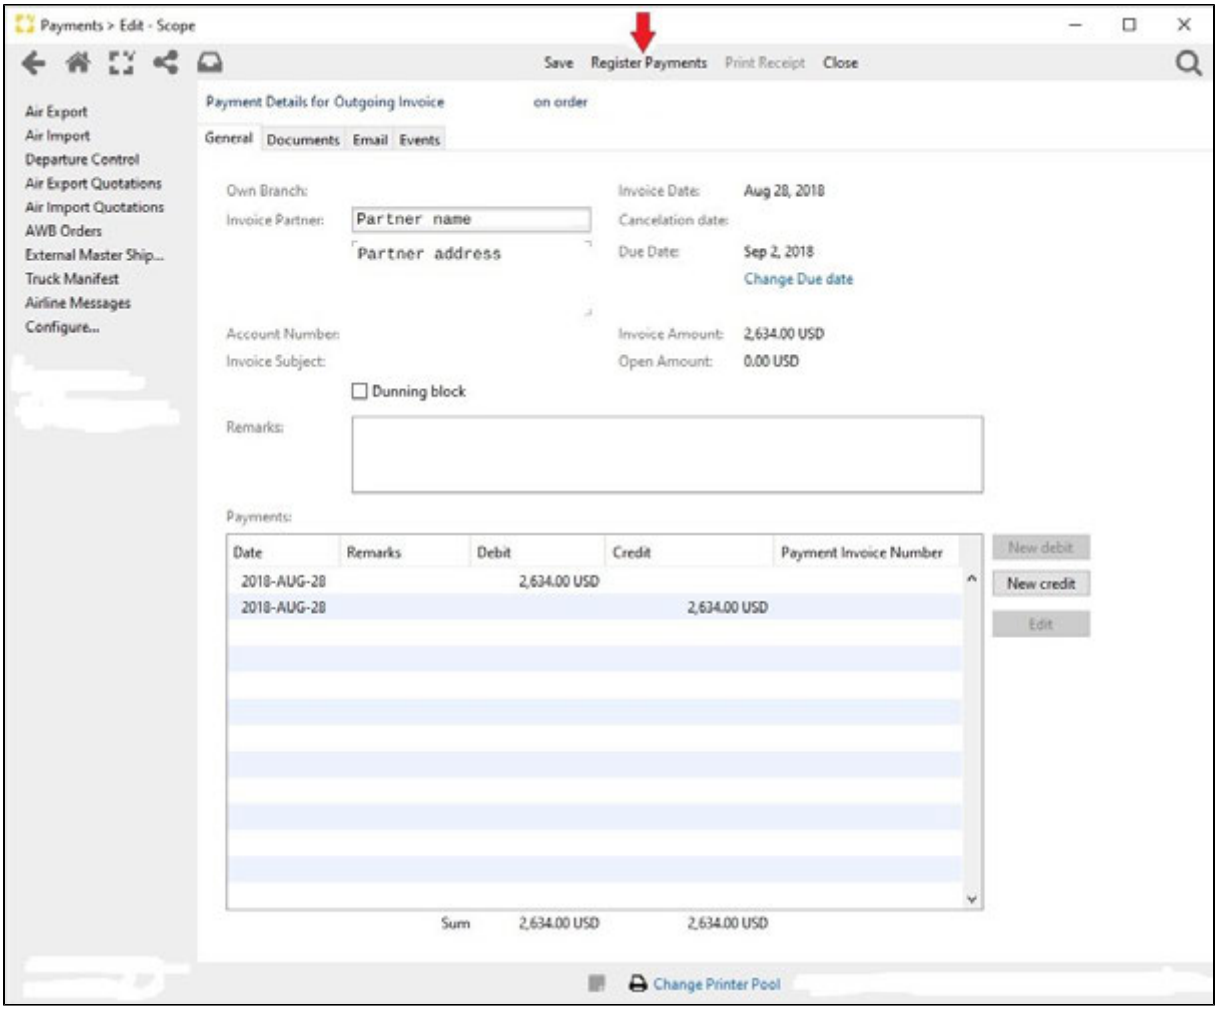
4. Registro ante el SAT de un Pago – total o parcial - de una Factura

4.1. Del listado, seleccione una Factura.

4.2. De doble-click sobre el registro u oprima “**Edit**”

4.3. De un click en “Register Payments” del menú superior.

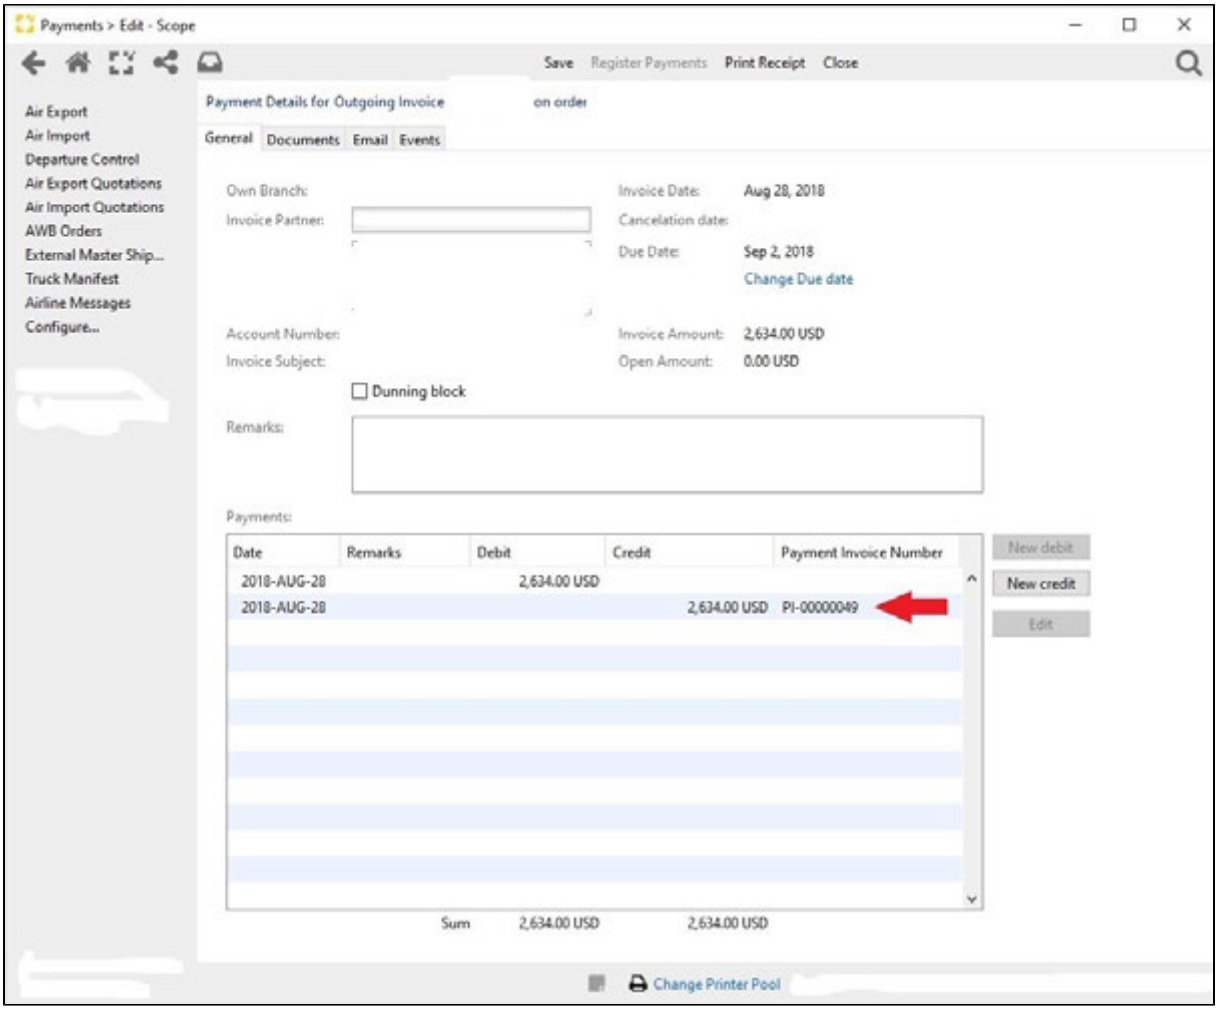
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



4.4.Esta acción enviará un archivo .XML al PAC – Proveedor Autorizado de Certificación, **para el debido registro del pago ante el SAT.**

4.5. Si el registro es exitoso, Scope asignará un número de pago de la factura.

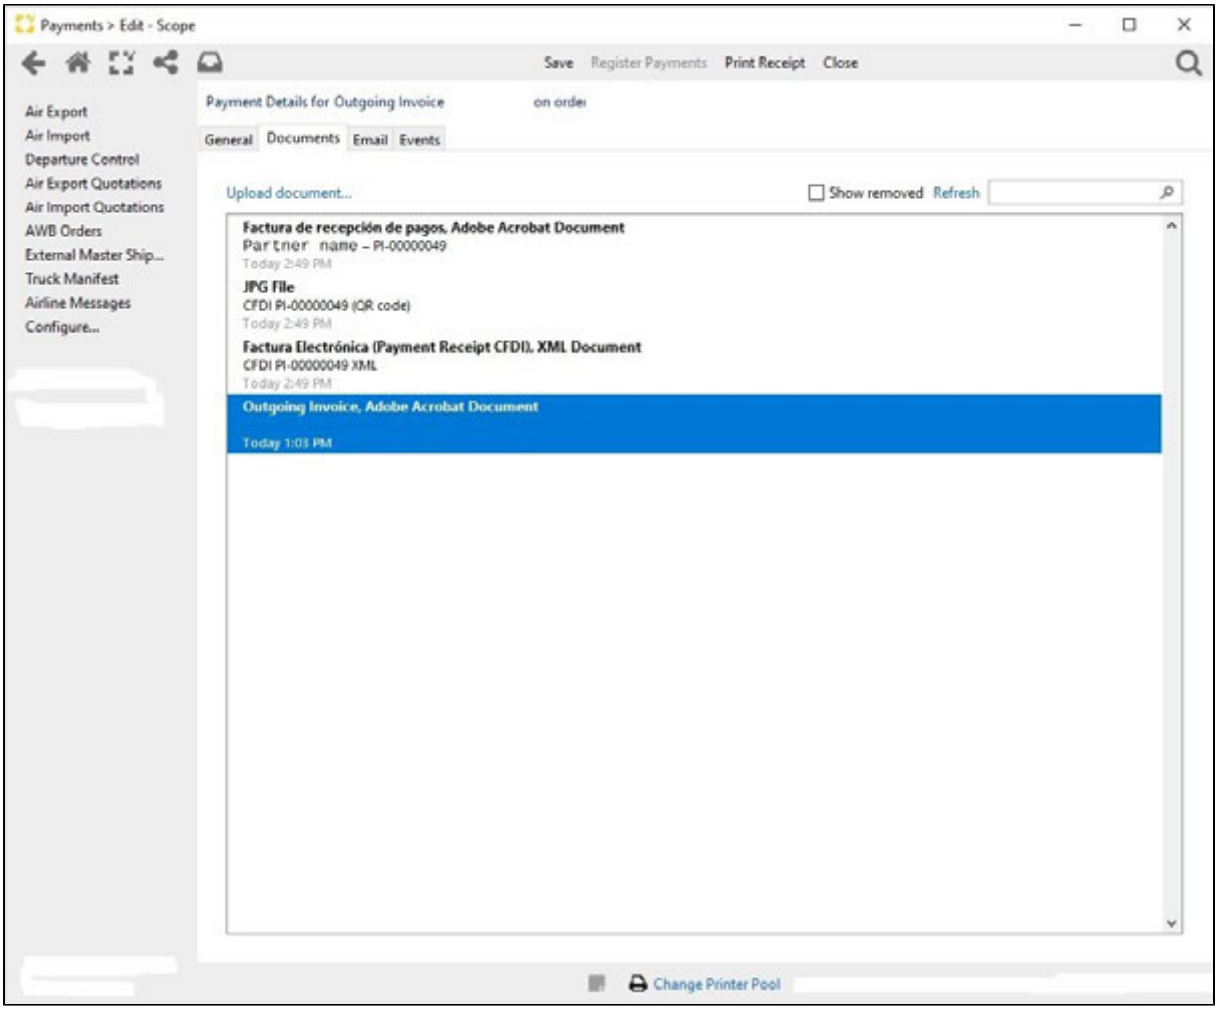
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



4.6. En la pestaña de documentos aparecerán:

- Factura original - XML y PDF
- Comprobante de Pago - XML y PDF

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



4.7 Ejemplo de un “Recibo de Pago Complementario”

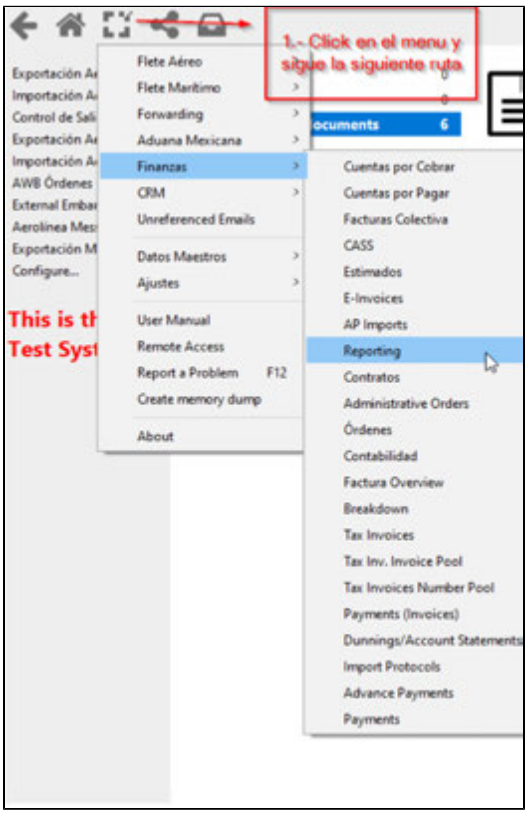
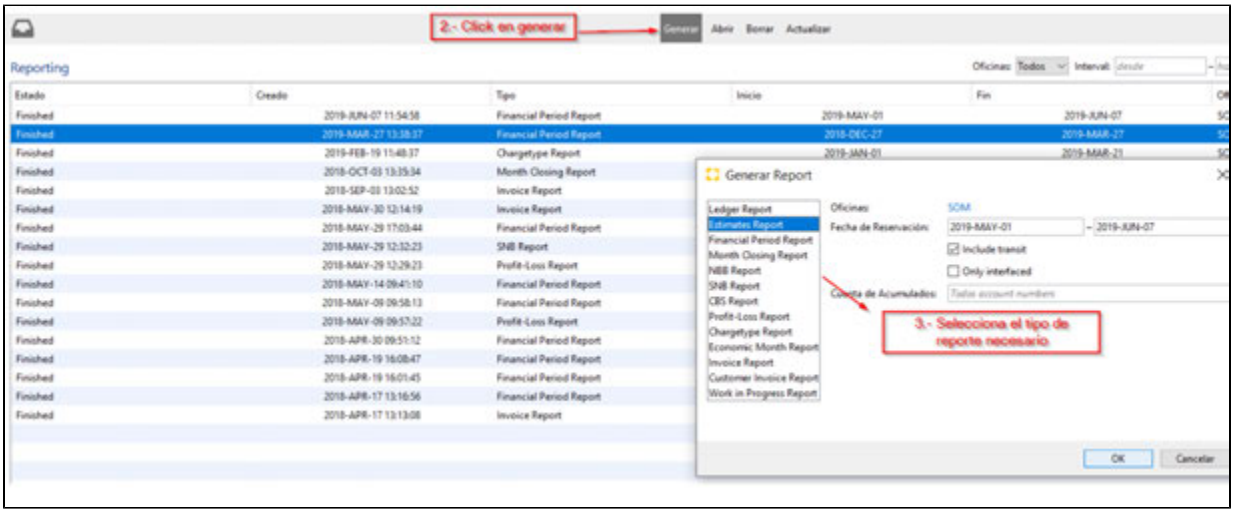
Reportes Financieros

En este apartado encontrará todos aquellos reportes relacionados con el módulo de Finanzas. A continuación, se muestra la ruta para ejecutar los reportes financieros.

1. Dar click en el botón de aplicaciones (menú)
2. Posiciona el mouse sobre el módulo de finanzas para que despliegue las opciones de este módulo y de click en "Reporting"
3. Localiza en la parte superior de la ventana, la opción "Generar" y de click
4. A continuación observará los diferentes reportes que este módulo genera
5. Seleccione el reporte de su interés





Nombre	Propósito	Ejemplo
Reporte del Libro	En este reporte nos ayuda a evaluar la facturación por libro mayor para conocer las partes rentables y menos rentables de la empresa.	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

		Reporte de Estimaciones	Lista de estimaciones abiertas, es decir, artículos que se calculan en función de las tasas de compra o venta almacenadas o la entrada manual por parte de un usuario, pero que no forman parte de una factura finalizada. No son cifras financieras actuales con respecto a la contabilidad, pero deben evaluarse para obtener una imagen clara de la situación financiera de la sucursal.	
Reporte de Periodo Financiero	Evaluar las cifras financieras reales (facturas finalizadas) por envío. Ofrece un desglose de las cifras financieras en el período dado.	Reporte de Cierre Mensual	Resumen de cifras financieras tanto reales (facturas finalizadas) como estimaciones (facturas abiertas). Además de las cifras financieras generales para el mes dado, muestra las cuentas por cobrar abiertas que se facturarán el próximo mes pero se relacionan con las transacciones realizadas en el mes dado. Mostrará los costos estimados donde aún no se ha recibido pago real, por lo tanto, los costos ocurrirán en el mes siguiente que a su vez se relacionarán con las transacciones efectuadas en el mes dado.	Reporte NBB	Lista de cuentas por pagar y cuentas por cobrar por socio de facturación y su respectivo volumen de negocios. Esto permitirá evaluar el volumen de negocios de ciertos socios e identificar el aumento y/o la disminución de negocios con socios determinados.	
Reporte SNB	Lista de la facturación de los socios (cuentas por pagar y cuentas por cobrar) para cada envío y su respectivo volumen de negocios. Esto permitirá evaluar el volumen de negocios de ciertos socios e identificar el aumento y/o la disminución de negocios con determinados socios.	Reporte CBS	Lista de todos los envíos por modo de transporte con ingresos y costos. Es necesario en algunos países informar estas cifras por modo de transporte al gobierno para fines estadísticos.	Reporte de Pérdidas y Ganancias	Lista de ganancias o pérdidas por envío. Los criterios del filtro permiten identificar fácilmente los envíos en los que la empresa sufrió pérdidas y al analizar los envíos respectivos para identificar posibles patrones para las transacciones sin fines de lucro.	

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Reporte de tipo de Cargo	Lista del volumen de negocios por tipo de socio y por socio de facturación (por pagar y por cobrar). Esto permite identificar servicios en los que la empresa gana o pierde capital. Permite dar la indicación para recomendar los ajustes a la tasa de ventas.	Reporte del Mes Económico	Este reporte en lista la facturación por mes económico y por sucursal. Esto permitirá evaluar el estado financiero de cada sucursal en particular en comparación con los meses anteriores.	Reporte de Facturación	Este reporte en lista todas las facturas finalizadas.	Reporte de Facturación por cliente.	Este reporte en lista las facturas de un determinado cliente, incluye el detalle de pago relacionados con la factura en particular. Permite evaluar cliente contra su volumen de negocios y su comportamiento de pagos. Ayuda a visualizar la situación financiera de los socios y sus comportamientos de pagos.	Reporte de Trabajo en Proceso	Este reporte te permite ver todas la cuentas por pagar y por cobrar (datos reales y estimaciones) sobre los envíos abiertos. Ofrece un resumen financiero de las transacciones en las que aún se están trabajando en las operaciones.	
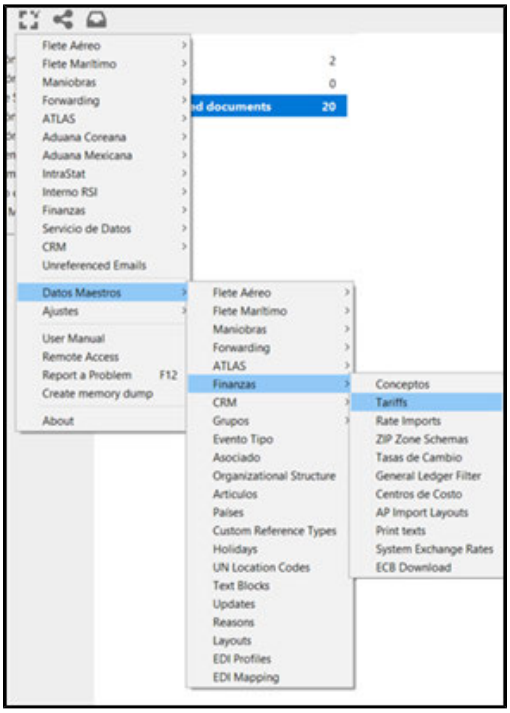
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Tarifas

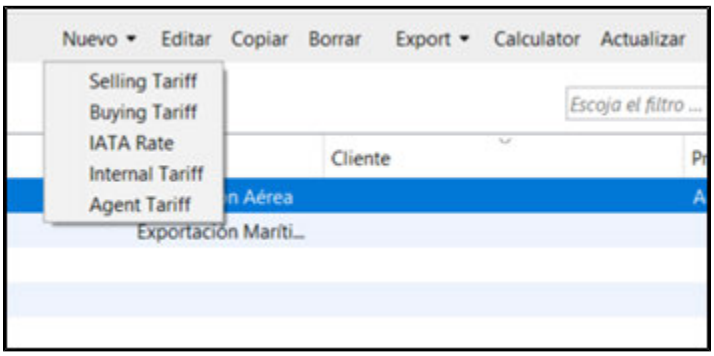
Introducción

El objetivo del presente documento es mostrar cómo crear Tarifas.

1. Ingrese al módulo Datos Maestros > Finanzas > Tariffs

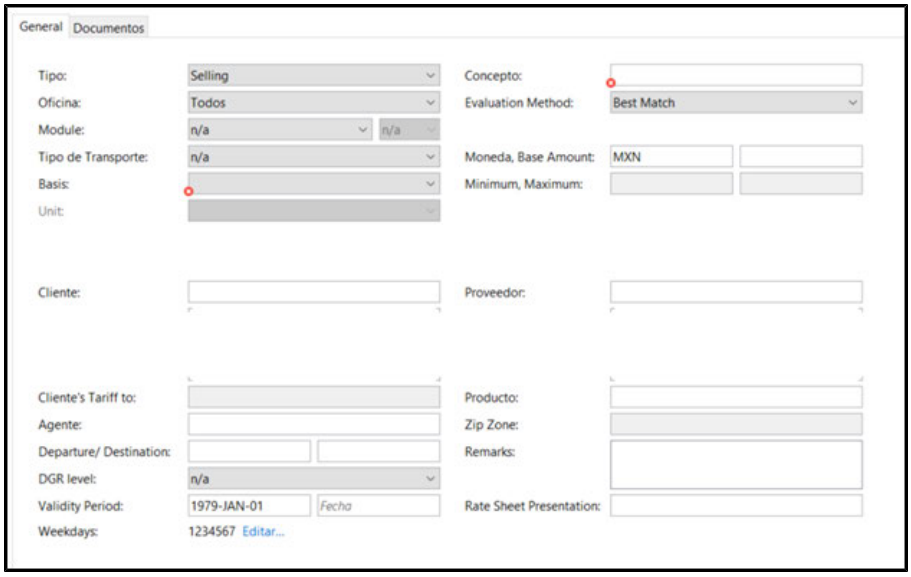


2. De click en new y seleccione el tipo de tarifa que desea agregar:



3. Por ejemplo, seleccione una tarifa de venta (Selling Tariff):

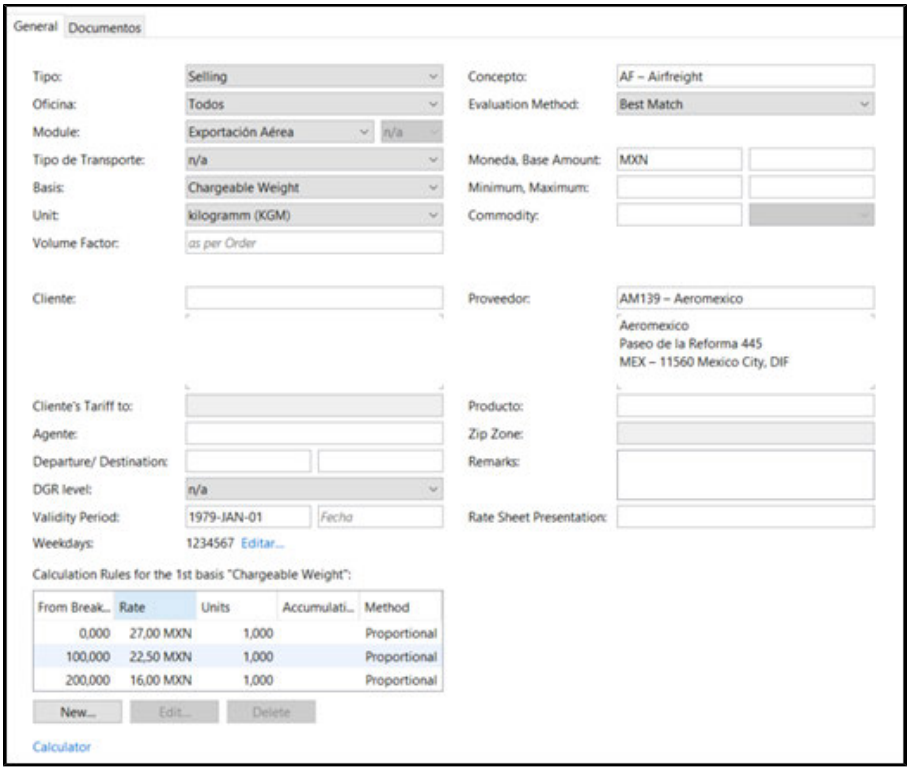
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Tipo	Tarifa
Oficina	A qué oficina aplica la tarifa
Módulo	Definir si la tarifa aplica a un solo modulo o a todos (n/a)
Tipo de Transporte	Si la tarifa aplica para un cierto tipo de embarque
Basis	Definir el tipo de base para la tarifa
Concepto	Definir a que concepto la tarifa será aplicada
Evaluación	• Como será evaluada la tarifa; • **Fixed**: Esta es una tarifa fija y no depende del número de unidades. • **Step**: El número de unidades siempre se redondea a una cantidad completa. • **Proportional**: La tasa es calculada por las unidades. Ejemplo: En el punto de corte "100 kgs" se cobra una cifra de "20.00" EUR por cada 10 kgs.
Moneda, Base Amount	Definir que moneda será usada por la tarifa, así como cantidad de la base
Cliente	Si la tarifa va a ser aplicada a un determinado cliente o dejar en blanco para todos los clientes
Proveedor	Usado para las tarifas de compra, y definir que proveedor proporciona la tarifa
Producto	Si la tarifa es aplicada a un producto en específico
Agente	Si la tarifa será aplicada a un agente en específico
Departure /Destination	Se usa para definir si la tarifa aplica a ciertos origines o destinos

Si usa una base que requiera reglas aparece un nuevo apartado para agregar dichas reglas

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.



Las tarifas serán aplicadas al momento de generar el Job Costing.

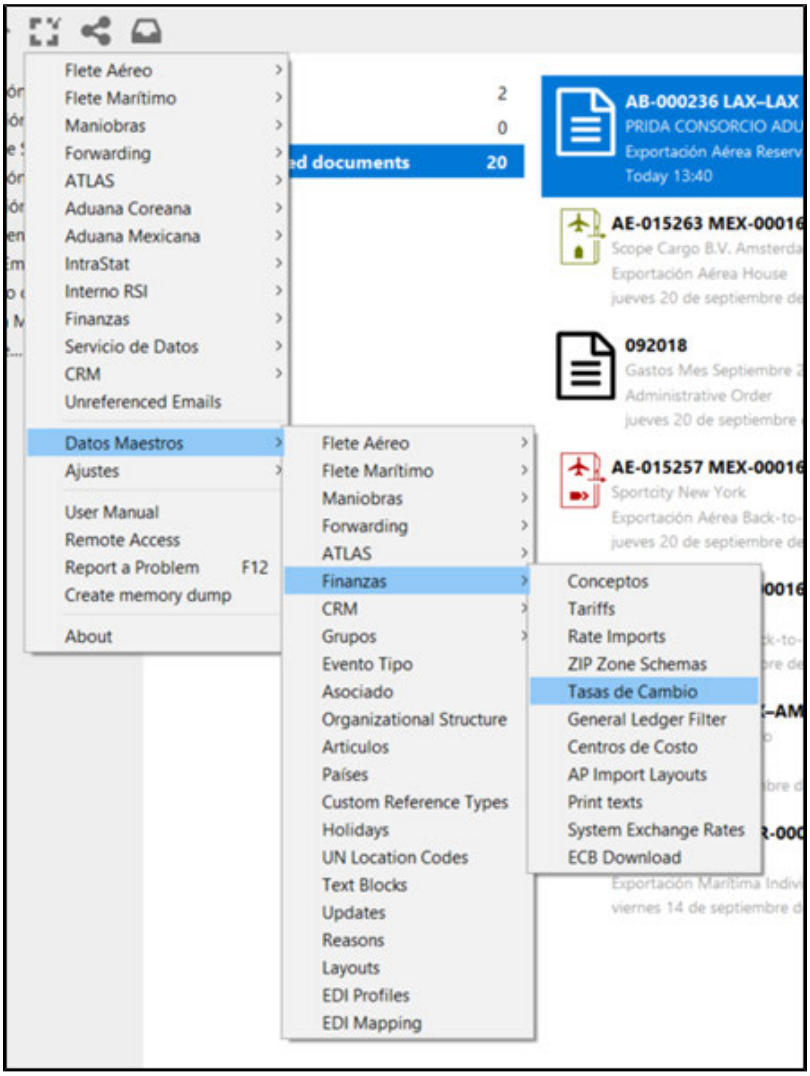
Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Tipo de Cambio

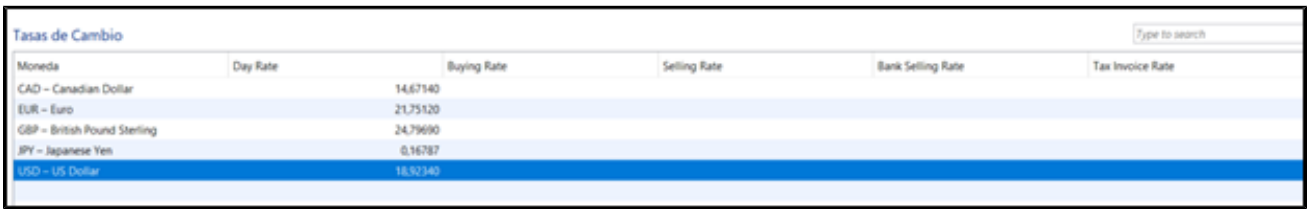
Introducción

El objetivo del presente documento es mostrar cómo mantener tipos de cambio

1. Ingrese al módulo: Datos Maestros > Finanzas > Tasas de Cambio



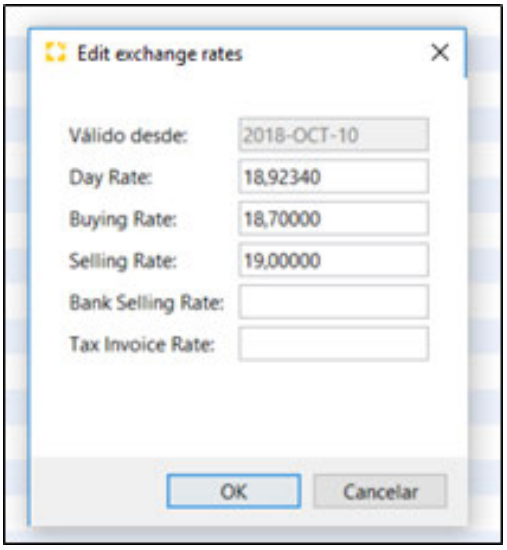
2. Seleccione la moneda que se va a actualizar, en este caso seleccionamos USD – US Dollar:



3. Al ingresar a la moneda, se presenta una pantalla con las tasas de cambio histórico, seleccionamos, dando doble click en el registro donde va a mantener las tarifas de compra y venta:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

4. Se presenta una pantalla para actualizar el tipo de cambio y se ingresan las cantidades:



Después de ingresar los tipos de cambio, dé click en **OK**.

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

Technical aspects

Technical requirements

You can find a list of all the technical requirements for the Scope installation and its usage here.

Scope Runtime

You can find a description of the "Scope Runtime", which is required since Scope release 11.0, including a FAQ section here.

Technical Requirements

- Introduction
- Requirements

Introduction

Please contact your Scope Support in order to confirm the technical requirements for the usage of Scope.

Requirements

Client

PC

- 768 MB free system RAM
- 1 GB free storage space

Display

- Minimal resolution: 1024 x 768
- Optimal screen resolution: 1920 x 1080

Software

Operating System

- Microsoft Windows 10
- Microsoft Windows 11
- Apple Mac OS X starting with version 10.14

Scope Runtime

- Scope requires the Scope Runtime to be installed. Download at https://www.riege.com/scope/download/ .

Printer

- All printers connected to Scope must either be connected to a print server or equipped with an Ethernet port (internal print server).
- Scope supports dot matrix printers, PCL and PostScript laser printers as well as selected label printers.

Network

Which one of the following options is suitable depends on the number of workstations, the amount of business transactions, the pre-existing infrastructure, the demands on quality and reliability of the connection as well as your internal IT guidelines.

Therefore a general recommendation cannot be made, Riege Software International is happy to provide individual advice to each customer.

Connectivity Options

Internet Access

The option is included in all Scope plans.

Direct connection to the Scope application over Internet. The data is transferred encrypted using HTTPS (Hyper Text Transfer Protocol Secure) between Scope server and Scope client. Attention should be paid to the fact that no direct printing is available. Documents must be downloaded and printed on the client computer. Please choose another option if direct printing is required.

IPSec-VPN-Tunnel via Internet

This option is available at an additional fee.

Minimum requirements on the customer side:

Copyright 1985-2014 Riege Software International GmbH. All rights reserved.

- synchronous broadband Internet access with at least 2MBit/s, static IP address and without 24h disconnect.
- Router with firewall and IPSec-VPN feature
    - Device compatibility cannot be guaranteed by Riege.
    - Riege uses Sophos UTM firewalls to terminate VPNs.

Both tunnel endpoints may be provided by the customer, an additional fee applies.

Firewall Rules for VPN usage on customer side

- Outbound:
    - HTTP protocol standard port 80
- Inbound:
    - Printer access from Scope server depending on used printing protocol:
        - Jetdirect protocol standard port 9100.
        - LPD protocol standard port 515.
        - IPP protocol standard port 631.

NOTE: It might be required to implement NAT or change the customer's local subnet in order to setup the VPN.

Managed Network Connection (MPLS)

Managed network connection between the customer's branch offices and Riege Software International's data center installed by the customer or an assigned service provider, typically in the flavour of MPLS networks.

Bandwidth

An synchronous broadband Internet access with at least 2MBit/s is recommended for small environments.

Proxy

In case of a proxy server usage, the proxy server must support the WebSocket protocol (RFC 6455).

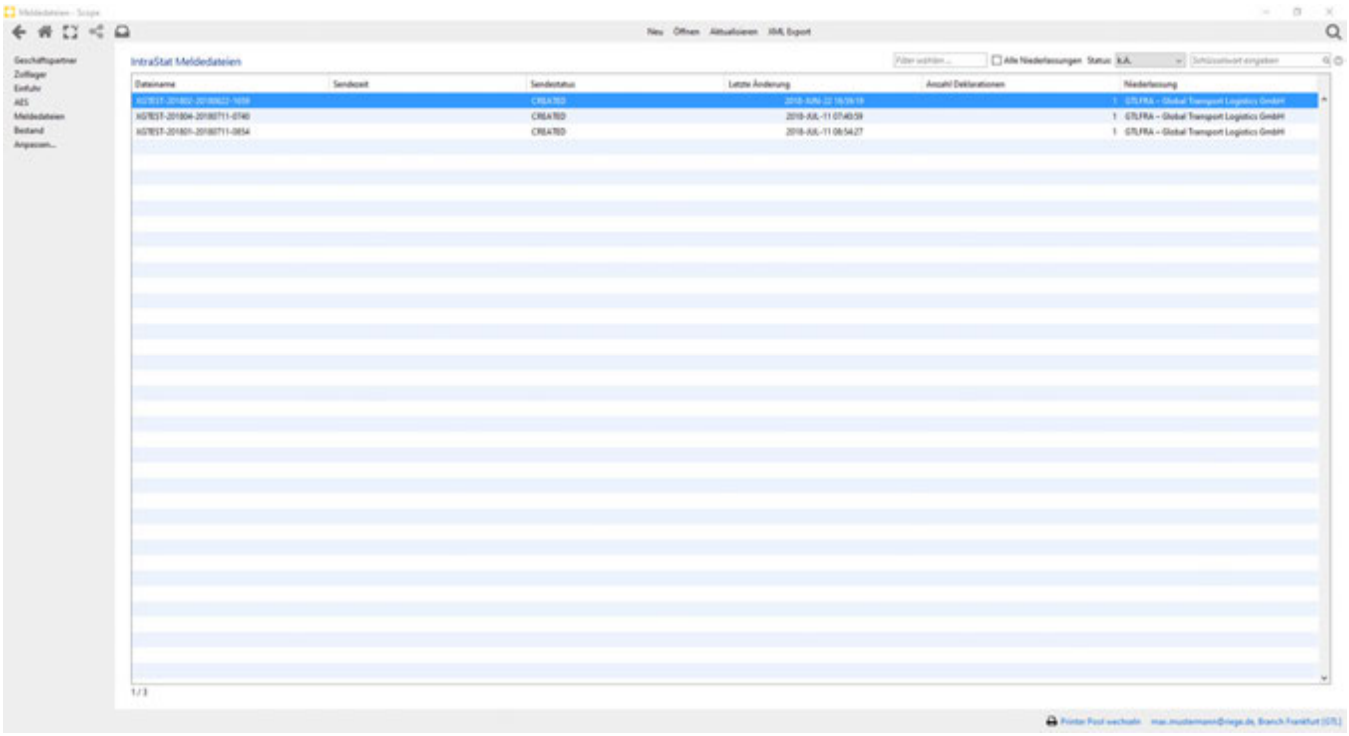
Meldedatei

Einleitung

Die Intrastat Meldedatei wird aus dem Bestand erzeugt. Erzeugte Meldedateien können über den XML Export als Datei heruntergeladen werden und anschließend beim STABA hochgeladen werden.

> Informationen zur Erhebung finden sie unter: Erhebungsportal

Beschreibung



Neu

Öffnet eine leere Meldedatei, die dazu benutzt werden kann, alle verfügbaren Bestände für einen gewissen Zeitraum in die Meldedatei zu ziehen.

Öffnen

Öffnet die markierte Meldedatei.

Aktualisieren

Aktualisiert die Ansicht des Homeview.

XML Export

Öffnet den Explorer. Der Benutzer kann das Verzeichnis auswählen in das die XML Datei, welche später an das STABA gesendet wird, abgelegt und gespeichert wird.
